CBWatch3 end of production phase

Dear customer,

As part of our ongoing product lifecycle management, we are writing to inform you that the production of our AIS switchgear monitoring system, CBWatch3, is scheduled to end in 2027. The product is entering its service lifetime phase with limited support.

CBWatch3 has served our customers well over many years, and we appreciate the confidence you have placed in our team throughout its lifecycle. We remain committed to supporting planned CBWatch3 installations until the end of production, subject to the applicable terms of your agreements with us.

Consistent with standard practice for maturing platforms, we do not plan to develop further features or security updates for CBWatch3. As with any deployed system, we recommend that CBWatch3 continues to be operated in accordance with established industry practices for network and operational security, including network segmentation, access controls, monitoring, and site-specific measures appropriate to your environment. Responsibility for the configuration, security, and operation of the deployed system rests with the operator, and we encourage you to review your controls with your internal security and IT teams.

To support your longer-term planning, we encourage you to consider a transition to our current circuit breaker monitoring solution, CSD100. CSD100 provides easy replacement to CBWatch3 and key monitoring capabilities on a modern platform, offering high sampling rates and extensive data storage to support your asset management needs with high-quality data. CSD100 has been developed with current security standards in mind and is certified to IEC 62443.

Our team is ready to support you throughout this transition. Please contact your local GE Vernova representative to arrange a detailed presentation of CSD100's monitoring capabilities.
