Table of Contents

About this Document.....	20
Purpose	20
Intended Audience.....	20
Additional Documentation	20
1. Version 1.00 (27-March-2019)	21
Software Versions	21
Predix Edge OS and Other Firmware Versions	21
Key Features	21
Capability and Capacity.....	23
1.1 Performance Test Levels.....	23
1.2 Standalone	23
1.2.1 Performance Test Results	23
1.2.2 HMI Response time	24
1.3 Hot Standby Redundancy	25
1.4 Warm Standby Redundancy	25
Time Sync Accuracy (PTP/IRIG-B/NTP)	26
1.5 PTP Accuracy	26
1.5.1 Test Steps:.....	26
1.5.2 Test Results:.....	26
1.6 IRIG-B Accuracy	27
1.6.1 Test Setup:	27
1.6.2 Test Results:.....	27
1.7 NTP IN Accuracy	27
1.7.1 Test Setup:	27
1.7.2 Test Results:.....	27
1.8 NTP OUT Accuracy	27
1.8.1 Test Results:.....	28
Application List	28
Known Issues	30
1.8.2 Cyber Security	30
1.8.3 Clients.....	30
1.8.4 Servers	30
1.8.5 Automation.....	30
1.8.6 Configuration	31
1.8.7 HMI	31
1.8.8 Pass-through	32
1.8.9 System.....	32
1.8.10 Hardware	32

2. Version 1.10 (14-February-2020)33

Software Versions	33
Predix Edge OS and Other Firmware Versions	33
Key Functions and Changes	33
2.1 Enhancements.....	33
2.1.1 Cyber Security	33
2.1.2 Clients.....	34
2.1.3 Server	34
2.1.4 Automation.....	34
2.1.5 HMI	34
2.1.6 Passthrough/VPN	35
2.1.7 System.....	35
2.1.8 Hardware	35
2.1.9 Documentation	35
2.2 Fixed defects	36
2.2.1 Cyber Security	36
2.2.2 Clients.....	36
2.2.3 Automation.....	36
2.2.4 Configuration	37
2.2.5 HMI	37
2.2.6 Pass-through	37
2.2.7 System.....	38
2.2.8 Hardware	38
2.3 Known Issues	38
2.3.1 Cyber Security	38
2.3.2 Clients.....	38
2.3.3 Servers	39
2.3.4 Automation.....	39
2.3.5 Configuration/Settings	39
2.3.6 HMI	40
2.3.7 Pass-through	41
2.3.8 System.....	41
2.3.9 Documentation	42
2.3.10 Hardware	42
Capability and Capacity	43
2.4 Performance Test Levels.....	43
2.5 Stand Alone	44
2.5.1 Performance Test Results	44
2.5.2 HMI Response time	45
2.6 Hot Standby Redundancy	45
2.7 Warm Standby Redundancy	46
Time Sync Accuracy (PTP/IRIG-B/NTP)	47
Application List	48

3. Version 2.00 (27-May-2020).....50

Software Versions	50
Predix Edge OS and Other Firmware Versions	50
Key Functions and Changes	50
3.1 Enhancements.....	50
3.1.1 Cyber Security	50

3.1.2 Clients	50
3.1.3 Servers	51
3.1.4 Automation.....	51
3.1.5 Configuration/Settings	51
3.1.6 HMI	51
3.1.7 Pass-through	51
3.1.8 System.....	52
3.1.9 Documentation	52
3.1.10 Hardware	52
3.2 Fixed defects	52
3.2.1 Cyber Security	52
3.2.2 Clients.....	52
3.2.3 Server	53
3.2.4 Automation.....	53
3.2.5 Configuration/Settings	53
3.2.6 HMI	53
3.2.7 Pass-through	53
3.2.8 System.....	53
3.2.9 Documentation	54
3.2.10 Hardware	54
3.3 Known Issues	54
3.3.1 Cyber Security	54
3.3.2 Clients.....	54
3.3.3 Servers	55
3.3.4 Automation.....	55
3.3.5 Configuration/Settings	55
3.3.6 HMI	56
3.3.7 Pass-through	56
3.3.8 System.....	56
3.3.9 Documentation	57
3.3.10 Hardware	57
Capability and Capacity.....	58
3.4 Application Limits.....	58
3.5 Performance Test Levels.....	61
3.6 Stand Alone	62
3.6.1 Performance Test Results	62
3.6.2 HMI Response time	63
3.6.3 D.20 HDLC Performance Test Results	63
3.7 Hot Standby Redundancy	64
3.8 Warm Standby Redundancy	65
Time Sync Accuracy (PTP/IRIG-B/NTP)	66
Application List	66

4. Version 2.10 (09-December-2020)69

Software Versions	69
Predix Edge OS and Other Firmware Versions	69
Key Functions and Changes	70
4.1 Enhancements.....	70
4.1.1 Cyber Security	70
4.1.2 Clients.....	70

4.1.3 Servers	70
4.1.4 Automation.....	70
4.1.5 Configuration/Settings	70
4.1.6 HMI	70
4.1.7 Pass-through	70
4.1.8 System.....	70
4.1.9 Documentation	71
4.1.10 Hardware	71
4.2 Fixed defects	71
4.2.1 Cyber Security	71
4.2.2 Clients.....	71
4.2.3 Server	71
4.2.4 Automation.....	71
4.2.5 Configuration/Settings	71
4.2.6 HMI	71
4.2.7 Pass-through	72
4.2.8 System.....	72
4.2.9 Documentation	72
4.2.10 Hardware	72
4.3 Known Issues	72
4.3.1 Cyber Security	72
4.3.2 Clients.....	72
4.3.3 Servers	73
4.3.4 Automation.....	73
4.3.5 Configuration/Settings	73
4.3.6 HMI	74
4.3.7 Pass-through	74
4.3.8 System.....	74
4.3.9 Documentation	75
4.3.10 Hardware	75
Capability and Capacity.....	76
4.4 Application Limits.....	76
4.5 Performance Test Levels.....	79
4.6 Stand Alone	80
4.6.1 D.20 HDLC Performance Test Results	80
4.7 Hot Standby Redundancy	81
4.8 Warm Standby Redundancy	81
Time Sync Accuracy (PTP/IRIG-B/NTP)	81
Application List	82

5. Version 2.50 (18-October-2021).....84

Software Versions	84
Predix Edge OS and Other Firmware Versions	84
Key Functions and Changes	85
5.1 Enhancements.....	85
5.1.1 Cyber Security	85
5.1.2 Clients.....	85
5.1.3 Servers	85
5.1.4 Automation.....	85
5.1.5 Configuration/Settings	86

5.1.6 HMI	86
5.1.7 Pass-through	86
5.1.8 System	86
5.1.9 Documentation	86
5.1.10 Hardware	86
5.2 Fixed defects	87
5.2.1 Cyber Security	87
5.2.2 Clients	87
5.2.3 Server	87
5.2.4 Automation	87
5.2.5 Configuration/Settings	88
5.2.6 HMI	88
5.2.7 Pass-through	88
5.2.8 System	88
5.2.9 Documentation	89
5.2.10 Hardware	89
5.3 Known Issues	89
5.3.1 Cyber Security	89
5.3.2 Clients	89
5.3.3 Servers	89
5.3.4 Automation	90
5.3.5 Configuration/Settings	90
5.3.6 HMI	91
5.3.7 Pass-through	91
5.3.8 System	91
5.3.9 Documentation	92
5.3.10 Hardware	92
Capability and Capacity	93
5.4 Application Limits	93
5.5 Performance Test Levels	97
5.6 Standalone (non-redundant)	97
5.7 Warm Standby Redundancy	97
5.8 Hot Standby Redundancy	98
5.9 Hot-Hot Redundancy	98
5.9.1 Performance Test Results	98
5.9.2 Redundancy Fail Over Time	100
5.9.3 HMI Response Times	100
Time Sync Accuracy (PTP/IRIG-B/NTP)	100
Application List	101

6. Version 2.60 (17-December-2021) 104

Software Versions	104
Predix Edge OS and Other Firmware Versions	104
Key Functions and Changes	105
6.1 Enhancements	105
6.1.1 Cyber Security	105
6.1.2 Clients	105
6.1.3 Servers	105
6.1.4 Automation	105
6.1.5 Configuration/Settings	105

6.1.6 HMI	106
6.1.7 Pass-through	106
6.1.8 System	106
6.1.9 Documentation	106
6.1.10 Hardware	106
6.2 Fixed defects	106
6.2.1 Cyber Security	106
6.2.2 Clients	106
6.2.3 Server	106
6.2.4 Automation	107
6.2.5 Configuration/Settings	107
6.2.6 HMI	107
6.2.7 Pass-through	107
6.2.8 System	107
6.2.9 Documentation	107
6.2.10 Hardware	107
6.3 Known Issues	108
6.3.1 Cyber Security	108
6.3.2 Clients	108
6.3.3 Servers	108
6.3.4 Automation	109
6.3.5 Configuration/Settings	109
6.3.6 HMI	110
6.3.7 Pass-through	110
6.3.8 System	110
6.3.9 Documentation	111
6.3.10 Hardware	111
Capability and Capacity	112
6.4 Application Limits	112
6.5 Performance Test Levels	112
6.6 Standalone (non-redundant)	112
6.7 Warm Standby Redundancy	112
6.8 Hot Standby Redundancy	112
6.9 Hot-Hot Redundancy	112
6.9.1 Performance Test Results	112
6.9.2 Redundancy Fail Over Time	112
6.9.3 HMI Response Times	112
Time Sync Accuracy (PTP/IRIG-B/NTP)	112
Application List	113

7. Version 2.70 (04-March-2022) - Projects Only116

Software Versions	116
Predix Edge OS and Other Firmware Versions	116
Key Functions and Changes	117
7.1 Enhancements	117
7.1.1 Cyber Security	117
7.1.2 Clients	117
7.1.3 Servers	117
7.1.4 Automation	117
7.1.5 Configuration/Settings	117

7.1.6 HMI	117
7.1.7 Pass-through	117
7.1.8 System	117
7.1.9 Documentation	118
7.1.10 Hardware	118
7.2 Fixed defects	118
7.2.1 Cyber Security	118
7.2.2 Clients	118
7.2.3 Server	118
7.2.4 Automation	118
7.2.5 Configuration/Settings	118
7.2.6 HMI	118
7.2.7 Pass-through	118
7.2.8 System	118
7.2.9 Documentation	119
7.2.10 Hardware	119
7.3 Known Issues	119
7.3.1 Cyber Security	119
7.3.2 Clients	119
7.3.3 Servers	120
7.3.4 Automation	120
7.3.5 Configuration/Settings	121
7.3.6 HMI	121
7.3.7 Pass-through	122
7.3.8 System	122
7.3.9 Documentation	122
7.3.10 Hardware	123
Capability and Capacity	123
7.4 Application Limits	123
7.5 Performance Test Levels	127
7.6 Standalone (non-redundant)	128
7.6.1 Performance Test Results	128
7.7 Warm Standby Redundancy	129
7.8 Hot Standby Redundancy	129
7.9 Hot-Hot Redundancy	129
7.9.1 Performance Test Results	130
7.9.2 Redundancy Fail Over Time	132
7.9.3 HMI Response Times	132
Time Sync Accuracy (PTP/IRIG-B/NTP)	132
Application List	132

8. Version 2.80 (18-July-2022) 135

Software Versions	135
Predix Edge OS and Other Firmware Versions	135
Key Functions and Changes	136
8.1 Enhancements	136
8.1.1 Cyber Security	136
8.1.2 Clients	136
8.1.3 Servers	136
8.1.4 Automation	136

8.1.5 Configuration/Settings	136
8.1.6 HMI	137
8.1.7 Pass-through	137
8.1.8 System	137
8.1.9 Documentation	137
8.1.10 Hardware	138
8.2 Fixed defects	138
8.2.1 Cyber Security	138
8.2.2 Clients	138
8.2.3 Server	138
8.2.4 Automation	138
8.2.5 Configuration/Settings	139
8.2.6 HMI	139
8.2.7 Pass-through	139
8.2.8 System	139
8.2.9 Documentation	139
8.2.10 Hardware	139
8.3 Known Issues	140
8.3.1 Cyber Security	140
8.3.2 Clients	140
8.3.3 Servers	140
8.3.4 Automation	141
8.3.5 Configuration/Settings	141
8.3.6 HMI	142
8.3.7 Pass-through	142
8.3.8 System	142
8.3.9 Documentation	143
8.3.10 Hardware	143
Capability and Capacity	144
8.4 Application Limits	144
8.5 Performance Test Levels	148
8.6 Standalone (non-redundant)	149
8.6.1 Performance Test Results	149
8.7 Warm Standby Redundancy	152
8.8 Hot Standby Redundancy	152
8.9 Hot-Hot Redundancy	152
8.9.1 Performance Test Results	152
8.9.2 Redundancy Fail Over Time	154
8.9.3 HMI Response Times	154
Time Sync Accuracy (PTP/IRIG-B/NTP)	155
Application List	155

9. Version 3.00 (28-April-2023) 158

Software Versions	158
Predix Edge OS and Other Firmware Versions	158
Key Functions and Changes	159
9.1 Enhancements	159
9.1.1 Cyber Security	159
9.1.2 Clients	159
9.1.3 Servers	159

9.1.4 Automation.....	159
9.1.5 Configuration/Settings	159
9.1.6 HMI	160
9.1.7 Pass-through	160
9.1.8 System.....	160
9.1.9 Documentation	160
9.1.10 Hardware	161
9.2 Fixed defects	161
9.2.1 Cyber Security	161
9.2.2 Clients.....	161
9.2.3 Servers	162
9.2.4 Automation.....	162
9.2.5 Configuration/Settings	162
9.2.6 HMI	163
9.2.7 Pass-through	163
9.2.8 System.....	163
9.2.9 Documentation	164
9.2.10 Hardware	164
9.3 Known Issues	164
9.3.1 Cyber Security	164
9.3.2 Clients.....	165
9.3.3 Servers	165
9.3.4 Automation.....	166
9.3.5 Configuration/Settings	166
9.3.6 HMI	167
9.3.7 Pass-through	167
9.3.8 System.....	167
9.3.9 Documentation	168
9.3.10 Hardware	168
Capability and Capacity for MCP	169
9.4 Application Limits.....	169
9.5 Performance Test Levels.....	175
9.5.1 Performance Test Results	177
9.5.2 Redundancy Fail Over Time.....	184
9.5.3 HMI Response Times	184
Time Sync Accuracy (PTP/IRIG-B/NTP)	185
Timestamp Accuracy	185
Application List	186
10. Version 3.10 (23-August-2023)	189
Software Versions	189
Predix Edge OS and Other Firmware Versions	189
Key Functions and Changes	190
10.1 Enhancements.....	190
10.1.1 Cyber Security	190
10.1.2 Clients.....	190
10.1.3 Servers	190
10.1.4 Automation.....	190
10.1.5 Configuration/Settings	190
10.1.6 HMI	190

10.1.7 Pass-through	191
10.1.8 System.....	191
10.1.9 Documentation	191
10.1.10 Hardware	191
10.2 Fixed defects	192
10.2.1 Cyber Security	192
10.2.2 Clients.....	192
10.2.3 Servers	193
10.2.4 Automation.....	193
10.2.5 Configuration/Settings	193
10.2.6 HMI	193
10.2.7 Pass-through	193
10.2.8 System.....	193
10.2.9 Documentation	193
10.2.10 Hardware	193
10.3 Known Issues	194
10.3.1 Cyber Security	194
10.3.2 Clients.....	194
10.3.3 Servers	194
10.3.4 Automation.....	195
10.3.5 Configuration/Settings	196
10.3.6 HMI	196
10.3.7 Pass-through	196
10.3.8 System.....	197
10.3.9 Documentation	197
10.3.10 Hardware	197
Capability and Capacity for MCP	198
10.4 Application Limits.....	198
10.5 Performance Test Levels.....	204
10.5.1 Performance Test Results	206
10.5.2 Redundancy Fail Over Time	212
10.5.3 HMI Response Times	212
Time Sync Accuracy (PTP/IRIG-B/NTP)	213
Timestamp Accuracy	213
Application List	214
11. Version 4.00 (12-April-2024)	217
Software Versions	217
Predix Edge OS and Other Firmware Versions	217
Limitations for D2x Functionality	218
Key Functions and Changes	218
11.1 Enhancements.....	218
11.1.1 Cyber Security	218
11.1.2 Clients.....	218
11.1.3 Servers	219
11.1.4 Automation.....	219
11.1.5 Configuration/Settings	219
11.1.6 HMI	219
11.1.7 Pass-through	219
11.1.8 System.....	219

11.1.9 Documentation	220
11.1.10 Hardware	220
11.2 Fixed defects	221
11.2.1 Cyber Security	221
11.2.2 Clients	221
11.2.3 Servers	221
11.2.4 Automation.....	221
11.2.5 Configuration/Settings	221
11.2.6 HMI	221
11.2.7 Pass-through	222
11.2.8 System.....	222
11.2.9 Documentation	222
11.2.10 Hardware	222
11.3 Known Issues	223
11.3.1 Cyber Security	223
11.3.2 Clients	223
11.3.3 Servers	223
11.3.4 Automation.....	224
11.3.5 Configuration/Settings	225
11.3.6 HMI	226
11.3.7 Pass-through	226
11.3.8 System.....	226
11.3.9 Documentation	227
11.3.10 Hardware	227
Capability and Capacity for MCP	228
11.4 Application Limits.....	228
11.5 Performance	233
11.5.1 Performance Test Levels and Results	234
11.5.2 Redundancy Fail Over Time	241
11.5.3 HMI Response Times	241
Time Sync Accuracy (PTP/IRIG-B/NTP)	242
Timestamp Accuracy	243
Timestamp Accuracy in IEDs when MCP is synching time over SCADA protocol	245
Application List	246

12. Version 4.10 (08-October-2024).....249

Software Versions	249
Cross Compatibility Versions	249
Predix Edge OS and Other Firmware Versions	249
Specific G500 D2x Characteristics and Limitations:	250
Key Functions and Changes	251
12.1 Enhancements.....	251
12.1.1 Cyber Security	251
12.1.2 Clients	251
12.1.3 Servers	251
12.1.4 Automation.....	252
12.1.5 Configuration/Settings	252
12.1.6 HMI	252
12.1.7 Pass-through	252
12.1.8 System.....	253
12.1.9 Documentation	253

12.1.10 Hardware	254
12.2 Fixed defects	254
12.2.1 Cyber Security	254
12.2.2 Clients	254
12.2.3 Servers	254
12.2.4 Automation.....	254
12.2.5 Configuration/Settings	255
12.2.6 HMI	255
12.2.7 Pass-through	255

About this Document

Purpose

The purpose of this document is to outline features, capabilities, and issues, known to exist within the MCP Substation Gateway at the time of release.

Intended Audience

This document is an external document intended for both GE Vernova Staff and Customers. It highlights the features and capabilities of the G500 / G100 firmware.

Additional Documentation

For further information about the MCP, refer to the following documents:

- *MCP Software Configuration Guide (SWM0101)*
- *G500 Substation Gateway Instruction Manual (994-0152)*
- *G100 Substation Gateway Instruction Manual (994-0155)*
- *G500 Quick Start Guide (SWM0106)*
- *G100 Quick Start Guide (SWM0116)*

For the most current version of the above documentation, please download a copy from:

<https://www.gevernova.com/grid-solutions/app/viewfiles.aspx?prod=g500&type=3>

1. Version 1.00 (27-March-2019)

Software Versions

The following defines the software versions required for interaction with the G500.

Package	Version	Notes
G500 Firmware	1.0.652	G500 Firmware Version.
DS Agile MCP Studio	1.0.0	Supported DS Agile MCP Studio Software.
G500 HMI Viewer	1.0.653	Supported G500 HMI 64-bit Software.

Predix Edge OS and Other Firmware Versions

The following defines the firmware versions supported for Predix Edge Linux OS, FPGA, CPLD, UEFI and BCOM FPGA in the G500 v1.0.652.

Package/Firmware	Version	Notes
Predix Edge OS	2.2.1	Supported GE's Secured Linux Operating System Version.
FPGA	1.02.00	Supported FPGA Version of Multi-Function Controller Platform (MCP)
CPLD	1.2.1	Supported CPLD Version of Multi-Function Controller Platform (MCP).
UEFI	VX5D0007.C01	Supported UEFI Version of Multi-Function Controller Platform (MCP).
BCOM FPGA	2.3.0	Supported COM's Module FPGA Version of Multi-Function Controller Platform (MCP).

Key Features

G500 is part of the Multi-Function Controller Platform (MCP).

G500 is designed to provide a reliable and accurate collection of data (metering, status, events and faults) from serial or LAN based intelligent substation devices to master applications such as SCADA, EMS, DMS or other enterprise applications. With its modern and robust cyber security features, the G500 is designed for smooth integration into NERC CIP and Cyber Security environments while consolidating functions such as ethernet communications, time synchronization, HMI and SCADA applications.

G500 supports the following key features as part of v1.00.

- Advanced Gateway** : G500 collects operational and non-operational data from substation protection, control, monitoring, RTU, and intelligent devices, pre-processes the data and moves it up to EMS and DMS SCADA systems providing centralized substation management.
- Advanced Automation** : G500 provides the computing platform necessary to automate substation procedures, such that intricate processes are carried out safely and efficiently by creating advanced custom automation programs using IEC 61131 compliant tools and perform basic math functions on data points using the built-in calculator tool.

Datalogging and Alarm Management	: G500 supports logging of analog and binary events, including alarm management. Users have access to view and extract logged data via Runtime HMI corresponding screens (Trending, SOE, Historical Data, Active Alarms).
Automated Records (files) Retrieval and Management (ARRM)	: G500 supports automated extraction of data files from IEDs, such as digital fault recording (DFR) records, event files, device information files, etc. Acquired files can be securely pushed automatically to remote systems.
Secure Passthrough Remote Access and VPN	: G500 allows users to securely access substation devices from remote locations through validated interactive sessions hosted by the G500.
User Authentication	: G500 provides Role Based Access Control (RBAC) with Local Account Authentication.
Runtime HMI	: G500 provides user interaction with Role Based Access Control via a portable Runtime HMI application that runs in the Local unit KVM interfaces, as well as Remote in Windows based computers. There is no requirement to install Java/JRE on the Windows computers.
Support for Predix Edge Connectivity	: G500 uses GE's Hardened <i>Predix EDGE</i> Operating System (Linux Yocto based) and supports secured connectivity for enrolling the unit into Predix Edge Manager. Predix Edge Manager is a GE Vernova hosted Cloud Application that provides asset / fleet management of enrolled devices.
Hardware Based PRP/Redundant LAN Support	: G500 supports up to 3 hardware based independent PRP or Redundant LAN through the rear ethernet ports.
Hardware Based IEEE 1588 PTP Master-Slave Support	: G500 supports hardware based PTP Master-Slave support on the rear ethernet ports.
Hardware Based IRIG-B Input Support	: G500 supports hardware based IRIG-B input.
Hardware Asset Management Application (HAMA)	: G500 supports monitoring of the hardware parameters, e.g., network modes, serial port settings, temperatures, real time utilizations of various resources, etc. and presenting of these to the G500 System Point Database by means of Analog/Digital/Accumulator/Text Points.

Capability and Capacity

1.1 Performance Test Levels

The G500 performance test levels are presented in this section.

G500 Hardware under test: 4 core CPU / 16 GB RAM variant.

NOTE: In the combined tables, numbers in brackets are for G500 variant with 2 core CPU / 8 GB RAM.

Requirement	Steady State Loading	Avalanche Loading
Loading Signal changes (continuously /sec)	AI-10,000 (5,000) DI-100	All points changing twice in 2 secs
Number of connected IEDs to G500	500 (250)	500 (250)
G500 total RTDB Point count	200,000 (100,000)	200,000 (100,000)
Points / IED DI & AI	400 150x DI and 250x AI per IED	400 150x DI and 250x AI per IED
Each G500 Server has points (half for 2 core CPU / 8 GB RAM)	DI = 18750 i.e., = $150 \times 500 / 4$ AI = 31250 i.e., = $250 \times 500 / 4$	DI = 18750 i.e., = $150 \times 500 / 4$ AI = 31250 i.e., = $250 \times 500 / 4$
Remote G500 HMI connections	3 Simultaneous connections	3 Simultaneous connections
Local G500 HMI connections	1 connection (multiple displays)	1 connection (multiple displays)
Datalogger / Continuous reports	1000 (500) AI mapped / 100 (50) reports	1000 (500) AI mapped / 100 (50) reports
ARRM	Maximum 240 file sets across all IEDs	Maximum 240 file sets across all IEDs
Alarms	100 (50) /sec	100 /sec (for 2 seconds)

1.2 Standalone

G500 provides the following performance capabilities in Single (non-redundant) Mode.

1.2.1 Performance Test Results

The performance of G500 is tested using the activity levels and disturbance scenarios presented next.

The master station response times are defined in Table 1.1: Standalone Performance test results.

Table 1.1: Standalone Performance test results

Activity	DNP	DNP	IEC 61850	IEC 61850
Hardware (CPU / RAM)	4 core / 16 GB	2 core / 8 GB	4 core / 16 GB	2 core / 8 GB
Loading Condition	Steady state	Steady state	Steady state	Steady state
Protocol – CLIENT / SERVER	DNP / DNP	DNP / DNP	IEC 61850 / DNP	IEC 61850 / DNP
RTDB Point count	200,000	100,000	200,000	100,000

Activity	DNP	DNP	IEC 61850	IEC 61850
Total RCB configured / Simulation per sec	NA	NA	6000 1000	3000 500
Number of IEDs	500 (250)	500 (250)	500 (250)	500 (250)
Points / IED (AI + DI + AO + DO)	[AI-250, 150-DI, 20-DO, 20-AO, 10-ACC]	150DI+250AI (Configured AO, DO no simulation)	150DI+250AI (Configured AO, DO no simulation)	150DI+250AI (Configured AO, DO no simulation)
Datalogger reports	100 (50) Periodic reports	100 (50) Periodic reports	100 (50) Periodic reports	100 (50) Periodic reports
Number of Master connections Point count / Server	8 DI-9300, AI-15500	4 DI-4650, AI-7750	8 DI-9300, AI-15500	4 DI-4650, AI-7750
Remote / Local HMI connections	1 Remote / 0 Local HMI	1 Remote / 0 Local HMI	1 Remote / 1 Local HMI	1 Remote / 0 Local HMI
CPU utilization – Avg, Min, Max (%) – values for 4 core CPU	60,50,92	80, 28, 95	56, 30, 95	46, 36, 75
Average Memory	2.4 GB	1.4 GB	3 GB	2 GB
Event latency in (msecs) Average, Min, Max	399,19,1.04sec	487,13,1.31	589, 5, 2200	330, 41, 652
Control latency in (msecs) Average, Min, Max	34,12,291	629,3,1.09	8, 6, 16	9, 3, 68

1.2.2 HMI Response time

Under heavy loading conditions, the G500 provides the HMI response times listed in Table 1.2: User Interface Response Time.

Table 1.2: User Interface Response Time

Activity	Normal	High
Screen Access (Point Summary)	< 2 s	< 2 s
Screen Access (One-Line Viewer)	5 to 7 s	5 to 7 s
System Logs	< 2s	2s
Alarm ACK Delay (Single Alarm)	< 1 s	< 1 s
Alarm ACK Delay (20,000 Alarms)	< 2 s	< 7 s
DI/AI Update to Point Summary Screen	< 1 s	< 1 s
Datalogger	<2s	<2s

NOTE: Under heavy loading conditions, the control latency was measured by simulating one control every 5 seconds continuously from the Master station.

1.3 Hot Standby Redundancy

G500 provides the following performance capabilities in Hot Standby Redundancy Mode.

Configuration	DNP	IEC61850
Hardware (CPU /RAM)	4 core / 16 GB	4 core / 16 GB
Redundancy	Hot Standby	Hot Standby
Number of IEDs	500 (250)	500 (250)
Protocol – CLIENT / SERVER	DNP / DNP	IEC61850 / DNP
RTDB Point count	200,000 (100,000)	200,000 (100,000)
Points / IED (AI + DI + AO + DO)	150 DI, 250 AI	150 DI, 250 AI
Number of Master connections Point count / Server	8 (4) DI-9300, AI-15500 (DI-4650, AI-7750)	8 (4) DI-9300, AI-15500 (DI-4650, AI-7750)
Total RCB configured / Simulation per sec	NA	6000 (3000) 1000 (500)
Datalogger / Continuous reports	NA	NA
ARRM	Not configured	Not configured
Alarms	100 (50) /sec	100 (50) /sec
Remote / Local HMI connections	1 Remote / 0 Local HMI	1 Remote / 0 Local HMI
CPU utilization – Avg, Min, Max (%) – values for 4 core CPU	60,34,71	32,46,67
Average Memory	3.12 GB	4.3 GB
Event latency – Average, Min, Max (msec)	390,60,1sec	368,2.8,1sec
Control latency – Average, Min, Max (msec)	30,12,377	3,1,73

1.4 Warm Standby Redundancy

G500 provides the following performance capabilities in Warm Standby Redundancy Mode.

Protocol	DNP	IEC61850	IEC 104
Hardware CPU / RAM	4 core / 16 GB (2 core / 8 GB)	4 core / 16 GB (2 core / 8 GB)	4 core / 16 GB (2 core / 8 GB)
Redundancy Mode	Warm Standby	Warm Standby	Warm Standby
Number of IEDs	500 (250)	500 (250)	500 (250)
Protocol – CLIENT / SERVER	DNP / DNP	IEC61850 / DNP	IEC 104 / IEC 104
RTDB Point count	200,000 (100,000)	200,000 (100,000)	200,000 (100,000)
Points / IED (AI + DI + AO + DO)	150 DI, 250 AI	150 DI, 250 AI	150 DI, 250 AI
Number of Master connections Point count / Server	8 (4) DI-9300, AI-15500 (DI-4650, AI-7750)	8 (4) DI-9300, AI-15500 (DI-4650, AI-7750)	8 (4) DI-9300, AI-15500 (DI-4650, AI-7750)

Protocol	DNP	IEC61850	IEC 104
Total RCB configured / Simulation per sec	NA	6000 (3000) 1000 (500)	NA
Datalogger reports	100 (50) Periodic reports	100 (50) Periodic reports	100 (50) continuous reports
ARRM	Not configured	Not configured	Not configured
Alarms	100 (50) /sec	100 (50) /sec	100 (50) /sec
Remote / Local HMI connections	1 Remote / 0 Local HMI	1 Remote / 0 Local HMI	1 Remote / 0 Local HMI
CPU utilization – Avg, Min, Max (%) – values for 4 core CPU	62,53,96	43,48,60	28,32,42
Average Memory	2.4 GB	3 GB	3.4 GB
Event latency – Average, Min, Max (msec)	437,26,1.06	683,323,1sec	221,107,380
Control latency – Average, Min, Max (msec)	44,11,240	3,1,85	30,10,331

NOTE: G500 Supports maximum of 4 simultaneous Runtime HMIs (Remote + Local) either in Standby or Redundancy Modes (Hot/Warm Redundancy).

Time Sync Accuracy (PTP/IRIG-B/NTP)

G500 supports Hardware based PTP/IRIG-B and Software based NTP Time Sync Accuracy.

1.5 PTP Accuracy

1.5.1 Test Steps:

Below are setup details used for measuring PTP IN Time sync accuracy:

- Total number of samples considered ~250,000.
- Accuracy found to be < +/- 1ms for 99.86% of samples.
- Measured the accuracy for every second at the G500 CPU or Kernel.

1.5.2 Test Results:

Time Sync Input	Accuracy % of samples within (+/- 1 msec)
PTP IN	99.86% (samples within +/-1 ms)

NOTES:

- Accuracy is measured in a scenario where the hardware /FPGA is fully loaded.
- If IEDs are getting time synced using any of the client communication protocols, then the above accuracy cannot be guaranteed at the IED.

1.6 IRIG-B Accuracy

1.6.1 Test Setup:

Below are setup details used for measuring IRIG-B IN Time sync accuracy:

- Total number of samples considered ~50,000.
- Accuracy found to be < +/- 1ms for 99.8% of samples.
- Measured the accuracy for every second at the G500 CPU or Kernel.

1.6.2 Test Results:

Time Sync Input	Accuracy % of samples within (+/- 1 msec)
IRIG-B IN	99.8% (samples within +/-1 ms)

NOTES:

- Accuracy is measured in a scenario where the hardware /FPGA is fully loaded.
- If IEDs are getting time synced using any of the client communication protocols, then the above accuracy cannot be guaranteed at the IED.

1.7 NTP IN Accuracy

1.7.1 Test Setup:

Below are setup details used for measuring NTP IN Time sync accuracy:

- Total number of samples considered ~50,000.
- Accuracy found to be < +/- 10ms for 99.97% of samples.
- Measured the accuracy for every second at the G500 CPU or Kernel.

1.7.2 Test Results:

Time Sync Input	Accuracy % of samples within (+/- 10 msec)
NTP IN	99.97% (samples within +/-10 ms)

NOTES: If IEDs are getting time synced using any of the client communication protocols, then the above accuracy cannot be guaranteed at the IED.

1.8 NTP OUT Accuracy

Below are setup details used for measuring NTP OUT Time sync accuracy:

- Total number of samples considered ~50,000.
- Accuracy found to be < +/- 1 ms for 99.9% of samples.
- Measured the accuracy for every second at the IED.

1.8.1 Test Results:

Time Sync Output	Accuracy % of samples within (+/- 1 msec)
NTP OUT	99.9% (samples within +/- 1ms)

NOTE: If IEDs are getting time synced using any of the client communication protocols, then the above accuracy cannot be guaranteed at the IED.

Application List

The following applications comprise the G500 v1.00 released firmware version and build 1.0.652.

Application	Support in Standalone/ Warm Standby	Support in Hot Standby
Runtime HMI	✓ Available	✓ Available
One-Line Viewer	✓ Available	✓ Available
Config GUI / Schemas	✓ Available	✓ Available
System Library	✓ Available	✓ Available
C++ System Library	✓ Available	✓ Available
Connection Parser	✓ Available	✓ Available
Calculator	✓ Available	✓ Available
Hardware Asset Management Application (HAMA)	✓ Available	✗ Not Available
PTP/IRIG-B Time Sync	✓ Available	✓ Available
Modbus Client	✓ Available	✓ Available
Modbus-TCP/SSH Client	✓ Available * Not Available in Warm Standby	✗ Not Available
SEL® Binary Client	✓ Available	✗ Not Available
Analog Data Logger	✓ Available	✗ Not Available
Generic ASCII Client	✓ Available	✗ Not Available
Modbus Server	✓ Available	✗ Not Available
DNP 3.0 Server	✓ Available	✓ Available
DNP 3.0 Client	✓ Available	✓ Available
Digital Event Manager	✓ Available	✓ Available
Database Server	✓ Available	✓ Available
DNP 3.0 TCP/IP Transport Layer	✓ Available	✓ Available
DNP 3.0 Server Serial Transport Layer	✓ Available	✓ Available
DNP 3.0 DDO	✓ Available	✗ Not Available
IEC 60870-5-101/104 Server	✓ Available	✗ Not Available
IEC 60870-5-103 Client	✓ Available	✗ Not Available

Application	Support in Standalone/ Warm Standby	Support in Hot Standby
IEC 61850 Client	✓ Available	✓ Available
IEC 60870-5-101/104 Client	✓ Available	✗ Not Available
Event Logger	✓ Available	✓ Available
Real-Time Database	✓ Available	✓ Available
LogicLinx IEC 61131-3 Soft Logic	✓ Available	✓ Available
Redundancy Manager	✓ Available	✓ Available
System Point Manager	✓ Available	✓ Available

OpenVPN	✓ Available	✓ Available

Known Issues

1.8.2 Cyber Security

Please refer to Product & Cyber Security Advisories on the GE Vernova Grid Solutions web site.

1.8.3 Clients

GE Vernova Internal Reference #	Summary	Impact
D-05002	Cannot perform file transfer from GENASCII devices.	ARRM file retrieval from SEL 1xx/2xx relays (using GENASCII) is not possible.

1.8.4 Servers

GE Vernova Internal Reference #	Summary	Impact
B-11968	No support for events in NVRAM in DNP3 Server.	Events that have not been yet transmitted to Master (Clients) are lost if G500 is power cycled / restarted. However – the integrity polls will continue to provide accurate database representation.
B-11967	No support for events in NVRAM in IEC101/104 Server.	Events that have not been yet transmitted to Master (Clients) are lost if G500 is power cycled / restarted. However – the integrity polls will continue to provide accurate database representation.
D-16253	Modbus Server writes the configured Offline Analog Value in both words of a 32 bit register.	As long as 0 (zero) is used as configured Offline Analog Value there is no impact.

1.8.5 Automation

GE Vernova Internal Reference #	Summary	Impact
D-05877	No warning message when storage space is reduced in datalogger configuration.	Currently datalogger application re-adjusts the storage space(increase/decrease) based on the newly allocated settings. In this case users might not be aware of the deletion of the records if the newly allocated storage space is smaller than the previous allocated one.
D-05033	Suppressed quality through Input Point Suppression (IPS) application is not reported to Masters.	DNP3 and IEC 101-104 Servers send Online Quality rather than the substituted/last reported quality when points are suppressed.

GE Vernova Internal Reference #	Summary	Impact
D-05462	Load shedding: Persistent storage of Zone Assignments is not working.	There is no persistency of zone assignments across power restarts when user sets the zones through Analog Setpoint commands.
B-11969	No support for events in NVRAM for DEM.	DEM is responsible for handling alarms. Events/Alarms that have not been yet committed to the SQL database are lost if G500 is power cycled / restarted. However – the integrity polls will continue to provide accurate database representation.
D-07025	Alarm/SOE Database corruption when abrupt G500 power failure happens & Events are simultaneously generated.	This is a remote case and if the database corruption happens the SQL server will not be started.

1.8.6 Configuration

GE Vernova Internal Reference #	Summary	Impact
D-06168	FPGA needs to be restarted via Power Cycle for PTP/IRIGB configuration change.	No functional impact. PTP/IRIG-B configuration will not be applied without reboot of G500.
N/A	If filenames with characters other than ASCII are present in the MCP file system - the MCP device and associated configuration tools will not work correctly.	The MCP device and associated configuration tools will not work correctly. Impact differs based on which files are named non-ASCII. Keep only ASCII characters in the filenames for Client Maps, Server Maps, OneLine .dra, OneLine Images, and other user files.

1.8.7 HMI

GE Vernova Internal Reference #	Summary	Impact
D-05802	Local HMI shows exception errors when screens are open and video resolution is changed lower than the current size of HMI frames.	Occurs only when screen resolutions are changed, and the Local HMI has windows opened with a larger size than the new set resolution. User must close the Local HMI and re-open again.
D-05463	Point groups: Points are missing after deleting an active group.	If a used point group is deleted from the systemwide configuration then points belonging to that group are not visible in the point group summary. However, if user changes the point group allocation from the corresponding instantiated client map file(s) then points will be visible in the point group summary.

1.8.8 Pass-through

GE Vernova Internal Reference #	Summary	Impact
D-07084	Cannot access hosts inside Internal Zone unless hosts have custom routing configured.	Only hosts in internal zone that allow configuration of custom routes can be accessed via VPN server from external zone.

1.8.9 System

GE Vernova Internal Reference #	Summary	Impact
D-05714	Update of only Edge OS is not supported.	If only Edge OS updates are required, the complete G500 firmware image needs to be updated.
D-06167	Full support for latest PTP power profiles: - IEEE C37.238-2017 - IEC61850-9-3 Ed.1 2016	Enhancement. G500 supports the following PTP profiles: - IEEE 1588-2008 J4 Peer-to-Peer Profile - IEEE C37.238-2011 Power System Profile (but this has been withdrawn) Limited IEC61850-9-3 Ed.1 2016 Power Utility Automation Profile
GS-02709884 /D-13470	Sometimes UTC time zone is getting overwritten by a different time zone.	The timestamps of DI events come with wrong time zone in the SOE Logs or in DNP3. Workaround: Configure GMT instead of UTC in DNP3 client and server configurations both in serial and ethernet modes.

1.8.10 Hardware

GE Vernova Internal Reference #	Summary	Impact
D-06232	IRIG-B Out is invalid during start-up.	IRIG-B OUT signal produces a 1970-01-01 signal for brief periods of time during G500 start-up.
D-06165	SFP Hot Plug in / Plug out detection.	No functional impact. Points that represent the status of SFP IN/OUT will not be reflected until G500 is rebooted.
D-06458	Audio Output Port is not working.	User is unable to hear Alarm or any sounds from the Audio Output Port of G500.

2. Version 1.10 (14-February-2020)

Software Versions

The following table defines the software versions required for interaction with the G500.

Package	Version	Notes
G500 Firmware	1.1.457	G500 Firmware Version.
DS Agile MCP Studio	2.0.0.0.35611	Minimum Supported DS Agile MCP Studio Software.
G500 HMI Viewer	1.1.458	Supported G500 HMI 64-bit Software.

Predix Edge OS and Other Firmware Versions

The following table defines the package/firmware versions supported for Predix Edge Linux OS, FPGA, CPLD, UEFI and BCOM FPGA in the G500 v1.1.457.

Package/Firmware	Version	Notes
Predix Edge OS	2.2.1	Supported GE's Secured Linux Operating System Version.
FPGA	1.03.00	Supported FPGA Version of Multi-Function Controller Platform (MCP).
CPLD	1.2.2	Supported CPLD Version of Multi-Function Controller Platform (MCP).
UEFI	VX5D0007.C01	Supported UEFI Version of Multi-Function Controller Platform (MCP).
BCOM FPGA	2.3.0	Supported COM's Module FPGA Version of Multi-Function Controller Platform (MCP).

Key Functions and Changes

2.1 Enhancements

This G500 version adds the following new features compared to V1.00:

2.1.1 Cyber Security

Please refer to Product & Cyber Security Advisories on the GE Vernova Grid Solutions web site.

2.1.2 Clients

GE Vernova Internal Reference #	Summary	Resolution
B-12826	Modbus TCP/SSH Client Support for Warm/Hot Standby.	Added Warm & Hot Standby Redundancy Support for Modbus TCP/SSH Client application.
R-01137	DNP Data Link Retries in G500 to be more like D20.	Added support for DNP Data Link Retries enable/disable option for Direct Operate controls.

2.1.3 Server

GE Vernova Internal Reference #	Summary	Resolution
R-01185	IEC101/104 Server support for NG implementation.	Added support for different link address to Backup Serial port in IEC101 DPA.
E-03739	Configurable DNP DPA Abs/Rel time for Binary Input Change Events.	Added support for Binary Input Change Events in DNP3 DPA to report with either Absolute timestamp or Relative timestamp.

2.1.4 Automation

GE Vernova Internal Reference #	Summary	Resolution
E-03776	Increase in DTA Application Limits.	Added support to increase the Application Limits for the following Automation applications. <i>Calculator</i> - Evaluation Expressions from 2,000 to 10,000 - Digital Assignments from 2,000 to 10,000 <i>System Point Manager</i> - Local groups from 256 to 1,000 - Input Point Suppression groups from 2 to 10,000 - Redundant IO groups from 256 to 10,000
R-01186	Remote Control Lockout Group Enhancements.	Added support for manual group ownership in Remote Control Lockout functionality by explicitly acquiring the lock using a Group pseudo DO point.

2.1.5 HMI

GE Vernova Internal Reference #	Summary	Resolution
E-03446	Support for Setting GUI in addition to mcpcfg.	Added web-based Setting GUI in addition to command line mcpcfg for configuring G500 settings.

2.1.6 Passthrough/VPN

GE Vernova Internal Reference #	Summary	Resolution
R-01113	Improve GUI of VPN Server Routing and Whitelisting.	Enhancements are implemented in the VPN Server Routing List and Whitelisting drop-down options in GUI.

2.1.7 System

GE Vernova Internal Reference #	Summary	Resolution
B-13018	Secure Tunnel between Active & Standby G500s.	Added support for secure tunnel framework for data/command exchange between Active and Standby G500s in Hot & Warm Standby Redundancy modes.
B-12766	Hardware Asset Management Application (HAMA) Enhancements.	Added the support to show information/status of additional PCIe expansion cards (serial and D.20 when available).
B-12663	SOE and Alarm functions in HMI.	Enhanced speed and efficiency of SOE and Alarm functions.

2.1.8 Hardware

GE Vernova Internal Reference #	Summary	Resolution
B-12575	Hardware Based IRIG-B Output Support.	Added support for hardware based IRIG-B output to existing IRIG-B input.
R-01184	Added Fiber Optic Single Mode GB SFP as order option "L".	Added support for Fiber Optic Single Mode GB SFP as order option "L" in the Ordering Guide.

2.1.9 Documentation

GE Vernova Internal Reference #	Summary	Resolution
R-01164	Add Note/description to Software Configuration Guide to clarify that Double Point functionality is only for Alarms.	Updated the Software Configuration Guide to clarify the support for Double Point Alarms as available only for Double Points in G500.
B-12696	Improve Documentation for Warm Standby Redundancy functionality.	Improved documentation for configuring Warm Standby Redundancy workflow in Software Configuration Guide.

2.2 Fixed defects

This version of G500 has the fixes for the following defects compared to V1.00:

2.2.1 Cyber Security

Please refer to Product & Cyber Security Advisories on the GE Vernova Grid Solutions web site.

2.2.2 Clients

GE Vernova Internal Reference #	Summary	Resolution
D-09785	DNP DCA memory usage increase when 10 controls/sec are simulated continuously.	Fixed the memory leak issue in DNP Client when more than 10 controls/sec are simulated continuously.

2.2.3 Automation

GE Vernova Internal Reference #	Summary	Resolution
D-07611	Sync To operation from DSAS "Overrides" Sync Manager Users.	DSAS excludes the Sync Manager configuration and users while doing Sync To operation to the G500.
D-05603	ARRM TFTP File retrieval is not working with 8-Series relays.	Fixed the issue of supporting file retrieval from 8-series relays through TFTP.
D-08328	ARRM FTP functionality is not working while restoring the snapshot to G500.	Fixed the issues with the decryption of FTP Password in the ARRM configuration files while restoring the configuration from the other G500 device.
D-07603	ARRM cannot read files from SEL via FTP.	Fixed the issues with the decryption of FTP Passwords from SEL relays while reading the files through ARRM.
D-08361	ARRM Directory path not updated after save and commit changes.	Fixed an issue where ARRM Change in Directory Path in File set Template was not propagating correctly after configuration save and commit.
D-08080	Redundant IO doesn't start unless there is at least one AI mapped.	Fixed an issue where Redundant IO doesn't start unless there is at least one AI being mapped, now works without any AI mapped.
D-05877	No warning message when storage space is reduced in datalogger configuration.	If the new configured datalogger file size is smaller than the current datalogger file size, pop up a confirmation dialog with the warning msg shown below: "The new requested size for this report is smaller than the current size of the data in the report. This operation will delete old/new/all data in the report. Do you want to continue?" Only saving datalogger configure when user clicks the 'yes' button

GE Vernova Internal Reference #	Summary	Resolution
D-07025	Alarm/SOE Database corruption when abrupt G500 power failure happens & Events are simultaneously generated.	After EdgeOS 2.2 upgrade timestamps off by random number of hours in MariaDB. By purging the database (apps automatically restarted), the issue was resolved.

2.2.4 Configuration

GE Vernova Internal Reference #	Summary	Resolution
D-08357	ARRM FTP/SFTP/TFTP default timeout increase to 10 sec.	Updated the default timeout for FTP/SFTP/TFTP from 2 secs to 10 secs.

2.2.5 HMI

GE Vernova Internal Reference #	Summary	Resolution
D-08521	G500 Buzzer should be disabled by default.	The default state of the G500 Buzzer after the firmware is installed is OFF.
D-09979	Manual forced accumulator values not supporting full range.	Fixed the issue with accumulators for not supporting max value of $2^{63}-1$.
D-10185	Saving of Datalogger reports in Local HMI.	Fixed the issue in saving the datalogger reports in Local HMI.
D-10233	Local HMI allows admin and operator users to copy private keys to USB.	Fixed the issue in Local HMI File Explorer to copy the private keys to USB for all users.
D-05802	Local HMI shows exception errors when screens are open and video resolution is changed lower than the current size of HMI frames.	Fixed.

2.2.6 Pass-through

GE Vernova Internal Reference #	Summary	Resolution
D-07084	Cannot access hosts inside VPN Internal Zone unless hosts have custom routing configured.	Fixed.

2.2.7 System

GE Vernova Internal Reference #	Summary	Resolution
B-13055	Password Encryption/Decryption getting failed for Snapshot/Restore of one G500 to another G500.	Fixed the issue with failure of Password Encryption/Decryptions while using the Snapshot and Restore functionalities across the G500s.
D-09906	Missing SOEs during SOE Export.	Fixed the issue of missing of SOEs in the export file while DI events are being simulated and deletion is in progress.

2.2.8 Hardware

GE Vernova Internal Reference #	Summary	Resolution
D-06232	IRIG-B Out is invalid during start-up.	IRIG-B OUT signal produces a 1970-01-01 signal for brief periods of time during G500 start-up.
D-06458	Audio Output Port is not working.	Fixed the issues with audio output port of G500.

2.3 Known Issues

This G500 version has the following known issues:

2.3.1 Cyber Security

Please refer to Product & Cyber Security Advisories on the GE Vernova Grid Solutions web site.

2.3.2 Clients

GE Vernova Internal Reference #	Summary	Impact
D-09916	SEL Binary Client application restarts when configured to communicate with SEL 351S relay.	SEL Binary Client fails to communicate to the SEL 351S relay when the relay is connected through G500's Virtual Serial Ports.
D-05002	ARRM file retrieval from SEL 1xx/2xx relays (using GENASCII) is not possible.	ARRM file retrieval from SEL 1xx/2xx relays (using GENASCII) is not possible.

2.3.3 Servers

GE Vernova Internal Reference #	Description
B-11967	No support for events in NVRAM in IEC101/104 Server. Events that have not been yet transmitted to Master (Clients) are lost if G500 is power cycled / restarted. However – the integrity polls will continue to provide accurate database representation.
B-11968	No support for events in NVRAM in DNP3 Server. Events that have not been yet transmitted to Master (Clients) are lost if G500 is power cycled / restarted. However – the integrity polls will continue to provide accurate database representation.
D-16253	Modbus Server writes the configured Offline Analog Value in both words of a 32 bit register. As long as 0 (zero) is used as configured Offline Analog Value there is no impact.

2.3.4 Automation

GE Vernova Internal Reference #	Summary	Impact
D-05033	Suppressed quality through Input Point Suppression (IPS) application is not reported to Masters.	DNP3 and IEC 101-104 Servers send Online Quality rather than the substituted/last reported quality when points are suppressed.
D-05462	Load shedding: Persistent storage of Zone Assignments is not working.	There is no persistency of zone assignments across power restarts when user sets the zones through Analog Setpoint commands.
B-11969	No support for events in NVRAM for DEM.	DEM is responsible for handling alarms. Events/Alarms that have not been yet committed to the SQL database are lost if G500 is power cycled / restarted. However – the integrity polls will continue to provide accurate database representation.

2.3.5 Configuration/Settings

GE Vernova Internal Reference #	Summary	Impact
D-10345	mcpcfg settings must be reconfigured while upgrading the G500 from v1.0 to v1.1.	As part of upgrading the G500 from v1.0 to v1.1, the configuration settings must be reconfigured using mcpcfg or settings GUI after upgrading to v1.1.
D-10346	PTP-1588 IN and IRIG-B IN cannot be enabled at the same time in G500 v1.1.	G500 v1.1 does not support both PTP IN and IRIG-B IN to be enabled at the same time. Also, by default these Time Sync Input sources are disabled and user can enable either of them using mcpcfg or settings GUI.

GE Vernova Internal Reference #	Summary	Impact
D-06168	FPGA needs to be restarted via Power Cycle for PTP/IRIGB configuration change.	No functional impact. PTP/IRIG-B configuration will not be applied without reboot of G500.
N/A	If filenames with characters other than ASCII are present in the MCP file system - the MCP device and associated configuration tools will not work correctly.	The MCP device and associated configuration tools will not work correctly. Impact differs based on which files are named non-ASCII. Keep only ASCII characters in the filenames for Client Maps, Server Maps, OneLine .dra, OneLine Images, and other user files.

2.3.6 HMI

GE Vernova Internal Reference #	Summary	Impact
D-09695	Operator User in Active G500 gets Observer Group privileges sometimes after multiple switch-over or fail-overs in Hot or Warm Standby Redundancy.	Runtime HMI needs to be logged out and logged in if this case happens.
D-09915	G500 HMI "Internal Access Error" after SEL DCA is configured and then crashes.	Runtime HMI cannot be logged in and it displays "Internal Access" error even after rebooting the G500. However, once SEL Binary Client Configuration is deleted from the configuration then this issue will not be observed.
D-09944	Internationalization: Settings and messages in the Powerbar in Runtime HMI are not changing to specified language.	No Functional Impact. However, the messages/settings in the Powerbar in Runtime HMI continue to be seen in English.
D-10324	"The configuration has been modified. Unsaved changes will be discarded. Do you want to discard the changes?" this message is getting displayed even though any changes made are already committed. This applies to the Access tab in the local HMI viewer.	No Functional Impact. However, the message creates inconvenience to the user.
D-10325	After saving the changes in the Access tab of the local HMI viewer and navigating to other tab without committing the changes, then Local HMI viewer is not accessible.	Impact: Loss of access to the Local HMI viewer. However, can be recovered by committing or discarding the changes from DSAS.

GE Vernova Internal Reference #	Summary	Impact
D-05463	Point groups: Points are missing after deleting an active group.	If a used point group is deleted from the systemwide configuration then points belonging to that group are not visible in the point group summary. However, if user changes the point group allocation from the corresponding instantiated client map file(s) then points will be visible in the point group summary.

2.3.7 Pass-through

None.

2.3.8 System

GE Vernova Internal Reference #	Summary	Impact
E-03371	No method to restore a G500 after all admin local logons lost/forgotten.	G500 cannot be logged in using SSH/HMI/ Front Serial Port. However, users can use the Single Image installer through USB and restore the Factory Default firmware and the configuration.
D-08036	Avoid not applicable errors displayed during G500 bootup process.	No Functional Impact. However, during reboot of G500, some not applicable error messages are displayed on the console connected to the display port.
D-10254	Double Quote (" ") are not allowed to use in the password field for FTP in Sync Manager.	Double quotes (" ") cannot be used in password field of FTP in the Sync Manager configuration.
D-05714	Update of only Edge OS is not supported.	If only Edge OS updates are required, the complete G500 firmware image needs to be updated.
D-06167	Full support for latest PTP power profiles: • IEEE C37.238-2017 • IEC61850-9-3 Ed.1 2016	Enhancement. G500 supports the following PTP profiles: • IEEE 1588-2008 J4 Peer-to-Peer Profile • IEEE C37.238-2011 Power System Profile (but this has been withdrawn) Limited IEC61850-9-3 Ed.1 2016 Power Utility Automation Profile
GS-02709884 / D-13470	Sometimes UTC time zone is getting overwritten by a different time zone.	The timestamps of DI events come with wrong time zone in the SOE Logs or in DNP3. Workaround: Configure GMT instead of UTC in DNP3 client and server configurations both in serial and ethernet modes.

2.3.9 Documentation

GE Vernova Internal Reference #	Summary	Impact
D-09783	G500 sync to UTC-(UTC_OFFSET) instead of UTC after fall back from PTP to IRIG-B - a reboot is required to fix the offset problem.	Dynamic failover at runtime between PTP and IRIG-B will not happen. Documentation does not capture this.
D-10131	Missing information about syslog file in the G500 SW Configuration Guide.	No Functional Impact. However, the examples that show the format of rsyslog file output are not available in the Software Configuration Guide.

2.3.10 Hardware

GE Vernova Internal Reference #	Summary	Impact
D-06165	SFP Hot Plug in / Plug out detection.	No functional impact. Points that represent the status of SFP IN/OUT will not be reflected until G500 is rebooted.

Capability and Capacity

2.4 Performance Test Levels

The G500 v1.10 meets below performance test level requirements.

NOTES:

- G500 Hardware under test: 4 core CPU / 16 GB RAM variant.
- In the below table, numbers inside the brackets are for the G500 variant with 2 core CPU / 8 GB RAM.

Requirement	Steady State Loading	Avalanche Loading
Loading Signal changes (continuously /sec)	AI-10,000 (5,000) DI-100	All points changing twice in 2 secs
Number of connected IEDs to G500	500 (250)	500 (250)
G500 total RTDB Point count	200,000 (100,000)	200,000 (100,000)
Points / IED DI & AI	400 150x DI and 250x AI per IED	400 150x DI and 250x AI per IED
Each G500 Server has points (half for 2 core CPU / 8 GB RAM)	DI = 18750 i.e., = $150 \times 500 / 4$ AI = 31250 i.e., = $250 \times 500 / 4$	DI = 18750 i.e., = $150 \times 500 / 4$ AI = 31250 i.e., = $250 \times 500 / 4$
Remote G500 HMI connections	3 Simultaneous connections	3 Simultaneous connections
Local G500 HMI connections	1 connection (multiple displays)	1 connection (multiple displays)
Datalogger / Continuous reports	1000 (500) AI mapped / 100 (50) reports	1000 (500) AI mapped / 100 (50) reports
ARRM	Maximum 240 file sets across all IEDs	Maximum 240 file sets across all IEDs
Alarms	100 (50) /sec	100 /sec (for 2 seconds)

2.5 Stand Alone

G500 provides the following performance capabilities in Single (non-redundant) Mode.

2.5.1 Performance Test Results

The performance of G500 is tested using the activity levels and disturbance scenarios presented next.

The master station response times are defined in Table 2.1: Standalone Performance test results.

Table 2.1: Standalone Performance test results

Activity	DNP	DNP	IEC 61850	IEC 61850
Hardware (CPU / RAM)	4 core / 16 GB	2 core / 8 GB	4 core / 16 GB	2 core / 8 GB
Loading Condition	Steady state	Steady state	Steady state	Steady state
Protocol – CLIENT / SERVER	DNP / DNP	DNP / DNP	IEC 61850 / DNP	IEC 61850 / DNP
RTDB Point count	200,000	100,000	200,000	100,000
Total RCB configured / Simulation per sec	NA	NA	6000 1000	3000 500
Number of IEDs	500 (250)	500 (250)	500 (250)	500 (250)
Points / IED (AI + DI + AO + DO)	[AI-250, 150-DI, 20-DO, 20-AO, 10-ACC]	150DI+250AI (Configured AO, DO no simulation)	150DI+250AI (Configured AO, DO no simulation)	150DI+250AI (Configured AO, DO no simulation)
Datalogger reports	100 (50) Periodic reports	100 (50) Periodic reports	100 (50) Periodic reports	100 (50) Periodic reports
Number of Master connections Point count / Server	8 DI-9300, AI-15500	4 DI-4650, AI-7750	8 DI-9300, AI-15500	4 DI-4650, AI-7750
Remote / Local HMI connections	1 Remote / 0 Local HMI	1 Remote / 0 Local HMI	1 Remote / 1 Local HMI	1 Remote / 0 Local HMI
CPU utilization – Avg, Min, Max (%) – values for 4 core CPU	60,50,92	80, 28, 95	56, 30, 95	46, 36, 75
Average Memory	2.4 GB	1.4 GB	3 GB	2 GB
Event latency in (msecs) Average, Min, Max	399,19,1.04sec	487,13,1.31	589, 5, 2200	330, 41, 652
Control latency in (msecs) Average, Min, Max	34,12,291	629,3,1.09	8, 6, 16	9, 3, 68

2.5.2 HMI Response time

Under heavy loading conditions, the G500 provides the HMI response times listed in Table 2.2: User Interface Response Time.

Table 2.2: User Interface Response Time

Activity	Normal	High
Screen Access (Point Summary)	< 2 s	< 2 s
Screen Access (One-Line Viewer)	5 to 7 s	5 to 7 s
System Logs	< 2s	2s
Alarm ACK Delay (Single Alarm)	< 1 s	< 1 s
Alarm ACK Delay (20,000 Alarms)	< 2 s	< 7 s
DI/AI Update to Point Summary Screen	< 1 s	< 1 s

NOTE: Under heavy loading conditions, the control latency was measured by simulating one control in every 5 seconds continuously from the Master station.

2.6 Hot Standby Redundancy

G500 provides the following performance capabilities in Hot Standby Redundancy Mode.

Configuration	DNP	IEC61850
Hardware (CPU /RAM)	4 core / 16 GB	4 core / 16 GB
Redundancy	Hot Standby	Hot Standby
Number of IEDs	500 (250)	500 (250)
Protocol – CLIENT / SERVER	DNP / DNP	IEC61850 / DNP
RTDB Point count	200,000 (100,000)	200,000 (100,000)
Points / IED (AI + DI + AO + DO)	150 DI, 250 AI	150 DI, 250 AI
Number of Master connections Point count / Server	8 (4) DI-9300, AI-15500 (DI-4650, AI-7750)	8 (4) DI-9300, AI-15500 (DI-4650, AI-7750)
Total RCB configured / Simulation per sec	NA	6000 (3000) 1000 (500)
Datalogger / Continuous reports	NA	NA
ARRM	Not configured	Not configured
Alarms	100 (50) /sec	100 (50) /sec
Remote / Local HMI connections	1 Remote / 0 Local HMI	1 Remote / 0 Local HMI
CPU utilization – Avg, Min, Max (%) – values for 4 core CPU	60,34,71	32,46,67
Average Memory	3.12 GB	4.3 GB
Event latency – Average, Min, Max (msec)	390,60,1sec	368,2.8,1sec
Control latency – Average, Min, Max (msec)	30,12,377	3,1,73

2.7 Warm Standby Redundancy

G500 provides the following performance capabilities in Warm Standby Redundancy Mode.

Protocol	DNP	IEC61850	IEC 104
Hardware CPU / RAM	4 core / 16 GB (2 core / 8 GB)	4 core / 16 GB (2 core / 8 GB)	4 core / 16 GB (2 core / 8 GB)
Redundancy Mode	Warm Standby	Warm Standby	Warm Standby
Number of IEDs	500 (250)	500 (250)	500 (250)
Protocol – CLIENT / SERVER	DNP / DNP	IEC61850 / DNP	IEC 104 / IEC 104
RTDB Point count	200,000 (100,000)	200,000 (100,000)	200,000 (100,000)
Points / IED (AI + DI + AO + DO)	150 DI, 250 AI	150 DI, 250 AI	150 DI, 250 AI
Number of Master connections Point count / Server	8 (4) DI-9300, AI-15500 (DI-4650, AI-7750)	8 (4) DI-9300, AI-15500 (DI-4650, AI-7750)	8 (4) DI-9300, AI-15500 (DI-4650, AI-7750)
Total RCB configured / Simulation per sec	NA	6000 (3000) 1000 (500)	NA
Datalogger reports	100 (50) Periodic reports	100 (50) Periodic reports	100 (50) continuous reports
ARRM	Not configured	Not configured	Not configured
Alarms	100 (50) /sec	100 (50) /sec	100 (50) /sec
Remote / Local HMI connections	1 Remote / 0 Local HMI	1 Remote / 0 Local HMI	1 Remote / 0 Local HMI
CPU utilization – Avg, Min, Max (%) – values for 4 core CPU	62,53,96	43,48,60	28,32,42
Average Memory	2.4 GB	3 GB	3.4 GB
Event latency – Average, Min, Max (msec)	437,26,1.06	683,323,1sec	221,107,380
Control latency – Average, Min, Max (msec)	44,11,240	3,1,85	30,10,331

NOTE: G500 Supports maximum of 4 simultaneous Runtime HMIs (Remote + Local) either in Standby or Redundancy Modes (Hot/Warm Redundancy).

Time Sync Accuracy (PTP/IRIG-B/NTP)

G500 supports Hardware based PTP/IRIG-B and Software based NTP Time Sync Accuracy.

The current version does not support runtime dynamic failover across different time sources.

Time Sync Input	Accuracy
PTP IN	100% samples within +/-121 microseconds
IRIG-B IN	100% samples within +/-100 microseconds
NTP IN	99.97% samples within +/-10 ms
NTP OUT	99.9% samples within +/- 1ms

NOTES:

- PTP and IRIG-B time accuracy is measured in a scenario where the hardware /FPGA is fully loaded and applies to G500 only.
- If IEDs are getting time synced using any of the client communication protocols (e.g., DNP3), then the above accuracy cannot be guaranteed at the IED.

Application List

The following applications comprise the G500 v1.10 released firmware version and build 1.1.457.

Application	Support in Standalone/ Warm Standby	Support in Hot Standby
Runtime HMI	✓ Available	✓ Available
One-Line Viewer	✓ Available	✓ Available
Config GUI / Schemas	✓ Available	✓ Available
System Library	✓ Available	✓ Available
C++ System Library	✓ Available	✓ Available
Connection Parser	✓ Available	✓ Available
Calculator	✓ Available	✓ Available
Hardware Asset Management Application (HAMA)	✓ Available	* Not available
PTP/IRIG-B Time Sync	✓ Available	✓ Available
Modbus Client	✓ Available	✓ Available
Modbus-TCP/SSH Client	✓ Available	✓ Available
SEL® Binary Client	✓ Available	* Not Available
Analog Data Logger	✓ Available	* Not Available
Generic ASCII Client	✓ Available	* Not Available

Sync Server Application	✓ Available	✓ Available
Analog Report Generator	✓ Available	✗ Not Available
OpenVPN	✓ Available	✓ Available

3. Version 2.00 (27-May-2020)

Software Versions

The following table defines the software versions required for interaction with the G500.

Package	Version	Notes
G500 Firmware	2.0.159	G500 Firmware Version.
DS Agile MCP Studio	2.1.0	Minimum Supported DS Agile MCP Studio Software.
G500 HMI Viewer	2.0.159	Supported G500 HMI 64-bit Software.

Predix Edge OS and Other Firmware Versions

The following table defines the package/firmware versions supported for Predix Edge Linux OS, FPGA, CPLD, UEFI and BCOM FPGA in the G500 v2.0.159.

Package/Firmware	Version	Notes
Predix Edge OS	2.2.1	Supported GE's Secured Linux Operating System Version.
FPGA	1.03.00	Supported FPGA Version of Multi-Function Controller Platform (MCP).
CPLD	1.2.2	Supported CPLD Version of Multi-Function Controller Platform (MCP).
UEFI	VX5D0007.C01	Supported UEFI Version of Multi-Function Controller Platform (MCP).
BCOM FPGA	2.3.0	Supported COM's Module FPGA Version of Multi-Function Controller Platform (MCP).

Key Functions and Changes

3.1 Enhancements

This G500 version adds the following new features compared to previous versions:

3.1.1 Cyber Security

Please refer to Product & Cyber Security Advisories on the GE Vernova Grid Solutions web site.

3.1.2 Clients

GE Vernova Internal Reference #	Description
E-03038	Added D.20 client (single instance) support to connect to D.20 IO peripherals.

3.1.3 Servers

None.

3.1.4 Automation

None.

3.1.5 Configuration/Settings

GE Vernova Internal Reference #	Description
E-03397	Allow import of full D.20 DCA configuration (IO peripherals and communication) from B003 (D2x) to G500. Minimum required version is B003 v722 and CCU Base (D20 Base is not supported).
B-13469	Added support to restore snapshots when Remote Authentication mode is enabled. After restore operation is completed, the device is in Local Authentication Mode. All Remote Authentication configuration parameters are retained after snapshot restoration and the user would need to reselect the Authentication mode to Remote (LDAP/TACACS+) from the Runtime HMI.
B-13418	Snapshots and configuration archives which contain internally configured passwords for IED, ARRM, Synch Manager, LDAP, TACAS+ are now portable across different G500 units of same or newer version (in previous versions this was possible only on the exact same unit).
B-13498	Added Encrypted MCPCloneSnapshot type. These may also be used for Firmware Upgrade operations.
B-13500	In redundant units, the serial port settings are configured separately in unit A and B and are not synchronized across to accommodate different serial port allocation between units A and B (required mainly for RS485 loops).
D-10254	Allow Double Quotes ("") when configuring passwords for FTP in Sync Manager.
D-09947	Ability to Save Changes of LDAP Server Settings without activating it (unit remains in Local Authentication mode).
B-13075	Added support for selecting the colors used to indicate errors in configuration. See Systemwide > GUI > Conditional Formatting.

3.1.6 HMI

GE Vernova Internal Reference #	Description
E-03784	In redundant devices: improved user experience and robustness for Local HMI during failover.
D-10576	Added support to view the existing emergency access code and forcing to generate a new emergency access code if needed.
D-10554	D.20 Traffic is not available to be visualized in Runtime HMI (this is an enforced rule, not a defect).
D-10577	When "mcpemergency" utility on local HMI is used to generate the emergency access code, is now possible to copy the code and paste it to the login prompt. Previously this had to be entered manually (the code is long and prone to make mistakes).

3.1.7 Pass-through

None.

3.1.8 System

GE Vernova Internal Reference #	Description
E-03629	Implemented Firmware Upgrade workflow using generic USB storage. External USB size must be between 8 – 32 GB in this release.
E-03371	Implemented a procedure to allow users to restore a G500 to Factory Default ("clean") configuration when all admin local logons have been lost (use USB storage method).

3.1.9 Documentation

GE Vernova Internal Reference #	Description
B-13504	Updated supported variants of Modbus Clients (Modbus RTU, Modbus TCP and Modbus TCP/SSH) and their support in warm and hot redundancy modes in the SWM0101 (Software Configuration Guide).
B-13513	Created Remote Authentication manuals for LDAP AD, Open LDAP, 389 DS.

3.1.10 Hardware

GE Vernova Internal Reference #	Description
E-03001	Added D.20 HDLC PCIe module as optional module, installable in PCIe slot 3. For additional details, please refer to "994-0152 G500 Substation Gateway Instruction Manual V200 R0".

3.2 Fixed defects

This version of G500 has the fixes for the following defects compared to V1.10:

3.2.1 Cyber Security

Please refer to Product & Cyber Security Advisories on the GE Vernova Grid Solutions web site.

3.2.2 Clients

GE Vernova Internal Reference #	Description
D-09916	SEL Binary Client was restarting abruptly when detected Double Precision Scaling Factors in a SEL relay (for e.g., SEL-351S). Now it logs a message into the diagnostic log and exits gracefully.
D-10226	An SNMP Disabled IED was enabled automatically after receiving a trap.

3.2.3 Server

GE Vernova Internal Reference #	Description
D-10392	AI and ACC parameters were not reported to DNP master based on the threshold settings in the DNP3 Server Mapfile.
D-07837	Modbus Server application failed to connect with message "killing modbusdpa application".

3.2.4 Automation

None.

3.2.5 Configuration/Settings

GE Vernova Internal Reference #	Description
D-10318	FTP in sync manager could not be configured from the Settings GUI.
D-10488	LDAP Remote Authentication configured settings (but not yet activated because "Enable" checkbox was not selected in the Settings tab) were not saved/persisted across reboots of G500.

3.2.6 HMI

GE Vernova Internal Reference #	Description
D-10378	HMI was occasionally displaying "Unsupported Value of Security Type".
D-10574	Local HMI could not login sometimes using Emergency Access code during startup of G500.
D-09944	Internationalization: Settings and messages in the Powerbar in Runtime HMI were not changing to specified language.
D-10324	Fixed the message "The configuration has been modified. Unsaved changes will be discarded. Do you want to discard the changes?" that was displayed even though any changes made are already committed. This applies to the Access tab in the local HMI viewer.
D-10325	After saving the changes in the Access tab of the local HMI viewer and navigating to other tab without committing the changes, then Local HMI viewer was not accessible.

3.2.7 Pass-through

None.

3.2.8 System

GE Vernova Internal Reference #	Description
D-10081	Accumulator values were not synchronized between Active and Standby in Warm Standby Redundancy.
D-10373	Local HMI login prompt and Emergency access terminal were not available if LDAP server was not available during reboot.

GE Vernova Internal Reference #	Description
D-10462	Pairing of redundancy failed after factory default settings was performed.
D-10479	The prompt "=> " was not returned during Secure Passthrough (SSH, Telnet, SSL/TLS) with SEL BIN.
D-10504	Multiple SSH sessions were not accessible in an LDAP enabled device.
D-10562	Datalogger Periodic Reports trending stopped/paused during long runs.
D-10563	SBO Controls were sometimes not accepted by RTDB if Control In Progress DTA was configured for the same DO Points or if control rate was >3 seconds in continuous/performance test scenarios.
D-10600	Active G500 was taking an additional ~1minute time to start when Standby G500 was powered off during start up.

3.2.9 Documentation

GE Vernova Internal Reference #	Description
D-09783	Only one-time source can be enabled at a time (PTP / IRIG-B); captured this in Software Configuration Guide.
D-10131	Added the format and details about Remote Syslogs of G500 in G500 Software Configuration Guide (SWM0101).

3.2.10 Hardware

None.

3.3 Known Issues

This G500 version has the following known issues:

3.3.1 Cyber Security

Please refer to Product & Cyber Security Advisories on the GE Vernova Grid Solutions web site.

3.3.2 Clients

GE Vernova Internal Reference #	Description
E-04038	D.20 Client is supported only in non-redundant systems in this release.
B-13475	SEL Binary Client doesn't support Double Precision Scaling Factors.
D-09915	SEL IEDs with this configuration type are not supported (e.g., SEL-351S).
D-05002	ARRM file retrieval from SEL 1xx/2xx relays (using GENASCII) is not possible.

3.3.3 Servers

GE Vernova Internal Reference #	Description
B-11967	No support for events in NVRAM in IEC101/104 Server. Events that have not been yet transmitted to Master (Clients) are lost if G500 is power cycled / restarted. However – the integrity polls will continue to provide accurate database representation.
B-11968	No support for events in NVRAM in DNP3 Server. Events that have not been yet transmitted to Master (Clients) are lost if G500 is power cycled / restarted. However – the integrity polls will continue to provide accurate database representation.
D-16253	Modbus Server writes the configured Offline Analog Value in both words of a 32 bit register. As long as 0 (zero) is used as configured Offline Analog Value there is no impact.

3.3.4 Automation

GE Vernova Internal Reference #	Description
D-05033	Suppressed quality through Input Point Suppression (IPS) application is not reported to Masters. DNP3 and IEC 101-104 Servers send Online Quality rather than the substituted/last reported quality when points are suppressed.
D-05462	Load shedding: There is no persistency of zone assignments across power restarts when user sets the zones through Analog Setpoint commands.
B-11969	DEM is responsible for handling alarms. Events/Alarms that have not been yet committed to the SQL database are lost if G500 is power cycled / restarted. However – the integrity polls will continue to provide accurate database representation.

3.3.5 Configuration/Settings

GE Vernova Internal Reference #	Description
D-10343	Sync Manager Settings are not retained during upgrade from V1.0 to V1.1. User needs to re-enter these manually. Will not fix.
D-10345	mcpcfg settings must be reconfigured after upgrading G500 from 1.0 to 1.1. Will not fix.
D-10502	NOT A DEFECT. If client applications are configured in non-redundant mode and later the device properties are switched to a redundant mode where some applications are not enabled - their respective points are still available to be mapped, but at runtime will be offline. This is to retain the mappings in case the user decides to switch later back to single mode and the client applications are active again, as previously configured.

GE Vernova Internal Reference #	Description
D-10388	TACACS+ remote authentication can be enabled and activated even if the TACACS+ Server is not available in that moment. This will conduct to a device that can only be accessed using Emergency Access process, if TACACS+ server is not available.
D-06168	FPGA needs to be restarted via Power Cycle for PTP/IRIGB configuration change. No functional impact. PTP/IRIG-B configuration will not be applied without reboot of G500.
D-10825	Online Editor / SNMP Agent Browser is not able to retrieve OID data if gathering data from target device takes more than 60 seconds. Workaround: configure the SNMP client offline, using OID from the end device (e.g., using a 3 rd party MIB browser).
N/A	If filenames with characters other than ASCII are present in the MCP file system - the MCP device and associated configuration tools will not work correctly. Keep only ASCII characters in the filenames for Client Maps, Server Maps, OneLine .dra, OneLine Images, and other user files.

3.3.6 HMI

GE Vernova Internal Reference #	Description
D-10229	Gateway -A /-B designation is missing from local HMI banner sometimes
D-09695	Operator User in Active G500 gets Observer Group privileges sometimes after multiple switch-over or fail-overs in Hot or Warm Standby Redundancy. Runtime HMI needs to be logged out and logged in if this case happens.
D-05463	If a used point group is deleted from the systemwide configuration then points belonging to that group are not visible in the point group summary. However, if user changes the point group allocation from the corresponding instantiated client map file(s) then points will be visible in the point group summary.

3.3.7 Pass-through

None.

3.3.8 System

GE Vernova Internal Reference #	Description
E-04130	The USB FLASH drive used for the Firmware Upgrade must be FAT32 format. As a result of this, only USB FLASH drives of maximum 32 GB can be used. The minimum size, imposed by storage requirements, is 8 GB.
E-03041 D-10346	Input time source selection (PTP / IRIG-B / NTP) does not support dynamic failover between time sources at runtime. Only the configured time source is active at a time.
D-10781	In redundant G500, if both units are (re)started at same time, the indications code and config out of sync are incorrect. Workaround: start one G500 at a time (wait for the first one to start) or restart one of the units while the other one runs.

GE Vernova Internal Reference #	Description
D-10763	Communications stops on D.20 link in rare cases and doesn't recover. Current workaround: when stop condition is detected, the system will be automatically rebooted. If the system reboots to recover from this condition, the following message will be logged to the system event log: MsgID=70; INFO; Description=Last Reset Cause; Misc=Last reset caused by WDT_CARRIER.D20
D-10227	Email does not send messages when an alarm is activated.
D-08036	During start of G500, some not applicable error messages are displayed on the console connected to the display port. No Functional Impact.
D-05714	Update of only Edge OS is not supported. If only Edge OS updates are required, the complete G500 firmware image needs to be updated.
D-06167	Full support for latest PTP power profiles: • IEEE C37.238-2017 • IEC61850-9-3 Ed.1 2016 Enhancement: G500 supports the following PTP profiles: • IEEE 1588-2008 J4 Peer-to-Peer Profile • IEEE C37.238-2011 Power System Profile (but this has been withdrawn) Limited IEC61850-9-3 Ed.1 2016 Power Utility Automation Profile.
GS-02709884 / D-13470	Sometimes UTC time zone is getting overwritten by different time zone and resulting SOE timestamps have wrong time zone. Workaround: Configure GMT instead of UTC in DNP3 client and server configurations both in serial and ethernet modes.

3.3.9 Documentation

None.

3.3.10 Hardware

GE Vernova Internal Reference #	Description
D-06165	No functional impact. SFP Hot Plug in / Plug out detection. Points that represent the status of SFP IN/OUT will not be reflected until G500 is rebooted.

Capability and Capacity

3.4 Application Limits

This G500 version supports the following application limits.

Application	Feature	Configuration Limits
Digital Event Manager	Alarms	
	Max Number of Alarm Groups	256
	Max number of members in an Alarm Group	1000
Calculator	Expression Type:	
	Evaluations	10000
	Timers	1000
	Analog Assignments	2000
	Digital Assignments	10000
	Quality Conversions	1000
	Type Conversions	1000
	Averages	1000
	Output to Input Conversions	1000
Load Shed DTA	Number of Feeders and Zones	
	Max Zones	50
	Max Feeders	100
Analog Reports DTA	Max Analog Reports	100
System Point Manager	Accumulator Freeze	100
	Analog Value Selection	100
	Control Lockout	
	• Remote Groups	8
	• Local Groups	10000
	Double Points	1000
	Input Point Suppression	10000
	Control in Progress	256
	Redundant I/O	10000
Analog Data Logger	Continuous Reports	1000
	Periodic Reports	1000
	Out of Range Reports	1000
VPN Server	Number of VPN Clients	8
SCADA – No. of Client or Server connections (Serial/Network/D.20)	Serial IEDs	
	DNP Multidrop	80
	DNP Multidrop (Modem)	80

Application	Feature	Configuration Limits
	Generic ASCII	80
	SEL Binary IED	80
	IEC 60870-5-101 Multidrop	80
	IEC60870-5-103 Multidrop	80
	Modbus Multidrop	80
	D.20	1
	Network IEDs	
	DNP3 TCP	500
	Modbus TCP/Modbus TCP-SSH	500
	IEC60870-5 104	500
	IEC61850	500
	SNMP	1
	VPN Server	1
	Serial Masters	
	DNP3 Serial Master	8
	IEC 60870-5-101 Master	8
	Modbus Serial Master	8
	Network Masters	
	DNP3 Network Master	8
	IEC 60870-5-104 Master	8
	Modbus TCP Master	8
SCADA - No. of IEDs or Master station LRUs in each connection	Serial /Network IEDs	
	IEC60870-5-103 Multidrop	255
	DNP3 Multidrop/Network	10
	Modbus Multidrop/TCP	20
	IEC60870-5 101 Multidrop	1000
	IEC60870-5 104	10
	SNMP Client	100
	GenASCII Client	120
	IEC61850 Client	60
	SEL Binary Client	1
	D.20 Client	120
	Serial /Network Masters	
	DNP3 Serial Master	32
	Modbus Serial Master	32
	IEC60870-1 101 Master	32
	DNP3 TCP Master	1

3.5 Performance Test Levels

This G500 version meets the following performance test levels (same as G500 v1.10).

NOTES:

- G500 Hardware under test: 4 core CPU / 16 GB RAM variant.
- In the following table(s), numbers inside the brackets are for the G500 variant with 2 core CPU / 8 GB RAM.

Requirement	Steady State Loading	Avalanche Loading
Loading Signal changes (continuously /sec)	AI-10,000 (5,000) DI-100	All points changing twice in 2 secs
Number of connected IEDs to G500	500 (250)	500 (250)
G500 total RTDB Point count	200,000 (100,000)	200,000 (100,000)
Points / IED DI & AI	400 150x DI and 250x AI per IED	400 150x DI and 250x AI per IED
Each G500 Server has points (half for 2 core CPU / 8 GB RAM)	DI = 18750 i.e., = 150*500 / 4 AI = 31250 i.e., = 250*500 / 4	DI = 18750 i.e., = 150*500 / 4 AI = 31250 i.e., = 250*500 / 4
Remote G500 HMI connections	3 Simultaneous connections	3 Simultaneous connections

Requirement	Steady State Loading	Avalanche Loading
Local G500 HMI connections	1 connection (multiple displays)	1 connection (multiple displays)
Datalogger / Continuous reports	1000 (500) AI mapped / 100 (50) reports	1000 (500) AI mapped / 100 (50) reports
ARRM	Maximum 240 file sets across all IEDs	Maximum 240 file sets across all IEDs
Alarms	100 (50) /sec	100 /sec (for 2 seconds)

3.6 Stand Alone

This G500 version provides the following performance capabilities in Single (non-redundant) Mode.

3.6.1 Performance Test Results

The performance of G500 is tested using the activity levels and disturbance scenarios presented next.

The master station response times are defined in Table 3.1: Standalone Performance test results.

Table 3.1: Standalone Performance test results

Activity	DNP	DNP	IEC 61850	IEC 61850
Hardware (CPU / RAM)	4 core / 16 GB	2 core / 8 GB	4 core / 16 GB	2 core / 8 GB
Loading Condition	Steady state	Steady state	Steady state	Steady state
Protocol – CLIENT / SERVER	DNP / DNP	DNP / DNP	IEC 61850 / DNP	IEC 61850 / DNP
RTDB Point count	200,000	100,000	200,000	100,000
Total RCB configured / Simulation per sec	NA	NA	6000 1000	3000 500
Number of IEDs	500 (250)	500 (250)	500 (250)	500 (250)
Points / IED (AI + DI + AO + DO)	[AI-250, DI-150, DI-20, AO-20, ACC-10]	150DI+250AI (Configured AO, DO no simulation)	150DI+250AI (Configured AO, DO no simulation)	150DI+250AI (Configured AO, DO no simulation)
Datalogger reports	100 (50) Periodic reports	100 (50) Periodic reports	100 (50) Periodic reports	100 (50) Periodic reports
Number of Master connections Point count / Server	8 DI-9300, AI-15500	4 DI-4650, AI-7750	8 DI-9300, AI-15500	4 DI-4650, AI-7750
Remote / Local HMI connections	1 Remote / 0 Local HMI	1 Remote / 0 Local HMI	1 Remote / 1 Local HMI	1 Remote / 0 Local HMI
CPU utilization – Avg, Min, Max (%) – values for 4 core CPU	60,46,97	80, 28, 95	56, 30, 95	46, 36, 75
Average Memory	2.9 GB	1.4 GB	3 GB	2 GB
Event latency in (msecs) Average, Min, Max	398,19,1.04sec	487,13,1.31	589, 5, 2200	330, 41, 652

Activity	DNP	DNP	IEC 61850	IEC 61850
Control latency in (msecs) Average, Min, Max	30,12,291	629,3,1.09	8, 6, 16	9, 3, 68

3.6.2 HMI Response time

Under heavy loading conditions, the G500 provides the HMI response times listed in Table 3.2: User Interface Response Time.

Table 3.2: User Interface Response Time

Activity	Normal	High
Screen Access (Point Summary)	< 2 s	< 2 s
Screen Access (One-Line Viewer)	5 to 7 s	5 to 7 s
System Logs	< 2s	2s
Alarm ACK Delay (Single Alarm)	< 1 s	< 1 s
Alarm ACK Delay (20,000 Alarms)	< 2 s	< 7 s
DI/AI Update to Point Summary Screen	< 1 s	< 1 s

NOTE: Under heavy loading conditions, the control latency was measured by simulating one control in every 5 seconds continuously from the Master station.

3.6.3 D.20 HDLC Performance Test Results

The performance of G500 with D.20 HDLC card is tested with different scenarios listed in Table 3.3.

Table 3.3: D.20 HDLC Performance test results

Activity	Multi-Protocol	Multi-Protocol
Hardware (CPU / RAM)	2 core / 8 GB	4 core / 16 GB
Loading Condition	Steady state	Steady state
Protocol – CLIENT / SERVER	DNP, IEC 103, IEC 104, Modbus, IEC 61850 / DNP, Modbus, IEC 104	DNP / DNP
RTDB Point count	8244	200,000
Total RCB configured / Simulation per sec	NA	NA
Number of IEDs	101x D.20 peripherals + 42 other protocol IEDs	101x D.20 peripherals + 400 DNP IEDs
Points / IED (AI + DI + AO + DO)	Total = AI (1935) + DI (5056) + AO (154) + DO (993) + ACC (106)	[AI-250, 150-DI, 20-DO, 20-AO, 10-ACC]
Datalogger reports	NA	100

Activity	Multi-Protocol	Multi-Protocol
Number of Master connections Point count / Server	7	8 DI-9300, AI-15500
Remote / Local HMI connections	1 Remote / 0 Local HMI	1 Remote / 0 Local HMI
CPU utilization – Avg (%)	35.8	58.20
Average Memory	2.4 GB	2.52 GB
Event latency in (msecs) Average, Min, Max	696, 51, 1.97 sec	-
Control latency in (msecs) Average, Min, Max	72, 49, 254	-

3.7 Hot Standby Redundancy

This G500 version provides the following performance capabilities in Hot Standby Redundancy Mode.

Configuration	DNP	IEC61850
Hardware (CPU /RAM)	4 core / 16 GB (2 core / 8 GB)	4 core / 16 GB (2 core / 8 GB)
Redundancy	Hot Standby	Hot Standby
Number of IEDs	500 (250)	500 (250)
Protocol – CLIENT / SERVER	DNP / DNP	IEC61850 / DNP
RTDB Point count	200,000 (100,000)	200,000 (100,000)
Points / IED (AI + DI + AO + DO)	150 DI, 250 AI	150 DI, 250 AI
Number of Master connections Point count / Server	8 (4) DI-9300, AI-15500 (DI-4650, AI-7750)	8 (4) DI-9300, AI-15500 (DI-4650, AI-7750)
Total RCB configured / Simulation per sec	NA	6000 (3000) 1000 (500)
Datalogger / Continuous reports	NA	NA
ARRM	Not configured	Not configured
Alarms	100 (50) /sec	100 (50) /sec
Remote / Local HMI connections	1 Remote / 0 Local HMI	1 Remote / 0 Local HMI
CPU utilization – Avg, Min, Max (%) – values for 4 core CPU	60,34,71	32,46,67
Average Memory	3.12 GB	4.3 GB
Event latency – Average, Min, Max (msec)	390,60,1sec	368,2.8,1sec
Control latency – Average, Min, Max (msec)	30,12,377	3,1,73

3.8 Warm Standby Redundancy

This G500 version provides the following performance capabilities in Warm Standby Redundancy Mode.

Protocol	DNP	IEC61850	IEC 104
Hardware CPU / RAM	4 core / 16 GB (2 core / 8 GB)	4 core / 16 GB (2 core / 8 GB)	4 core / 16 GB (2 core / 8 GB)
Redundancy Mode	Warm Standby	Warm Standby	Warm Standby
Number of IEDs	500 (250)	500 (250)	500 (250)
Protocol – CLIENT / SERVER	DNP / DNP	IEC61850 / DNP	IEC 104 / IEC 104
RTDB Point count	200,000 (100,000)	200,000 (100,000)	200,000 (100,000)
Points / IED (AI + DI + AO + DO)	150 DI, 250 AI	150 DI, 250 AI	150 DI, 250 AI
Number of Master connections Point count / Server	8 (4) DI-9300, AI-15500 (DI-4650, AI-7750)	8 (4) DI-9300, AI-15500 (DI-4650, AI-7750)	8 (4) DI-9300, AI-15500 (DI-4650, AI-7750)
Total RCB configured / Simulation per sec	NA	6000 (3000) 1000 (500)	NA
Datalogger reports	100 (50) Periodic reports	100 (50) Periodic reports	100 (50) continuous reports
ARRM	Not configured	Not configured	Not configured
Alarms	100 (50) /sec	100 (50) /sec	100 (50) /sec
Remote / Local HMI connections	1 Remote / 0 Local HMI	1 Remote / 0 Local HMI	1 Remote / 0 Local HMI
CPU utilization – Avg, Min, Max (%) – values for 4 core CPU	62,53,96	43,48,60	28,32,42
Average Memory	2.4 GB	3 GB	3.4 GB
Event latency – Average, Min, Max (msec)	437,26,1.06	683,323,1sec	221,107,380
Control latency – Average, Min, Max (msec)	44,11,240	3,1,85	30,10,331

NOTE: G500 Supports maximum of 4 simultaneous Runtime HMIs (Remote + Local) either in Standby or Redundancy Modes (Hot/Warm Redundancy).

Time Sync Accuracy (PTP/IRIG-B/NTP)

This G500 version supports Hardware based PTP/IRIG-B and Software based NTP Time Sync Accuracy.

This version does not support runtime dynamic failover across different time sources.

Time Sync Input	Accuracy
PTP IN	100% samples within +/-121 microseconds
IRIG-B IN	100% samples within +/-100 microseconds
NTP IN	99.97% samples within +/-10 ms
NTP OUT	99.9% samples within +/- 1ms

NOTES:

- PTP and IRIG-B time accuracy is measured in a scenario where the hardware /FPGA is fully loaded and applies to G500 only.
- If IEDs are getting time synced using any of the client communication protocols (e.g., DNP3), then the above accuracy cannot be guaranteed at the IED.

Application List

This G500 version has the following applications available depending on configured redundancy mode.

Application	Support in Standalone	Support in Warm Standby	Support in Hot Standby
Runtime HMI	✓ Available	✓ Available	✓ Available
One-Line Viewer	✓ Available	✓ Available	✓ Available
Config GUI / Schemas	✓ Available	✓ Available	✓ Available
System Library	✓ Available	✓ Available	✓ Available
C++ System Library	✓ Available	✓ Available	✓ Available
Connection Parser	✓ Available	✓ Available	✓ Available
Calculator	✓ Available	✓ Available	✓ Available
Hardware Asset Management Application (HAMA)	✓ Available	✓ Available	✗ Not available

OpenVPN	✓ Available	✓ Available	✓ Available

4. Version 2.10 (09-December-2020)

Software Versions

The following table defines the software versions required for interaction with the G500.

Package	Version	Notes
G500 Firmware	2.1.47	G500 Firmware Version.
DS Agile MCP Studio	2.2.0	Minimum Supported DS Agile MCP Studio Software.
G500 HMI Viewer	2.1.42	Supported G500 HMI 64-bit Software.
MCP Utilities	1.0.12	Minimum Supported MCP Firmware Upgrade Utilities

Predix Edge OS and Other Firmware Versions

The following table defines the package/firmware versions supported for Predix Edge Linux OS, FPGA, CPLD, UEFI and BCOM FPGA in the G500 v2.1.47.

Package/Firmware	Version	Notes
Predix Edge OS	2.2.1	Supported GE's Secured Linux Operating System Version.
FPGA	1.03.00	Supported FPGA Version of Multi-Function Controller Platform (MCP).
CPLD	1.2.2	Supported CPLD Version of Multi-Function Controller Platform (MCP).
UEFI	VX5D0007.C01	Supported UEFI Version of Multi-Function Controller Platform (MCP).
BCOM FPGA	2.3.0	Supported COM's Module FPGA Version of Multi-Function Controller Platform (MCP).

Key Functions and Changes

4.1 Enhancements

This G500 version adds the following new features compared to previous versions:

4.1.1 Cyber Security

None.

4.1.2 Clients

GE Vernova Internal Reference #	Description
R-01289	IEC 60870-5-101 ed.2 Master DNV Certification (Balanced and Unbalanced) IEC 60870-5-104 ed.2 Master DNV Certification
R-01290	IEC61850 Ed.2 Client UCA Level B Certification

4.1.3 Servers

GE Vernova Internal Reference #	Description
R-01289	IEC 60870-5-101 ed.2 Slave DNV Certification (Balanced and Unbalanced) IEC 60870-5-104 ed.2 Slave DNV Certification

4.1.4 Automation

None.

4.1.5 Configuration/Settings

GE Vernova Internal Reference #	Description
B-13679	Added SNMP Template for Reason LAN Switch S2024.

4.1.6 HMI

None.

4.1.7 Pass-through

None.

4.1.8 System

None.

4.1.9 Documentation

None.

4.1.10 Hardware

None.

4.2 Fixed defects

This version of G500 has the fixes for the following defects compared to V2.00:

4.2.1 Cyber Security

None.

4.2.2 Clients

GE Vernova Internal Reference #	Description
GS-02329341, D-11629	Fixed an issue where D.20 stops communicating with all the peripherals which then would be flashing in fault mode, and a manual reset is required for the G500 to recover.
D-10763	Fixed an issue where communications stop on D.20 link in rare cases and doesn't recover.
GS-02010744, D-09804	Fixed an issue where G500 61850 client cannot communicate with F650 ed.2 Server.

4.2.3 Server

GE Vernova Internal Reference #	Description
D-11483	Fixed an issue where RTS/CTS do not operate correctly in G500 DNP3 DPA over serial connection.

4.2.4 Automation

None.

4.2.5 Configuration/Settings

GE Vernova Internal Reference #	Description
GS-02223597, D-10928	Fixed an issue, where cannot upgrade G500 V1.0 to 2.0 due to not being able to load snapshot.

4.2.6 HMI

None.

4.2.7 Pass-through

None.

4.2.8 System

GE Vernova Internal Reference #	Description
D-10906	Fixed an issue where Enabled NTP time sync caused increasing zombies and then caused the system reboot eventually.

4.2.9 Documentation

GE Vernova Internal Reference #	Description
GS-02312730, D-11532	Fixed an issue where G500 SW Manual "Chassis Intrusion State" point was incorrect described.

4.2.10 Hardware

None.

4.3 Known Issues

This G500 version has the following known issues:

4.3.1 Cyber Security

Please refer to Product & Cyber Security Advisories on the GE Vernova Grid Solutions web site.

4.3.2 Clients

GE Vernova Internal Reference #	Description
E-04038	D.20 Client is supported only in non-redundant systems in this release.
B-13475, D-09915	SEL Binary Client doesn't support Double Precision Scaling Factors.
D-05002	ARRM file retrieval from SEL 1xx/2xx relays (using GENASCII) is not possible.
R-01498, GS-02706688, DCSSUP-21882	G500 is not communicating with Modbus IED devices if the least significant group of the IP address has 3 digits.

4.3.3 Servers

GE Vernova Internal Reference #	Description
B-11967	No support for events in NVRAM in IEC101/104 Server. Events that have not been yet transmitted to Master (Clients) are lost if G500 is power cycled / restarted. However – the integrity polls will continue to provide accurate database representation.
B-11968	No support for events in NVRAM in DNP3 Server. Events that have not been yet transmitted to Master (Clients) are lost if G500 is power cycled / restarted. However – the integrity polls will continue to provide accurate database representation.
D-16253	Modbus Server writes the configured Offline Analog Value in both words of a 32 bit register. As long as 0 (zero) is used as configured Offline Analog Value there is no impact.

4.3.4 Automation

GE Vernova Internal Reference #	Description
D-05033	Suppressed quality through Input Point Suppression (IPS) application is not reported to Masters. DNP3 and IEC 101-104 Servers send Online Quality rather than the substituted/last reported quality when points are suppressed.
D-05462	Load shedding: There is no persistency of zone assignments across power restarts when user sets the zones through Analog Setpoint commands.
B-11969	DEM is responsible for handling alarms. Events/Alarms that have not been yet committed to the SQL database are lost if G500 is power cycled / restarted. However – the integrity polls will continue to provide accurate database representation.
DCSSUP-19948, D-11999	Initial value for variables configured in LogicLinx wizard does not work at runtime (starts at 0 always).
DCSSUP-19948, D-12000	Restore the last value for variables configured in LogicLinx wizard does not work at runtime (starts at 0 always).

4.3.5 Configuration/Settings

GE Vernova Internal Reference #	Description
D-10343	Sync Manager Settings are not retained during upgrade from V1.0 to V1.1. User needs to re-enter these manually. Will not fix.
D-10345	mcpcfg settings must be reconfigured after upgrading G500 from 1.0 to 1.1. Will not fix.

GE Vernova Internal Reference #	Description
D-10502	NOT A DEFECT. If client applications are configured in non-redundant mode and later the device properties are switched to a redundant mode where some applications are not enabled - their respective points are still available to be mapped, but at runtime will be offline. This is to retain the mappings in case the user decides to switch later back to single mode and the client applications are active again, as previously configured.
D-10388	TACACS+ remote authentication can be enabled and activated even if the TACACS+ Server is not available in that moment. This will conduct to a device that can only be accessed using Emergency Access process, if TACACS+ server is not available.
D-06168	FPGA needs to be restarted via Power Cycle for PTP/IRIGB configuration change. No functional impact. PTP/IRIG-B configuration will not be applied without reboot of G500.
D-10825	Online Editor / SNMP Agent Browser is not able to retrieve OID data if gathering data from target device takes more than 60 seconds. Workaround: configure the SNMP client offline, using OID from the end device (e.g., using a 3 rd party MIB browser).
N/A	If filenames with characters other than ASCII are present in the MCP file system - the MCP device and associated configuration tools will not work correctly. Keep only ASCII characters in the filenames for Client Maps, Server Maps, OneLine .dra, OneLine Images, and other user files.

4.3.6 HMI

GE Vernova Internal Reference #	Description
D-10229	Gateway -A /-B designation is missing from local HMI banner sometimes
D-09695	Operator User in Active G500 gets Observer Group privileges sometimes after multiple switch-over or fail-overs in Hot or Warm Standby Redundancy. Runtime HMI needs to be logged out and logged in if this case happens.
D-05463	If a used point group is deleted from the systemwide configuration then points belonging to that group are not visible in the point group summary. However, if user changes the point group allocation from the corresponding instantiated client map file(s) then points will be visible in the point group summary.

4.3.7 Pass-through

None.

4.3.8 System

GE Vernova Internal Reference #	Description
E-04130	The USB FLASH drive used for the Firmware Upgrade must be FAT32 format. As a result of this, only USB FLASH drives of maximum 32 GB can be used. The minimum size, imposed by storage requirements, is 8 GB.

GE Vernova Internal Reference #	Description
E-03041 D-10346	Input time source selection (PTP / IRIG-B / NTP) does not support dynamic failover between time sources at runtime. Only the configured time source is active at a time.
D-10781	In redundant G500, if both units are (re)started at same time, the indications code and config out of sync are incorrect. Workaround: start one G500 at a time (wait for the first one to start) or restart one of the units while the other one runs.
D-10227	Email does not send messages when an alarm is activated.
D-08036	During start of G500, some not applicable error messages are displayed on the console connected to the display port. No Functional Impact.
D-05714	Update of only Edge OS is not supported. If only Edge OS updates are required, the complete G500 firmware image needs to be updated.
D-06167	Full support for latest PTP power profiles: - IEEE C37.238-2017 - IEC61850-9-3 Ed.1 2016 Enhancement: G500 supports the following PTP profiles: - IEEE 1588-2008 J4 Peer-to-Peer Profile - IEEE C37.238-2011 Power System Profile (but this has been withdrawn) Limited IEC61850-9-3 Ed.1 2016 Power Utility Automation Profile.
D-11689	Control Lockout: Incorrect behavior when IED DO point is mapped to both Local and Remote Group with Manual Ownership, and the issuer of the command had both RG and LG ownership, later after having RG ownership removed – will still execute the DO point mapped to the LG.
D-12039	After clearing logs from either mcpcfg, or sudo mcpcfg, or Settings GUI – the G500 must be rebooted to re-initialize the HMI server.
D-11904	Soft reboot command fails in rare occasions. Performing a hardware reboot is successful, no functional impact.
GS-02709884 / D-13470	Sometimes UTC time zone is getting overwritten by different time zone and resulting SOE timestamps have wrong time zone Workaround: Configure GMT instead of UTC in DNP3 client and server configurations both in serial and ethernet modes.

4.3.9 Documentation

None.

4.3.10 Hardware

GE Vernova Internal Reference #	Description
D-06165	No functional impact. SFP Hot Plug in / Plug out detection. Points that represent the status of SFP IN/OUT will not be reflected until G500 is rebooted.

Capability and Capacity

4.4 Application Limits

This G500 version supports the following application limits.

Application	Feature	Configuration Limits
Digital Event Manager	Alarms	
	Max Number of Alarm Groups	256
	Max number of members in an Alarm Group	1000
Calculator	Expression Type:	
	Evaluations	10000
	Timers	1000
	Analog Assignments	2000
	Digital Assignments	10000
	Quality Conversions	1000
	Type Conversions	1000
	Averages	1000
	Output to Input Conversions	1000
Load Shed DTA	Number of Feeders and Zones	
	Max Zones	50
	Max Feeders	100
Analog Reports DTA	Max Analog Reports	100
System Point Manager	Accumulator Freeze	100
	Analog Value Selection	100
	Control Lockout	
	• Remote Groups	8
	• Local Groups	10000
	Double Points	1000
	Input Point Suppression	10000
	Control in Progress	256
	Redundant I/O	10000
Analog Data Logger	Continuous Reports	1000
	Periodic Reports	1000
	Out of Range Reports	1000
VPN Server	Number of VPN Clients	8
SCADA – No. of Client or Server connections (Serial/Network/D.20)	Serial IEDs	
	DNP Multidrop	80
	DNP Multidrop (Modem)	80

Application	Feature	Configuration Limits
	Generic ASCII	80
	SEL Binary IED	80
	IEC 60870-5-101 Multidrop	80
	IEC60870-5-103 Multidrop	80
	Modbus Multidrop	80
	D.20	1
	Network IEDs	
	DNP3 TCP	500
	Modbus TCP/Modbus TCP-SSH	500
	IEC60870-5 104	500
	IEC61850	500
	SNMP	1
	VPN Server	1
	Serial Masters	
	DNP3 Serial Master	8
	IEC 60870-5-101 Master	8
	Modbus Serial Master	8
	Network Masters	
	DNP3 Network Master	8
	IEC 60870-5-104 Master	8
	Modbus TCP Master	8
SCADA - No. of IEDs or Master station LRUs in each connection	Serial /Network IEDs	
	IEC60870-5-103 Multidrop	255
	DNP3 Multidrop/Network	10
	Modbus Multidrop/TCP	20
	IEC60870-5 101 Multidrop	1000
	IEC60870-5 104	10
	SNMP Client	100
	GenASCII Client	120
	IEC61850 Client	60
	SEL Binary Client	1
	D.20 Client	120
	Serial /Network Masters	
	DNP3 Serial Master	32
	Modbus Serial Master	32
	IEC60870-1 101 Master	32
	DNP3 TCP Master	1

Application	Feature		Configuration Limits
	Modbus TCP Master		1
	IEC60870-1 104 Master		1
SCADA - No. of points configured in each IED/Peripheral mapfile	DNP3 Multi-Drop/Network IEDs		1000
	Modbus Multi-Drop/Network IEDs		1000
	GenASCII IED		1000
	SNMP IED		1000
	IEC60870-1 103 Multi-Drop		1000
	IEC60870-1 101/104 Multi-Drop		
	• Bitstream		32
	• Double Command		1000
	• Integrate Total		1000
	• Measurand		1000
	• Packed Single Point		16
	• Regulating Step Command		1000
	• Set Point Command		1000
	• Single Point		1000
	• Step Position		1000
	SEL Binary IED		
	• Fast Meter Analog Input		32
	• Demand Analog Input		32
	• Peak Demand Analog Input		32
	• SER Digital Input		1000
	D.20 Peripheral Client		
	D.20 S Card		64 Digital Inputs, or 32 Double Point Inputs, or 64 Transition Counters, or 32 Form C Counters
	D.20 A Card		32 Analog Inputs
	D.20 K Card		32 Digital Outputs
	D.20 C Card	C0	16 Digital Inputs 8 Digital Outputs
		C1	16 Digital Inputs 8 Digital Outputs 16 Analog Inputs

Application	Feature		Configuration Limits
		C2	16 Digital Inputs 8 Digital Outputs 8 Analog Inputs 8 Analog Outputs
SCADA - No. of points mapped into server mapfile	DNP3 Serial/TCP Master		DI-10000 AI-15000 DO-5000 ACC-3000
	Modbus Serial/TCP Master		DI-10000 AI-15000 DO-5000 ACC-3000
	IEC60870-1 101/104 Master		DI-10000 AI-15000 DO-5000 ACC-3000

4.5 Performance Test Levels

This G500 version meets the following performance test levels (same as G500 v1.10).

NOTES:

- G500 Hardware under test: 4 core CPU / 16 GB RAM variant.
- In the following table(s), numbers inside the brackets are for the G500 variant with 2 core CPU / 8 GB RAM.

Requirement	Steady State Loading	Avalanche Loading
Loading Signal changes (continuously /sec)	AI-10,000 (5,000) DI-100	All points changing twice in 2 secs
Number of connected IEDs to G500	500 (250)	500 (250)
G500 total RTDB Point count	200,000 (100,000)	200,000 (100,000)
Points / IED DI & AI	400 150x DI and 250x AI per IED	400 150x DI and 250x AI per IED
Each G500 Server has points (half for 2 core CPU / 8 GB RAM)	DI = 18750 i.e., = 150*500 / 4 AI = 31250 i.e., = 250*500 / 4	DI = 18750 i.e., = 150*500 / 4 AI = 31250 i.e., = 250*500 / 4
Remote G500 HMI connections	3 Simultaneous connections	3 Simultaneous connections

Requirement	Steady State Loading	Avalanche Loading
Local G500 HMI connections	1 connection (multiple displays)	1 connection (multiple displays)
Datalogger / Continuous reports	1000 (500) AI mapped / 100 (50) reports	1000 (500) AI mapped / 100 (50) reports
ARRM	Maximum 240 file sets across all IEDs	Maximum 240 file sets across all IEDs
Alarms	100 (50) /sec	100 /sec (for 2 seconds)

4.6 Stand Alone

NOTE: This G500 version provides the performance capabilities of G500 version 2.00. In addition to that, the following D.20 HDLC performance scenarios are tested in Single (non-redundant) Mode.

4.6.1 D.20 HDLC Performance Test Results

The performance of G500 with D.20 HDLC card is tested with different scenarios listed in Table 4.1.

Table 4.1: D.20 HDLC Performance test results

Activity	Multi-Protocol	Multi-Protocol
Hardware (CPU / RAM)	2 core / 8 GB	4 core / 16 GB
Loading Condition	Steady state	Steady state
Protocol – CLIENT / SERVER	DNP, IEC 103, IEC 104, Modbus, IEC 61850 / DNP, Modbus, IEC 104	DNP / DNP
RTDB Point count	8244	30,400
Total RCB configured / Simulation per sec	NA	NA
Number of IEDs	101x D.20 peripherals + 42 other protocol IEDs	94x D.20 peripherals + 60 DNP IEDs
Points / IED (AI + DI + AO + DO)	Total = AI (1935) + DI (5056) + AO (154) + DO (993) + ACC (106)	[AI-250, 150-DI, 20-DO, 20-AO, 10-ACC]
Datalogger reports	NA	NA
Number of Master connections Point count / Server	7	8 DI-9300, AI-15500
Remote / Local HMI connections	1 Remote / 0 Local HMI	1 Remote / 0 Local HMI
CPU utilization – Avg (%)	35.8	58.20
Average Memory	2.4 GB	2.52 GB

Activity	Multi-Protocol	Multi-Protocol
Event latency in (msecs) Average, Min, Max	696, 51, 1.97 sec	479, 143, 920
Control latency in (msecs) Average, Min, Max	72, 49, 254	23,14,54

4.7 Hot Standby Redundancy

NOTE: This G500 version provides the performance capabilities of G500 version 2.00 in Hot Standby Redundancy Mode.

4.8 Warm Standby Redundancy

NOTE: This G500 version provides the performance capabilities of G500 version 2.00 in Warm Standby Redundancy Mode.

Time Sync Accuracy (PTP/IRIG-B/NTP)

This G500 version supports Hardware based PTP/IRIG-B and Software based NTP Time Sync Accuracy.

This version does not support runtime dynamic failover across different time sources.

Time Sync Input	Accuracy
PTP IN	100% samples within +/-121 microseconds
IRIG-B IN	100% samples within +/-100 microseconds
NTP IN	99.97% samples within +/-10 ms
NTP OUT	99.9% samples within +/- 1ms

NOTES:

- PTP and IRIG-B time accuracy is measured in a scenario where the hardware /FPGA is fully loaded and applies to G500 only.
- If IEDs are getting time synced using any of the client communication protocols (e.g., DNP3), then the above accuracy cannot be guaranteed at the IED.

Application List

This G500 version has the following applications available depending on configured redundancy mode.

Application	Support in Standalone	Support in Warm Standby	Support in Hot Standby
Runtime HMI	✓ Available	✓ Available	✓ Available
One-Line Viewer	✓ Available	✓ Available	✓ Available
Config GUI / Schemas	✓ Available	✓ Available	✓ Available
System Library	✓ Available	✓ Available	✓ Available
C++ System Library	✓ Available	✓ Available	✓ Available
Connection Parser	✓ Available	✓ Available	✓ Available
Calculator	✓ Available	✓ Available	✓ Available
Hardware Asset Management Application (HAMA)	✓ Available	✓ Available	✗ Not available

5. Version 2.50 (18-October-2021)

Software Versions

The following table defines the software versions required for interaction with the G500.

Package	Version	Notes
G500 Firmware	2.5.114	G500 Firmware Version.
DS Agile MCP Studio	2.5.0	Minimum Supported DS Agile MCP Studio Software.
G500 HMI Viewer	2.5.112	Supported G500 HMI 64-bit Software.
MCP Utilities	1.1.10	Minimum Supported MCP Firmware Upgrade Utilities.

Predix Edge OS and Other Firmware Versions

The following table defines the package/firmware versions supported for Predix Edge Linux OS, FPGA, CPLD, UEFI and BCOM FPGA in the G500 v2.5.114.

Package/Firmware	Version	Notes
Predix Edge OS	2.6.0	Supported GE's Secured Linux Operating System Version.
FPGA	1.03.00	Supported FPGA Version of Multi-Function Controller Platform (MCP).
CPLD	1.2.2	Supported CPLD Version of Multi-Function Controller Platform (MCP).
UEFI	VX5D0007.C01	Supported UEFI Version of Multi-Function Controller Platform (MCP).
BCOM FPGA	2.3.0	Supported COM's Module FPGA Version of Multi-Function Controller Platform (MCP).

Key Functions and Changes

5.1 Enhancements

This G500 version adds the following new features compared to previous versions:

5.1.1 Cyber Security

None.

5.1.2 Clients

GE Vernova Internal Reference #	Description
E-04038	Added support for D.20 client redundancy to connect to D.20 IO with redundant G500 devices.
E-04255	Added support for IEC 62351-14 syslog client in G500.

5.1.3 Servers

GE Vernova Internal Reference #	Description
E-04361	Added support in DNP3 DPA to assign Analog/Digital Input event change notifications through Class 0.
E-04362	Enhanced the support in DNP3 DPA for incrementing the sequence number when all the application layer retries are exhausted.
E-04363	Enhanced the support in DNP3 DPA for reporting local IIN flag/bit when a digital output point goes offline.
E-04364	Enhanced the support in DNP3 DPA for updating the retry value of unsolicited messages based on the value of the application layer retry count.
E-04365	Added support in DNP3 DPA to increase the RTS modem control pre-transmission delay from 400ms to 2000ms.
E-04366	Added support in DNP3 DPA to read the DCD status while establishing the serial connections with the SCADA Master.

5.1.4 Automation

GE Vernova Internal Reference #	Description
R-01432, GS-02538028	Added support for increasing the Analog Value Selection (AVS) groups to 250.
B-15358	Added support for increasing the Accumulator Freeze (AF) groups to 250.

5.1.5 Configuration/Settings

GE Vernova Internal Reference #	Description
E-04146	G500 One-Line Designer: allow copy and paste of instantiated symbols including source data.
E-04147	G500 One-Line Designer: during design, display only a small placeholder for the flags.

5.1.6 HMI

GE Vernova Internal Reference #	Description
E-04480	Runtime HMI Point Details and Connection pages show the source of data for IEDs and mode of operation of G500 for Masters in the system level hot-hot redundancy.
E-04257	Updated Runtime HMI Point Details/Point Forcing pages with all the supported G500 quality mnemonics.
E-03006	Quality Flag Symbol in SLD screens can now be TEXT in addition to Images

5.1.7 Pass-through

None.

5.1.8 System

GE Vernova Internal Reference #	Description
E-03935 R-01264	Added support for Hot-Hot/Hybrid redundancy in G500.
E-04170 E-04283	Implemented DI indications when configuration was accessed, or configuration changed in G500.
E-04000	Changed the name of the network interface/port from Maintenance IP to Adapter IP.
E-04322	Upgrade G500 to Edge OS 2.6.0.
E-04527	Implemented G500 front panel LED1 and LED2 status colors to represent the different redundancy/system states.
B-15418	Added support for resetting the user accounts of Predix Edge Technician Console (PETC) to recover access to the PETC after user lost/forgot the PETC Login credentials.

5.1.9 Documentation

GE Vernova Internal Reference #	Description
B-15403	Created a new instruction manual 994-0169 for Rear Serial Termination Assembly Panel.

5.1.10 Hardware

None.

5.2 Fixed defects

This version of G500 has the fixes for the following defects compared to V2.50:

5.2.1 Cyber Security

Please refer to Product & Cyber Security Advisories on the GE Vernova Grid Solutions web site.

5.2.2 Clients

GE Vernova Internal Reference #	Description
D-12835	Fixed the issue of SEL Binary Client could not process the interleaved responses when unsolicited and poll messages came simultaneously from SEL relays.
D-12986	Fixed the issue of wrong state description for "Enable test Flag in Controls" Digital Output pseudo point in IEC61850 client.
B-15424	Fixed the issue of removing the non-ascii/invalid characters from the point references of SEL auto-discovery files.
B-14232	Fixed the issue of SNMP Client could not communicate with Kyland SICOM3024P switch.
D-11870	Fixed the issue of SNMP client was not communicating with Power Supervisory Module Device - Enatel Power SM34.
D-13079	Fixed the issue of DO command status takes time sometimes to update the Real Time Database (RTDB).
R-01388 D-12308	Fixed the issue in G500 Modbus Serial Client did not receive the response from IED for AO and DO commands.

5.2.3 Server

GE Vernova Internal Reference #	Description
D-12965	Fixed the issue of Modbus Server reports parity errors while communicating with the Modbus Master through the serial expansion card ports.
D-12568	Fixed the issue of MODBUS Serial Server responding to invalid requests from the Modbus Master.

5.2.4 Automation

GE Vernova Internal Reference #	Description
D-05462 D-12666	Load Shedding: Fixed the issue of persistency of zone assignments across power restarts when user sets the zones through Analog Setpoint commands.
DCSSUP-19948, D-11999	Fixed the issue of initial value for variables configured in LogicLinx wizard did not work at runtime (starts at 0 always).
D-13014	Fixed the issue of Logiclinx Operate block cannot perform transient controls on D.20 DO points.
D-12972	Fixed the issue of DI self-triggered Calculator DTA timer expressions stopped updating if manual force was applied and removed later.
D-12662	Fixed the issue of file retrieval from SEL Binary /SEL ASCII relays was failed when they were configured with virtual serial port.

5.2.5 Configuration/Settings

GE Vernova Internal Reference #	Description
D-10825	Fixed the issue of Online Editor / SNMP Agent Browser was not able to retrieve OID data if the reading of the data from target device took more than 60 seconds.
DCSSUP-19634 / D-11665	Fixed the issue where LDAP client does not support "-" (hyphen) character in the DN name in LDAP Settings.
DCSSUP-21099, GS-02579781	Fixed the issue of configuration sync to G500 not working if LDAP Remote Authentication is configured.

5.2.6 HMI

GE Vernova Internal Reference #	Description
D-10229	Fixed the issue of Gateway A /B designation was missing from local HMI banner sometimes.

5.2.7 Pass-through

None.

5.2.8 System

GE Vernova Internal Reference #	Description
D-10781	Fixed the issue in redundant G500 that if both units were (re)started at same time, the DI indications for code and config out of sync were incorrect.
E-03919	Fixed the issue of "StandbyGatewayUnavailable" pseudo DI point to reset to zero after the standby G500 completed its initialization instead of fixed timeout of 3 minutes in Hot Standby and Hot-Hot Redundancy modes.
D-13030	Fixed the issues of applications were not initialized properly sometimes after reboot of G500.
D-08036	Fixed issue of error messages was displayed on the console during boot up of G500.
D-11689 B-14315	Fixed the issue of incorrect behavior in control lockout i.e., When IED DO point was mapped to both Local and Remote Group with Manual Ownership, the priority should be given to the Remote Groups first and then to Local Control Groups.
D-12039	Fixed the issue that after clearing logs from either mcpcfg, or sudo mcpcfg, or Settings GUI – the G500 must be rebooted to re-initialize the HMI server.
D-11904	Fixed the issue of soft reboot command failed in rare occasions.
D-12892 D-12924	Fixed the issue of G500 was not communicating correctly in Redundant LAN mode.

5.2.9 Documentation

GE Vernova Internal Reference #	Description
D-12199	Corrected the discrepancies about the point descriptions of Modbus Server in the Software Configuration Manual.

5.2.10 Hardware

None.

5.3 Known Issues

This G500 version has the following known issues:

5.3.1 Cyber Security

Please refer to Product & Cyber Security Advisories on the GE Vernova Grid Solutions web site.

5.3.2 Clients

GE Vernova Internal Reference #	Description
B-13475 D-09915	SEL Binary Client doesn't support Double Precision Scaling Factors.
D-05002	ARRM file retrieval from SEL 1xx/2xx relays (using GENASCII) is not possible.
D-12900	Alarm inhibit tag & Scan inhibit tags on DI point of D20 peripheral (S-card) is getting removed after failover in redundancy.
D-12834	Modbus Client could not process PRF events comes from SR 369 relay.
D-11261	IEC 61850 DCA transactions with IED are failing (reducing the efficiency) sometimes while issuing controls from LogicLinx DTA.
D-13075	D20A card in bad state can cause false behavior/functionality when it is configured in warm or hot-hot redundancy.
R-01498, GS- 02706688, DCSSUP- 21882	G500 is not communicating with Modbus IED devices if the least significant group of the IP address has 3 digits.

5.3.3 Servers

GE Vernova Internal Reference #	Description
D-12889	DNP DPA/Server takes high CPU if more than 5000 Analog Inputs are configured in Unbuffered mode.

GE Vernova Internal Reference #	Description
B-11967	No support for events in NVRAM in IEC101/104 Server. Events that have not been yet transmitted to Master (Clients) are lost if G500 is power cycled / restarted. However – the integrity polls will continue to provide accurate database representation.
B-11968	No support for events in NVRAM in DNP3 Server. Events that have not been yet transmitted to Master (Clients) are lost if G500 is power cycled / restarted. However – the integrity polls will continue to provide accurate database representation.
D-16253	Modbus Server writes the configured Offline Analog Value in both words of a 32 bit register. As long as 0 (zero) is used as configured Offline Analog Value there is no impact.

5.3.4 Automation

GE Vernova Internal Reference #	Description
D-05033	Suppressed quality through Input Point Suppression (IPS) application is not reported to Masters. DNP3 and IEC 101-104 Servers send Online Quality rather than the substituted/last reported quality when points are suppressed.
B-11969	DEM is responsible for handling alarms. Events/Alarms that have not been yet committed to the SQL database are lost if G500 is power cycled / restarted. However – the integrity polls will continue to provide accurate database representation.
DCSSUP-19948, D-12000	Restore the last value for variables configured in LogicLinx wizard does not work at runtime (starts at 0 always).
R-01422, DCSSUP-20715	Automatic Record Retrieval Manager (ARRM) DTA locks up/failed to retrieve the large size files from UR relay over SFTP.

5.3.5 Configuration/Settings

GE Vernova Internal Reference #	Description
D-10343	Sync Manager Settings are not retained during upgrade from V1.0 to V1.1. User needs to re-enter these manually. Will not fix.
D-10345	mcpcfg settings must be reconfigured after upgrading G500 from 1.0 to 1.1. Will not fix.
D-10502	NOT A DEFECT. If client applications are configured in non-redundant mode and later the device properties are switched to a redundant mode where some applications are not enabled - their respective points are still available to be mapped, but at runtime will be offline. This is to retain the mappings in case the user decides to switch later back to single mode and the client applications are active again, as previously configured.

GE Vernova Internal Reference #	Description
D-10388	TACACS+ remote authentication can be enabled and activated even if the TACACS+ Server is not available in that moment. This will conduct to a device that can only be accessed using Emergency Access process, if TACACS+ server is not available.
D-06168	FPGA needs to be restarted via Power Cycle for PTP/IRIGB configuration change. No functional impact. PTP/IRIG-B configuration will not be applied without reboot of G500.
D-11620	Abruptly disconnecting a session of mcpcfg locks it out the user till the completion of inactivity timeout duration.
D-12969	Adaptor IP is not getting removed completely for Net-1 interface in G500 after doing 'Remove Configuration and Reboot' from Settings GUI.
D-13028	Add more protection for memory leaks in Apache webserver settings.
D-13084	Need to remove unwanted text message displayed on the console when user tries to open mcpcfg/Settings GUI simultaneously in a particular scenario.
D-13088	Sometimes incorrect time zone is coming in the command prompt/shell, mcpcfg and settings GUI when IRIG-B/B006 is configured as time sync source from settings GUI. Note: Time zone is displaying correctly in Remote and Local HMI.
B-15613	The configuration through Bulk Editor is not supported for G500 after v2.10.
N/A	If filenames with characters other than ASCII are present in the MCP file system - the MCP device and associated configuration tools will not work correctly. Keep only ASCII characters in the filenames for Client Maps, Server Maps, OneLine .dra, OneLine Images, and other user files.

5.3.6 HMI

GE Vernova Internal Reference #	Description
D-12981	Issues in Runtime HMI if 8 Active Alarm Viewers are opened during performance characterization of G500.

5.3.7 Pass-through

GE Vernova Internal Reference #	Description
D-12990	In LDAP authentication, after passthrough connection is timed out, auto logout event is not generated into user activity log by IEC 103 Client.

5.3.8 System

GE Vernova Internal Reference #	Description
E-04130	The USB FLASH drive used for the Firmware Upgrade must be FAT32 format. As a result of this, only USB FLASH drives of maximum 32 GB can be used. The minimum size, imposed by storage requirements, is 8 GB.
E-03041 D-10346	Input time source selection (PTP / IRIG-B / NTP) does not support dynamic failover between time sources at runtime. Only the configured time source is active at a time.

GE Vernova Internal Reference #	Description
D-10227	Email does not send messages when an alarm is activated.
D-05714	Update of only Edge OS is not supported. If only Edge OS updates are required, the complete G500 firmware image needs to be updated.
D-06167	Full support for latest PTP power profiles: • IEEE C37.238-2017 • IEC61850-9-3 Ed.1 2016 Enhancement: G500 supports the following PTP profiles: • IEEE 1588-2008 J4 Peer-to-Peer Profile • IEEE C37.238-2011 Power System Profile (but this has been withdrawn) Limited IEC61850-9-3 Ed.1 2016 Power Utility Automation Profile.
D-12984	Daisy chained secondary monitor shows always duplicate monitor, but it does not show the extended desktop.
D-13083	Add support for progress bar to be displayed during "Applying update" procedure through Predix Edge Technician Console (PETC).
D-13039	When both G500's are power cycled at the same time and if switch panel configured as a master, then one of the G500 can go to the failed state. Note: If switch panel is configured as Master and one of the G500 is power cycled with a delay then this issue will not be observed.
GS-02709884 / D-13470	Sometimes UTC time zone is getting overwritten by different time zone and resulting SOE timestamps have wrong time zone Workaround: Configure GMT instead of UTC in DNP3 client and server configurations both in serial and ethernet modes.

5.3.9 Documentation

None.

5.3.10 Hardware

GE Vernova Internal Reference #	Description
D-06165	No functional impact. SFP Hot Plug in / Plug out detection. Points that represent the status of SFP IN/OUT will not be reflected until G500 is rebooted.

Capability and Capacity

This G500 version supports the following limits.

The maximum number of IEDs or Masters is total across all Connections.

The maximum size of the system is given by whichever limit comes first (groups vs members, number of Connections vs IEDs, number of Master instances vs LRUs in the Master etc.). User is responsible to ensure resource usage limits are not exceeded at runtime.

The 4 cores system has a maximum of 500 IEDs, 200k points and 8 Masters (LRUs).

The 2 cores system has a maximum of 250 IEDs, 100k points and 8 Masters (LRUs) unless otherwise restricted by system loading.

Below are the limits for the Maximum number of Remote HMI sessions that can be connected simultaneously:

Application	G500 4-core	G500 2-core
Remote HMI	8	4

Note: The Local HMI session and Online Editor session coming from DS Agile MCP Studio are not counted in the above-mentioned limits.

5.4 Application Limits

This G500 version supports the following application limits.

Application	Feature	Configuration Limits
Digital Event Manager	Alarms	
	Max Number of Alarm Groups	256
	Max number of members in an Alarm Group	1000
Calculator	Expression Type:	
	Evaluations	10000
	Timers	1000
	Analog Assignments	2000
	Digital Assignments	10000
	Quality Conversions	1000
	Type Conversions	1000
	Averages	1000
	Output to Input Conversions	1000
Load Shed DTA	Number of Feeders and Zones	
	Max Zones	50
	Max Feeders	100
Analog Reports DTA	Max Analog Reports	256
System Point Manager	Accumulator Freeze	250
	Analog Value Selection	250
	Control Lockout	

Application	Feature	Configuration Limits
	Remote Groups	8
	Local Groups	10000
	Double Points	1000
	Input Point Suppression	10000
	Control in Progress	256
	Redundant I/O	10000
Analog Data Logger	Continuous Reports	1000
	Periodic Reports	1000
	Out of Range Reports	1000
VPN Server	Number of VPN Clients	8
	Number of VPN Server Instances	1
SCADA – No. of Client or Server connections (Serial/Network/D.20)	Serial IED Connections	
	(Note: Total number of connections are limited by maximum number of physical and virtual serial ports)	
	DNP Multidrop	80
	DNP Multidrop (Modem)	80
	Generic ASCII	80
	SEL Binary IED	80
	IEC 60870-5-101 Multidrop	80
	IEC 60870-5-103 Multidrop	80
	Modbus Multidrop	80
	D.20	1
	Network IED Connections	
	DNP3 TCP	50
	Modbus TCP/Modbus TCP-SSH	50
	IEC 60870-5 104	50
	IEC 61850	Calculated by Loader based on system size
	SNMP	1
	Serial Master Connections	
	DNP3 Serial Master	8
	IEC 60870-5-101 Master	8
	Modbus Serial Master	8
	Network Master Connections	
	DNP3 Network Master	8
	IEC 60870-5-104 Master	8
	Modbus Network Master	8

Application	Feature	Configuration Limits
SCADA - No. of IEDs or Master station LRUs in each connection	Serial /Network IEDs	
	IEC 60870-5-103 Multidrop	255
	DNP3 Multidrop/Network	10
	Modbus Multidrop/TCP	20
	IEC 60870-5 101 Multidrop	1000
	IEC 60870-5 104	10
	SNMP Client	100
	GenASCII Client	120
	IEC 61850 Client	Calculated by Loader based on system size (maximum 500 in total)
	SEL Binary Client	1
	D.20 Client	120
	Serial/Network Masters	
	DNP3 Serial Master	8
	Modbus Serial Master	8
	IEC 60870-1 101 Master	8
	DNP3 TCP Master	1
	Modbus TCP Master	1
	IEC 60870-1 104 Master	1
SCADA - No. of points configured in each IED/Peripheral mapfile	DNP3 Multi-Drop/Network IEDs	Limited by protocol
	Modbus Multi-Drop/Network IEDs	Limited by protocol
	GenASCII IED	1000
	SNMP IED	1000
	IEC60870-1 103 Multi-Drop	Limited by protocol
	IEC60870-1 101/104 Multi-Drop	
	• Bitstream	Limited by protocol
	• Double Command	Limited by protocol
	• Integrate Total	Limited by protocol
	• Measurand	Limited by protocol
	• Packed Single Point	Limited by protocol
	• Regulating Step Command	Limited by protocol
	• Set Point Command	Limited by protocol
	• Single Point	Limited by protocol
	• Step Position	Limited by protocol
	SEL Binary IED	
	• Fast Meter Analog Input	Limited by IED

Application	Feature		Configuration Limits
	• Demand Analog Input		Limited by IED
	• Peak Demand Analog Input		Limited by IED
	• SER Digital Input		Limited by IED
	D.20 Peripheral Client		
	D.20 S Card		64 Digital Inputs, or 32 Double Point Inputs, or 64 Transition Counters, or 32 Form C Counters
	D.20 A Card		32 Analog Inputs
	D.20 K Card		32 Digital Outputs
	D.20 C Card	C0	16 Digital Inputs 8 Digital Outputs
		C1	16 Digital Inputs 8 Digital Outputs 16 Analog Inputs
		C2	16 Digital Inputs 8 Digital Outputs 8 Analog Inputs 8 Analog Outputs
SCADA - No. of points mapped into server mapfile	DNP3 Serial/TCP Master		DI-10000 AI-15000 DO-5000 AO-5000 ACC-3000
	Modbus Serial/TCP Master		DI-10000 AI-15000 DO-5000 AO-5000 ACC-3000
	IEC 60870-1 101/104 Master		DI-10000 AI-15000 DO-5000 AO-5000 ACC-3000

5.5 Performance Test Levels

This G500 version meets the following performance test levels.

- G500 Hardware under test: 4 core CPU / 16 GB RAM variant.
- In the following table(s), numbers inside the brackets are for the G500 variant with 2 core CPU / 8 GB RAM, if the loading levels are smaller, then the total number of IEDs and RTDB points can increase but no more than specified limits under Capability and Capacity section above.

Requirement	Steady State Loading	Avalanche Loading
Loading Signal changes (continuously /sec)	AI-5,000 (1,200) DI-100 (50)	DI-63,000 (18,900) AI-113,000 (33,600)
Number of connected IEDs to G500	500 (150)	500 (150)
G500 total RTDB Point count	200,000 (60,000)	200,000 (60,000)
Points / IED DI & AI	400 150x DI and 250x AI per IED	400 150x DI and 250x AI per IED
Each G500 Server has points	4 core: DI = 9375 i.e., = $150 \times 500 / 8$ AI = 15625 i.e., = $250 \times 500 / 8$ 2 core: DI = 5625 i.e., = $150 \times 150 / 4$ AI = 9375 i.e., = $250 \times 150 / 4$	4 core: DI = 9375 i.e., = $150 \times 500 / 8$ AI = 15625 i.e., = $250 \times 500 / 8$ 2 core: DI = 5625 i.e., = $150 \times 150 / 4$ AI = 9375 i.e., = $250 \times 150 / 4$
Remote G500 HMI connections	3 Simultaneous connections	3 Simultaneous connections
Local G500 HMI connections	1 connection (multiple displays)	1 connection (multiple displays)
Datalogger - Periodic reports/sec	4 core: 1000 AI mapped	4 core: 1000 AI mapped
ARRM	Maximum 240 file sets across all IEDs	Maximum 240 file sets across all IEDs
Alarms	100 (50) /sec	100 (50) /sec

5.6 Standalone (non-redundant)

The performance capabilities of Standalone are same as that of Hot-Hot redundancy mode in this version of G500.

5.7 Warm Standby Redundancy

The performance capabilities of Warm Standby Redundancy are same as that of Hot-Hot redundancy mode in this version of G500.

5.8 Hot Standby Redundancy

The performance capabilities of Hot Standby Redundancy (for the supported applications) are same as that of Hot-Hot redundancy mode in this version of G500.

5.9 Hot-Hot Redundancy

This G500 version provides the following performance capabilities in Hot-Hot/Hybrid redundancy mode.

5.9.1 Performance Test Results

The performance of G500 is tested using the activity levels and disturbance scenarios presented next.

The master station response times are defined in Table 5.1: Hot-Hot Performance Test Results.

Table 5.1: Hot-Hot Performance Test Results

Activity	DNP (4 Core)	DNP (2 Core)	DNP + D.20	IEC 61850	Multi-Protocol
Hardware (CPU / RAM)	4 core / 16 GB	2 core / 8 GB	4 core / 16 GB	4 core / 16 GB	4 core / 16 GB
Loading Condition	Steady state	Steady state	Steady state	Steady state	Steady state
Protocol – Client /Server	DNP / DNP	DNP / DNP	DNP + D2.0/DNP	IEC 61850+DNP/ DNP	IEC 104 + MODBUS + DNP + IEC 101 + SEL Binary/ IEC 104
RTDB Point count	200,000	60,000	200,000	200,000	200,000
Total RCB configured	NA	NA	NA	250	NA
DI & AI Simulation /sec (Steady Load, not with large occasional peaks and then averaged)	100 DI/Sec, 5000 AI/Sec	48 DI/Sec, 1200 AI/Sec	100 DI/Sec, 5000 AI/Sec	100 DI/Sec, 5000 AI/Sec	103 DI/Sec, 5000 AI/Sec
Number of IEDs	400-Hot-Hot, 100-Hot Standby	140 -Hot-Hot, 10-Hot Standby	101 x D.20 peripherals + 400 DNP IEDs	500	500
Points / IED (AI + DI + AO + DO)	[AI-225, DI-125, DO-20,	[AI-225, DI-125, DO-20,	DNP: [AI-225, DI-125,	[AI-225, DI-125, DO-20,	IEC 104: [AI-160, DI-160,

Activity	DNP (4 Core)	DNP (2 Core)	DNP + D.20	IEC 61850	Multi-Protocol
	AO-20, ACC-10]	AO-20, ACC-10]	DO-20, AO-20, ACC-10]	AO-20, ACC-10]	DO-40, AO-20, ACC-20) MODBUS: [AI-210, DI-150, DO-15, AO-15] DNP: [AI-225, DI-125, DO-20, AO-20, ACC-10] IEC 101: [AI-160, DI-160, DO-40, AO-20, ACC-20) SEL Binary: [AI-75, DI-806, DO-101]
Datalogger reports	100 Periodic reports	No reports	100 Periodic reports	100 Periodic reports	100 Periodic reports
Number of Master connections Point Count / Server	8 DI-7750, AI-13950	4 DI-4625, AI-8325	8 DI-7750, AI-13950	8 DI-7750, AI-13950	8 DI-11160 AI-9920
Remote / Local HMI connections	8 Remote / 1 Local HMI	4 Remote / 0 Local HMI	1 Remote	8 Remote / 1 Local HMI	8 Remote / 1 Local HMI
CPU utilization (%) Min, Max, Median	16, 98, 72.9	54.2, 100, 86.1	71.8, 99.9, 81.4	33, 99.2, 79.4	82.73, 31.90, 100
Average Used Memory (GB) Min, Max, Median	2.83, 3.19, 3.05	1.61, 1.74, 1.68	2.395, 2.646, 2.587	2.56 2.77 2.70	3.45, 4.03, 3.88

Activity	DNP (4 Core)	DNP (2 Core)	DNP + D.20	IEC 61850	Multi-Protocol
Event latency in (msecs) Min, Max, Median	59.4, 2480, 1272.2	35.2, 1760, 556	243, 2431, 720	12.23, 1301.6, 585.3	94, 1215, 204
Control latency in (msecs) Min, Max, Median	21.7, 163, 92	21.9, 542, 282	<1, 426, 9	4.195, 1986.72, 72.02	20, 1204, 63

5.9.2 Redundancy Fail Over Time

This G500 version supports below fail-over times (i.e., when Active G500 is power cycled) in the Hot-Hot/Hybrid Redundancy with the default 300ms heart-beat rate and with default 3 retries.

Table 5.2: Redundancy Fail Over Times

Hot-Hot Redundancy/D.20 Configuration	Maximum Fail-Over Time (msec)
D.20 is not configured	1250
D.20 is configured	1450

5.9.3 HMI Response Times

Under steady state loading conditions, this version of G500 provides the HMI response times listed in the below Table 5.3: User Interface Response Times – Steady State Normal Conditions.

Table 5.3: User Interface Response Times – Steady State Normal Conditions

Activity	Minimum	Maximum	Median
Screen Access (Point Summary)	1.44 s	2.39 s	1.88 s
Screen Access (One-Line Viewer)	NA	NA	NA
System Logs	2.42 s	3.08 s	2.60 s
Alarm ACK Delay (Single Alarm)	400 msec	550 msec	450 msec
Alarm ACK Delay (20,000 Alarms)	< 1 s	< 1 s	< 1 s
DI/AI Update to Point Summary Screen	< 1 s	< 1 s	< 1 s

NOTE: Under heavy loading conditions, the control latency was measured by simulating one control in every 5 seconds continuously from the Master station.

Time Sync Accuracy (PTP/IRIG-B/NTP)

This G500 version supports the time sync accuracy results similar to G500 version 210, see: *Time Sync Accuracy (PTP/IRIG-B/NTP)*.

Application List

This G500 version has the following applications available depending on configured redundancy mode.

Application	Support in Standalone	Support in Hot-Hot/Hybrid	Support in Warm Standby	Support in Hot Standby

6. Version 2.60 (17-December-2021)

Software Versions

The following table defines the software versions required for interaction with the G500.

Package	Version	Notes
G500 Firmware	2.6.90	G500 Firmware Version.
DS Agile MCP Studio	2.6.0	Minimum Supported DS Agile MCP Studio Software.
G500 HMI Viewer	2.6.90	Supported G500 HMI 64-bit Software.
MCP Utilities	1.1.11	Minimum Supported MCP Firmware Upgrade Utilities.

Predix Edge OS and Other Firmware Versions

The following table defines the package/firmware versions supported for Predix Edge Linux OS, FPGA, CPLD, UEFI and BCOM FPGA in the G500 v2.6.90.

Package/Firmware	Version	Notes
Predix Edge OS	2.6.0	Supported GE's Secured Linux Operating System Version.
FPGA	1.03.00	Supported FPGA Version of Multi-Function Controller Platform (MCP).
CPLD	1.2.2	Supported CPLD Version of Multi-Function Controller Platform (MCP).
UEFI	VX5D0007.C01	Supported UEFI Version of Multi-Function Controller Platform (MCP).
BCOM FPGA	2.3.0	Supported COM's Module FPGA Version of Multi-Function Controller Platform (MCP).

Key Functions and Changes

Analog Reports are no longer supported.

6.1 Enhancements

This G500 version adds the following new features compared to previous versions:

6.1.1 Cyber Security

None.

6.1.2 Clients

GE Vernova Internal Reference #	Description
R-01448/ CCR#219884396	Added support for Double Bit Binary in DNP3 Client in G500.
B-15569	Added support in D.20 client for syncing of Transition counters and Form C counters to the standby D.20 client in the hot-hot/hybrid redundancy.

6.1.3 Servers

GE Vernova Internal Reference #	Description
R-01448/ CCR#219884396	Added support for Double Bit Binary in DNP3 Server in G500.
R-01379	Upgraded IEC101-104 Server with the TMW protocol library version (3.29).

6.1.4 Automation

None.

6.1.5 Configuration/Settings

GE Vernova Internal Reference #	Description
B-15555	Added support of single group inherited for both points of a Double Bit Binary Inputs in the DNP3/ IEC101-104/IEC 103 Client Mapfiles.
B-15567	Added support for trimming of point descriptions that were greater than 128 characters in Digital Event Manager/Alarm configurations.
B-15550	Added support for automatic ON point selection in the Double Point DI configuration of DNP3/IEC101-104 Server Map Editor.

6.1.6 HMI

GE Vernova Internal Reference #	Description
R-01463, DCSSUP-21251	Added support for not to display the tooltip message in the One-Line Viewer (OLV) through the configuration option in the One-Line Designer (OLD).

6.1.7 Pass-through

None.

6.1.8 System

None.

6.1.9 Documentation

None.

6.1.10 Hardware

None.

6.2 Fixed defects

This version of G500 has the fixes for the following defects compared to G500 version 250:

6.2.1 Cyber Security

Please refer to Product & Cyber Security Advisories on the GE Vernova Grid Solutions web site.

6.2.2 Clients

None.

6.2.3 Server

GE Vernova Internal Reference #	Description
D-13101	Fixed the issue of RTS pre-amble timeout was not adding to the data link timeout in DNP3 Serial Server.
D-13182	Fixed the issue of IEC101 DPA event time stamp jumped by an hour when short time tag (CP24) was used, and the event timestamp was not within the range of the last clock sync hour.

6.2.4 Automation

GE Vernova Internal Reference #	Description
D-13111	Fixed the issue of Accumulator freeze functionality was not working for the delta-based copy value policy when the same point was mapped to the different groups and different freeze intervals were configured.
D-13123	Fixed the issue of Accumulator freeze functionality was not working for Logiclinx DTA accumulator pseudo points.
D-13124	Fixed the issue of Accumulator freeze functionality was not working for Loadshed DTA accumulator pseudo points.

6.2.5 Configuration/Settings

GE Vernova Internal Reference #	Description
D-13206	Fixed the issue of validation of server certificate was failed while configuring the OpenVPN in G500.

6.2.6 HMI

None.

6.2.7 Pass-through

None.

6.2.8 System

GE Vernova Internal Reference #	Description
R-01459, DCSSUP-21250	Fixed the issue of SOEs were not updating when point description had more than 70 unicode characters.

6.2.9 Documentation

None.

6.2.10 Hardware

None.

6.3 Known Issues

This G500 version has the following known issues:

6.3.1 Cyber Security

Please refer to Product & Cyber Security Advisories on the GE Vernova Grid Solutions web site.

6.3.2 Clients

GE Vernova Internal Reference #	Description
B-13475 D-09915	SEL Binary Client doesn't support Double Precision Scaling Factors.
D-05002	ARRM file retrieval from SEL 1xx/2xx relays (using GENASCII) is not possible.
D-12900	Alarm inhibit tag & Scan inhibit tags on DI point of D20 peripheral (S-card) is getting removed after failover in redundancy.
D-12834	Modbus Client could not process PRF events comes from SR 369 relay.
D-11261	IEC 61850 DCA transactions with IED are failing (reducing the efficiency) sometimes while issuing controls from LogicLinx DTA.
D-13075	D20A card in bad state can cause false behavior/functionality when it is configured in warm or hot-hot redundancy.
D-13214	DNP3 Client doesn't support object types 31 and 33 for Frozen Analog Inputs (all variations).
R-01498, GS- 02706688, DCSSUP- 21882	G500 is not communicating with Modbus IED devices if the least significant group of the IP address has 3 digits.

6.3.3 Servers

GE Vernova Internal Reference #	Description
D-12889	DNP DPA/Server takes high CPU if more than 5000 Analog Inputs are configured in Unbuffered mode.
B-11967	No support for events in NVRAM in IEC101/104 Server. Events that have not been yet transmitted to Master (Clients) are lost if G500 is power cycled / restarted. However – the integrity polls will continue to provide accurate database representation.
B-11968	No support for events in NVRAM in DNP3 Server. Events that have not been yet transmitted to Master (Clients) are lost if G500 is power cycled / restarted. However – the integrity polls will continue to provide accurate database representation.
D-13134/ D-13135	RTS Post-amble time is not added to the data link confirm timeout or application timeout in DNP3 Serial Server.

GE Vernova Internal Reference #	Description
D-12566	IEC101 DPA/Server in unbalanced mode sometimes reports duplicate Digital Input events to the Master if the event happens at exactly the same time as General Interrogation response.
D-16253	Modbus Server writes the configured Offline Analog Value in both words of a 32 bit register. As long as 0 (zero) is used as configured Offline Analog Value there is no impact.

6.3.4 Automation

GE Vernova Internal Reference #	Description
D-05033	Suppressed quality through Input Point Suppression (IPS) application is not reported to Masters. DNP3 and IEC 101-104 Servers send Online Quality rather than the substituted/last reported quality when points are suppressed.
B-11969	DEM is responsible for handling alarms. Events/Alarms that have not been yet committed to the SQL database are lost if G500 is power cycled / restarted. However – the integrity polls will continue to provide accurate database representation.
DCSSUP-19948, D-12000	Restore the last value for variables configured in LogicLinx wizard does not work at runtime (starts at 0 always).
R-01422, DCSSUP-20715	Automatic Record Retrieval Manager (ARRM) DTA locks up/failed to retrieve the large size files from UR relay over SFTP.

6.3.5 Configuration/Settings

GE Vernova Internal Reference #	Description
D-10502	NOT A DEFECT. If client applications are configured in non-redundant mode and later the device properties are switched to a redundant mode where some applications are not enabled - their respective points are still available to be mapped, but at runtime will be offline. This is to retain the mappings in case the user decides to switch later back to single mode and the client applications are active again, as previously configured.
D-10388	TACACS+ remote authentication can be enabled and activated even if the TACACS+ Server is not available in that moment. This will conduct to a device that can only be accessed using Emergency Access process, if TACACS+ server is not available.
D-06168	FPGA needs to be restarted via Power Cycle for PTP/IRIGB configuration change. No functional impact. PTP/IRIG-B configuration will not be applied without reboot of G500.
D-11620	Abruptly disconnecting a session of mcpcfg locks it out the user till the completion of inactivity timeout duration.
D-12969	Adaptor IP is not getting removed completely for Net-1 interface in G500 after doing 'Remove Configuration and Reboot' from Settings GUI.
D-13028	Add more protection for memory leaks in Apache webserver settings.

GE Vernova Internal Reference #	Description
D-13084	Need to remove unwanted text message displayed on the console when user tries to open mcpcfg/Settings GUI simultaneously in a particular scenario.
D-13088	Sometimes incorrect time zone is coming in the command prompt/shell, mcpcfg and settings GUI when IRIG-B/B006 is configured as time sync source from settings GUI. Note: Time zone is displaying correctly in Remote and Local HMI.
B-15613	The configuration through Bulk Editor is not supported for G500 after v2.10.
N/A	If filenames with characters other than ASCII are present in the MCP file system - the MCP device and associated configuration tools will not work correctly. Keep only ASCII characters in the filenames for Client Maps, Server Maps, OneLine .dra, OneLine Images, and other user files.

6.3.6 HMI

GE Vernova Internal Reference #	Description
D-12981	Issues in Runtime HMI if 8 Active Alarm Viewers are opened during performance characterization of G500.
B-15650	The following features of the Analog Report Viewer are not available: • View online reports • Save and view offline reports

6.3.7 Pass-through

GE Vernova Internal Reference #	Description
D-12990	In LDAP authentication, after passthrough connection is timed out, auto logout event is not generated into user activity log by IEC 103 Client.

6.3.8 System

GE Vernova Internal Reference #	Description
E-04130	The USB FLASH drive used for the Firmware Upgrade must be FAT32 format. As a result of this, only USB FLASH drives of maximum 32 GB can be used. The minimum size, imposed by storage requirements, is 8 GB.
E-03041 D-10346	Input time source selection (PTP / IRIG-B / NTP) does not support dynamic failover between time sources at runtime. Only the configured time source is active at a time.
D-10227	Email does not send messages when an alarm is activated.
D-05714	Update of only Edge OS is not supported. If only Edge OS updates are required, the complete G500 firmware image needs to be updated.

GE Vernova Internal Reference #	Description
D-06167	Full support for latest PTP power profiles: • IEEE C37.238-2017 • IEC61850-9-3 Ed.1 2016 Enhancement: G500 supports the following PTP profiles: • IEEE 1588-2008 J4 Peer-to-Peer Profile • IEEE C37.238-2011 Power System Profile (but this has been withdrawn) Limited IEC61850-9-3 Ed.1 2016 Power Utility Automation Profile.
D-12984	Daisy chained secondary monitor shows always duplicate monitor, but it does not show the extended desktop.
D-13083	Add support for progress bar to be displayed during "Applying update" procedure through Predix Edge Technician Console (PETC).
D-13039	When both G500's are power cycled at the same time and if switch panel configured as a master, then one of the G500 can go to the failed state. Note: If switch panel is configured as Master and one of the G500 is power cycled with a delay then this issue will not be observed.
GS-02709884 / D-13470	Sometimes UTC time zone is getting overwritten by different time zone and resulting SOE timestamps have wrong time zone. Workaround: Configure GMT instead of UTC in DNP3 client and server configurations both in serial and ethernet modes.

6.3.9 Documentation

None.

6.3.10 Hardware

GE Vernova Internal Reference #	Description
D-06165	No functional impact. SFP Hot Plug in / Plug out detection. Points that represent the status of SFP IN/OUT will not be reflected until G500 is rebooted.

Capability and Capacity

This G500 version supports the limits similar to G500 version 250, except Analog Reports HMI Viewer is no longer supported.

6.4 Application Limits

The application limits of this G500 version in Standalone are similar to G500 version 250.

6.5 Performance Test Levels

The performance test levels of this G500 version in Standalone are similar to G500 version 250.

6.6 Standalone (non-redundant)

The performance capabilities of this G500 version in Standalone are similar to G500 version 250.

6.7 Warm Standby Redundancy

The performance capabilities of this G500 version in Warm Standby Redundancy are similar to G500 version 250.

6.8 Hot Standby Redundancy

The performance capabilities of this G500 version in Hot Standby Redundancy are similar to G500 version 250.

6.9 Hot-Hot Redundancy

The performance capabilities of this G500 version in Hot-Hot Redundancy are similar to G500 version 250.

6.9.1 Performance Test Results

The performance test results of this G500 version are similar to G500 version 250.

6.9.2 Redundancy Fail Over Time

This G500 version supports the Redundancy fail over times similar to G500 version 250.

6.9.3 HMI Response Times

This G500 version supports the Runtime HMI response times similar to G500 version 250.

Time Sync Accuracy (PTP/IRIG-B/NTP)

This G500 version supports the time sync accuracy results similar to G500 version 210, see: *Time Sync Accuracy (PTP/IRIG-B/NTP)*.

Application List

This G500 version has the following applications available depending on configured redundancy mode.

Application	Support in Standalone	Support in Hot-Hot/Hybrid	Support in Warm Standby	Support in Hot Standby

7. Version 2.70 (04-March-2022) - Projects Only

Software Versions

The following table defines the software versions required for interaction with the G500.

Package	Version	Notes
G500 Firmware	2.7.69	G500 Firmware Version.
DS Agile MCP Studio	2.7.0	Minimum Supported DS Agile MCP Studio Software.
G500 HMI Viewer	2.7.69	Supported G500 HMI 64-bit Software.
MCP Utilities	1.1.12	Minimum Supported MCP Firmware Upgrade Utilities.

Predix Edge OS and Other Firmware Versions

The following table defines the package/firmware versions supported for Predix Edge Linux OS, FPGA, CPLD, UEFI and BCOM FPGA in the G500 v2.7.69.

Package/Firmware	Version	Notes
Predix Edge OS	2.6.0	Supported GE's Secured Linux Operating System Version.
FPGA	1.03.00	Supported FPGA Version of Multi-Function Controller Platform (MCP).
CPLD	1.2.2	Supported CPLD Version of Multi-Function Controller Platform (MCP).
UEFI	VX5D0007.C01	Supported UEFI Version of Multi-Function Controller Platform (MCP).
BCOM FPGA	2.3.0	Supported COM's Module FPGA Version of Multi-Function Controller Platform (MCP).

Key Functions and Changes

7.1 Enhancements

G500 version 2.70 is **Projects targeted**, which adds IEC 61850 Server as **Special Order**.

All other features are identical as G500 v2.60.

7.1.1 Cyber Security

Please refer to Product & Cyber Security Advisories on the GE Vernova Grid Solutions web site.

7.1.2 Clients

None.

7.1.3 Servers

GE Vernova Internal Reference #	Description
E-04668	Added support for IEC 61850 Ed.2 MMS Server with Agency as micro-service and enabled with a specific license option.

7.1.4 Automation

None.

7.1.5 Configuration/Settings

GE Vernova Internal Reference #	Description
E-04757	Added support for creation of IEC 61850 “cid” and server mapfiles using a custom “cid” creation tool to be delivered upon request to Projects teams.
E-03009	Added support for configurable decimal points for Analog Input displayed values in MCP One Line Designer screens (OLD).

7.1.6 HMI

None.

7.1.7 Pass-through

None.

7.1.8 System

None.

7.1.9 Documentation

GE Vernova Internal Reference #	Description
E-04720	Created “SWM0124 IEC 61850 Server User Guide V100 R0” for configuring the IEC 61850 Ed2 server.
B-15832	Updated document [994-0152] G500 Substation Gateway Instruction Manual with Ordering Codes for IEC 61850 Server (Projects only).

7.1.10 Hardware

None.

7.2 Fixed defects

This version of G500 has the fixes for the following defects compared to G500 version 260:

7.2.1 Cyber Security

Please refer to Product & Cyber Security Advisories on the GE Vernova Grid Solutions web site.

7.2.2 Clients

None.

7.2.3 Server

None.

7.2.4 Automation

None.

7.2.5 Configuration/Settings

None.

7.2.6 HMI

None.

7.2.7 Pass-through

None.

7.2.8 System

GE Vernova Internal Reference #	Description
B-15994	Increased the default value of maximum RTDB initialization/startup time to 540 secs to start the communication with the IEDs and Masters with larger system configurations.

7.2.9 Documentation

GE Vernova Internal Reference #	Description
B-15990/ B-15989	Updated document [994-0152] G500 Substation Gateway Instruction Manual for D.20 fuse rating to 2.5 A and added clarification about IRIG-B Input Invalid signal.

7.2.10 Hardware

None.

7.3 Known Issues

This G500 version has the following known issues:

7.3.1 Cyber Security

Please refer to Product & Cyber Security Advisories on the GE Vernova Grid Solutions web site.

7.3.2 Clients

GE Vernova Internal Reference #	Description
B-13475 D-09915	SEL Binary Client doesn't support Double Precision Scaling Factors.
D-05002	ARRM file retrieval from SEL 1xx/2xx relays (using GENASCII) is not possible.
D-12900	Alarm inhibit tag & Scan inhibit tags on DI point of D20 peripheral (S-card) is getting removed after failover in redundancy.
D-12834	Modbus Client could not process PRF events comes from SR 369 relay.
D-11261	IEC 61850 DCA transactions with IED are failing (reducing the efficiency) sometimes while issuing controls from LogicLinx DTA.
D-13075	D20A card in bad state can cause false behavior/functionality when it is configured in warm or hot-hot redundancy.
D-13214	DNP3 Client doesn't support object types 31 and 33 for Frozen Analog Inputs (all variations).
D-13357	IEC 101 client ignores the Double Bit and Measurand objects when the IED sends unrequested events (i.e., events with invalid/bad object addresses) during the General or Group Interrogation period. Workaround: Ensure the configuration parameter "ignoreUnrequestedGIData" in the IEC 101 Application parameter settings to "Disabled".
R-01498, GS-02706688, DCSSUP-21882	G500 is not communicating with Modbus IED devices if the least significant group of the IP address has 3 digits.

7.3.3 Servers

GE Vernova Internal Reference #	Description
D-12889	DNP DPA/Server takes high CPU if more than 5000 Analog Inputs are configured in Unbuffered mode.
B-11967	No support for events in NVRAM in IEC101/104 Server. Events that have not been yet transmitted to Master (Clients) are lost if G500 is power cycled / restarted. However – the integrity polls will continue to provide accurate database representation.
B-11968	No support for events in NVRAM in DNP3 Server. Events that have not been yet transmitted to Master (Clients) are lost if G500 is power cycled / restarted. However – the integrity polls will continue to provide accurate database representation.
D-13134/ D-13135	RTS Post-amble time is not added to the data link confirm timeout or application timeout in DNP3 Serial Server.
D-12566	IEC101 DPA/Server in unbalanced mode sometimes reports duplicate Digital Input events to the Master if the event happens at exactly the same time as General Interrogation response.
D-13332	Text points values (e.g., Bay ID, Device ID, Line ID, PRF TEXT etc.) are not updating from IEC 61850 server to the master properly.
D-13363	IEC 61850 Server is out of sync with the IED data when the system wide setting parameter “ Event Queue Full Action ” is configured as "LoseNewestEvents". Workaround: Ensure “ Event Queue Full Action ” is configured as "DoNotLoseEvents" always.
D-13359	IEC 61850 Server is not updating qualities of the GenASCII IED pseudo DI points to the master properly.
D-16253	Modbus Server writes the configured Offline Analog Value in both words of a 32 bit register. As long as 0 (zero) is used as configured Offline Analog Value there is no impact.

7.3.4 Automation

GE Vernova Internal Reference #	Description
D-05033	Suppressed quality through Input Point Suppression (IPS) application is not reported to Masters. DNP3 and IEC 101-104 Servers send Online Quality rather than the substituted/last reported quality when points are suppressed.
B-11969	DEM is responsible for handling alarms. Events/Alarms that have not been yet committed to the SQL database are lost if G500 is power cycled / restarted. However – the integrity polls will continue to provide accurate database representation.
DCSSUP-19948, D-12000	Restore the last value for variables configured in LogicLinx wizard does not work at runtime (starts at 0 always).

GE Vernova Internal Reference #	Description
R-01422, DCSSUP-20715	Automatic Record Retrieval Manager (ARRM) DTA locks up/failed to retrieve the large size files from UR relay over SFTP.

7.3.5 Configuration/Settings

GE Vernova Internal Reference #	Description
D-10502	NOT A DEFECT. If client applications are configured in non-redundant mode and later the device properties are switched to a redundant mode where some applications are not enabled - their respective points are still available to be mapped, but at runtime will be offline. This is to retain the mappings in case the user decides to switch later back to single mode and the client applications are active again, as previously configured.
D-10388	TACACS+ remote authentication can be enabled and activated even if the TACACS+ Server is not available in that moment. This will conduct to a device that can only be accessed using Emergency Access process, if TACACS+ server is not available.
D-06168	FPGA needs to be restarted via Power Cycle for PTP/IRIGB configuration change. No functional impact. PTP/IRIG-B configuration will not be applied without reboot of G500.
D-11620	Abruptly disconnecting a session of mpcfg locks it out the user till the completion of inactivity timeout duration.
D-12969	Adaptor IP is not getting removed completely for Net-1 interface in G500 after doing 'Remove Configuration and Reboot' from Settings GUI.
D-13028	Add more protection for memory leaks in Apache webserver settings.
D-13084	Need to remove unwanted text message displayed on the console when user tries to open mpcfg/Settings GUI simultaneously in a particular scenario.
D-13088	Sometimes incorrect time zone is coming in the command prompt/shell, mpcfg and settings GUI when IRIG-B/B006 is configured as time sync source from settings GUI. Note: Time zone is displaying correctly in Remote and Local HMI.
B-15613	The configuration through Bulk Editor is not supported for G500 after v2.10.
N/A	If filenames with characters other than ASCII are present in the MCP file system - the MCP device and associated configuration tools will not work correctly. Keep only ASCII characters in the filenames for Client Maps, Server Maps, OneLine .dra, OneLine Images, and other user files.

7.3.6 HMI

GE Vernova Internal Reference #	Description
D-12981	Issues in Runtime HMI if 8 Active Alarm Viewers are opened during performance characterization of G500.
B-15650	The following features of the Analog Report Viewer are not available: • View online reports • Save and view offline reports

7.3.7 Pass-through

GE Vernova Internal Reference #	Description
D-12990	In LDAP authentication, after passthrough connection is timed out, auto logout event is not generated into user activity log by IEC 103 Client.

7.3.8 System

GE Vernova Internal Reference #	Description
E-04130	The USB FLASH drive used for the Firmware Upgrade must be FAT32 format. As a result of this, only USB FLASH drives of maximum 32 GB can be used. The minimum size, imposed by storage requirements, is 8 GB.
E-03041 D-10346	Input time source selection (PTP / IRIG-B / NTP) does not support dynamic failover between time sources at runtime. Only the configured time source is active at a time.
D-10227	Email does not send messages when an alarm is activated.
D-05714	Update of only Edge OS is not supported. If only Edge OS updates are required, the complete G500 firmware image needs to be updated.
D-06167	Full support for latest PTP power profiles: • IEEE C37.238-2017 • IEC61850-9-3 Ed.1 2016 Enhancement: G500 supports the following PTP profiles: • IEEE 1588-2008 J4 Peer-to-Peer Profile • IEEE C37.238-2011 Power System Profile (but this has been withdrawn) Limited IEC61850-9-3 Ed.1 2016 Power Utility Automation Profile.
D-12984	Daisy chained secondary monitor shows always duplicate monitor, but it does not show the extended desktop.
D-13083	Add support for progress bar to be displayed during "Applying update" procedure through Predix Edge Technician Console (PETC).
D-13039	When both G500's are power cycled at the same time and if switch panel configured as a master, then one of the G500 can go to the failed state. Note: If switch panel is configured as Master and one of the G500 is power cycled with a delay then this issue will not be observed.
D-13365	Config Sync fails the standby G500 if switch panel is wrongly wired, and switch-panel mode is configured as "slave" in the redundancy configuration.
GS-02709884 / D-13470	Sometimes UTC time zone is getting overwritten by different time zone and resulting SOE timestamps have wrong time zone. Workaround: Configure GMT instead of UTC in DNP3 client and server configurations both in serial and ethernet modes.

7.3.9 Documentation

None.

7.3.10 Hardware

GE Vernova Internal Reference #	Description
D-06165	No functional impact. SFP Hot Plug in / Plug out detection. Points that represent the status of SFP IN/OUT will not be reflected until G500 is rebooted.

Capability and Capacity

This G500 version supports the following limits.

The maximum number of IEDs or Masters is total across all Connections.

The maximum size of the system is given by whichever limit comes first (groups vs members, number of Connections vs IEDs, number of Master instances vs LRUs in the Master etc.). User is responsible to ensure resource usage limits are not exceeded at runtime.

The 4 cores system has a maximum of 500 IEDs, 200k points and 8 Masters (LRUs).

The 2 cores system has a maximum of 250 IEDs, 100k points and 8 Masters (LRUs) unless otherwise restricted by system loading.

Below are the limits for the Maximum number of Remote HMI sessions that can be connected simultaneously:

Application	G500 4-core	G500 2-core
Remote HMI	8	4

Note: The Local HMI session and Online Editor session coming from DS Agile MCP Studio are not counted in the above-mentioned limits.

7.4 Application Limits

This G500 version supports the following application limits.

Application	Feature	Configuration Limits
Digital Event Manager	Alarms	
	Max Number of Alarm Groups	256
	Max number of members in an Alarm Group	1000
Calculator	Expression Type:	
	Evaluations	10000
	Timers	1000
	Analog Assignments	2000
	Digital Assignments	10000
	Quality Conversions	1000
	Type Conversions	1000
	Averages	1000

Application	Feature	Configuration Limits
	Output to Input Conversions	1000
Load Shed DTA	Number of Feeders and Zones	
	Max Zones	50
	Max Feeders	100
Analog Reports DTA	Not available starting with MCP V2.6 and newer.	None
System Point Manager	Accumulator Freeze	250
	Analog Value Selection	250
	Control Lockout	
	• Remote Groups	8
	• Local Groups	10000
	Double Points	1000
	Input Point Suppression	10000
	Control in Progress	256
	Redundant I/O	10000
Analog Data Logger	Continuous Reports	1000
	Periodic Reports	1000
	Out of Range Reports	1000
VPN Server	Number of VPN Clients	8
	Number of VPN Server Instances	1
SCADA – No. of Client or Server connections (Serial/Network/D.20)	Serial IED Connections	
	(Note: Total number of serial connections are limited by maximum number of physical and virtual serial ports)	
	DNP Multidrop	80
	DNP Multidrop (Modem)	80
	Generic ASCII	80
	SEL Binary IED	80
	IEC 60870-5-101 Multidrop	80
	IEC60870-5-103 Multidrop	80
	Modbus Multidrop	80
	D.20	1
	Network IED Connections	
	DNP3 TCP	50
	Modbus TCP/Modbus TCP-SSH	50
	IEC60870-5 104	50
	IEC61850	Calculated by Loader based on system size
	SNMP	1

Application	Feature	Configuration Limits
	Serial Master Connections

7.5 Performance Test Levels

This G500 version meets the following performance test levels.

- G500 Hardware under test: 4 core CPU / 16 GB RAM variant.
- In the following table(s), numbers inside the brackets are for the G500 variant with 2 core CPU / 8 GB RAM, if the loading levels are smaller, then the total number of IEDs and RTDB points can increase but no more than specified limits under the Capability and Capacity section above.

Requirement	Steady State Loading	Avalanche Loading
Loading Signal changes (continuously /sec)	AI-5,000 (1,200) DI-100 (50)	DI-63,000 (18,900) AI-113,000 (33,600)
Number of connected IEDs to G500	500 (150)	500 (150)
G500 total RTDB Point count	200,000 (60,000)	200,000 (60,000)
Points / IED DI & AI	400 150x DI and 250x AI per IED	400 150x DI and 250x AI per IED
Each G500 Server has points	4 core: DI = 9375 i.e., = 150*500 / 8 AI = 15625 i.e., = 250*500 / 8 2 core: DI = 5625 i.e., = 150*150 / 4 AI = 9375 i.e., = 250*150 / 4	4 core: DI = 9375 i.e., = 150*500 / 8 AI = 15625 i.e., = 250*500 / 8 2 core: DI = 5625 i.e., = 150*150 / 4 AI = 9375 i.e., = 250*150 / 4
Remote G500 HMI connections	3 Simultaneous connections	3 Simultaneous connections
Local G500 HMI connections	1 connection (multiple displays)	1 connection (multiple displays)

Requirement	Steady State Loading	Avalanche Loading
Datalogger - Periodic reports/sec	4 core: 1000 AI mapped	4 core: 1000 AI mapped
ARRM	Maximum 240 file sets across all IEDs	Maximum 240 file sets across all IEDs
Alarms	100 (50) /sec	100 (50) /sec

7.6 Standalone (non-redundant)

The performance capabilities of Standalone are same as that of Hot-Hot redundancy mode in this version of G500- with the exception of IEC61850 Server, as shown below.

7.6.1 Performance Test Results

The performance test levels of G500 version with IEC61850 server in the stand-alone mode is tested using the activity levels and disturbance scenarios presented next.

Table 7.1: IEC 61850 Server Standalone Performance Test Results

Activity	IEC 61850 Server (4 Core)	IEC61850 Server (2 Core)
Hardware (CPU / RAM)	4 core / 16 GB	2 core / 8 GB
Loading Condition	Steady state	Steady state
Protocol – Client /Server	DNP / IEC61850	DNP / IEC61850
RTDB Point count	200,000	60,000
Number of IEC61850 Server instances/Logical Remote Units (LRU)	6	2
Simultaneous IEC61850 Client connections for each LRU	1	1
Total number of IEDs in the system & Points per each IED	500 DNP3 IEDs [AI-225, DI-125, DO-20, AO-20, ACC-10]	160 DNP3 IEDs [AI-225, DI-125, DO-20, AO-20, ACC-10]
Total DI & AI simulation/Sec (Steady Load, not with large occasional peaks and then averaged)	5000 – AI/sec 100 – DI/sec	480 – AI/sec 50 – DI/sec
Number of RTDB points mapped to each LRU	25000	25000

Activity	IEC 61850 Server (4 Core)	IEC61850 Server (2 Core)
Total number of Logical Devices (LDs) in the system	2000 (4*500 i.e., 4 LDs for each IED)	640 (4*160 i.e., 4 LDs for each IED)
Datasets configured per each LRU	254 for each LRU	254 for each LRU
RCBs configured per each LRU	159 URCB for each LRU 95 BRCB for each LRU	159 URCB for each LRU 95 BRCB for each LRU
Datalogger reports	75 Periodic reports	48 Periodic Reports
Alarms/sec	100 On update Alarms	48 On update Alarms
Remote / Local HMI connections	4 Remote / 1 Local HMI	1 Remote / 0 Local HMI
CPU utilization (%) Min, Max, Median	77, 100, 88	41, 100, 63
Average Used Memory (GB) Min, Max, Median	5.1962, 5.6131, 5.3079	3.87, 4.16, 3.92
Event latency in (msecs) Min, Max, Median	59.4, 2480, 1272.2	35.2, 1760, 556
Control latency in (msecs) Min, Max, Median	21.7, 163, 92	21.9, 542, 282

7.7 Warm Standby Redundancy

The performance capabilities of Warm Standby Redundancy are same as that of Hot-Hot redundancy mode in this version of G500.

7.8 Hot Standby Redundancy

The performance capabilities of Hot Standby Redundancy are same as that of Hot-Hot redundancy mode in this version of G500.

7.9 Hot-Hot Redundancy

This G500 version provides the following performance capabilities in Hot-Hot/Hybrid redundancy mode.

7.9.1 Performance Test Results

The performance of G500 is tested using the activity levels and disturbance scenarios presented next.

The master station response times are defined in Table 5.1: Hot-Hot Performance Test Results.

Table 7.2: Hot-Hot Performance Test Results

Activity	DNP (4 Core)	DNP (2 Core)	DNP + D.20	IEC 61850	Multi-Protocol
Hardware (CPU / RAM)	4 core / 16 GB	2 core / 8 GB	4 core / 16 GB	4 core / 16 GB	4 core / 16 GB
Loading Condition	Steady state	Steady state	Steady state	Steady state	Steady state
Protocol – Client /Server	DNP / DNP	DNP / DNP	DNP + D2.0/DNP	IEC 61850+DNP/ DNP	IEC 104 + MODBUS + DNP + IEC 101 + SEL Binary/ IEC 104
RTDB Point count	200,000	60,000	200,000	200,000	200,000
Total RCB configured	NA	NA	NA	250	NA
DI & AI Simulation/Sec	100 DI/Sec, 5000 AI/Sec	48 DI/Sec, 1200 AI/Sec	100 DI/Sec, 5000 AI/Sec	100 DI/Sec, 5000 AI/Sec	103 DI/Sec, 5000 AI/Sec
Number of IEDs	400-Hot-Hot, 100-Hot Standby	140 -Hot-Hot, 10-Hot Standby	101 x D.20 peripherals + 400 DNP IEDs	500	500
Points / IED (AI + DI + AO + DO)	[AI-225, DI-125, DO-20, AO-20, ACC-10]	[AI-225, DI-125, DO-20, AO-20, ACC-10]	DNP: [AI-225, DI-125, DO-20, AO-20, ACC-10]	[AI-225, DI-125, DO-20, AO-20, ACC-10]	IEC 104: [AI-160, DI-160, DO-40, AO-20, ACC-20) MODBUS: [AI-210, DI-150, DO-15, AO-15] DNP: [AI-225, DI-125,

Activity	DNP (4 Core)	DNP (2 Core)	DNP + D.20	IEC 61850	Multi-Protocol
					DO-20, AO-20, ACC-10] IEC 101: [AI-160, DI-160, DO-40, AO-20, ACC-20) SEL Binary: [AI-75, DI-806, DO-101]
Datalogger reports	100 Periodic reports	No reports	100 Periodic reports	100 Periodic reports	100 Periodic reports
Number of Master connections Point Count / Server	8 DI-7750, AI-13950	4 DI-4625, AI-8325	8 DI-7750, AI-13950	8 DI-7750, AI-13950	8 DI-11160 AI-9920
Remote / Local HMI connections	8 Remote / 1 Local HMI	4 Remote / 0 Local HMI	1 Remote	8 Remote / 1 Local HMI	8 Remote / 1 Local HMI
CPU utilization (%) Min, Max, Median	16, 98, 72.9	54.2, 100, 86.1	71.8, 99.9, 81.4	33, 99.2, 79.4	82.73, 31.90, 100
Average Used Memory (GB) Min, Max, Median	2.83, 3.19, 3.05	1.61, 1.74, 1.68	2.395, 2.646, 2.587	2.56 2.77 2.70	3.45, 4.03, 3.88
Event latency in (msecs) Min, Max, Median	59.4, 2480, 1272.2	35.2, 1760, 556	243, 2431, 720	12.23, 1301.6, 585.3	94, 1215, 204
Control latency in (msecs) Min, Max, Median	21.7, 163, 92	21.9, 542, 282	<1, 426, 9	4.195, 1986.72, 72.02	20, 1204, 63

7.9.2 Redundancy Fail Over Time

This G500 version supports below fail-over times (i.e., when Active G500 is power cycled) in the Hot-Hot/Hybrid Redundancy with the default 300ms heart-beat rate and with default 3 retries.

Table 7.3: Redundancy Fail Over Times

Hot-Hot Redundancy/D.20 Configuration	Maximum Fail-Over Time (msec)
D.20 is not configured	1250
D.20 is configured	1450

7.9.3 HMI Response Times

Under steady state loading conditions, this version of G500 provides the HMI response times listed in the below Table 7.4: User Interface Response Times – Steady State Normal Conditions.

Table 7.4: User Interface Response Times – Steady State Normal Conditions

Activity	Minimum	Maximum	Median
Screen Access (Point Summary)	1.44 s	2.39 s	1.88 s
Screen Access (One-Line Viewer)	NA	NA	NA
System Logs	2.42 s	3.08 s	2.60 s
Alarm ACK Delay (Single Alarm)	400 msec	550 msec	450 msec
Alarm ACK Delay (20,000 Alarms)	< 1 s	< 1 s	< 1 s
DI/AI Update to Point Summary Screen	< 1 s	< 1 s	< 1 s

NOTE: Under heavy loading conditions, the control latency was measured by simulating one control in every 5 seconds continuously from the Master station.

Time Sync Accuracy (PTP/IRIG-B/NTP)

This G500 version supports the time sync accuracy results similar to G500 version 210, see: *Time Sync Accuracy (PTP/IRIG-B/NTP)*.

Application List

This G500 version has the following applications available depending on configured redundancy mode.

Application	Support in Standalone	Support in Hot-Hot/Hybrid	Support in Warm Standby	Support in Hot Standby
Runtime HMI	✓ Available	✓ Available	✓ Available	✓ Available
One-Line Viewer	✓ Available	✓ Available	✓ Available	✓ Available

8. Version 2.80 (18-July-2022)

Software Versions

The following table defines the software versions required for interaction with the G500.

Package	Version	Notes
G500 Firmware	2.8.189	G500 Firmware Version.
DS Agile MCP Studio	2.8.0	Minimum Supported DS Agile MCP Studio Software.
G500 HMI Viewer	2.8.189	Supported G500 HMI 64-bit Software.
MCP Utilities	1.1.13	Minimum Supported MCP Firmware Upgrade Utilities.
IEC61850 CID Tool	6.0.2	Minimum Supported CID configuration tool for automatically creating IEC 61850 Server map files.

Predix Edge OS and Other Firmware Versions

The following table defines the package/firmware versions supported for Predix Edge Linux OS, FPGA, CPLD, UEFI and BCOM FPGA in the G500 v2.8.189.

Package/Firmware	Version	Notes
Predix Edge OS	2.6.0	Supported GE's Secured Linux Operating System Version.
FPGA	1.03.00	Supported FPGA Version of Multi-Function Controller Platform (MCP).
CPLD	1.2.2	Supported CPLD Version of Multi-Function Controller Platform (MCP).
UEFI	VX5D0007.C01	Supported UEFI Version of Multi-Function Controller Platform (MCP).
BCOM FPGA	2.3.0	Supported COM's Module FPGA Version of Multi-Function Controller Platform (MCP).

Key Functions and Changes

8.1 Enhancements

8.1.1 Cyber Security

Please refer to Product & Cyber Security Advisories on the GE Vernova Grid Solutions web site.

8.1.2 Clients

GE Vernova Internal Reference #	Description
B-16268	Added configuration option for DNP3 class order in DNP3 client application parameters to communicate with custom IEDs e.g., EPM9450 meters.
B-16152, B-16148	Added support for clearing the Frozen values in DNP3 client and D.20 client applications.

8.1.3 Servers

GE Vernova Internal Reference #	Description
E-04671	Added support for Tejas V Server when enabled with D2x Legacy license.
E-04668	Added support for IEC 61850 Ed.2 MMS Server with Agency as micro-service and enabled with IEC 61850 Server license.

8.1.4 Automation

GE Vernova Internal Reference #	Description
E-04670	Added support to enable a pseudo Digital Input point for each accumulator group that will pulse when a freeze operation has been performed on any of the mapped Accumulators in the group.
E-04671	Added support to enable a pseudo Digital Output point for each accumulator group that will freeze the group when a PULSE ON, LATCH ON or CLOSE command is operated on that point.
E-04669	Added support in Accumulator Freeze DTA to support all possible freeze combinations. i.e., timer based freeze, DI trigger based freeze and Group DO based freeze operations.

8.1.5 Configuration/Settings

GE Vernova Internal Reference #	Description
E-04671	Added support for Tejas V Server in DSAS Online and Offline Editor, when enabled with D2x Legacy license.
E-04820	Added support for IEC 61850 Server automatic configuration using the CID Tool as general distribution, when enabled with IEC 61850 Server license.
E-03009	Added support for configurable decimal points for Analog Input displayed values in MCP One Line Designer screens (OLD).

GE Vernova Internal Reference #	Description
E-04234	Added support for sorting in lexicographic order and filter for Line/Bay/Device ID in G500 One Line Designer screens (OLD) Data Source selection.

8.1.6 HMI

None.

8.1.7 Pass-through

None.

8.1.8 System

GE Vernova Internal Reference #	Description
DCSSUP-21532	Adjusted log messages severity to be more appropriate to the message classes.
B-16207	Added support for new operation type “Clear Running and Frozen” for the accumulator freeze and clear commands in G500 control log
B-16206	Added support to append “With_Clear” to the control type for control commands in G500 control log.
R-01519/ E-03688	Added support for Predix Edge Technician Console (PETC) based firmware deployment (without USB) in G500.

8.1.9 Documentation

GE Vernova Internal Reference #	Description
E-04773	Updated document SWM0106 G500 Quick Start Guide to make content consistent with SWM0116 G100 Quick Start Guide.
E-04626	Updated document G500 Instruction Manual (994-0152) with ordering code and licensing options for Tejas V Server and removed Special Order option for the IEC61850 Server.
E-04720	Updated “SWM0124 IEC 61850 Server User Guide” for configuring the IEC 61850 Ed2 server.
B-15927	Updated Software Configuration Guide SWM0101 for Tejas V Server, added informational appendix for Logs in MCP.
E-04631	Updated Secure Deployment Guide SWM0105 to add a note for User Role recommendation for DSAS offline editor, strong security recommendations for the use of SFTP instead of FTP/TFTP and strong physical security recommendations to protect MCP inside a locked cabinet.
E-04730	Updated the list of supported MCP versions in the Analog Reports User Guide (SWM0102)

8.1.10 Hardware

None.

8.2 Fixed defects

This version of G500 has the fixes for the following defects compared to G500 version 270:

8.2.1 Cyber Security

Please refer to Product & Cyber Security Advisories on the GE Vernova Grid Solutions web site.

8.2.2 Clients

GE Vernova Internal Reference #	Description
R-01498, GS-02706688, DCSSUP-21882	Fixed the issue of G500 not communicating with Modbus IED devices if the least significant group of the IP address has 3 digits.
DCSSUP-21911, R-01507	Fixed an issue with time sync in DNP3 client not working with some IEDs.

8.2.3 Server

GE Vernova Internal Reference #	Description
D-13332	Fixed the issue of Text points values (e.g., Bay ID, Device ID, Line ID, PRF TEXT etc.) not updating from IEC 61850 server to the master properly.
D-13363	Fixed the issue of IEC 61850 Server out of sync with the IED data when the system wide setting parameter "Event Queue Full Action" is configured as "LoseNewestEvents" as the default value in "DoNotLoseEvents" always.
D-13359	Fixed the issue of IEC 61850 Server not updating qualities of the GenASCII IED pseudo DI points to the master properly.
DCSSUP-21466, R-01494	Fixed the issue of IEC104 Master not connecting to the G500 after failover in a redundant system.
D-13630	Fixed the issue of IEC 61850 Server restarts during switch/fail-overs in a warm standby redundant system.

8.2.4 Automation

GE Vernova Internal Reference #	Description
R-01422, DCSSUP-20715	Fixed the issue of Automatic Record Retrieval Manager (ARRM) DTA locked up or failed to retrieve the large size files from UR relay over SFTP.
D-13565/ D-13566/ D-13567	Fixed issues in Control Lockout functionality with IEC101 DPA multiple LRUs configurations.

GE Vernova Internal Reference #	Description
D-13517/ D-13530	Fixed issues in Control Lockout functionality with Select Before Operate (SBO) commands from the Masters.

8.2.5 Configuration/Settings

GE Vernova Internal Reference #	Description
D-11620	Fixed the issue of abruptly disconnecting a session of mcpcfg locks out the user until completion of inactivity timeout duration.
DCSSUP-22093/ GS-02741036	Fixed the issue where after synch of configuration from DSAS to G500 - the ConfigSeqNumber gets set to "2" instead of having the value from DSAS.

8.2.6 HMI

GE Vernova Internal Reference #	Description
D-13536	Fixed the issue of G500 runtime HMI showing wrong serial port for IEC 103 Client.
D-13576	Fixed the issue of G500 runtime HMI failed to create the VPN Client configuration file while doing the Save & Commit.
D-13564	Fixed the issue where ARRM Runtime HMI continuously shows connection status as disconnected if the descriptions of the file sets contain Unicode/UTF-8 characters.

8.2.7 Pass-through

None.

8.2.8 System

GE Vernova Internal Reference #	Description
D-13365	Fixed the issue of Config Sync fails the standby G500 if switch panel is wrongly wired, and switch-panel mode is configured as "slave" in the redundancy configuration.

8.2.9 Documentation

None.

8.2.10 Hardware

None.

8.3 Known Issues

This G500 version has the following known issues:

8.3.1 Cyber Security

Please refer to Product & Cyber Security Advisories on the GE Vernova Grid Solutions web site.

8.3.2 Clients

GE Vernova Internal Reference #	Description
B-13475 D-09915	SEL Binary Client doesn't support Double Precision Scaling Factors.
D-05002	ARRM file retrieval from SEL 1xx/2xx relays (using GENASCII) is not possible.
D-12900	Alarm inhibit tag & Scan inhibit tags on DI point of D20 peripheral (S-card) is getting removed after failover in redundancy.
D-12834	Modbus Client could not process PRF events comes from SR 369 relay.
D-11261	IEC 61850 DCA transactions with IED are failing (reducing the efficiency) sometimes while issuing controls from LogicLinx DTA.
D-13075	D20A card in bad state can cause false behavior/functionality when it is configured in warm or hot-hot redundancy.
D-13214	DNP3 Client doesn't support object types 31 and 33 for Frozen Analog Inputs (all variations).
D-13357	IEC 101 client ignores the Double Bit and Measurand objects when the IED sends unrequested events (i.e., events with invalid/bad object addresses) during the General or Group Interrogation period. Workaround: Ensure the configuration parameter "ignoreUnrequestedGIData" in the IEC 101 Application parameter settings to "Disabled".
D-13592	DNP3 client does not support Clear command when Remote Accumulators parameter is set to False.

8.3.3 Servers

GE Vernova Internal Reference #	Description
D-12889	DNP DPA/Server takes high CPU if more than 5000 Analog Inputs are configured in Unbuffered mode.
B-11967	No support for events in NVRAM in IEC101/104 Server. Events that have not been yet transmitted to Master (Clients) are lost if G500 is power cycled / restarted. However – the integrity polls will continue to provide accurate database representation.
B-11968	No support for events in NVRAM in DNP3 Server. Events that have not been yet transmitted to Master (Clients) are lost if G500 is power cycled / restarted. However – the integrity polls will continue to provide accurate database representation.

GE Vernova Internal Reference #	Description
D-13134/ D-13135	RTS Post-amble time is not added to the data link confirm timeout or application timeout in DNP3 Serial Server.
D-12566	IEC101 DPA/Server in unbalanced mode sometimes reports duplicate Digital Input events to the Master if the event happens at the same time as General Interrogation response.
D-16253	Modbus Server writes the configured Offline Analog Value in both words of a 32 bit register. As long as 0 (zero) is used as configured Offline Analog Value there is no impact.

8.3.4 Automation

GE Vernova Internal Reference #	Description
D-05033	Suppressed quality through Input Point Suppression (IPS) application is not reported to Masters. DNP3 and IEC 101-104 Servers send Online Quality rather than the substituted/last reported quality when points are suppressed.
B-11969	DEM is responsible for handling alarms. Events/Alarms that have not been yet committed to the SQL database are lost if G500 is power cycled / restarted. However – the integrity polls will continue to provide accurate database representation.
DCSSUP-19948, D-12000	Restore the last value for variables configured in LogicLinx wizard does not work at runtime (starts at 0 always).

8.3.5 Configuration/Settings

GE Vernova Internal Reference #	Description
D-10502	NOT A DEFECT. If client applications are configured in non-redundant mode and later the device properties are switched to a redundant mode where some applications are not enabled - their respective points are still available to be mapped, but at runtime will be offline. This is to retain the mappings in case the user decides to switch later back to single mode and the client applications are active again, as previously configured.
D-10388	TACACS+ remote authentication can be enabled and activated even if the TACACS+ Server is not available in that moment. This will conduct to a device that can only be accessed using Emergency Access process, if TACACS+ server is not available.
D-06168	FPGA needs to be restarted via Power Cycle for PTP/IRIGB configuration change. No functional impact. PTP/IRIG-B configuration will not be applied without reboot of G500.
D-12969	Adaptor IP is not getting removed completely for Net-1 interface in G500 after doing 'Remove Configuration and Reboot' from Settings GUI.
D-13028	Add more protection for memory leaks in Apache webserver settings.

GE Vernova Internal Reference #	Description
D-13084	Need to remove unwanted text message displayed on the console when user tries to open mcpcfg/Settings GUI simultaneously in a particular scenario.
D-13088	Sometimes incorrect time zone is coming in the command prompt/shell, mcpcfg and settings GUI when IRIG-B/B006 is configured as time sync source from settings GUI. Note: Time zone is displaying correctly in Remote and Local HMI.
B-15613	The configuration through Bulk Editor is not supported for G500 after v2.10.
N/A	If filenames with characters other than ASCII are present in the MCP file system - the MCP device and associated configuration tools will not work correctly. Keep only ASCII characters in the filenames for Client Maps, Server Maps, OneLine .dra, OneLine Images, and other user files.

8.3.6 HMI

GE Vernova Internal Reference #	Description
D-12981	Issues in Runtime HMI if 8 Active Alarm Viewers are opened during performance characterization of G500.
B-15650	The following features of the Analog Report Viewer are not available: - View online reports - Save and view offline reports

8.3.7 Pass-through

GE Vernova Internal Reference #	Description
D-12990	In LDAP authentication, after passthrough connection is timed out, auto logout event is not generated into user activity log by IEC 103 Client.

8.3.8 System

GE Vernova Internal Reference #	Description
E-04130	The USB FLASH drive used for the Firmware Upgrade must be FAT32 format. As a result of this, only USB FLASH drives of maximum 32 GB can be used. The minimum size, imposed by storage requirements, is 8 GB.
E-03041 D-10346	Input time source selection (PTP / IRIG-B / NTP) does not support dynamic failover between time sources at runtime. Only the configured time source is active at a time.
D-10227	Email does not send messages when an alarm is activated.
D-05714	Update of only Edge OS is not supported. If only Edge OS updates are required, the complete G500 firmware image needs to be updated.

GE Vernova Internal Reference #	Description
D-06167	Full support for latest PTP power profiles: • IEEE C37.238-2017 • IEC61850-9-3 Ed.1 2016 Enhancement: G500 supports the following PTP profiles: • IEEE 1588-2008 J4 Peer-to-Peer Profile • IEEE C37.238-2011 Power System Profile (but this has been withdrawn) Limited IEC61850-9-3 Ed.1 2016 Power Utility Automation Profile.
D-12984	Daisy chained secondary monitor shows always duplicate monitor, but it does not show the extended desktop.
D-13083	Add support for progress bar to be displayed during "Applying update" procedure through Predix Edge Technician Console (PETC).
D-13039	When both G500's are power cycled at the same time and if switch panel configured as a master, then one of the G500 can go to the failed state. Note: If switch panel is configured as Master and one of the G500 is power cycled with a delay then this issue will not be observed.
GS-02709884 / D-13470	Sometimes UTC time zone is getting overwritten by different time zone and resulting SOE timestamps have wrong time zone. Workaround: Configure GMT instead of UTC in DNP3 client and server configurations both in serial and ethernet modes.

8.3.9 Documentation

None.

8.3.10 Hardware

GE Vernova Internal Reference #	Description
D-06165	No functional impact. SFP Hot Plug in / Plug out detection. Points that represent the status of SFP IN/OUT will not be reflected until G500 is rebooted.

Capability and Capacity

This G500 version supports the following limits.

The maximum number of IEDs or Masters is total across all connections.

The maximum size of the system is given by whichever limit comes first (groups vs members, number of Connections vs IEDs, number of Master instances vs LRUs in the Master etc.). User is responsible to ensure resource usage limits are not exceeded at runtime.

The 4 cores system has a maximum of 500 IEDs, 200k points and 8 Masters (LRUs).

The 2 cores system has a maximum of 250 IEDs, 100k points and 8 Masters (LRUs) unless otherwise restricted by system loading.

Tejas V Master/LRU instances are not counted as part of 8 Masters or LRUs calculations, both for 4 core and 2 core G500s.

Below are the limits for the Maximum number of Remote HMI sessions that can be connected simultaneously:

Application	G500 4-core	G500 2-core
Remote HMI	8	4

Note: The Local HMI session and Online Editor session coming from DS Agile MCP Studio are not counted in the above-mentioned limits.

8.4 Application Limits

This G500 version supports the following application limits.

Application	Feature	Configuration Limits
Digital Event Manager	Alarms	
	Max Number of Alarm Groups	256
	Max number of members in an Alarm Group	1000
Calculator	Expression Type:	
	Evaluations	10000
	Timers	1000
	Analog Assignments	2000
	Digital Assignments	10000
	Quality Conversions	1000
	Type Conversions	1000
	Averages	1000
	Output to Input Conversions	1000
Load Shed DTA	Number of Feeders and Zones	
	Max Zones	50
	Max Feeders	100
Analog Reports DTA	Not available starting with MCP V2.6 and newer.	None

Application	Feature	Configuration Limits
System Point Manager	Accumulator Freeze	250
	Analog Value Selection	250
	Control Lockout	
	• Remote Groups	8
	• Local Groups	10000
	Double Points	1000
	Input Point Suppression	10000
	Control in Progress	256
	Redundant I/O	10000
Analog Data Logger	Continuous Reports	1000
	Periodic Reports	1000
	Out of Range Reports	1000
VPN Server	Number of VPN Clients	8
	Number of VPN Server Instances	1
SCADA – No. of Client or Server connections (Serial/Network/D.20)	Serial IED Connections	
	(Note: Total number of serial connections are limited by maximum number of physical and virtual serial ports)	
	DNP Multidrop	80
	DNP Multidrop (Modem)	80
	Generic ASCII	80
	SEL Binary IED	80
	IEC 60870-5-101 Multidrop	80
	IEC60870-5-103 Multidrop	80
	Modbus Multidrop	80
	D.20	1
	Network IED Connections	
	DNP3 TCP	50
	Modbus TCP/Modbus TCP-SSH	50
	IEC60870-5 104	50
	IEC61850	Calculated by Loader based on system size
	SNMP	1
	Serial Master Connections	
	DNP3 Serial Master	8
	IEC 60870-5-101 Master	8
	Modbus Serial Master	8

Application	Feature	Configuration Limits
	Network Master Connections	
	DNP3 Network Master	8
	IEC 60870-5-104 Master	8
	Modbus Network Master	8
	IEC 61850 Server	8 (2 for 2 cores)
SCADA - No. of IEDs or Master station LRUs in each connection	Serial /Network IEDs	
	IEC60870-5-103 Multidrop	255
	DNP3 Multidrop/Network	10
	Modbus Multidrop/TCP	20
	IEC60870-5 101 Multidrop	1000
	IEC60870-5 104	10
	SNMP Client	100
	GenASCII Client	120
	IEC61850 Client	Calculated by Loader based on system size (maximum 500 in total)
	SEL Binary Client	1
	D.20 Client	120
	Serial/Network Masters	
	DNP3 Serial Master	8
	Modbus Serial Master	8
	IEC 60870-1 101 Master	8
	Tejas V Master	The maximum number of LRUs is 99 per serial port, regardless of 2/4 cores.
	DNP3 TCP Master	1
	Modbus TCP Master	1
	IEC 60870-1 104 Master	1
	IEC 61850 Server (This is number of maximum concurrent IEC 61850 Clients for same Server Instance / LRU in CID file)	3
SCADA - No. of points configured in each IED/Peripheral mapfile	DNP3 Multi-Drop/Network IEDs	Limited by protocol
	Modbus Multi-Drop/Network IEDs	Limited by protocol
	GenASCII IED	1000
	SNMP IED	1000

Application	Feature		Configuration Limits
	IEC 60870-1 103 Multi-Drop		Limited by protocol
	IEC 60870-1 101/104 Multi-Drop		
	• Bitstream		Limited by protocol
	• Double Command		Limited by protocol
	• Integrate Total		Limited by protocol
	• Measurand		Limited by protocol
	• Packed Single Point		Limited by protocol
	• Regulating Step Command		Limited by protocol
	• Set Point Command		Limited by protocol
	• Single Point		Limited by protocol
	• Step Position		Limited by protocol
	SEL Binary IED		
	• Fast Meter Analog Input		Limited by IED
	• Demand Analog Input		Limited by IED
	• Peak Demand Analog Input		Limited by IED
	• SER Digital Input		Limited by IED
	D.20 Peripheral Client		
	D.20 S Card		64 Digital Inputs, or 32 Double Point Inputs, or 64 Transition Counters, or 32 Form C Counters
	D.20 A Card		32 Analog Inputs
	D.20 K Card		32 Digital Outputs
	D.20 C Card	C0	16 Digital Inputs 8 Digital Outputs
		C1	16 Digital Inputs 8 Digital Outputs 16 Analog Inputs
		C2	16 Digital Inputs 8 Digital Outputs 8 Analog Inputs 8 Analog Outputs

Application	Feature	Configuration Limits
SCADA - No. of points mapped into server mapfile	DNP3 Serial/TCP Master	DI-10000 AI-15000 DO-5000 AO-5000 ACC-3000
	Modbus Serial/TCP Master	DI-10000 AI-15000 DO-5000 AO-5000 ACC-3000
	IEC 60870-1 101/104 Master	DI-10000 AI-15000 DO-5000 AO-5000 ACC-3000
	IEC 61850 Server CID Note: when configured to maximum size it may take up to 10 minutes for the IEC 61850 Server Instance (LRU) to complete initialization.	DI-10000 AI-15000 DO-5000 AO-5000 ACC-3000
	Tejas V Master	DI-256 AI-510 DO-256 AO-64 ACC-510 3 control groups, each group with 1 raise and 1 lower DO point. Optional DI indication for local / remote status. Optional DI indication for accumulator freeze indication.

8.5 Performance Test Levels

This G500 version meets the following performance test levels.

- G500 Hardware under test: 4 core CPU / 16 GB RAM variant.
- In the following table(s), numbers inside the brackets are for the G500 variant with 2 core CPU / 8 GB RAM, if the loading levels are smaller, then the total number of IEDs and RTDB points can increase but no more than specified limits under the Capability and Capacity section above.

Requirement	Steady State Loading	Avalanche Loading
Loading Signal changes (continuously /sec)	AI-5,000 (1,200) DI-100 (50)	DI-63,000 (18,900) AI-113,000 (33,600)
Number of connected IEDs to G500	500 (150)	500 (150)
G500 total RTDB Point count	200,000 (60,000)	200,000 (60,000)
Points / IED DI & AI	400 150x DI and 250x AI per IED	400 150x DI and 250x AI per IED
Each G500 Server has points	4 core: DI = 9375 i.e., = $150 \times 500 / 8$ AI = 15625 i.e., = $250 \times 500 / 8$ 2 core: DI = 5625 i.e., = $150 \times 150 / 4$ AI = 9375 i.e., = $250 \times 150 / 4$	4 core: DI = 9375 i.e., = $150 \times 500 / 8$ AI = 15625 i.e., = $250 \times 500 / 8$ 2 core: DI = 5625 i.e., = $150 \times 150 / 4$ AI = 9375 i.e., = $250 \times 150 / 4$
Remote G500 HMI connections	3 Simultaneous connections	3 Simultaneous connections
Local G500 HMI connections	1 connection (multiple displays)	1 connection (multiple displays)
Datalogger - Periodic reports/sec	4 core: 1000 AI mapped	4 core: 1000 AI mapped
ARRM	Maximum 240 file sets across all IEDs	Maximum 240 file sets across all IEDs
Alarms	100 (50) /sec	100 (50) /sec

8.6 Standalone (non-redundant)

The performance capabilities of this G500 version in Standalone are same as that of Hot-Hot redundancy mode in this version of G500 – with the exception of IEC 61850 Server and Tejas V Server, presented below.

8.6.1 Performance Test Results

The performance test levels of G500 version with IEC61850 server in the stand-alone mode is tested using the activity levels and disturbance scenarios presented next.

Table 8.1: IEC 61850 Server Standalone Performance Test Results

Activity	IEC 61850 Server (4 Core)	IEC61850 Server (2 Core)
Hardware (CPU / RAM)	4 core / 16 GB	2 core / 8 GB
Loading Condition	Steady state	Steady state
Protocol – Client /Server	DNP / IEC61850	DNP / IEC61850

Activity	IEC 61850 Server (4 Core)	IEC61850 Server (2 Core)
RTDB Point count	200,000	60,000
Number of IEC61850 Server instances/Logical Remote Units (LRU)	6	2
Simultaneous IEC61850 Client connections for each LRU	1	1
Total number of IEDs in the system & Points per each IED	500 DNP3 IEDs [AI-225, DI-125, DO-20, AO-20, ACC-10]	160 DNP3 IEDs [AI-225, DI-125, DO-20, AO-20, ACC-10]
Total DI & AI simulation/Sec (Steady Load, not with large occasional peaks and then averaged)	5000 – AI/sec 100 – DI/sec	480 – AI/sec 50 – DI/sec
Number of RTDB points mapped to each LRU	25000	25000
Total number of Logical Devices (LDs) in the system	2000 (4*500 i.e., 4 LDs for each IED)	640 (4*160 i.e., 4 LDs for each IED)
Datasets configured per each LRU	254 for each LRU	254 for each LRU
RCBs configured per each LRU	159 URCB for each LRU 95 BRCB for each LRU	159 URCB for each LRU 95 BRCB for each LRU
Datalogger reports	75 Periodic reports	48 Periodic Reports
Alarms/sec	100 On update Alarms	48 On update Alarms
Remote / Local HMI connections	4 Remote / 1 Local HMI	1 Remote / 0 Local HMI
CPU utilization (%) Min, Max, Median	77, 100, 88	41, 100, 63
Average Used Memory (GB) Min, Max, Median	5.1962, 5.6131, 5.3079	3.87, 4.16, 3.92
Event latency in (msecs) Min, Max, Median	59.4, 2480, 1272.2	35.2, 1760, 556
Control latency in (msecs) Min, Max, Median	21.7, 163, 92	21.9, 542, 282

The performance test levels of G500 version with Tejas server in the stand-alone mode is tested using the activity levels presented next IEC 61850 Server.

Table 8.2: Tejas V Server Standalone Performance Test Results

Activity	Tejas V Server (2 Core)
Hardware (CPU / RAM)	2 core / 8 GB
Loading Condition	Steady state
Protocol – Client /Server	DNP3 / Tejas V
Number of Tejas V instances/Logical Remote Units (LRU)	10
Total number of IEDs in the system & Points per each IED	60 DNP3 IEDs [AI-225, DI-125, DO-20, AO-20, ACC-10]
Points to mapped to each Tejas V Master	[AI-225, DI-125, DO-20, AO-20, ACC-10]
Total DI & AI simulation/Sec	840 – AI/sec 50 – DI/sec
Datalogger reports	12 Periodic reports and each report with 10 AI/sec
Remote/Local HMI connections	1 Remote / 0 Local HMI
Alarms/sec	50 Deviation Alarms
CPU utilization (%) Min, Max, Median	48, 100, 82
Average Used Memory (GB) Min, Max, Median	1.27,1.4,1.34
Event latency in (msecs) Min, Max, Median	221, 812,700
Control latency in (msecs) Min, Max, Median	75, 81, 78

8.7 Warm Standby Redundancy

The performance capabilities of Warm Standby Redundancy are same as that of Hot-Hot redundancy mode in this version of G500.

8.8 Hot Standby Redundancy

The performance capabilities of Hot Standby Redundancy are same as that of Hot-Hot redundancy mode in this version of G500.

8.9 Hot-Hot Redundancy

This G500 version provides the following performance capabilities in Hot-Hot/Hybrid redundancy mode.

8.9.1 Performance Test Results

The performance of G500 is tested using the activity levels and disturbance scenarios presented next.

The master station response times are defined in Table 9.1: Performance Test Results.

Table 8.3: Hot-Hot Performance Test Results

Activity	DNP (4 Core)	DNP (2 Core)	DNP + D.20	IEC 61850	Multi-Protocol
Hardware (CPU / RAM)	4 core / 16 GB	2 core / 8 GB	4 core / 16 GB	4 core / 16 GB	4 core / 16 GB
Loading Condition	Steady state	Steady state	Steady state	Steady state	Steady state
Protocol – Client / Server	DNP / DNP	DNP / DNP	DNP + D2.0/DNP	IEC 61850+DNP/ DNP	IEC 104 + MODBUS + DNP + IEC 101 + SEL Binary/ IEC 104
RTDB Point count	200,000	60,000	200,000	200,000	200,000
Total RCB configured	NA	NA	NA	250	NA

CPU utilization (%)	16, 98, 72.9	54.2, 100, 86.1	71.8, 99.9, 81.4	33, 99.2, 79.4	82.73, 31.90, 100

Activity	DNP (4 Core)	DNP (2 Core)	DNP + D.20	IEC 61850	Multi-Protocol
Min, Max, Median					
Average Used Memory (GB) Min, Max, Median	2.83, 3.19, 3.05	1.61, 1.74, 1.68	2.395, 2.646, 2.587	2.56 2.77 2.70	3.45, 4.03, 3.88
Event latency in (msecs) Min, Max, Median	59.4, 2480, 1272.2	35.2, 1760, 556	243, 2431, 720	12.23, 1301.6, 585.3	94, 1215, 204
Control latency in (msecs) Min, Max, Median	21.7, 163, 92	21.9, 542, 282	<1, 426, 9	4.195, 1986.7, 72.02	20, 1204, 63

8.9.2 Redundancy Fail Over Time

This G500 version supports below fail-over times (i.e., when active G500 is power cycled) in the Hot-Hot/Hybrid Redundancy with the default 300ms heart-beat rate and with default 3 retries.

Table 8.4: Redundancy Fail Over Times

Hot-Hot Redundancy/D.20 Configuration	Maximum Fail-Over Time (msec)
D.20 is not configured	1250
D.20 is configured	1450

8.9.3 HMI Response Times

Under steady state loading conditions, this version of G500 provides the HMI response times listed in the below Table 8.5: User Interface Response Times – Steady State Normal Conditions.

Table 8.5: User Interface Response Times – Steady State Normal Conditions

Activity	Minimum	Maximum	Median
Screen Access (Point Summary)	1.44 s	2.39 s	1.88 s
Screen Access (One-Line Viewer)	NA	NA	NA
System Logs	2.42 s	3.08 s	2.60 s
Alarm ACK Delay (Single Alarm)	400 msec	550 msec	450 msec
Alarm ACK Delay (20,000 Alarms)	< 1 s	< 1 s	< 1 s
DI/AI Update to Point Summary Screen	< 1 s	< 1 s	< 1 s

NOTE: Under heavy loading conditions, the control latency was measured by simulating one control in every 5 seconds continuously from the Master station.

Time Sync Accuracy (PTP/IRIG-B/NTP)

This G500 version supports the time sync accuracy results similar to G500 version 210, see: *Time Sync Accuracy (PTP/IRIG-B/NTP)*.

Application List

This G500 version has the following applications available depending on configured redundancy mode.

Application	Support in Standalone	Support in Hot-Hot/Hybrid	Support in Warm Standby	Support in Hot Standby
Runtime HMI	✓ Available	✓ Available	✓ Available	✓ Available
One-Line Viewer	✓ Available	✓ Available	✓ Available	✓ Available

9. Version 3.00 (28-April-2023)

Software Versions

The following table defines the software versions required for interaction with the MCP.

Package	Version	Notes
G500 Firmware	3.0.2528	G500 Firmware Version.
G100 Firmware	3.0.2528	G100 Firmware Version.
DS Agile MCP Studio	3.0.0	Minimum Supported DS Agile MCP Studio Software.
MCP HMI Viewer	3.0.2528	Supported MCP HMI 64-bit Software.
MCP Utilities	1.1.13	Minimum Supported MCP Firmware Upgrade Utilities.
IEC61850 CID Tool	8.0.7	Minimum Supported CID configuration tool for automatically creating IEC 61850 Server map files.

Predix Edge OS and Other Firmware Versions

The following table defines the package/firmware versions supported for Predix Edge Linux OS, FPGA, CPLD, UEFI and BCOM FPGA in this MCP version.

Package/Firmware	G100 Version	G500 Version	Notes
Predix Edge OS	2.7.0	2.7.0	Supported GE's Secured Linux Operating System Version.
FPGA	NA	1.03.00	Supported FPGA Version of Multi-Function Controller Platform (MCP).
CPLD	NA	1.2.3	Supported CPLD Version of Multi-Function Controller Platform (MCP).
UEFI	FLEBG100A00006V107	VX5D0007.C01	Supported UEFI Version of Multi-Function Controller Platform (MCP).
BCOM FPGA	NA	2.3.0	Supported COM's Module FPGA Version of Multi-Function Controller Platform (MCP).

Key Functions and Changes

Converged G100 and G500.

9.1 Enhancements

9.1.1 Cyber Security

Please refer to Product & Cyber Security Advisories on the GE Vernova Grid Solutions web site.

9.1.2 Clients

GE Vernova Internal Reference #	Description
E-04750	Added separate default DNP DCA application parameters for serial and network connections.
E-04001	Changed SEL auto discovery to be a manually initiated process.
E-04942	Added support for clearing communication statistics for D.20 DCA.
E-03661	Made visible in editor the "autodiscovery" files for SELBIN (Offline & online editors).

9.1.3 Servers

GE Vernova Internal Reference #	Description
E-04940	Added support in IEC 61850 server to support SBO Normal Security via CID Tool setting.
E-04204	Added support in IEC 61850 server to operate as hot-hot or warm standby modes when G500 is configured in Hot-Hot redundant mode.
E-04367	Implemented DNP3 DPA set time only when other clock sources failed.

9.1.4 Automation

None.

9.1.5 Configuration/Settings

GE Vernova Internal Reference #	Description
E-04879	Starting with V3.00 - redundancy with an RS232 Switch Panel always uses the assigned A and B designation from mcpcfg / Settings GUI, instead of the CTS signal. This simplifies redundancy wiring by using same watchdog cable. Upgrading from a previous G500 version does not require cable changes, however the A and B designation assignment is now mandatory.
E-05010 E-05020 E-05021	Enhanced DSAS Miscellaneous > Updates to download new artefacts: MCP Firmware PETC, MCP Applications PETC, Remote HMI Installers.

9.1.6 HMI

GE Vernova Internal Reference #	Description
E-04511	Added runtime HMI dashboard that shows status of configured applications.
E-03570	Added support in Point Details / AI tab to show both value and AI Text Enumeration at runtime.
E-03364	Added support to open Active Alarms already filtered by group, by calling the Active Alarms window using a "group" parameter when configuring the "open" action from OLD.
R-01471	Added Remote Desktop Server functionality which allows connection to the Local HMI using Microsoft Windows Remote Desktop client.
R-01605 / E-05015	Added runtime HMI feature to open multiple User Screens with one single action.

9.1.7 Pass-through

None.

9.1.8 System

GE Vernova Internal Reference #	Description
E-04495	Added support for Hot-Hot/Hybrid redundancy in G100.

9.1.9 Documentation

GE Vernova Internal Reference #	Description
E-04736	Updated MCP Runtime HMI Help file with System Status and Redundancy in G100.
E-04600	Update Help file content on the configuration changes needed for IEC 61850 Server in DSAS offline/online editor.
E-04869	Updated document [SWM0111] Configuring the MCP for Centralized LDAP Authentication using Windows AD Installation and Configuration Guide (V300 R0) to add a note for Distinguished Name tables, updated XCA certificate Signature Algorithm references to SHA-256.
E-04875	Updated document [SWM0106] G500 Quick Start Guide (V300 R0).
E-04627	Updated document [SWM0116] G100 Quick Start Guide (V300 R0).
E-04734	Updated document [SWM0105] G500 Secure Deployment User Guide (V300 R0).
E-04936	Updated document [SWM0123] G100 Secure Deployment User Guide (V300 R0).
E-04599	Updated document [SWM0101] MCP Software Configuration Guide (V320 R0).
R-01525	Added 517-0169 Western D20 C Type 1 Version 1 to compatibility list in document [994-0155] G100 Instruction Manual (V300 R0).
E-04872	Updated document [994-0152] G500 Substation Gateway Instruction Manual (V300 R0).
E-04877	Updated document [994-0155] G100 Substation Gateway Instruction Manual (V300 R0).

GE Vernova Internal Reference #	Description
E-04873	Updated document [SWM0124] IEC 61850 Server User Guide (V300 R0).
E-04874	Updated document [PRBT-0429] MCP NERC CIP5 Response (V410 R0).
E-04871	Updated document [TN0116] MCP Firmware Upgrade and Restore to Defaults Workflows (V300 R6).
E-04876	Updated document [TN0125] MCP Firmware Upgrade via PETC (V300 R0).
E-04318	Updated document [MIS-0109] MCP Firmware Release Notes (V300 R0).
E-05026	Created document [994-0153] MCP Binder and ISO Image (V300 R0).

9.1.10 Hardware

GE Vernova Internal Reference #	Description
B-16456	Created new MCP Watchdog cable (977-0568).
B-16831	Created new Redundancy Kit MCP-REDN.

9.2 Fixed defects

This version of MCP has the fixes for the following defects compared to G500 version 280.

9.2.1 Cyber Security

Please refer to Product & Cyber Security Advisories on the GE Vernova Grid Solutions web site.

9.2.2 Clients

GE Vernova Internal Reference #	Description
D-13592	Fixed the issue in DNP3 Client to support Clear command when Remote Accumulators parameter is set to False.
D-13321	Added a fix in DNP Client to recover itself and starts polling in case if the polling gets stuck at the transport layer.
R-01572 DCSSUP-22808 DCSSUP-22855	Fixed the IEC61850 Client Restarts issue after a refused command (by IED in Local).
R-01570, R-01556/ DCSSUP-22614, DCSSUP-22833	Fixed the issue of IEC-60870-104 Client getting frozen randomly after few days of operation (once in a month).
R-01542/ DCSSUP-22403	Fixed an issue where IEC 608705-103 Client keeps restarting with large values of "Max confirm Idle timeout" and "Respond Idle timeout".

GE Vernova Internal Reference #	Description
D-14006	Fixed the issue of Peak demand data misinterpretation by adding Demand and Peak Demand readings in Double Floating Point format only.
D-14078	Fixed the IEC61850 client restart issue when issuing command to CDC=DPC when status is in intermediate state (0 0).
D-12853	Fixed the issue of Local GPIO DCA Command Failed Accum Pseudo Point not getting to increment on TTL failure.
DCSSUP-20185, GS-02402538 / R-01388	Fixed the issue where Modbus Client Serial Communications, AO orders, do not receive response back from slave.

9.2.3 Servers

GE Vernova Internal Reference #	Description
R-01539 / DCSSUP-22426	Fixed the issue that third party IEC 61850 communication is taking more time to report in A-View.
D-13722	Fixed the issue of IEC61850 Server not working when more than 50 LDs are being configured in 61850 LRU.
D-12931	Fixed the issue of G500 is not getting time synced from DNP master when primary time sync source IRIG-B is enabled but in failed condition.

9.2.4 Automation

GE Vernova Internal Reference #	Description
D-14003	Fixed the issue of Event Logger (Elog) failing to persist PRF events to mSQL database.
D-13127	Fixed the issue of LogicLinx failing to run post upgrade of configuration from v2.1 to v2.5.
D-13248	Fixed the LogicLinx memory corruption issue when system point not mapped.
D-13613	Fixed the issue in HAMA application where the last cause of reboot is being shown as "Reset WDT Carrier", no matter how the unit is rebooted.

9.2.5 Configuration/Settings

GE Vernova Internal Reference #	Description
D-12969	Fixed the issue of Adaptor IP being removed completely from Net1 interface in G500 after doing 'Remove Configuration and Reboot' from Settings GUI.
D-13088	Fixed the issue of incorrect time zone being displayed sometimes in the command prompt/shell, mcpcfg and settings GUI when IRIG-B/B006 is configured as time sync source from settings GUI.
D-13868	Fixed the issue of serial ports mode configuration (RS485 4w) being available in Settings GUI despite not being supported by G100.
D-14057	Fixed an issue where upgrade of snapshots or configurations fails if containing one or more malformed SEL DCA self-description files.
D-13713	Fixed the issue of mandatory configuration for secondary IP when using settings GUI to configure RM with single LAN.

GE Vernova Internal Reference #	Description
D-14099	Fixed the issue of no 'Point Description' being displayed in the 'Online Trends' when the point description character length is more than 128 characters.
D-13797	Fixed the issue in Web GUI where eth0 and eth1 are being displayed as available network interfaces in firewall rules of G100.
DCSSUP-23243 / R-01593	Fixed the issue of G500 Losing 104 Devices Reference when Convert Settings to v2.7 or Higher.
D-12810	The order in which pseudo points appear in the offline editor of is different when compared to the online editor for the applications Modbus DCA, D.20 DCA and SNMP DCA.

9.2.6 HMI

GE Vernova Internal Reference #	Description
R-01549, DCSSUP-22543	Fixed the issue of G500 HMI Tag being lost when navigated to different screen and back.
D-12981	Fixed the issue in Runtime HMI if 8 Active Alarm Viewers are opened during performance characterization of G500.
D-13845	Fixed the issue of MCP Runtime HMI (in Windows) being installed only for current user.
D-13900	Fixed the issue of MCP login Security Banner not accepting some of the ASCII characters like- @ # \$ % & ; :
D-13841	Fixed the issue of MCP login security banner not accepting the foreign languages.
D-13976	Fixed the issue of Autologin settings not being saved, when modified and saved from the runtime HMI.
D-13947	Fixed the issue of Failing to Export Trending database from runtime HMI, if the configured datalogger report point has a comma(,) in the point reference.

9.2.7 Pass-through

None.

9.2.8 System

GE Vernova Internal Reference #	Description
GS-02709884 / D-13470	Fixed issue of UTC time zone getting overwritten by different time zone and resulting SOE timestamps have wrong time zone.
D-13904	Fixed the issue of passthrough and terminal server functionalities not working properly when LDAP is configured.
DCSSUP-22261 / R-01529	Fixed the issue of G500 NTP Signal Present Input via NTP from GPS clock server RT430 not always working when GPS clock is powered off.
DCASUP-22556 / R-01552	Fixed the issue of Firewall rules for DNP/TCP rules not taking effect when configured from web settings GUI and works properly when configured from mcpcfg.
D-13819	Fixed the issue of duplicate firewall rules getting added in firewall rule table when two DNP servers are configured on the same port.
D-13823	Fixed an issue where firewall rules for were not added for NTP client.

GE Vernova Internal Reference #	Description
D-13832	Fixed the issue of MQTT_Outbound rule getting displayed in firewall settings though it is used only internally.
D-13792	Fixed a race condition in NTP which is preventing the MCP unit from time syncing.
D-13709	Fixed the issue of G100 DHCP client failing to set default gateway on Net2 after reboot.
D-13663	Fixed the issue of hostname not being automatically updated in the list of hosts which is resulting in nuisance errors while trying to connect as a root user.
D-13560	Fixed an issue when G500 locks and becomes unresponsive after multiple SW WDOG events.
GS-02683392 / D-13811	Fixed the issue causing Permission Denied message in NTP Log.
D-12140	Merged fix from D400: Calculator stops evaluating averaging expressions.
D-13835	Fixed the issue of NTP IN pseudo point taking very long time (around 9 minutes) to update when NTP signal is in.
D-12887	G100 GPIO input_overflow warning messages are logged periodically (~30 s) in the kernel log on loaded systems. The impact is that the MCP support bundle will not be able to retrieve a kernel log event older than approximately 22 days on a busy system, so ensure MCP support bundle is created, if necessary, soon after a kernel event that may need to be investigated.

9.2.9 Documentation

GE Vernova Internal Reference #	Description
D-13906	Removed the print button from local HMI help.
D-09928	Corrected described procedure for Sync Manger SFTP Key transfer in SWM0101 MCP Software Configuration Guide (V3.20 R0).

9.2.10 Hardware

None.

9.3 Known Issues

This G500 version has the following known issues:

9.3.1 Cyber Security

GE Vernova Internal Reference #	Description
D-14069	The MCP Settings GUI does not automatically log off after the inactivity timeout. It requires that the user click into the web page or hit refresh after the timeout occurs to trigger the Settings GUI to close the session. The mcpcfg utility will be locked out from use while the MCP Settings GUI session is open. If MCP Settings GUI was left open after the inactivity timeout has expired (maliciously or unintentionally), as a workaround, you can login and logout of the MCP Settings GUI in another browser to release the lockout of the mcpcfg utility.

For any additional known issues, please refer to Product & Cyber Security Advisories on the GE Vernova Grid Solutions web site.

9.3.2 Clients

GE Vernova Internal Reference #	Description
B-13475 D-09915	SEL Binary Client doesn't support Double Precision Scaling Factors.
D-05002	ARRM file retrieval from SEL 1xx/2xx relays (using GENASCII) is not possible.
D-12900	Alarm inhibits tag & Scan inhibit tags on DI point of D20 peripheral (S-card) is getting removed after failover in redundancy.
D-12834	Modbus Client could not process PRF events comes from SR 369 relay.
D-13075	D20A card in bad state can cause false behaviour/functionality when it is configured in warm or hot-hot redundancy.
D-13214	DNP3 Client doesn't support object types 31 and 33 for Frozen Analog Inputs (all variations).
D-14111	Cold Reboot Required DI (1) based on HDLC card faulty state will be reset on warm reboot also.

9.3.3 Servers

GE Vernova Internal Reference #	Description
D-12889	DNP DPA/Server takes high CPU if more than 5000 Analog Inputs are configured in Unbuffered mode.
B-11967	No support for events in NVRAM in IEC101/104 Server. Events that have not been yet transmitted to Master (Clients) are lost if G500 is power cycled / restarted. However – the integrity polls will continue to provide accurate database representation.
B-11968	No support for events in NVRAM in DNP3 Server. Events that have not been yet transmitted to Master (Clients) are lost if G500 is power cycled / restarted. However – the integrity polls will continue to provide accurate database representation.
D-13134/ D-13135	RTS Post-amble time is not added to the data link confirm timeout or application timeout in DNP3 Serial Server.
D-12566	IEC101 DPA/Server in unbalanced mode sometimes reports duplicate Digital Input events to the Master if the event happens at the same time as General Interrogation response.
D-13996	IEC101/104 DPA buffer overflow DI events will be lost when set as discard newest
D-13383	IEC 61850 Server does not report correct point values when both the digital points (Bit-1 and Bit-2) are 'ON' and will not recover until a new event occurs.
D-12567	The time sync accuracy of G100 when IEC101 Server (Unbalanced/Balanced) is used as a time sync source is > +/- 4 msec.

GE Vernova Internal Reference #	Description
R-01651 / DCSSUP-24080 / DCSSUP - 23792	IEC 61850 Server does not update the quality of the points in a remote IEC61850 Client at startup
R-01668	DNP3 Server doesn't set IIN Local when DO "ForceControlsLockout" is ON.
R-01682/ DCSSUP-24417	DNP3 DPA is not setting the correct Local IIN bit "Digital Output in Local"
D-16253	Modbus Server writes the configured Offline Analog Value in both words of a 32 bit register. As long as 0 (zero) is used as configured Offline Analog Value there is no impact.

9.3.4 Automation

GE Vernova Internal Reference #	Description
D-05033	Suppressed quality through Input Point Suppression (IPS) application is not reported to Masters. DNP3 and IEC 101-104 Servers send Online Quality rather than the substituted/last reported quality when points are suppressed.
B-11969	DEM is responsible for handling alarms. Events/Alarms that have not been yet committed to the SQL database are lost if G500 is power cycled / restarted. However – the integrity polls will continue to provide accurate database representation.
DCSSUP-19948, D-12000	Restore the last value for variables configured in LogicLinx wizard does not work at runtime (starts at 0 always).
D-14100	In MCP Runtime HMI, data points in 'Online Trends' do not display 'underscore (_)' in Point description even though it is there in the configuration.
D-13941	Control in progress DI pseudo point for GPIO DCA DO point is not getting high till pulse on +pulse off time when control command is getting executed on GPIO DCA DO point

9.3.5 Configuration/Settings

GE Vernova Internal Reference #	Description
D-10502	NOT A DEFECT. If client applications are configured in non-redundant mode and later the device properties are switched to a redundant mode where some applications are not enabled - their respective points are still available to be mapped, but at runtime will be offline. This is to retain the mappings in case the user decides to switch later back to single mode and the client applications are active again, as previously configured.
D-10388	TACACS+ remote authentication can be enabled and activated even if the TACACS+ Server is not available in that moment. This will conduct to a device that can only be accessed using Emergency Access process, if TACACS+ server is not available.

GE Vernova Internal Reference #	Description
D-06168	FPGA needs to be restarted via Power Cycle for PTP/IRIGB configuration change. No functional impact. PTP/IRIG-B configuration will not be applied without reboot of G500.
D-13028	Add more protection for memory leaks in Apache webserver settings.
D-13084	Need to remove unwanted text message displayed on the console when user tries to open mcpcfg/Settings GUI simultaneously in a particular scenario.
B-15613	The configuration through Bulk Editor is not supported for G500 after v2.10.
N/A	If filenames with characters other than ASCII are present in the MCP file system - the MCP device and associated configuration tools will not work correctly. Keep only ASCII characters in the filenames for Client Maps, Server Maps, OneLine.dra, OneLine Images, and other user files.

9.3.6 HMI

GE Vernova Internal Reference #	Description
B-15650	The following features of the Analog Report Viewer are not available: • View online reports • Save and view offline reports
B-14982	The product references in the Runtime (Local/Remote) HMI logs need to be changed as "MCP".
D-05463	If a used point group is deleted from the systemwide configuration then points belonging to that group are not visible in the point group summary. However, if user changes the point group allocation from the corresponding instantiated client map file(s) then points will be visible in the point group summary.

9.3.7 Pass-through

GE Vernova Internal Reference #	Description
D-12990	In LDAP authentication, after passthrough connection is timed out, auto logout event is not generated into user activity log by IEC 103 Client.

9.3.8 System

GE Vernova Internal Reference #	Description
E-04130	The USB FLASH drive used for the Firmware Upgrade must be FAT32 format. As a result of this, only USB FLASH drives of maximum 32 GB can be used. The minimum size, imposed by storage requirements, is 8 GB.
E-03041 D-10346	Input time source selection (PTP / IRIG-B / NTP) does not support dynamic failover between time sources at runtime. Only the configured time source is active at a time.
D-10227	Email does not send messages when an alarm is activated.
D-05714	Update of only Edge OS is not supported. If only Edge OS updates are required, the complete G500 firmware image needs to be updated.

GE Vernova Internal Reference #	Description
D-06167	Full support for latest PTP power profiles: • IEEE C37.238-2017 • IEC61850-9-3 Ed.1 2016 Enhancement: G500 supports the following PTP profiles: • IEEE 1588-2008 J4 Peer-to-Peer Profile • IEEE C37.238-2011 Power System Profile (but this has been withdrawn) Limited IEC61850-9-3 Ed.1 2016 Power Utility Automation Profile.
D-12984	Daisy chained secondary monitor shows always duplicate monitor, but it does not show the extended desktop.
D-13083	Add support for progress bar to be displayed during "Applying update" procedure through Predix Edge Technician Console (PETC).
D-13039	When both G500's are power cycled at the same time and if switch panel configured as a master, then one of the G500 can go to the failed state. Note: If switch panel is configured as Master and one of the G500 is power cycled with a delay then this issue will not be observed.
B-14973	The software licensing application reports core license 012 as "G500 Core", it should be "MCP Core". There is no functional impact.

9.3.9 Documentation

None.

9.3.10 Hardware

GE Vernova Internal Reference #	Description
D-06165	No functional impact. SFP Hot Plug in / Plug out detection. Points that represent the status of SFP IN/OUT will not be reflected until G500 is rebooted.

Capability and Capacity for MCP

This MCP version supports the following limits.

The maximum number of IEDs or Masters is total across all connections.

The maximum size of the system is given by whichever limit comes first (groups vs members, number of Connections vs IEDs, number of Master instances vs LRUs in the Master etc.). User is responsible to ensure resource usage limits are not exceeded at runtime. For tested performance levels, refer to Table 9.1 and Table 9.2.

The G500 4 cores system has a maximum of 500 IEDs, 200k points and 8 Masters (LRUs) unless otherwise restricted by system loading.

The G500 2 cores system has a maximum of 250 IEDs, 100k points and 8 Masters (LRUs) unless otherwise restricted by system loading.

The G100 system has a maximum of 120 IEDs, 24k points and 8 Masters (LRUs) unless otherwise restricted by system loading.

Tejas V Master/LRU instances are not counted as part of 8 Masters or LRUs calculations, both for 4 core and 2 core G500s and for G100.

Below are the limits for the Maximum number of Remote HMI sessions that can be connected simultaneously:

Application	G500 4-core	G500 2-core	G100
Remote HMI	8	4	2

Note: The Local HMI session and Online Editor session coming from DS Agile MCP Studio are not counted in the above-mentioned limits.

9.4 Application Limits

This G500 version supports the following application limits.

Application	Feature	Configuration Limits	
		G500	G100
Digital Event Manager	Alarms		
	Max Number of Alarm Groups	256	256
	Max number of members in an Alarm Group	1000	1000
Calculator	Expression Type

Note 1: Indicates recommended value which can be exceeded with an increased level of event latency.

9.5 Performance Test Levels

This MCP version meets the following performance test levels.

- MCP Hardware under test:
 - o G500 4 core CPU / 16 GB RAM
 - o G500 2 core CPU / 8 GB RAM
 - o G100 8 GB RAM
- The following table(s) indicate the G500 4 core, G500 2 core and G100 values in different loading conditions.
- If the loading levels are lower, then the total number of IEDs and RTDB points can increase but no more than specified limits under the Capability and Capacity section above.

Requirement	Steady State Loading			Avalanche Loading		
	G500 (4 Core)	G500 (2 Core)	G100	G500 (4 Core)	G500 (2 Core)	G100
Loading Signal changes (continuously / sec)	AI-5,000 DI-100	AI-1200 DI-50	AI-1200 DI-12	DI-62500 AI-112500	DI-18750 AI-33750	All points changing twice in 2 secs
Number of connected IEDs	500	150	120	500	150	120

9.5.1 Performance Test Results

This MCP version provides the following performance capabilities when configured in different modes (Standalone / Hot-Hot Redundancy/ Hot Standby Redundancy / Warm Standby Redundancy).

The performance of MCP is tested using the activity levels and configuration scenarios presented next:

Notes:

- The performance tests results in **Table 9.1** were determined in Hot-Hot redundancy mode. The results apply to Warm Standby, Hot Standby and Standalone modes.
- The Tejas V Server performance tests results in **Table 9.2** were determined in Standalone mode. The results apply to Warm Standby, Hot Standby and Hot-Hot redundancy modes, if a 4 core G500 is used.

9.5.2 Redundancy Fail Over Time

This MCP version supports below fail-over times (i.e., when active G500 / G100 is power cycled) in the Hot-Hot/Hybrid Redundancy with the default 300ms heart-beat rate and with default 3 retries.

Table 9.3: Hot-Hot Redundancy Fail Over Times

Hot-Hot Redundancy/D.20 Configuration	Maximum Fail-Over Time (msec)	
	G500	G100
D.20 is not configured	1250	1780
D.20 is configured	1450	1940

9.5.3 HMI Response Times

Under steady state loading conditions, this version of G500 provides the HMI response times listed in the below Table 9.4: User Interface Response Times – Steady State Normal Conditions.

Table 9.4: User Interface Response Times – Steady State Normal Conditions

Activity	G500 (4 Core)	G500 (2 Core)	G100
Screen Access (Point Summary) (Min, Max, Median) sec	2, 2.6, 2.1 sec	1.5, 5.3, 1.9 sec	0.9, 1.7, 1.4 sec
Screen Access (One-Line Viewer) (Min, Max, Median) sec	9 sec	54 sec	14 sec
System Logs) (Min, Max, Median) sec	1.9, 2.7, 1.9 sec	4.9, 12.1, 5.9 sec	3.1, 3.9, 3.1 sec
Alarm ACK Delay (Single Alarm)	3 sec	<1 sec	<1 sec
Alarm ACK Delay (20,000 Alarms)	< 1 sec	16 sec	6 sec
DI/AI Update to Point Summary Screen	< 1 sec	< 1 sec	< 1 sec

NOTE: Under heavy loading conditions, the control latency was measured by simulating one control in every 5 seconds continuously from the Master station.

Screen Access time was measured in heavy loading condition.

Time Sync Accuracy (PTP/IRIG-B/NTP)

This MCP version supports Hardware based PTP/IRIG-B and Software based NTP Time Sync Accuracy.

This version does not support runtime dynamic failover across different time sources.

Time Sync Input	Accuracy	
	G500	G100
IRIG-B IN	100% samples within 945 microseconds with an average of 39 microseconds and standard deviation of 28 microseconds - Total number of samples considered ~3507	100% samples within 866 microseconds with an average of 90 microseconds and standard deviation of 76 microseconds - Total number of samples considered ~3758
PTP IN	100% samples within 693 microseconds with an average of 40 microseconds and standard deviation of 31 microseconds - Total number of samples considered ~3457	NA
NTP IN	100% samples within 1065 microseconds with an average of 437 microseconds and standard deviation of 216 microseconds - Total number of samples considered ~3614	100% samples within 867 microseconds with an average of 92 microseconds and standard deviation of 81 microseconds - Total number of samples considered ~3259

NOTES:

- IRIG-B/ PTP time accuracy is measured in a scenario where the hardware is fully loaded.

Timestamp Accuracy

This MCP version provides the following Timestamp Accuracy.

Protocol	Accuracy	
	% @ N = % of samples within +/- N milliseconds	
	G500	G100
D.20 HDLC	99.92% @ 1 ms 100% @ 2 ms - Total number of samples considered ~18,000 - Measured the accuracy for every five seconds at a D.20 S peripheral	98.32% @ 1 ms 99.96% @ 2 ms 100% @ 3 ms - Total number of samples considered ~33,000 - Measured the accuracy for every five seconds at a D.20 S peripheral
GPIO	NA	96.5% @ 1 ms 99.92% @ 2 ms 100% @ 3 ms - Total number of samples considered ~33,000 - Measured the accuracy for every five seconds at the GPIO

Protocol	Accuracy	
	% @ N = % of samples within +/- N milliseconds	
	G500	G100
DNP I/O	83.33% @ 1 ms 99.82% @ 2 ms 99.86% @ 3 ms 100% @ 4 ms - Total number of samples considered ~16476 - Measured the accuracy for every five seconds at a DNP I/O S peripheral	3.4% @ 1 ms 80.14% @ 2 ms 96.15% @ 3ms 99.16% @ 4 ms 99.88% @ 5 ms 100% @ 6 ms - Total number of samples considered ~11790 - Measured the accuracy for every five seconds at a DNP I/O S peripheral

Application List

This MCP version has the following applications available depending on configured redundancy mode.

Application	Support in Standalone	Support in Hot-Hot/Hybrid	Support in Warm Standby	Support in Hot Standby
Runtime HMI	✓ Available	✓ Available	✓ Available	✓ Available
One-Line Viewer	✓ Available	✓ Available	✓ Available	✓ Available

10. Version 3.10 (23-August-2023)

Software Versions

The following table defines the software versions required for interaction with the MCP.

Package	Version	Notes
G500 Firmware	3.1.153	G500 Firmware Version.
G100 Firmware	3.1.153	G100 Firmware Version.
DS Agile MCP Studio	3.1.0	Minimum Supported DS Agile MCP Studio Software.
MCP HMI Viewer	3.1.153	Supported MCP HMI 64-bit Software.
MCP Utilities	1.1.13	Minimum Supported MCP Firmware Upgrade Utilities.
IEC61850 CID Tool	8.0.8	Minimum Supported CID configuration tool for automatically creating IEC 61850 Server map files.

Predix Edge OS and Other Firmware Versions

The following table defines the package/firmware versions supported for Predix Edge Linux OS, FPGA, CPLD, UEFI and BCOM FPGA in this MCP version.

Package/Firmware	G100 Version	G500 Version	Notes
Predix Edge OS	2.7.0	2.7.0	Supported GE's Secured Linux Operating System Version.
FPGA	NA	1.03.00	Supported FPGA Version of Multi-Function Controller Platform (MCP).
CPLD	NA	1.2.3	Supported CPLD Version of Multi-Function Controller Platform (MCP).
UEFI	FLEBG100A00006V107	VX5D0007.C01	Supported UEFI Version of Multi-Function Controller Platform (MCP).
BCOM FPGA	NA	2.3.0	Supported COM's Module FPGA Version of Multi-Function Controller Platform (MCP).

Key Functions and Changes

10.1 Enhancements

10.1.1 Cyber Security

Please refer to Product & Cyber Security Advisories on the GE Vernova Grid Solutions web site.

10.1.2 Clients

GE Vernova Internal Reference #	Description
R-01598 / E-05035	Add a parameter to control the logic type of "Enable/Disable Device" in the MCP DNP3 Client Map file.
R-01599 / E-05036	Add a parameter to control the logic type of "Enable/Disable Polling" in the MCP DNP3 Client Map file.
R-01600 / E-05037	Implement DNP3 Client quality flags behavior when devices are disabled at runtime, as a new Client Map parameter "Device Disable Sets Remote Force and Offline".

10.1.3 Servers

GE Vernova Internal Reference #	Description
R-01601 / E-05038	Implement DNP3 Server runtime behavior based on quality flags, as a new DNP3 DPA LRU Application Parameter "Report Remote Forced and Offline Points".
B-17119	Add support for time sync rejection based on time quality to IEC 101/104 DPA.

10.1.4 Automation

None.

10.1.5 Configuration/Settings

GE Vernova Internal Reference #	Description
B-17274	Removed support for 110 Baud rate from all serial protocols in the connection configuration GUI.
R-01542 / DCSSUP-22403	Updated default values for IEC 60870-5-103 Application Parameters.

10.1.6 HMI

None.

10.1.7 Pass-through

None.

10.1.8 System

GE Vernova Internal Reference #	Description
B-14973	Implement the change needed to show "MCP Core" for license 012 which currently shows up as "G500 Core".
B-17229	Make serial port FIFO trigger level in G100 to be same as G500 at baud rates below 115200.

10.1.9 Documentation

GE Vernova Internal Reference #	Description
E-05118	Updated document [SWM0101] MCP Software Configuration Guide (V321 R0) including enhancements in DNP Serial and Network Master sections, IEC 101/104 Application Parameters, IEC 103 Client and Application default values, One Line Designer tool tip options, merging and deleting redundant tables, removing "slave" references where applicable.
E-05123	Updated help file content in DSAS online/offline editor and Runtime HMI including enhancements in DNP Serial and Network Master sections, IEC 101/104 Application Parameters, IEC 103 Client and Application default values, One Line Designer tool tip options, merging and deleting redundant tables, removing "slave" references where applicable.
E-05128	Updated document [SWM0103] Integration of MCP with OpenVPN Client (V200 R3).
E-05143	Updated document [SWM0122] Configuring UEFI Settings on G100 User Guide (V200 R0).
E-05117	Updated document [SWM0124] IEC 61850 Server User Guide (V310 R0) to include new added DNP Pseudo Points.
B-17156	Updated document [MIS-0109] MCP Firmware Release Notes (V310 R0) with Time Sync Accuracy and Timestamp Accuracy.
B-17242	Updated document [MIS-0110] Open Source License Information (V310 R0).
D-15231	Updated document [SWM0109] Secure Integration of SCADA Third Party Equipment with MCP (V200 R3) with stunnel software download link.
E-05137	Updated document [TN0116] MCP Firmware Upgrade and Restore to Defaults Workflows (V300 R7).
E-05188	Updated document [994-0152] G500 Substation Gateway Instruction Manual for V310 release (V310 R0).
E-05187	Updated document [994-0155] G100 Substation Gateway Instruction Manual for V310 release (V310 R0).
E-05165	Created document [994-0153] MCP Binder and ISO Image (V310 R0).

10.1.10 Hardware

None.

10.2 Fixed defects

This version of MCP has the fixes for the following defects compared to MCP version 300.

10.2.1 Cyber Security

Please refer to Product & Cyber Security Advisories on the GE Vernova Grid Solutions web site.

10.2.2 Clients

GE Vernova Internal Reference #	Description
R-01620 / DCSSUP-23567	Fixed the issue in G100 where GPIO will not refresh.
D-15247	Fixed the issue of incorrect current time calculation in Modbus DCA (the key rotation may be too fast or too slow).
R-01609 / DCSSUP-23393 / DCSSUP-23574 / DCSSUP-23649	Fixed the data update issue with MODBUS RTU DCA (Serial).
R-01542 / DCSSUP-22403	Fixed multiple issues in IEC 60870-5-103 DCA: - Diagnostic Log was flooded with "Call b032_producer_update_quality fail -60" messages when IEC103 IED went offline - An empty message was logged when IED reported "COT: RESTART or POWERON" after being initialized - Parity or Framing errors stopped application layer and caused devices to go offline - One IED failure could take other IEDs to offline - One or more IEDs would go offline after sometime - Improved Telemetry time updates
D-15220	Fixed the issue in G100 GPIO DCA, where DO point is looped back to DI point, after 'Save and Commit' changes, the DI point status persists to '1' but DO point status becomes '0'.
D-15132	Fixed the issue in D.20 FPGA where Rx is not disabled when switching to dormant mode.
D-15268	Fixed the issue in Modbus DCA that the device remains online when DCA receives a message with invalid CRC.
D-15280	Fixed the issue in Modbus DCA that DO command exception responses are not triggering protocol errors in HMI.
D-15269	Fixed the issue in Modbus DCA that HMI does not show protocol errors when invalid CRC DO/AO response received.
D-15256	Fixed the issue in Modbus DCA that Write Single Coil/Write Single Register Response Comm Errors Masked when first byte of address is 0,1 or 2, and Write Multiple Register results in false failure if first byte of "Starting Address" is not 0.
R-01650 / DCSSUP - 23512	Fixed the issue IEC61850 Client does not always send "report enable"

10.2.3 Servers

None.

10.2.4 Automation

None.

10.2.5 Configuration/Settings

None.

10.2.6 HMI

None.

10.2.7 Pass-through

None.

10.2.8 System

GE Vernova Internal Reference #	Description
D-15169	Fixed the issue in a case where Hot-hot system with HDLC configured is not handling the HDLC driver's FAULTY state (device remains online and transactions are frozen, points are not offline).
D-15179	Fixed the issue in Hot-hot system where HDLC driver falls into faulty mode after switchovers.
D-15124	Fixed the issue in Standalone system with HDLC configured, which is not handling the HDLC driver's FAULTY state.
D-15127	Fixed the issue of incorrect diagnostic log message in case of HDLC card fault requiring cold reboot occurs.

10.2.9 Documentation

GE Vernova Internal Reference #	Description
D-15227/ R-01626	Corrected document [994-0155] G100 Instruction Manual (V300 R1) to indicate that the DP port requires active DP to HDMI or active DP to DVI-D adapters. Passive adapters are not supported.

10.2.10 Hardware

None.

10.3 Known Issues

This MCP version has the following known issues:

10.3.1 Cyber Security

GE Vernova Internal Reference #	Description
D-14069	The MCP Settings GUI does not automatically log off after the inactivity timeout. It requires that the user click into the web page or hit refresh after the timeout occurs to trigger the Settings GUI to close the session. The mcpcfg utility will be locked out from use while the MCP Settings GUI session is open. If MCP Settings GUI was left open after the inactivity timeout has expired (maliciously or unintentionally), as a workaround, you can login and logout of the MCP Settings GUI in another browser to release the lockout of the mcpcfg utility.

For any additional known issues, please refer to Product & Cyber Security Advisories on the GE Vernova Grid Solutions web site.

10.3.2 Clients

GE Vernova Internal Reference #	Description
B-13475 D-09915	SEL Binary Client doesn't support Double Precision Scaling Factors.
D-05002	ARRM file retrieval from SEL 1xx/2xx relays (using GENASCII) is not possible.
D-12900	Alarm inhibits tag & Scan inhibit tags on DI point of D20 peripheral (S-card) is getting removed after failover in redundancy.
D-12834	Modbus Client could not process PRF events comes from SR 369 relay.
D-13075	D20A card in bad state can cause false behaviour/functionality when it is configured in warm or hot-hot redundancy.
D-13214	DNP3 Client doesn't support object types 31 and 33 for Frozen Analog Inputs (all variations).
D-14111	Cold Reboot Required DI (1) based on HDLC card faulty state will be reset on warm reboot also.

10.3.3 Servers

GE Vernova Internal Reference #	Description
D-12889 / B-16203	DNP DPA/Server takes high CPU if more than 5000 Analog Inputs are configured in Unbuffered mode.
B-11967	No support for events in NVRAM in IEC101/104 Server. Events that have not been yet transmitted to Master (Clients) are lost if G500 is power cycled / restarted. However – the integrity polls will continue to provide accurate database representation.

GE Vernova Internal Reference #	Description
B-11968	No support for events in NVRAM in DNP3 Server. Events that have not been yet transmitted to Master (Clients) are lost if G500 is power cycled / restarted. However – the integrity polls will continue to provide accurate database representation.
D-13134 / D-13135	RTS Post-amble time is not added to the data link confirm timeout or application timeout in DNP3 Serial Server.
D-12566	IEC101 DPA/Server in unbalanced mode sometimes reports duplicate Digital Input events to the Master if the event happens at the same time as General Interrogation response.
D-13996	IEC101/104 DPA buffer overflow DI events will be lost when set as discard newest.
D-13383	IEC 61850 Server does not report correct point values when both the digital points (Bit-1 and Bit-2) are 'ON' and will not recover until a new event occurs.
D-12567	The time sync accuracy of G100 when IEC101 Server (Unbalanced/Balanced) is used as a time sync source is > +/- 4 msec.
R-01651 / DCSSUP-24080 / DCSSUP - 23792	IEC 61850 Server does not update the quality of the points in a remote IEC61850 Client at startup
R-01668	DNP3 Server doesn't set IIN Local when DO "ForceControlsLockout" is ON.
R-01682/ DCSSUP-24417	DNP3 DPA is not setting the correct Local IIN bit "Digital Output in Local"
D-16253	Modbus Server writes the configured Offline Analog Value in both words of a 32 bit register. As long as 0 (zero) is used as configured Offline Analog Value there is no impact.

10.3.4 Automation

GE Vernova Internal Reference #	Description
D-05033	Suppressed quality through Input Point Suppression (IPS) application is not reported to Masters. DNP3 and IEC 101-104 Servers send Online Quality rather than the substituted/last reported quality when points are suppressed.
B-11969	DEM is responsible for handling alarms. Events/Alarms that have not been yet committed to the SQL database are lost if G500 is power cycled / restarted. However – the integrity polls will continue to provide accurate database representation.
DCSSUP-19948 / D-12000 / R-01430	Restore the last value for variables configured in LogicLinx wizard does not work at runtime (starts at 0 always).
D-14100	In MCP Runtime HMI, data points in 'Online Trends' do not display 'underscore (_)' in Point description even though it is there in the configuration.
D-13941	Control in progress DI pseudo point for GPIO DCA DO point is not getting high till pulse on +pulse off time when control command is getting executed on GPIO DCA DO point.

10.3.5 Configuration/Settings

GE Vernova Internal Reference #	Description
D-10502	NOT A DEFECT. If client applications are configured in non-redundant mode and later the device properties are switched to a redundant mode where some applications are not enabled - their respective points are still available to be mapped, but at runtime will be offline. This is to retain the mappings in case the user decides to switch later back to single mode and the client applications are active again, as previously configured.
D-10388	TACACS+ remote authentication can be enabled and activated even if the TACACS+ Server is not available in that moment. This will conduct to a device that can only be accessed using Emergency Access process, if TACACS+ server is not available.
D-06168	FPGA needs to be restarted via Power Cycle for PTP/IRIGB configuration change. No functional impact. PTP/IRIG-B configuration will not be applied without reboot of G500.
D-13028	Add more protection for memory leaks in Apache webserver settings.
D-13084	Need to remove unwanted text message displayed on the console when user tries to open mcpcfg/Settings GUI simultaneously in a particular scenario.
B-15613	The configuration through Bulk Editor is not supported for G500 after v2.10.
N/A	If filenames with characters other than ASCII are present in the MCP file system - the MCP device and associated configuration tools will not work correctly. Keep only ASCII characters in the filenames for Client Maps, Server Maps, OneLine .dra, OneLine Images, and other user files.

10.3.6 HMI

GE Vernova Internal Reference #	Description
B-15650	The following features of the Analog Report Viewer are not available: • View online reports • Save and view offline reports
B-14982	The product references in the Runtime (Local/Remote) HMI logs need to be changed as "MCP".
D-05463	If a used point group is deleted from the systemwide configuration then points belonging to that group are not visible in the point group summary. However, if user changes the point group allocation from the corresponding instantiated client map file(s) then points will be visible in the point group summary.

10.3.7 Pass-through

GE Vernova Internal Reference #	Description
D-12990	In LDAP authentication, after passthrough connection is timed out, auto logout event is not generated into user activity log by IEC 103 Client.

10.3.8 System

GE Vernova Internal Reference #	Description
E-04130	The USB FLASH drive used for the Firmware Upgrade must be FAT32 format. As a result of this, only USB FLASH drives of maximum 32 GB can be used. The minimum size, imposed by storage requirements, is 8 GB.
E-03041 D-10346	Input time source selection (PTP / IRIG-B / NTP) does not support dynamic failover between time sources at runtime. Only the configured time source is active at a time.
D-10227	Email does not send messages when an alarm is activated.
D-05714	Update of only Edge OS is not supported. If only Edge OS updates are required, the complete G500 firmware image needs to be updated.
D-06167	Full support for latest PTP power profiles: • IEEE C37.238-2017 • IEC61850-9-3 Ed.1 2016 Enhancement: G500 supports the following PTP profiles: • IEEE 1588-2008 J4 Peer-to-Peer Profile • IEEE C37.238-2011 Power System Profile (but this has been withdrawn) Limited IEC61850-9-3 Ed.1 2016 Power Utility Automation Profile.
D-12984	Daisy chained secondary monitor shows always duplicate monitor, but it does not show the extended desktop.
D-13083	Add support for progress bar to be displayed during "Applying update" procedure through Predix Edge Technician Console (PETC).
D-13039	When both G500's are power cycled at the same time and if switch panel configured as a master, then one of the G500 can go to the failed state. Note: If switch panel is configured as Master and one of the G500 is power cycled with a delay then this issue will not be observed.

10.3.9 Documentation

None.

10.3.10 Hardware

GE Vernova Internal Reference #	Description
D-06165	No functional impact. SFP Hot Plug in / Plug out detection. Points that represent the status of SFP IN/OUT will not be reflected until G500 is rebooted.

Capability and Capacity for MCP

This MCP version supports the following limits.

The maximum number of IEDs or Masters is total across all connections.

The maximum size of the system is given by whichever limit comes first (groups vs members, number of Connections vs IEDs, number of Master instances vs LRUs in the Master etc.). User is responsible to ensure resource usage limits are not exceeded at runtime. For tested performance levels, refer to Table 10.1 and Table 10.2.

The G500 4 cores system has a maximum of 500 IEDs, 200k points and 8 Masters (LRUs) unless otherwise restricted by system loading.

The G500 2 cores system has a maximum of 250 IEDs, 100k points and 8 Masters (LRUs) unless otherwise restricted by system loading.

The G100 system has a maximum of 120 IEDs, 24k points and 8 Masters (LRUs) unless otherwise restricted by system loading.

Tejas V Master/LRU instances are not counted as part of 8 Masters or LRUs calculations, both for 4 core and 2 core G500s and for G100.

Below are the limits for the Maximum number of Remote HMI sessions that can be connected simultaneously:

Application	G500 4-core	G500 2-core	G100
Remote HMI	8	4	2

Note: The Local HMI session and Online Editor session coming from DS Agile MCP Studio are not counted in the above-mentioned limits.

10.4 Application Limits

This G500 version supports the following application limits.

Application	Feature	Configuration Limits	
		G500	G100
Digital Event Manager	Alarms		
	Max Number of Alarm Groups	256	256
	Max number of members in an Alarm Group	1000	1000
Calculator	Expression Type		
	Evaluations	10000	10000
	Timers	1000	1000
	Analog Assignments	2000	2000
	Digital Assignments	10000	10000
	Quality Conversions	1000	1000
	Type Conversions	1000	1000
	Averages	1000	1000
	Output to Input Conversions	1000	1000

Application	Feature	Configuration Limits	
		G500	G100
Load Shed DTA	Number of Feeders and Zones		
	Max Zones	50	50
	Max Feeders	100	100
Analog Reports DTA	Analog Reports are not available starting with MCP V2.6 and newer	None	None
System Point Manager	Accumulator Freeze	250	250
	Analog Value Selection	250	250

Note 1: Indicates recommended value which can be exceeded with an increased level of event latency.

10.5 Performance Test Levels

This MCP version meets the following performance test levels.

- MCP Hardware under test:
 - o G500 4 core CPU / 16 GB RAM
 - o G500 2 core CPU / 8 GB RAM
 - o G100 8 GB RAM
- The following table(s) indicate the G500 4 core, G500 2 core and G100 values in different loading conditions.
- If the loading levels are lower, then the total number of IEDs and RTDB points can increase but no more than specified limits under the Capability and Capacity section above.

Requirement	Steady State Loading			Avalanche Loading		
	G500 (4 Core)	G500 (2 Core)	G100	G500 (4 Core)	G500 (2 Core)	G100
Loading Signal changes (continuously / sec)	AI-5,000 DI-100	AI-1200 DI-50	AI-1200 DI-12	DI-62500 AI-112500	DI-18750 AI-33750	All points changing twice in 2 secs
Number of connected IEDs	500	150	120	500	150	120
Total RTDB Point count	200,000	60,000	24,000	200,000	60,000	24,000
Points / IED DI/AI/DO/AO/ACC	400 125-DI, 225-AI, 20-DO, 20-AO & 10-Acc per IED	400 125-DI, 225-AI, 20-DO, 20-AO & 10-Acc per IED	400 125-DI, 225-AI, 20-DO, 20-AO & 10-Acc per IED	400 125-DI, 225-AI, 20-DO, 20-AO & 10-Acc per IED	400 125-DI, 225-AI, 20-DO, 20-AO & 10-Acc per IED	400 125-DI, 225-AI, 20-DO, 20-AO & 10-Acc per IED
Each Server has points	4 core: DI = 7812 i.e., = 125*500 / 8	2 core: DI = 4687 i.e., = 125*150 / 4	4 DI = 1875 i.e., = 125*60 / 4 AI = 3375 i.e., = 225*60 / 4	4 core: DI = 7812 i.e., = 125*500 / 8	2 core: DI = 4687 i.e., = 125*150 / 4	4 DI = 1875 i.e., = 125*60 / 4 AI = 3375 i.e., = 225*60 / 4

10.5.1 Performance Test Results

This MCP version provides the following performance capabilities when configured in different modes (Standalone / Hot-Hot Redundancy / Hot Standby Redundancy / Warm Standby Redundancy).

The performance of MCP is tested using the activity levels and configuration scenarios presented next:

Notes:

- The performance tests results in **Table 10.1** were determined in Hot-Hot redundancy mode. The results apply to Warm Standby, Hot Standby and Standalone modes.
- The Tejas V Server performance tests results in **Table 10.2** were determined in Standalone mode. The results apply to Warm Standby, Hot Standby and Hot-Hot redundancy modes, if a 4 core G500 is used.

10.5.2 Redundancy Fail Over Time

This MCP version supports below fail-over times (i.e., when active G500 / G100 is power cycled) in the Hot-Hot/Hybrid Redundancy with the default 300ms heart-beat rate and with default 3 retries.

Table 10.3: Hot-Hot Redundancy Fail Over Times

Hot-Hot Redundancy/D.20 Configuration	Maximum Fail-Over Time (msec)	
	G500	G100
D.20 is not configured	1250	1780
D.20 is configured	1450	1940

10.5.3 HMI Response Times

Under steady state loading conditions, this version of G500 provides the HMI response times listed in the below Table 10.4: User Interface Response Times – Steady State Normal Conditions.

Table 10.4: User Interface Response Times – Steady State Normal Conditions

Activity	G500 (4 Core)	G500 (2 Core)	G100
Screen Access (Point Summary) (Min, Max, Median) sec	2, 2.6, 2.1 sec	1.5, 5.3, 1.9 sec	0.9, 1.7, 1.4 sec
Screen Access (One-Line Viewer) (Min, Max, Median) sec	9 sec	54 sec	14 sec
System Logs (Min, Max, Median) sec	1.9, 2.7, 1.9 sec	4.9, 12.1, 5.9 sec	3.1, 3.9, 3.1 sec
Alarm ACK Delay (Single Alarm)	3 sec	< 1 sec	< 1 sec
Alarm ACK Delay (20,000 Alarms)	< 1 sec	16 sec	6 sec
DI/AI Update to Point Summary Screen	< 1 sec	< 1 sec	< 1 sec

NOTE: Under heavy loading conditions, the control latency was measured by simulating one control in every 5 seconds continuously from the Master station.

Screen Access time was measured in heavy loading condition.

Time Sync Accuracy (PTP/IRIG-B/NTP)

This MCP version supports Hardware based PTP/IRIG-B and Software based NTP Time Sync Accuracy.

This version does not support runtime dynamic failover across different time sources.

Time Sync Input	Accuracy	
	G500	G100
IRIG-B IN	100% samples within 945 microseconds with an average of 39 microseconds and standard deviation of 28 microseconds - Total number of samples considered ~3507	100% samples within 866 microseconds with an average of 90 microseconds and standard deviation of 76 microseconds - Total number of samples considered ~3758
PTP IN	100% samples within 693 microseconds with an average of 40 microseconds and standard deviation of 31 microseconds - Total number of samples considered ~3457	NA
NTP IN	100% samples within 1065 microseconds with an average of 437 microseconds and standard deviation of 216 microseconds - Total number of samples considered ~3614	100% samples within 867 microseconds with an average of 92 microseconds and standard deviation of 81 microseconds - Total number of samples considered ~3259

NOTES:

- IRIG-B/ PTP time accuracy is measured in a scenario where the hardware is fully loaded.

Timestamp Accuracy

This MCP version provides the following Timestamp Accuracy.

Protocol	Accuracy	
	% @ N = % of samples within +/- N milliseconds	
	G500	G100
D.20 HDLC	99.92% @ 1 ms 100% @ 2 ms - Total number of samples considered ~18,000 - Measured the accuracy for every five seconds at a D.20 S peripheral	98.32% @ 1 ms 99.96% @ 2 ms 100% @ 3 ms - Total number of samples considered ~33,000 - Measured the accuracy for every five seconds at a D.20 S peripheral
GPIO	NA	96.5% @ 1 ms 99.92% @ 2 ms 100% @ 3 ms - Total number of samples considered ~33,000 - Measured the accuracy for every five seconds at the GPIO
DNP I/O	83.33% @ 1 ms 99.82% @ 2 ms 99.86% @ 3 ms 100% @ 4 ms	3.4% @ 1 ms 80.14% @ 2 ms 96.15% @ 3ms 99.16% @ 4 ms 99.88% @ 5 ms

Protocol	Accuracy	
	% @ N = % of samples within +/- N milliseconds	
	G500	G100
	- Total number of samples considered ~16476 - Measured the accuracy for every five seconds at a DNP I/O S peripheral	100% @ 6 ms - Total number of samples considered ~11790 - Measured the accuracy for every five seconds at a DNP I/O S peripheral

Application List

This MCP version has the following applications available depending on configured redundancy mode.

Application	Support in Standalone	Support in Hot-Hot/Hybrid	Support in Warm Standby	Support in Hot Standby
Runtime HMI	✓ Available	✓ Available	✓ Available	✓ Available
One-Line Viewer	✓ Available	✓ Available	✓ Available	✓ Available

11. Version 4.00 (12-April-2024)

Software Versions

The following table defines the software versions required for interaction with the MCP.

Package	Version	Notes
G500 Firmware	4.0.320	G500 Firmware Version.
G100 Firmware	4.0.320	G100 Firmware Version.
DS Agile MCP Studio	4.0.0	Minimum Supported DS Agile MCP Studio Software.
MCP HMI Viewer	4.0.320	Supported MCP HMI 64-bit Software.
MCP Utilities	1.1.16	Minimum Supported MCP Firmware Upgrade Utilities.
IEC61850 CID Tool	8.0.8	Minimum Supported CID configuration tool for automatically creating IEC 61850 Server map files.

Predix Edge OS and Other Firmware Versions

The following table defines the package/firmware versions supported for Predix Edge Linux OS, FPGA, CPLD, UEFI and BCOM FPGA in this MCP version.

Package/Firmware	G100 Version	G500 Version	Notes
Predix Edge OS RT	2.9.0	2.9.0	Supported GE's Secured Linux Operating System Version.
FPGA	NA	1.03.00	Supported FPGA Version of Multi-Function Controller Platform (MCP).
CPLD	NA	1.2.3	Supported CPLD Version of Multi-Function Controller Platform (MCP).
UEFI	FLEBG100A00006V107	VX5D0007.C01	Supported UEFI Version of Multi-Function Controller Platform (MCP).
BCOM FPGA	NA	2.3.0 or 2.4.0	Supported COM's Module FPGA Version of Multi-Function Controller Platform (MCP).
D2X	NA	SMXA0.400.0006	General release.

Limitations for D2x Functionality

D2x has an associated Environment Type in the G500 which is equivalent to a hardware based CPU Board.

Type SMC-0001-11 ("G500-D20 Environment, RAM only, single partition, max 7 serial ports") is the one released with G500 v4.00. This type has the following characteristics and limitations:

Only D2x configurations equivalent to Single Node D20/D200 or Single Partition D20MX are supported. Configurations using Multiple Nodes D200 or Multiple Partitions D20MX are not supported unless are first scaled down to a single node / partition.

G500 cannot use the exact same D20 Firmware from D20 based RTUs (SABxxxx or SANxxxx). The D2x Firmware running in G500 is specific to MCP platform (is similar to a CCU Base D20ME firmware but uses different applications). Existing configurations will go through a D2x Firmware Upgrade process for G500.

NVRAM is not available in G500 as D2x RTU – even if D2x application settings are configured for NVRAM. This applies also to "Save Points on Power Fail" not being possible.

Only COM1 to COM7 are available to D2x applications (same as in a single board D20 CPU).

Devices configured for Function "D" and with Device Redundancy Enabled – must have their configuration deployed separately from DSAS, the WESMAINT DATABASE SYNC is not operational.

Time sync of DNP3 outstations using DNP3 DCA (B023-0) has a time accuracy jitter of up to 60 msec, therefore should be avoided and outstations obtain their own time synch where possible.

If changing or reloading D2x configuration while in "sa com" in 68k shell - the D2X doesn't start again. Requires reboot of the G500 and then deploy again the D2x configuration using "d2xload" command or "sync to" (D-16780).

Key Functions and Changes

Added support to run MCP and D2X applications in G500 as configurable **Functions** (in DSAS > Device Properties > Edit)

- **Function S:** MCP only, no D2X (this is the MCP application similar to previous MCP versions)
- **Function D:** D2X only, no MCP (this runs only D2X applications, equivalent to D20 RTU)
- **Function C:** MCP and D2X at same time (only in G500 AMD 4 cores)

SMXA0.400 is the general release D2x Firmware version.

11.1 Enhancements

11.1.1 Cyber Security

Please refer to Product & Cyber Security Advisories on the GE Vernova Grid Solutions web site.

11.1.2 Clients

GE Vernova Internal Reference #	Description
B-17858	Updated the new default values for some parameters in IEC 60870-5-103 DCA Application Parameters and Device Properties.

11.1.3 Servers

None.

11.1.4 Automation

None.

11.1.5 Configuration/Settings

GE Vernova Internal Reference #	Description
E-05145	Updated “mcpcfg” utility and Settings GUI to add support for D2x functions.
B-18097	Added support to MCP Utilities to prevent restoring a snapshot for an MCP/D2x device to a dual core unit.

11.1.6 HMI

None.

11.1.7 Pass-through

None.

11.1.8 System

GE Vernova Internal Reference #	Description
E-05126	Upgraded MCP to Edge OS 2.9.0.
E-04823	Emulated 68K in Edge OS.
E-05062	Updated Real Time kernel extensions for MCP.
E-05133	Changed existing license name from D2x Legacy to TEJAS V Server.
B-17671	Added MCP hardware identifier into the output of the command “mcpsi”.
E-05221	Updated MCP licensing to add support for D2x licenses.
E-04956	Updated MCP ordering SKU to allow users to order the MCP with D2x functions.
E-05159	Updated MCP redundancy to consolidate redundancy types.
E-04821 / E-05219 / E-05070	Added support to run D2X applications in MCP.

11.1.9 Documentation

GE Vernova Internal Reference #	Description
E-05164	Updated document [MIS-0109] MCP Firmware Release Notes (V400 R0) with Max number of HMI sessions allowed under Capability and Capacity and to Indicate limitations of D2X function.
E-05179	Updated document [SWM0101] MCP Software Configuration Guide (V400 R0) with a new Chapter for D2X configuration and operation, new defaults for IEC 60870-5-103 Application Parameters, MCP Redundancy consolidation, changing the license name from "D2X Legacy" to "Tejas V Server", inserting a new section for D2X RTU, D2X Licensing information, model number changes, serial ports and Net being used in D2X, updating HAMA Power Supply AI values, statements when Reset Database Tables actions are required.
E-05230	Updated document [SWM0106] G500 Substation Gateway Quick Start Guide (V400 R0) with D2X licensing information and changing the license name from "D2X Legacy" to "Tejas V Server".
E-05245	Updated document [SWM0116] G100 Substation Gateway Quick Start Guide (V400 R0) with D2X licensing information and changing the license name from "D2X Legacy" to "Tejas V Server".
E-05232	Updated document [994-0152] G500 Substation Gateway Instruction Manual for V400 release (V400 R0) with D2X wiring, serial ports required in D2X mode, updating order codes, redundancy consolidation, changing the license name from "D2X Legacy" to "Tejas V Server", D2X function with RS 232 switch panel, Manufacturer P/N for the D.20 HDLC connector, clarifications for Status 1 LED and Alarm Relay.
E-05271	Updated document [994-0155] G100 Substation Gateway Instruction Manual for V400 release (V400 R0) with updating order codes, redundancy consolidation, changing the license name from "D2X Legacy" to "Tejas V Server", D2X function with RS 232 switch panel, D.20 topologies for redundant G100, Manufacturer P/N for the D.20 HDLC connector.
E-05298	Created document [994-0153] MCP Binder and ISO Image (V400 R0).
E-05277	Updated document [B012-0SCG] IIRIG-B DCA Configuration Guide (V300 R0).
E-05278	Updated document [B099-0SCG] SNTP Client DTA Configuration Guide (V200 R0).
E-05233	Updated help file content in DSAS online/offline editor with D2X licensing and MCP redundancy consolidation.
E-05234	Update help file in MCP Runtime HMI with redundancy consolidation and Runtime HMI availability when function D is selected.
B-17752	Updated new GE Vernova Logo in to all the GE release documents.
B-18100	Updated document [MIS-0110] Open Source License Information (V400 R0).
E-05339	Updated document [SWM0105] G500 Secure Deployment User Guide (V400 R0).

11.1.10 Hardware

None.

11.2 Fixed defects

This version of MCP has the fixes for the following defects compared to MCP version 310.

11.2.1 Cyber Security

Please refer to Product & Cyber Security Advisories on the GE Vernova Grid Solutions web site.

11.2.2 Clients

None.

11.2.3 Servers

GE Vernova Internal Reference #	Description
R-01686 / DCSSUP-24492	Fixed the issue in DNP DPA, where Master Address is ignored when Application Parameters are set to Use Default.
R-01677 / DCSSUP-24274	Fixed the issue related to IEC61850 Server not running after upgrade of configuration to v3.10 and with IEC 61850 server already enabled. Service Update provided for firmware version 3.10

11.2.4 Automation

GE Vernova Internal Reference #	Description
R-01665 / DCSSUP-024198	Fixed the issue in ARRM application, where ARRM shows up as Failed in System Status when it is not even configured.

11.2.5 Configuration/Settings

None.

11.2.6 HMI

GE Vernova Internal Reference #	Description
D-15511	Fixed the issue in HMI – Points Details – HAMA, where the power supply text points are not updating on the fly (e.g., when one wasn't present at boot up and you insert it later) resulting in the power supply status showing Invalid (6).

GE Vernova Internal Reference #	Description
D-15380	Fixed the issue in HMI – Points Details – HAMA, where the DI point for power supply does not turn off when power lost.

11.2.7 Pass-through

None.

11.2.8 System

GE Vernova Internal Reference #	Description
D-15432	Fixed the issue in “swlic-batch” script, where the script comes back with “No batch files found: batch.lic” even when the mounted USB contains a good and valid “batch.lic” file.

11.2.9 Documentation

GE Vernova Internal Reference #	Description
D-15827	Corrected document [994-0152] G500 Instruction Manual (V310 R0) to demonstrate the correct connection of D.20 link for G500B in the diagram of “Single D.20 link with redundant G500” and “Single D.20 link, redundant LAN with redundant G500”.
D-15828	Corrected document [994-0155] G100 Instruction Manual (V310 R0) to indicate the maxim power ratings for D.20 Power.
R-01678	Updated the Capability and Capacity section of the document MIS-0109 MCP Firmware Release Notes as new V310 R1 to clarify maximum number of HMI sessions allowed.
R-01666 / DCSSUP-24173	Corrected the document [SWM0101] MCP Software Configuration Guide (V400 R0) to update the HAMA AI point values.

11.2.10 Hardware

None.

11.3 Known Issues

This MCP version has the following known issues:

11.3.1 Cyber Security

GE Vernova Internal Reference #	Description
D-14069	The MCP Settings GUI does not automatically log off after the inactivity timeout. It requires that the user click into the web page or hit refresh after the timeout occurs to trigger the Settings GUI to close the session. The mcpcfg utility will be locked out from use while the MCP Settings GUI session is open. If MCP Settings GUI was left open after the inactivity timeout has expired (maliciously or unintentionally), as a workaround, you can login and logout of the MCP Settings GUI in another browser to release the lockout of the mcpcfg utility.

For any additional known issues, please refer to Product & Cyber Security Advisories on the GE Vernova Grid Solutions web site.

11.3.2 Clients

GE Vernova Internal Reference #	Description
B-13475 D-09915	SEL Binary Client doesn't support Double Precision Scaling Factors.
D-05002	ARRM file retrieval from SEL 1xx/2xx relays (using GENASCII) is not possible.
D-12900	Alarm inhibits tag & Scan inhibit tags on DI point of D20 peripheral (S-card) is getting removed after failover in redundancy.
D-12834	Modbus Client could not process PRF events comes from SR 369 relay.
D-13075	D20A card in bad state can cause false behaviour/functionality when it is configured in warm or hot-hot redundancy.
D-13214	DNP3 Client doesn't support object types 31 and 33 for Frozen Analog Inputs (all variations).
D-14111	Cold Reboot Required DI (1) based on HDLC card faulty state will be reset on warm reboot also.
D-15320	With Auto Time Sync enabled, IEC103 DCA does not automatically perform a time sync when there is a change in local time.

11.3.3 Servers

GE Vernova Internal Reference #	Description
D-12889 / B-16203	DNP DPA/Server takes high CPU if more than 5000 Analog Inputs are configured in Unbuffered mode.

GE Vernova Internal Reference #	Description
B-11967	No support for events in NVRAM in IEC101/104 Server. Events that have not been yet transmitted to Master (Clients) are lost if G500 is power cycled / restarted. However – the integrity polls will continue to provide accurate database representation.
B-11968	No support for events in NVRAM in DNP3 Server. Events that have not been yet transmitted to Master (Clients) are lost if G500 is power cycled / restarted. However – the integrity polls will continue to provide accurate database representation.
D-13134 / D-13135	RTS Post-amble time is not added to the data link confirm timeout or application timeout in DNP3 Serial Server.
D-12566	IEC101 DPA/Server in unbalanced mode sometimes reports duplicate Digital Input events to the Master if the event happens at the same time as General Interrogation response.
D-13996	IEC101/104 DPA buffer overflow DI events will be lost when set as discard newest.
D-13383	IEC 61850 Server does not report correct point values when both the digital points (Bit-1 and Bit-2) are 'ON' and will not recover until a new event occurs.
D-12567	The time sync accuracy of G100 when IEC101 Server (Unbalanced/Balanced) is used as a time sync source is > +/- 4 msec.
D-15288	G500 time synch from serial masters (IEC101, DNP3) relies on the regular crystal clock (Linux clock) which drifts and is inaccurate.
R-01651 / DCSSUP-24080 / DCSSUP - 23792	IEC 61850 Server does not update the quality of the points in a remote IEC61850 Client at startup
R-01668	DNP3 Server doesn't set IIN Local when DO "ForceControlsLockout" is ON.
R-01682/ DCSSUP-24417	DNP3 DPA is not setting the correct Local IIN bit "Digital Output in Local"
D-16253	Modbus Server writes the configured Offline Analog Value in both words of a 32 bit register. As long as 0 (zero) is used as configured Offline Analog Value there is no impact.
N/A	In MCP-D2X MODBUS DPA (A068) > Port Configuration: for RS485-2 wires ports the "Modem Used" parameter must be set to "RTS Only".

11.3.4 Automation

GE Vernova Internal Reference #	Description
D-05033	Suppressed quality through Input Point Suppression (IPS) application is not reported to Masters. DNP3 and IEC 101-104 Servers send Online Quality rather than the substituted/last reported quality when points are suppressed.

GE Vernova Internal Reference #	Description
B-11969	DEM is responsible for handling alarms. Events/Alarms that have not been yet committed to the SQL database are lost if G500 is power cycled / restarted. However – the integrity polls will continue to provide accurate database representation.
DCSSUP-19948 / D-12000 / R-01430	Restore the last value for variables configured in LogicLin wizard does not work at runtime (starts at 0 always).
D-14100	In MCP Runtime HMI, data points in 'Online Trends' do not display 'underscore (_)' in Point description even though it is there in the configuration.
D-13941	Control in progress DI pseudo point for GPIO DCA DO point is not getting high till pulse on +pulse off time when control command is getting executed on GPIO DCA DO point.
R-01654 / DCSSUP-23785	LogicLin ITC application fails when using an Internal Transition counter.

11.3.5 Configuration/Settings

GE Vernova Internal Reference #	Description
D-10502	NOT A DEFECT. If client applications are configured in non-redundant mode and later the device properties are switched to a redundant mode where some applications are not enabled - their respective points are still available to be mapped, but at runtime will be offline. This is to retain the mappings in case the user decides to switch later back to single mode and the client applications are active again, as previously configured.
D-10388	TACACS+ remote authentication can be enabled and activated even if the TACACS+ Server is not available in that moment. This will conduct to a device that can only be accessed using Emergency Access process, if TACACS+ server is not available.
D-06168	FPGA needs to be restarted via Power Cycle for PTP/IRIGB configuration change. No functional impact. PTP/IRIG-B configuration will not be applied without reboot of G500.
D-13028	Add more protection for memory leaks in Apache webserver settings.
D-13084	Need to remove unwanted text message displayed on the console when user tries to open mcpcfg/Settings GUI simultaneously in a particular scenario.
B-15613	The configuration through Bulk Editor is not supported for G500 after v2.10.
N/A	If filenames with characters other than ASCII are present in the MCP file system - the MCP device and associated configuration tools will not work correctly. Keep only ASCII characters in the filenames for Client Maps, Server Maps, OneLine .dra, OneLine Images, and other user files.

11.3.6 HMI

GE Vernova Internal Reference #	Description
B-15650	The following features of the Analog Report Viewer are not available: View online reports Save and view offline reports
B-14982	The product references in the Runtime (Local/Remote) HMI logs need to be changed as "MCP".
D-05463	If a used point group is deleted from the systemwide configuration, then points belonging to that group are not visible in the point group summary. However, if user changes the point group allocation from the corresponding instantiated client map file(s) then points will be visible in the point group summary.
D-15869	D2x Wesmaint Screen over network (d2xcon) is getting locked in a case when up and down arrow is continually pressed to navigate.

11.3.7 Pass-through

GE Vernova Internal Reference #	Description
D-12990	In LDAP authentication, after passthrough connection is timed out, auto logout event is not generated into user activity log by IEC 103 Client.

11.3.8 System

GE Vernova Internal Reference #	Description
E-04130	The USB FLASH drive used for the Firmware Upgrade must be FAT32 format. As a result of this, only USB FLASH drives of maximum 32 GB can be used. The minimum size, imposed by storage requirements, is 8 GB.
E-03041 D-10346	Input time source selection (PTP / IRIG-B / NTP) does not support dynamic failover between time sources at runtime. Only the configured time source is active at a time.
D-10227	Email does not send messages when an alarm is activated.
D-05714	Update of only Edge OS is not supported. If only Edge OS updates are required, the complete G500 firmware image needs to be updated.

GE Vernova Internal Reference #	Description
D-06167	Full support for latest PTP power profiles: • IEEE C37.238-2017 • IEC61850-9-3 Ed.1 2016 Enhancement: G500 supports the following PTP profiles: • IEEE 1588-2008 J4 Peer-to-Peer Profile • IEEE C37.238-2011 Power System Profile (but this has been withdrawn) Limited IEC61850-9-3 Ed.1 2016 Power Utility Automation Profile.
D-12984	Daisy chained secondary monitor shows always duplicate monitor, but it does not show the extended desktop.
D-13083	Add support for progress bar to be displayed during "Applying update" procedure through Predix Edge Technician Console (PETC).
D-13039	When both G500's are power cycled at the same time and if switch panel configured as a master, then one of the G500 can go to the failed state. Note: If switch panel is configured as Master and one of the G500 is power cycled with a delay then this issue will not be observed.
D-15745	Incorrect subnets overlap checks when DHCP is enabled on any of the Network Interfaces

11.3.9 Documentation

None.

11.3.10 Hardware

GE Vernova Internal Reference #	Description
D-06165	No functional impact. SFP Hot Plug in / Plug out detection. Points that represent the status of SFP IN/OUT will not be reflected until G500 is rebooted.

Capability and Capacity for MCP

This MCP version supports the following limits when configured in Function S (MCP only).

Functions D (D2X) and C (MCP and D2X) offer infinite configuration scenarios. Due to this vast configurability, comprehensive limit testing for Functions D and C is impracticable. Users are advised to consult additional D2X documentation or guidelines for the optimal configuration and usage of Functions D and C. The maximum number of IEDs or Masters is total across all connections.

The maximum size of the system is given by whichever limit comes first (groups vs members, number of Connections vs IEDs, number of Master instances vs LRUs in the Master etc.). User is responsible to ensure resource usage limits are not exceeded at runtime. For tested performance levels, refer to Table 11.1 and Table 11.2.

The G500 4 cores system has a maximum of 500 IEDs, 200k points and 8 Masters (LRUs) unless otherwise restricted by system loading.

The G500 4 cores system can have MCP and D2X enabled at same time (Function C), in which case the capability limits and performance test configuration are reduced by approximately 50% (half).

The G500 2 cores system has a maximum of 250 IEDs, 100k points and 8 Masters (LRUs) unless otherwise restricted by system loading.

The G100 system has a maximum of 120 IEDs, 24k points and 8 Masters (LRUs) unless otherwise restricted by system loading.

Tejas V Master/LRU instances are not counted as part of 8 Masters or LRUs calculations, both for 4 core and 2 core G500s and for G100.

Below are the limits for the Maximum number of Remote HMI sessions that can be connected simultaneously:

Application	G500 4-core	G500 2-core	G100
Remote HMI	8	4	2

Note: The Local HMI session and Online Editor session coming from DS Agile MCP Studio are not counted in the above-mentioned limits.

11.4 Application Limits

This G500 version supports the following application limits.

Application	Feature	Configuration Limits	
		G500	G100
Digital Event Manager	Alarms		
	Max Number of Alarm Groups	256	256
	Max number of members in an Alarm Group	1000	1000
Calculator	Expression Type		
	Evaluations	10000	10000
	Timers	1000	1000
	Analog Assignments	2000	2000
	Digital Assignments	10000	10000
	Quality Conversions	1000	1000

Application	Feature	Configuration Limits	
		G500	G100
	Type Conversions	1000	1000
	Averages	1000	1000
	Output to Input Conversions	1000	1000
Load Shed DTA	Number of Feeders and Zones		
	Max Zones	50	50
	Max Feeders	100	100
Analog Reports DTA	Analog Reports are not available starting with MCP V2.6 and newer	None	None
System Point Manager	Accumulator Freeze	250	250
	Analog Value Selection	250	250
	Control Lockout		
	• Remote Groups	8	8
	• Local Groups	10000	10000
	Double Points	1000	1000
	Input Point Suppression	10000	10000
	Control in Progress	256	256
	Redundant I/O	10000	10000
Analog Data Logger	Continuous Reports	1000	1000
	Periodic Reports	1000	1000
	Out of Range Reports	1000	1000
VPN Server	Number of VPN Clients	8	8
	Number of VPN Server Instances	1	1
SCADA – No. of Client or Server <u>connections</u> (Serial/Network/D.20)	Serial IED Connections		
	[Note: Total number of serial connections are limited by maximum number of physical and virtual serial ports (150)]		
	DNP Multidrop	80	80
	DNP Multidrop (Modem)	80	80
	Generic ASCII	80	80
	SEL Binary IED	80	80
	IEC 60870-5-101 Multidrop	80	80
	IEC60870-5-103 Multidrop	80	80
	Modbus Multidrop	80	80
	D.20	1	1
	Network IED Connections		
	DNP3 TCP	50	50

Application	Feature	Configuration Limits	
		G500	G100
	Modbus TCP/Modbus TCP-SSH	50	50
	IEC60870-5 104	50	50
	IEC61850	Calculated by Loader based on system size	Calculated by Loader based on system size
	SNMP	1	1
	Serial Master Connections		
	DNP3 Serial Master	8	8
	IEC 60870-5-101 Master	8	8
	Modbus Serial Master	8	8
	Network Master Connections		
	DNP3 Network Master	8	8
	IEC 60870-5-104 Master	8	8
	Modbus Network Master	8	8
	IEC 61850 Server	8	8
SCADA - No. of IEDs or Master station LRUs in each connection	Serial /Network IEDs		
	IEC60870-5-103 Multidrop	255	255
	DNP3 Multidrop/Network	10 (Note 1)	10 (Note 1)
	Modbus Multidrop/TCP	20 (Note 1)	20 (Note 1)
	IEC60870-5 101 Multidrop	1000	1000
	IEC60870-5 104	10 (Note 1)	10 (Note 1)
	SNMP Client	100	100
	GenASCII Client	120	120
	IEC61850 Client	Calculated by Loader based on system size (maximum 500 in total)	Calculated by Loader based on system size (maximum 120 in total)
	SEL Binary Client	1	1
	D.20 Client	120	120
	Serial/Network Masters		
	DNP3 Serial Master	8	8
	Modbus Serial Master	8	8
	IEC 60870-1 101 Master	8	8

Application	Feature	Configuration Limits	
		G500	G100
	Tejas V Master	The maximum number of LRUs is 99 per serial port, regardless of 2/4 cores.	The maximum number of LRUs is 99 per serial port
	DNP3 TCP Master	1	1
	Modbus TCP Master	1	1
	IEC 60870-1 104 Master	1	1
	IEC 61850 Server (This is number of maximum concurrent IEC 61850 Clients for same Server Instance / LRU in CID file)	3	3

Note 1: Indicates recommended value which can be exceeded with an increased level of event latency.

11.5 Performance

This MCP version meets the following performance test levels.

- MCP Hardware under test:
 - o G500 4 core CPU / 16 GB RAM
 - o G500 2 core CPU / 8 GB RAM
 - o G100 8 GB RAM
- The following sections indicate the G500 4 core, G500 2 core and G100 values in different loading conditions.
- If the loading levels are lower, then the total number of IEDs and RTDB points can increase but no more than specified limits under the Capability and Capacity section above.

11.5.1 Performance Test Levels and Results

This MCP version provides the following performance capabilities when configured in different modes (Standalone and Hot-Hot Redundancy).

The performance of MCP was tested using the activity levels and configuration scenarios presented next:

Note:

- To see the performance tests results which were performed before V4.0 release, refer to the tables: Table 10.1 and Table 10.2.
- Performance test results in MCP Standalone mode for V4.0 release are in **Table 11.1**.
“NA” indicates a specific test and combination that was not performed in V4.0.

Table 11.1: Performance Test Results in Standalone Mode

Firmware Version	G500 V4.0	G500 V4.0	G100 V4.0	G100 V4.0
Standalone Activity	Multi-protocol	Multi-protocol	Multi-Protocol	IEC 61850

Event latency in (msecs) Min, Max, Median	100.99, 363.182, 210.003
Control latency in (msecs) Min, Max, Median	11.951, 125.195, 24.427

11.5.2 Redundancy Fail Over Time

This MCP version supports below fail-over times (i.e., when active G500 / G100 is power cycled) in the Hot-Hot/Hybrid Redundancy with the default 300ms heart-beat rate and with default 3 retries.

Table 11.3: Hot-Hot Redundancy Fail Over Times

Hot-Hot Redundancy/D.20 Configuration	Maximum Fail-Over Time (msec)	
	G500	G100
D.20 is not configured	1250	1780
D.20 is configured	1450	1940

11.5.3 HMI Response Times

HMI Response Times were not tested in V4.00 – but are expected to be similar to V3.10. Please refer to [HMI Response Times](#) section.

Time Sync Accuracy (PTP/IRIG-B/NTP)

This MCP version supports Hardware based PTP/IRIG-B and Software based NTP Time Sync Accuracy.

This version does not support runtime dynamic failover across different time sources.

Time Sync Input	Accuracy	
	G500	G100
IRIG-B IN (G100 tested in V3.10)	100% samples within 991 microseconds with an average of 51 microseconds and standard deviation of 37 microseconds - Total number of samples considered ~4989	100% samples within 866 microseconds with an average of 90 microseconds and standard deviation of 76 microseconds - Total number of samples considered ~3758
PTP IN (tested in V3.10)	100% samples within 693 microseconds with an average of 40 microseconds and standard deviation of 31 microseconds - Total number of samples considered ~3457	NA
NTP IN (tested in V3.10)	100% samples within 700 microseconds with an average of 192 microseconds and standard deviation of 75 microseconds - Total number of samples considered ~3889	100% samples within 867 microseconds with an average of 92 microseconds and standard deviation of 81 microseconds - Total number of samples considered ~3259

NOTES:

- IRIG-B / PTP time accuracy is measured in a scenario where the hardware is fully loaded.

Timestamp Accuracy

This MCP version provides the following Timestamp Accuracy.

Protocol	Accuracy				
	% @ N = % of samples within +/- N milliseconds				
	G500			G500	G100
	Time sync source (IRIG-B)			Time sync source (DNP3 Serial IN)	Time sync source (DNP3 Serial IN)
	MCP Container (2 Core) Function Type-S	D2x Container (2 Core) Function Type-D	D2x Container (4 Core) Function Type-C	MCP Container (2 Core) Function Type-S	MCP Container Function Type-S
D.20 HDLC	98% @ +/- 4 ms - Total number of samples considered ~8000 - Measured the accuracy for every second at a D.20 S peripheral	98.7% @ +/- 4 ms - Total number of samples considered ~8627 - Measured the accuracy for every second at a D.20 S peripheral	99.94% @ +/- 2 ms 100% @ +/- 3 ms - Total number of samples considered ~5149 - Measured the accuracy for every second at a D.20 S peripheral	90.04% @ +/- 2 ms 97.39% @ +/- 3 ms - Total number of samples considered ~6388 - Measured the accuracy for every second at a D.20 S peripheral	57.99% @ +/- 2 ms 72.14% @ +/- 3 ms - Total number of samples considered ~6525 - Measured the accuracy for every second at a D.20 S peripheral
GPIO	NA	NA	NA	NA	96.5% @ 1 ms 99.92% @ 2 ms 100% @ 3 ms - Total number of samples considered ~33,000 - Measured the accuracy for every five seconds at the GPIO

Protocol	Accuracy				
	% @ N = % of samples within +/- N milliseconds				
	G500 Time sync source (IRIG-B)			G500 Time sync source (DNP3 Serial IN)	G100 Time sync source (DNP3 Serial IN)
	MCP Container (2 Core) Function Type-S	D2x Container (2 Core) Function Type-D	D2x Container (4 Core) Function Type-C	MCP Container (2 Core) Function Type-S	MCP Container Function Type-S
DNP I/O (tested in V3.10)	83.33% @ 1 ms 99.82% @ 2 ms 99.86% @ 3 ms 100% @ 4 ms - Total number of samples considered ~16476 - Measured the accuracy for every five seconds at a DNP I/O S peripheral	Test results not available	Test results not available	Test results not available	3.4% @ 1 ms 80.14% @ 2 ms 96.15% @ 3ms 99.16% @ 4 ms 99.88% @ 5 ms 100% @ 6 ms - Total number of samples considered ~11790 - Measured the accuracy for every five seconds at a DNP I/O S peripheral

Timestamp Accuracy in IEDs when MCP is syncing time over SCADA protocol

Notes:

- MCP device is receiving time via time sync when the source is IRIG-B.
- MCP device is sending time to downstream IEDs over SCADA protocol.

Time Sync Output	Accuracy		
	% @ N = % of samples within +/- N milliseconds		
	G500 (2 core)	(G500 4 core)	G100
	MCP Container (2 Core) Function Type-S	MCP Container (4 Core) Function Type-C	MCP Container Function Type-S
DNP3 Serial (DNP DCA)	• 97.65% @ +/- 2 ms • 100% @ +/- 3 ms • Total number of samples considered ~6499 • Measured the accuracy for every second at a D.20 S peripheral	• 85.79% @ +/- 1 ms • 99.95% @ +/- 2 ms • 100% @ +/- 3 ms • Total number of samples considered ~6501 • Measured the accuracy for every second at a D.20 S peripheral	• 99.21% @ +/- 2 ms • 100% @ +/- 3 ms • Total number of samples considered ~4781 • Measured the accuracy for every second at a D.20 S peripheral

Application List

This MCP version has the following applications available depending on configured redundancy mode.

12. Version 4.10 (08-October-2024)

Software Versions

The following table defines the software versions required for interaction with the MCP.

Package	Version	Notes
G500 Firmware	4.1.231	G500 Firmware Version.
G100 Firmware	4.1.231	G100 Firmware Version.
DS Agile MCP Studio	4.1.0	Minimum Supported DS Agile MCP Studio Software.
MCP HMI Viewer	4.1.231	Supported MCP HMI 64-bit Software.
MCP Utilities	1.1.20	Minimum Supported MCP Firmware Upgrade Utilities.
IEC61850 CID Tool	8.1.1	Minimum Supported CID configuration tool for automatically creating IEC 61850 Server map files.

Cross Compatibility Versions

The following table defines the compatibility between G500 firmware versions and SMX firmware versions.

Compatibility	G500 ≤ v3.10 (C1)	G500 v4.00 (D0)	G500 v4.10 (D1)
SMXnn.400 (RAM only, should not be used)	N	Y	Y
SMXnn.401	N	Y	Y
SMXnn.410	N	N	Y

Predix Edge OS and Other Firmware Versions

The following table defines the package/firmware versions supported for Predix Edge Linux OS, FPGA, CPLD, UEFI and BCOM FPGA in this MCP version.

Package/Firmware	G100 Version	G500 Version	Notes
Predix Edge OS	2.9.0	2.9.0	Supported GE's Secured Linux Operating System Version.
FPGA	NA	1.03.00	Supported FPGA Version of Multi-Function Controller Platform (MCP).
CPLD	NA	1.2.3	Supported CPLD Version of Multi-Function Controller Platform (MCP).
UEFI	FLEBG100A00006V107	VX5D0007.C01	Supported UEFI Version of Multi-Function Controller Platform (MCP).

Package/Firmware	G100 Version	G500 Version	Notes
BCOM FPGA	NA	2.3.0 or 2.4.0	Supported COM's Module FPGA Version of Multi-Function Controller Platform (MCP).
D2X	NA	SMXA0.410.0004	General release.

Specific G500 D2x Characteristics and Limitations:

D2x has an associated Environment Type in the G500 which is equivalent to a hardware based CPU Board.

Only D2x configurations equivalent to Single Node D20/D200 or Single Partition D20MX are supported. Configurations using Multiple Nodes D200 or Multiple Partitions D20MX are not supported unless are first scaled down to a single node / partition.

G500 cannot use the exact same D20 Firmware from D20 based RTUs (SABxxxx or SANxxxx). The D2x Firmware running in G500 is specific to MCP platform (is similar to a CCU Base D20ME firmware but uses different applications). Existing configurations will go through a D2x Firmware Upgrade process for G500 D2x.

Redundant CCU option is not supported in D.20 Communication Parameters; use instead the D2X Application Communication Watchdog (A026-1S) to monitor the redundant CCU state.

Secondary IP Addressing in LAN Settings is not supported.

If changing or reloading D2x configuration while in "sa com" in 68k shell - the D2X doesn't start again. Requires reboot of the G500 and then deploy again the D2x configuration using "d2xload" command or "sync to" (D-16780).

Type **SMC-0001-11** ("G500-D20 Environment, RAM only, single partition, max 7 serial ports") has the following additional characteristics and limitations:

- NVRAM is not available in G500 as D2x RTU – even if D2x application settings are configured for NVRAM. This applies also to "Save Points on Power Fail" not being possible.
- Only COM1 to COM7 are available to D2x applications (same as in a single board D20 CPU).

Type **SMC-0001-01** ("G500-D20 Environment, single partition, max 7 serial ports") has the following additional characteristics and limitations:

- Enables NVRAM for G500-D2X Applications.
- Only COM1 to COM7 are available to D2x applications (same as in a single board D20 CPU).
- Requires New DSAS Firmware Library with SMXA0.401 or later.
- Requires New **D2x Firmware** Name and Version **SMXA0.401** or later.
- DSAS v4.10 contains these updates.
- For DSAS v4.00 users:
 - o Install above exhibits, packaged in a single "meta package" file: "G500-D2X_SMXA0_401_20240430_NVRAM_MetaPackage.7zip".
 - o Technical Note **TN0128** describes how to install and enable the above.

Starting with **DSAS v4.10** and **SMXA0.410** (using B014-1S V600 or later) - the D2x WESMAINT access Passwords are encrypted and cannot be visualized anymore in the B014-1S table. In addition – the following rules are enforced for WESMAINT users and passwords:

- User name cannot be blank.
- The rules for entering strong passwords are:
 - o Between 8 and 22 English characters.
 - o At least one English uppercase character (A through Z).
 - o At least one English lowercase character (a through z).
 - o At least one number, Base 10 digits (0 through 9).
 - o At least one non-alpha-numeric character.
- When creating a new device configuration – strong passwords must be entered.
- After importing D20MX configurations – strong passwords must be entered.
- After importing D20 (not D20MX) configurations – the original D20 passwords are retained as long as changes are not done again for the passwords. If password changes are required – then strong password rules are enforced and apply.

For more details, please refer to MCP Software Configuration Guide V410 R0 (SWM0101).

Key Functions and Changes

- SMXA0.410 is the general release D2x Firmware version.
- Remote Desktop HMI is not available anymore for any MCP version.

12.1 Enhancements

12.1.1 Cyber Security

Please refer to Product & Cyber Security Advisories on the GE Vernova Grid Solutions web site.

12.1.2 Clients

GE Vernova Internal Reference #	Description
R-01709 / DCSSUP-24499	Enhanced SNMP Agent Browser to retrieve all available OIDs from the IED, regardless of being public or private.
B-18397	Enhanced DNP3 DCA to add support for RTS/CTS flow control.
B-18264	Enhanced Programmable Synchrocheck Relay (PSR) DCA configured with MCP-D device to add support for end to end TTL to B003/HDLC Driver to ensure control doesn't miss PSR window.

12.1.3 Servers

GE Vernova Internal Reference #	Description
R-01560 / E-04926	Added support for compacting data over IEC 101 and IEC 104 server connections using SQ=1.

GE Vernova Internal Reference #	Description
R-01644 / DCSSUP-23837	Enhanced DNP3 DPA (network and serial) to add a new parameter “Binary Input Event Variation same as Queued Variation” (false by default) to provide an option for the response variation to be the device profile default variation when the master issues a read request using variation 0, or a class data scan.
R-01639 / DCSSUP-23768	Enhanced DNP3 DPA (network and serial) to add a new parameter “Offline Sets Local IIN” (true by default) to provide an option for the Local IIN not to be set when there are Invalid/Control Inhibited condition for the binary output points mapped by the DNP3 DPA.

12.1.4 Automation

GE Vernova Internal Reference #	Description
R-01655 / E-05292	Enhanced the functionality of MCP Input Point Suppression (IPS) to allow the user to override both the Value and Quality of the point.
B-18399	Enhanced IPS functionality for ACC point type to be overridden as well as AI and DI point types.
E-05471	Increased number of user defined DEM (Alarm) group to 500.

12.1.5 Configuration/Settings

GE Vernova Internal Reference #	Description
E-05352	Added support for configuring Net redundancy in mcpcfg and Settings GUI for G100
B-18764	Added support for ARP Monitoring Peer IP List in mcpcfg and Settings GUI for G100

12.1.6 HMI

GE Vernova Internal Reference #	Description
R-01691 / DCSSUP-24448	Enhanced the Local and Remote HMI to add support for invalidating the HMI session when there is an MCP switchover

12.1.7 Pass-through

None.

12.1.8 System

GE Vernova Internal Reference #	Description
E-05332	Enhanced G100 network interfaces to allow LAN teaming so that it can be used for failover/redundant mode.
B-18709	Added support to load as PoC, via PETC: the DvM Edge and DvM UR Adapter, operating with below limitations: 1. The DvM Edge and UR Adapter containers can only access the EdgeOS Host and Edge Manager ports. This means that the MCP would have to be in a DMZ with an external firewall because both upstream and downstream connections would be on same physical port. This limitation may be lifted by putting the DvM Edge and UR Adapter on the same network as the mcp_core container, but isolation between the DvM Edge/UR Adapter and MCP Core apps would not be as strong. 2. The DvM Edge and UR Adapters must be signed and built with the IP address of the DvM host baked into the application. At this time there is no provision for a configuration file (this is a future DvM enhancement).
R-01742 / DCSSUP-24965	Improved timing at startup to eliminate a potential race condition related to file system check during POST.

12.1.9 Documentation

GE Vernova Internal Reference #	Description
E-05321	Updated document [MIS-0109] MCP Firmware Release Notes (V410 R0) with short explanation about D2x B014 encrypted passwords.
E-05395	Updated document [SWM0101] MCP Software Configuration Guide (V410 R0) with IPS functionality, IEC 101/104 Global Settings/Server Map/Master Station Application Parameters, D2x B014 encrypted passwords, G500 as D2x limitations, describing the new settings for Local and Remote HMI heartbeat, LAN redundancy in G100, restarting G100 after changing Maintenance port, DNP Master station application parameters with new additions.
E-05393	Updated help file content in DSAS online/offline editor with updating IEC 101/104 Global Settings/Server Map/Master Station Application Parameters.
E-05436	Updated document [994-0152] G500 Substation Gateway Instruction Manual (V410 R0) with adding section to specify D.20 Link Capabilities and restrictions, RD HMI license no longer available, SFP related information and order codes.
E-05437	Updated document [994-0155] G100 Substation Gateway Instruction Manual (V410 R0) with adding section to specify D.20 Link Capabilities and restrictions, RD HMI license no longer available, Product specification for Ethernet connections and order codes.
E-05453	Created document [994-0153] MCP Binder and ISO Image (V410 R0).
E-05419	Updated D2X Documentation A113-0S CG, B013-0S CG based on SMXA0.410
E-05476	Updated document [SWM0105] G500 Secure Deployment Guide (V410 R0) by adding security for D2x functionality.
E-05490	Updated document [MIS-0110] Open Source License Information (V410 R0).

12.1.10 Hardware

None.

12.2 Fixed defects

This version of MCP has the fixes for the following defects compared to MCP version 400.

12.2.1 Cyber Security

Please refer to Product & Cyber Security Advisories on the GE Vernova Grid Solutions web site.

12.2.2 Clients

None.

12.2.3 Servers

GE Vernova Internal Reference #	Description
D-13373	Fixed the issue in IEC61850 DPA server application that it will have a child restart if system time jumps by more than 4 hours
R-01682 / DCSSUP-24417	Fixed the issue in DNP3 DPA, where it does not set the correct IIN "Digital Output in Local" bit but set the wrong IIN "Parameters Invalid or Out of Range" bit in the response when Force Controls Lock Out is set in DNP3 Master.
R-01651 / DCSSUP-24080 / DCSSUP-23792	IEC 61850 Server does not update the quality of the points in a remote IEC61850 Client at startup
R-01668	DNP3 Server doesn't set IIN Local when DO "ForceControlsLockout" is ON.
R-01736 / DCSSUP-24926	Fixed the issue in DNP3 DPA, where it does not respond correctly to Class 1 + Analog Input poll request with DI event without time stamp and no analog values.
R-01672 / DCSSUP-23813	Fixed the issue in DNP3 DPA, where it was responding to analog polls with "Parameters Invalid or Out of Range".

12.2.4 Automation

GE Vernova Internal Reference #	Description
D-05033	Suppressed quality through Input Point Suppression (IPS) application is not reported to Masters. DNP3 and IEC 101-104 Servers send Online Quality rather than the substituted/last reported quality when points are suppressed.

12.2.5 Configuration/Settings

GE Vernova Internal Reference #	Description
D-15745	Fixed the issue in Configuring Network Interfaces, where incorrect subnet overlap checking is in place when DHCP is enabled on Net.

12.2.6 HMI

GE Vernova Internal Reference #	Description
D-15869	D2x Wesmaint Screen over network (d2xcon) is getting locked in a case when up and down arrow is continually pressed to navigate. Note: Fixed in SMX.A0.410

12.2.7 Pass-through

None.

12.2.8 System

GE Vernova Internal Reference #	Description
R-01716 / DCSSUP-24554	Fixed the issue in Hot-Hot redundancy, where Alarm and One Line Diagram are not updating correctly in new active G500 after failover.
D-15907	Fixed the issue in Network Summary of mcpcfg / Settings GUI, where D2x allocated network ports are getting displayed as DHCP instead of Static when any of MCP network ports is configured as DHCP.
R-01654 / DCSSUP-23785	Fixed the cosmetic issue in HMI's System Status, where Internal Transition Counter of LogicLinx is getting displayed as Failed.
D-15785	Fixed the issue in mcpfwupgrade utility 1.1.16, where a v4.0 snapshot for an MCP/D2x device along with a v4.0 firmware image was allowed to load to a G500 2-core unit without any error messages.
D-15745	Fixed the issue related to incorrect subnets overlap checks when DHCP is enabled on any of the Network Interfaces
R-01658/ DCSSUP-23531	Fixed the issue where SSH passthrough tunnels are allowed by default into other internal zone IEDs

12.2.9 Documentation

GE Vernova Internal Reference #	Description
D-16016	Updated document [994-0155] G100 Substation Gateway Instruction Manual with a note for the SFP Module 1000BASE-SX LC (580-3785)

12.2.10 Hardware

None.

12.3 Known Issues

This MCP version has the following known issues:

12.3.1 Cyber Security

GE Vernova Internal Reference #	Description
D-14069	The MCP Settings GUI does not automatically log off after the inactivity timeout. It requires that the user click into the web page or hit refresh after the timeout occurs to trigger the Settings GUI to close the session. The mcpcfg utility will be locked out from use while the MCP Settings GUI session is open. If MCP Settings GUI was left open after the inactivity timeout has expired (maliciously or unintentionally), as a workaround, you can login and logout of the MCP Settings GUI in another browser to release the lockout of the mcpcfg utility.

For any additional known issues, please refer to Product & Cyber Security Advisories on the GE Vernova Grid Solutions web site.

12.3.2 Clients

GE Vernova Internal Reference #	Description
B-13475 D-09915	SEL Binary Client doesn't support Double Precision Scaling Factors.
D-05002	ARRM file retrieval from SEL 1xx/2xx relays (using GENASCII) is not possible.
D-12834	Modbus Client could not process PRF events comes from SR 369 relay.
D-13075	D20A card in bad state can cause false behaviour/functionality when it is configured in warm or hot-hot redundancy.
D-13214	DNP3 Client doesn't support object types 31 and 33 for Frozen Analog Inputs (all variations).
D-14111	Cold Reboot Required DI (1) based on HDLC card faulty state will be reset on warm reboot also.
D-15320	With Auto Time Sync enabled, IEC103 DCA does not automatically perform a time sync when there is a change in local time.
D-15881	G100 D.20 DCA failed after some run time (long run setup)

12.3.3 Servers

GE Vernova Internal Reference #	Description
D-12889 / B-16203	DNP DPA/Server takes high CPU if more than 5000 Analog Inputs are configured in Unbuffered mode.
B-11967	No support for events in NVRAM in IEC101/104 Server. Events that have not been yet transmitted to Master (Clients) are lost if G500 is power cycled / restarted. However – the integrity polls will continue to provide accurate database representation.
B-11968	No support for events in NVRAM in DNP3 Server. Events that have not been yet transmitted to Master (Clients) are lost if G500 is power cycled / restarted. However – the integrity polls will continue to provide accurate database representation.
D-13134 / D-13135	RTS Post-amble time is not added to the data link confirm timeout or application timeout in DNP3 Serial Server.
D-12566	IEC101 DPA/Server in unbalanced mode sometimes reports duplicate Digital Input events to the Master if the event happens at the same time as General Interrogation response.
D-13996	IEC101/104 DPA buffer overflow DI events will be lost when set as discard newest.
D-12567	The time sync accuracy of G100 when IEC101 Server (Unbalanced/Balanced) is used as a time sync source is > +/- 4 msec.
D-15288	G500 time synch from serial masters (IEC101, DNP3) relies on the regular crystal clock (Linux clock) which drifts and is inaccurate.
D-16253	Modbus Server writes the configured Offline Analog Value in both words of a 32 bit register. As long as 0 (zero) is used as configured Offline Analog Value there is no impact.
N/A	In MCP-D2X MODBUS DPA (A068) > Port Configuration: for RS485-2 wires ports the "Modem Used" parameter must be set to "RTS Only".

12.3.4 Automation

GE Vernova Internal Reference #	Description
B-11969	DEM is responsible for handling alarms. Events/Alarms that have not been yet committed to the SQL database are lost if G500 is power cycled / restarted. However – the integrity polls will continue to provide accurate database representation.
DCSSUP-19948 / D-12000 / R-01430	Restore the last value for variables configured in LogicLinx wizard does not work at runtime (starts at 0 always).
D-14100	In MCP Runtime HMI, data points in 'Online Trends' do not display 'underscore (_)' in Point description even though it is there in the configuration.
D-15945	When manual force quality "Comm Lost CX" is applied on any AI/DI/Acc points then it is not getting reported as "Old Data" quality to IEC61850DPA

12.3.5 Configuration/Settings

GE Vernova Internal Reference #	Description
D-10502	NOT A DEFECT. If client applications are configured in non-redundant mode and later the device properties are switched to a redundant mode where some applications are not enabled - their respective points are still available to be mapped, but at runtime will be offline. This is to retain the mappings in case the user decides to switch later back to single mode and the client applications are active again, as previously configured.
D-10388	TACACS+ remote authentication can be enabled and activated even if the TACACS+ Server is not available in that moment. This will conduct to a device that can only be accessed using Emergency Access process, if TACACS+ server is not available.
D-06168	FPGA needs to be restarted via Power Cycle for PTP/IRIGB configuration change. No functional impact. PTP/IRIG-B configuration will not be applied without reboot of G500.
D-13028	Add more protection for memory leaks in Apache webserver settings.
B-15613	The configuration through Bulk Editor is not supported for G500 after v2.10.
N/A	If filenames with characters other than ASCII are present in the MCP file system - the MCP device and associated configuration tools will not work correctly. Keep only ASCII characters in the filenames for Client Maps, Server Maps, OneLine .dra, OneLine Images, and other user files.

12.3.6 HMI

GE Vernova Internal Reference #	Description
B-15650	The following features of the Analog Report Viewer are not available: • View online reports Save and view offline reports
B-14982	The product references in the Runtime (Local/Remote) HMI logs need to be changed as "MCP".
D-05463	If a used point group is deleted from the systemwide configuration, then points belonging to that group are not visible in the point group summary. However, if user changes the point group allocation from the corresponding instantiated client map file(s) then points will be visible in the point group summary.

12.3.7 Pass-through

GE Vernova Internal Reference #	Description
D-12990	In LDAP authentication, after passthrough connection is timed out, auto logout event is not generated into user activity log by IEC 103 Client.

12.3.8 System

GE Vernova Internal Reference #	Description
E-04130	The USB FLASH drive used for the Firmware Upgrade must be FAT32 format. As a result of this, only USB FLASH drives of maximum 32 GB can be used. The minimum size, imposed by storage requirements, is 8 GB.
E-03041 D-10346	Input time source selection (PTP / IRIG-B / NTP) does not support dynamic failover between time sources at runtime. Only the configured time source is active at a time.
D-10227	Email does not send messages when an alarm is activated.
D-05714	Update of only Edge OS is not supported. If only Edge OS updates are required, the complete G500 firmware image needs to be updated.
D-06167	Full support for latest PTP power profiles: • IEEE C37.238-2017 • IEC61850-9-3 Ed.1 2016 Enhancement: G500 supports the following PTP profiles: • IEEE 1588-2008 J4 Peer-to-Peer Profile • IEEE C37.238-2011 Power System Profile (but this has been withdrawn) Limited IEC61850-9-3 Ed.1 2016 Power Utility Automation Profile.
D-13083	Add support for progress bar to be displayed during "Applying update" procedure through Predix Edge Technician Console (PETC).
D-13039	When both G500's are power cycled at the same time and if switch panel configured as a master, then one of the G500 can go to the failed state. Note: If switch panel is configured as Master and one of the G500 is power cycled with a delay then this issue will not be observed.
D-12984	Daisy chained secondary monitor shows always duplicate monitor, but it does not show the extended desktop.
D-15990	Wesmaint Screen does not allow user to login with the maximum characters when username has 22 characters and password has 64 characters
R-01637 / DCSSUP- 23735	Issue with Network Interfaces of G500, where the internal MAC address shows up in switching table when any rear port is connected to the Switch.

GE Vernova Internal Reference #	Description
N/A	The following limitations exist for G100 Redundant LAN. Please refrain from using unsupported functionalities. 1. An Active IP cannot be configured on a Redundant LAN interface. 2. The Static IP of a Redundant LAN interface cannot be used as the PEER IP used for pairing a Hot-Hot MCP system. 3. VLAN's cannot be configured on a Redundant LAN interface. 4. DHCP cannot be configured on a Redundant LAN interface. 5. Only one Redundant LAN interface can be configured, either on Net 1/Net 2 or on Net 3/Net 4. Despite limitations 1 and 2, G100 Redundant LAN can be used in a Hot-Hot G100 system. For example, a valid configuration for a Hot-Hot G100 system would be the following. • Net 1 and Net 2 configured as Single LAN Interfaces, each having an Active and Static IP. • PEER IP using either Net 1 or Net 2 Static IP of the peer G100. • Net 3 and Net 4 configured as a Redundant LAN interface with only a Static IP. Note that limitations 1 and 2 imply that in a Hot-Hot G100 redundant system, only the following applications can communicate over the Redundant LAN interface. • DNP 3.0 Network Client • IEC 61850 Client and Server • Modbus TCP Client The reason is that these applications will use the Static IP of the interface when communicating in Hot-Hot mode. Typical failover time for G100 Redundant LAN is 3 seconds. Better performance can be expected with the G500 Redundant LAN.

12.3.9 Documentation

None.

12.3.10 Hardware

GE Vernova Internal Reference #	Description
D-06165	No functional impact. SFP Hot Plug in / Plug out detection. Points that represent the status of SFP IN/OUT will not be reflected until G500 is rebooted.

Capability and Capacity for MCP

This MCP version supports the following limits when configured in Function S (MCP only).

Functions D (D2X) and C (MCP and D2X) offer infinite configuration scenarios. Due to this vast configurability, comprehensive limit testing for Functions D and C is impracticable. Users are advised to consult additional D2X documentation or guidelines for the optimal configuration and usage of Functions D and C.

The maximum number of IEDs or Masters is total across all connections.

The maximum size of the system is given by whichever limit comes first (groups vs members, number of Connections vs IEDs, number of Master instances vs LRUs in the Master etc.). User is responsible to ensure resource usage limits are not exceeded at runtime. For tested performance levels, refer to Table 12.1 and Table 12.2.

The G500 4 cores system has a maximum of 500 IEDs, 200k points and 8 Masters (LRUs) unless otherwise restricted by system loading.

The G500 4 cores system can have MCP and D2X enabled at same time (Function C), in which case the capability limits and performance test configuration are reduced by approximately 50% (half).

The G500 2 cores system has a maximum of 250 IEDs, 100k points and 8 Masters (LRUs) unless otherwise restricted by system loading.

The G100 system has a maximum of 120 IEDs, 24k points and 8 Masters (LRUs) unless otherwise restricted by system loading.

Tejas V Master/LRU instances are not counted as part of 8 Masters or LRUs calculations, both for 4 core and 2 core G500s and for G100.

Below are the limits for the Maximum number of Remote HMI sessions that can be connected simultaneously:

Application	G500 4-core	G500 2-core	G100
Remote HMI	8	4	2

Note: The Local HMI session and Online Editor session coming from DS Agile MCP Studio are not counted in the above-mentioned limits.

12.4 Application Limits

This G500 version supports the following application limits.

Application	Feature	Configuration Limits	
		G500	G100
Digital Event Manager	Alarms		
	Max Number of Alarm Groups	500	500
	Max number of members in an Alarm Group	1000	1000
Calculator	Expression Type		
	Evaluations	10000	10000
	Timers	1000	1000
	Analog Assignments	2000	2000
	Digital Assignments	10000	10000

Application	Feature	Configuration Limits	
		G500	G100
	Quality Conversions	1000	1000
	Type Conversions	1000	1000
	Averages	1000	1000
	Output to Input Conversions	1000	1000
Load Shed DTA	Number of Feeders and Zones		
	Max Zones	50	50
	Max Feeders	100	100
Analog Reports DTA	Analog Reports are not available starting with MCP V2.6 and newer	None	None
System Point Manager	Accumulator Freeze	250	250
	Analog Value Selection	250	250
	Control Lockout		
	• Remote Groups	8	8
	• Local Groups	10000	10000
	Double Points	1000	1000
	Input Point Suppression	10000	10000
	Control in Progress	256	256
	Redundant I/O	10000	10000
Analog Data Logger	Continuous Reports	1000	1000
	Periodic Reports	1000	1000
	Out of Range Reports	1000	1000
VPN Server	Number of VPN Clients	8	8
	Number of VPN Server Instances	1	1
SCADA – No. of Client or Server <u>connections</u> (Serial/Network/D.20)	Serial IED Connections		
	[Note: Total number of serial connections are limited by maximum number of physical and virtual serial ports (150)]		
	DNP Multidrop	80	80
	DNP Multidrop (Modem)	80	80
	Generic ASCII	80	80
	SEL Binary IED	80	80
	IEC 60870-5-101 Multidrop	80	80
	IEC60870-5-103 Multidrop	80	80
	Modbus Multidrop	80	80
	D.20	1	1
	Network IED Connections		

Application	Feature	Configuration Limits	
		G500	G100
	DNP3 TCP	50	50
	Modbus TCP/Modbus TCP-SSH	50	50
	IEC60870-5 104	50	50
	IEC61850	Calculated by Loader based on system size	Calculated by Loader based on system size
	SNMP	1	1
	Serial Master Connections		
	DNP3 Serial Master	8	8
	IEC 60870-5-101 Master	8	8
	Modbus Serial Master	8	8
	Network Master Connections		
	DNP3 Network Master	8	8
	IEC 60870-5-104 Master	8	8
	Modbus Network Master	8	8
	IEC 61850 Server	8	8
SCADA - No. of IEDs or Master station LRUs in each connection	Serial /Network IEDs		
	IEC60870-5-103 Multidrop	255	255
	DNP3 Multidrop/Network	10 (Note 1)	10 (Note 1)
	Modbus Multidrop/TCP	20 (Note 1)	20 (Note 1)
	IEC60870-5 101 Multidrop	1000	1000
	IEC60870-5 104	10 (Note 1)	10 (Note 1)
	SNMP Client	100	100
	GenASCII Client	120	120
	IEC61850 Client	Calculated by Loader based on system size (maximum 500 in total)	Calculated by Loader based on system size (maximum 120 in total)
	SEL Binary Client	1	1
	D.20 Client	120	120
	Serial/Network Masters		
	DNP3 Serial Master	8	8
	Modbus Serial Master	8	8
	IEC 60870-1 101 Master	8	8

Application	Feature	Configuration Limits	
		G500	G100
	Tejas V Master	The maximum number of LRUs is 99 per serial port, regardless of 2/4 cores.	The maximum number of LRUs is 99 per serial port
	DNP3 TCP Master	1	1
	Modbus TCP Master	1	1
	IEC 60870-1 104 Master	1	1
	IEC 61850 Server (This is number of maximum concurrent IEC 61850 Clients for same Server Instance / LRU in CID file)	3	3

Optional DI indication for local / remote status. Optional DI indication for accumulator freeze indication.

Note 1: Indicates recommended value which can be exceeded with an increased level of event latency.

12.5 Performance

This MCP version meets the following performance test levels.

- MCP Hardware under test:
 - o G500 4 core CPU / 16 GB RAM
 - o G500 2 core CPU / 8 GB RAM
 - o G100 8 GB RAM
- The following sections indicate the G500 4 core, G500 2 core and G100 values in different loading conditions.
- If the loading levels are lower, then the total number of IEDs and RTDB points can increase but no more than specified limits under the Capability and Capacity section above.

12.5.1 Performance Test Levels and Results

This MCP version provides the following performance capabilities when configured in different modes (Standalone and Hot-Hot Redundancy).

The performance of MCP was tested using the activity levels and configuration scenarios presented next:

Note:

- To see the performance tests results which were performed before V4.0 release, refer to the tables: Table 10.1 and Table 10.2.
- Performance test results in MCP Standalone mode for V4.1 release are in **Table 12.1**.
“NA” indicates a specific test and combination that was not performed in V4.1.

Table 12.1: Performance Test Results in Standalone Mode

Firmware Version	G500 V4.0	G500 V4.0	G100 V4.0	G100 V4.0
Standalone Activity	Multi-protocol	Multi-protocol	Multi-Protocol	IEC 61850

Control latency in (msecs) Min, Max, Median	11.951, 125.195, 24.427

12.5.2 Redundancy Fail Over Time

This MCP version supports below fail-over times (i.e., when active G500 / G100 is power cycled) in the Hot-Hot/Hybrid Redundancy with the default 300ms heart-beat rate and with default 3 retries.

Table 12.3: Hot-Hot Redundancy Fail Over Times

Hot-Hot Redundancy/D.20 Configuration	Maximum Fail-Over Time (msec)	
	G500	G100
D.20 is not configured	1250	1780
D.20 is configured	1450	1940

12.5.3 HMI Response Times

HMI Response Times were not tested in V4.10 – but are expected to be similar to V3.10. Please refer to [HMI Response Times](#) section.

Time Sync Accuracy (PTP/IRIG-B/NTP)

This MCP version supports Hardware based PTP/IRIG-B and Software based NTP Time Sync Accuracy.

This version does not support runtime dynamic failover across different time sources.

Time Sync Input	Accuracy	
	G500	G100
IRIG-B IN (G100 tested in V3.10)	100% samples within 991 microseconds with an average of 51 microseconds and standard deviation of 37 microseconds - Total number of samples considered ~4989	100% samples within 866 microseconds with an average of 90 microseconds and standard deviation of 76 microseconds - Total number of samples considered ~3758
PTP IN (tested in V3.10)	100% samples within 693 microseconds with an average of 40 microseconds and standard deviation of 31 microseconds - Total number of samples considered ~3457	NA
NTP IN (tested in V3.10)	100% samples within 700 microseconds with an average of 192 microseconds and standard deviation of 75 microseconds - Total number of samples considered ~3889	100% samples within 867 microseconds with an average of 92 microseconds and standard deviation of 81 microseconds - Total number of samples considered ~3259

NOTES:

- IRIG-B / PTP time accuracy is measured in a scenario where the hardware is fully loaded.

Timestamp Accuracy

This MCP version provides the following Timestamp Accuracy.

Protocol	Accuracy				
	% @ N = % of samples within +/- N milliseconds				
	G500			G500	G100
	Time sync source (IRIG-B)			Time sync source (DNP3 Serial IN)	Time sync source (DNP3 Serial IN)
	MCP Container (2 Core) Function Type-S	D2x Container (2 Core) Function Type-D	D2x Container (4 Core) Function Type-C	MCP Container (2 Core) Function Type-S	MCP Container Function Type-S
D.20 HDLC	98% @ +/- 4 ms - Total number of samples considered ~8000 - Measured the accuracy for every second at a D.20 S peripheral	98.7% @ +/- 4 ms - Total number of samples considered ~8627 - Measured the accuracy for every second at a D.20 S peripheral	99.94% @ +/- 2 ms 100% @ +/- 3 ms - Total number of samples considered ~5149 - Measured the accuracy for every second at a D.20 S peripheral	90.04% @ +/- 2 ms 97.39% @ +/- 3 ms - Total number of samples considered ~6388 - Measured the accuracy for every second at a D.20 S peripheral	57.99% @ +/- 2 ms 72.14% @ +/- 3 ms - Total number of samples considered ~6525 - Measured the accuracy for every second at a D.20 S peripheral
GPIO	NA	NA	NA	NA	96.5% @ 1 ms 99.92% @ 2 ms 100% @ 3 ms - Total number of samples considered ~33,000 - Measured the accuracy for every five seconds at the GPIO

Protocol	Accuracy				
	% @ N = % of samples within +/- N milliseconds				
	G500			G500	G100
	Time sync source (IRIG-B)			Time sync source (DNP3 Serial IN)	Time sync source (DNP3 Serial IN)
	MCP Container (2 Core) Function Type-S	D2x Container (2 Core) Function Type-D	D2x Container (4 Core) Function Type-C	MCP Container (2 Core) Function Type-S	MCP Container Function Type-S
DNP I/O	83.33% @ 1 ms 99.82% @ 2 ms 99.86% @ 3 ms 100% @ 4 ms - Total number of samples considered ~16476 - Measured the accuracy for every five seconds at a DNP I/O S peripheral Note: Tested in V3.10	90.5% @ +/- 2 ms 99.63% @ +/- 3 ms - Total number of samples considered ~4668 - Measured the accuracy for every second at a DNP I/O S peripheral Note: Tested in V4.10	Test results not available	Test results not available	3.4% @ 1 ms 80.14% @ 2 ms 96.15% @ 3ms 99.16% @ 4 ms 99.88% @ 5 ms 100% @ 6 ms - Total number of samples considered ~11790 - Measured the accuracy for every five seconds at a DNP I/O S peripheral Note: Tested in V3.10

Timestamp Accuracy in IEDs when MCP is syncing time over SCADA protocol

Notes:

- MCP device is receiving time via time sync when the source is IRIG-B.
- MCP device is sending time to downstream IEDs over SCADA protocol.

Time Sync Output	Accuracy		
	% @ N = % of samples within +/- N milliseconds		
	G500 (2 core)	(G500 4 core)	G100
	MCP Container (2 Core) Function Type-S	MCP Container (4 Core) Function Type-C	MCP Container Function Type-S
DNP3 Serial (DNP DCA)	• 97.65% @ +/- 2 ms • 100% @ +/- 3 ms • Total number of samples considered ~6499 • Measured the accuracy for every second at a D.20 S peripheral	• 85.79% @ +/- 1 ms • 99.95% @ +/- 2 ms • 100% @ +/- 3 ms • Total number of samples considered ~6501 • Measured the accuracy for every second at a D.20 S peripheral	• 99.21% @ +/- 2 ms • 100% @ +/- 3 ms • Total number of samples considered ~4781 • Measured the accuracy for every second at a D.20 S peripheral

Application List

This MCP version has the following applications available depending on configured redundancy mode.

Application	Support in Standalone	Support in Hot-Hot/Hybrid	Support in Warm Standby	Support in Hot Standby
Runtime HMI	✓ Available	✓ Available	✓ Available	✓ Available

13. Version 5.00 (21-November-2024)

Software Versions

The following table defines the software versions required for interaction with the MCP.

Package	Version	Notes
G500 Firmware	5.0.50	G500 Firmware Version.
G100 Firmware	5.0.50	G100 Firmware Version.
DS Agile MCP Studio	5.0.0	Minimum Supported DS Agile MCP Studio Software.
MCP HMI	500.50.13	MCP HMI Version.
MCP Dynamic Remote HMI	1.0.0.5	Remote HMI compatible with all MCP Versions, 64-bit Software.
MCP Utilities	1.2.6	Minimum Supported MCP Firmware Upgrade Utilities.
IEC61850 CID Tool	9.1.5	Minimum Supported CID configuration tool for automatically creating IEC 61850 Server map files.

Cross Compatibility Versions

The following table defines the compatibility between G500 firmware versions and SMX firmware versions.

Compatibility	G500 <= v3.10 (C1)	G500 v4.00 (D0)	G500 v4.10 (D1)	G500 v5.00 (E0)
SMXnn.400 (RAM only, should not be used)	N	Y	Y	Y
SMXnn.401	N	Y	Y	Y
SMXnn.410	N	N	Y	Y

Predix Edge OS and Other Firmware Versions

The following table defines the package/firmware versions supported for Predix Edge Linux OS, FPGA, CPLD, UEFI and BCOM FPGA in this MCP version.

Package / Firmware	G100 Version	G500 AMD Version	G500 Intel Version	Notes
Predix Edge OS	2.9.0	2.9.0	2.9.0	Supported GE's Secured Linux Operating System Version.
FPGA	NA	1.03.00	1.03.00	Supported FPGA Version of Multi-Function Controller Platform (MCP).

Package / Firmware	G100 Version	G500 AMD Version	G500 Intel Version	Notes
CPLD	NA	1.2.3	2.0.2	Supported CPLD Version of Multi-Function Controller Platform (MCP).
UEFI	FLEBG100A00006V107	VX5D0007.C01	VB780242	Minimum Supported UEFI Version of Multi-Function Controller Platform (MCP).
BCOM FPGA	NA	2.3.0 or 2.4.0	2.5.0	Supported COM's Module FPGA Version of Multi-Function Controller Platform (MCP).
D2X	NA	SMXA0.410.0005	SMXA0.410.0005	General release.

Specific G500 D2x Characteristics and Limitations:

D2x has an associated Environment Type in the G500 which is equivalent to a hardware based CPU Board.

Only D2x configurations equivalent to Single Node D20/D200 or Single Partition D20MX are supported. Configurations using Multiple Nodes D200 or Multiple Partitions D20MX are not supported unless are first scaled down to a single node / partition.

G500 cannot use the exact same D20 Firmware from D20 based RTUs (SABxxxx or SANxxxx). The D2x Firmware running in G500 is specific to MCP platform (is similar to a CCU Base D20ME firmware but uses different applications). Existing configurations will go through a D2x Firmware Upgrade process for G500 D2x.

Redundant CCU option is not supported in D.20 Communication Parameters; use instead the D2X Application Communication Watchdog (A026-1S) to monitor the redundant CCU state.

Secondary IP Addressing in LAN Settings is not supported.

If changing or reloading D2x configuration while in "sa com" in 68k shell - the D2X doesn't start again. Requires reboot of the G500 and then deploy again the D2x configuration using "d2xload" command or "sync to" (D-16780).

Type **SMC-0001-11** ("G500-D20 Environment, RAM only, single partition, max 7 serial ports") has the following additional characteristics and limitations:

- NVRAM is not available in G500 as D2x RTU – even if D2x application settings are configured for NVRAM. This applies also to "Save Points on Power Fail" not being possible.
- Only COM1 to COM7 are available to D2x applications (same as in a single board D20 CPU).

Type **SMC-0001-01** ("G500-D20 Environment, single partition, max 7 serial ports") has the following additional characteristics and limitations:

- Enables NVRAM for G500-D2X Applications.
- Only COM1 to COM7 are available to D2x applications (same as in a single board D20 CPU).
- Requires New DSAS Firmware Library with SMXA0.401 or later.
- Requires New **D2x Firmware** Name and Version **SMXA0.401** or later.
- DSAS v4.10 contains these updates.
- For DSAS v4.00 users:
 - o Install above exhibits, packaged in a single "meta package" file: "G500-D2X_SMXA0_401_20240430_NVRAM_MetaPackage.7zip".
 - o Technical Note **TN0128** describes how to install and enable the above.

Starting with **DSAS v4.10** and **SMXA0.410** (using B014-1S V600 or later) - the D2x WESMAINT access Passwords are encrypted and cannot be visualized anymore in the B014-1S table. In addition – the following rules are enforced for WESMAINT users and passwords:

- User name cannot be blank.
- The rules for entering strong passwords are:
 - o Between 8 and 22 English characters.
 - o At least one English uppercase character (A through Z).
 - o At least one English lowercase character (a through z).
 - o At least one number, Base 10 digits (0 through 9).
 - o At least one non-alpha-numeric character.
- When creating a new device configuration – strong passwords must be entered.
- After importing D20MX configurations – strong passwords must be entered.
- After importing D20 (not D20MX) configurations – the original D20 passwords are retained as long as changes are not done again for the passwords. If password changes are required – then strong password rules are enforced and apply.

For more details, please refer to MCP Software Configuration Guide V500 R0 (SWM0101).

Key Functions and Changes

Added G500 hardware with Intel i3 and Intel Xeon CPU.

Intel units can run only MCP V5.00 or later.

Should Intel units shipped with V5.00 require a re-flash of V5.00 – only the USB process is available.

SMXA0.410 is the general release D2x Firmware version.

Created a Version Independent MCP Remote HMI.

Remote Desktop HMI is not available anymore for any MCP version.

13.1 Enhancements

13.1.1 Cyber Security

Please refer to Product & Cyber Security Advisories on the GE Vernova Grid Solutions web site.

13.1.2 Clients

GE Vernova Internal Reference #	Description
R-01745	Added per device pseudo points in DNP3 Client. See SWM0101 V5.00 for details.

13.1.3 Servers

None.

13.1.4 Automation

None.

13.1.5 Configuration/Settings

None.

13.1.6 HMI

GE Vernova Internal Reference #	Description
E-05414	Created a Version Independent MCP Remote HMI which is installed once and then runs with any MCP version.

13.1.7 Pass-through

None.

13.1.8 System

None.

13.1.9 Documentation

GE Vernova Internal Reference #	Description
E-05423	Updated document [MIS-0109] MCP Firmware Release Notes (V500 R0) to include Intel (Xeon and i3) Hardware.
E-05426	Updated document [994-0152] G500 Substation Gateway Instruction Manual (V500 R0) to include Intel (Xeon and i3) Hardware, new CPU options in order code and D.20 Layouts with Redundancy G500.
E-05502	Updated document [994-0155] G100 Substation Gateway Instruction Manual (V500 R0) with G100 order code and D.20 Layouts with Redundancy G100.
E-05499	Created document [994-0153] MCP Binder and ISO Image (V500 R0).
E-05424	Updated document [SWM0101] MCP Software Configuration Guide (V500 R0) for new DNP3 per device Pseudo Points and MCP Dynamic Remote HMI.
E-05427	Created document [SWM0125] Configuring UEFI Settings on G500 with Intel Hardware User Guide V100 R0.
E-05503	Updated document [SWM0124] IEC 61850 Server User Guide (V500 R0) for CID Tool V9.*
E-05490	Updated document [MIS-0110] Open Source License Information (V500 R0).

13.1.10 Hardware

GE Vernova Internal Reference #	Description
E-04791	Added Intel Xeon and i3 models.

13.2 Fixed defects

This version of MCP has the fixes for the following defects compared to MCP version 410.

13.2.1 Cyber Security

Please refer to Product & Cyber Security Advisories on the GE Vernova Grid Solutions web site.

13.2.2 Clients

GE Vernova Internal Reference #	Description
R-01750 / DCSSUP-24918	Fixed an issue where Modbus Client would crash and restart.

13.2.3 Servers

GE Vernova Internal Reference #	Description
R-01739 / DCSSUP-24621	Fixed an issue where DNP3 Server Serial successful reply generates "No DPA with address" error in Diagnostic log.

13.2.4 Automation

None.

13.2.5 Configuration/Settings

None.

13.2.6 HMI

None.

13.2.7 Pass-through

None.

13.2.8 System

GE Vernova Internal Reference #	Description
R-01744 / DCSSUP-24955	Fixed an issue where IEC 61850 Client MMS.log was not part of MCPCSB bundle.
R-01743	Fixed an issue where license_report.txt in mcpcsb does not show d2x license.
D-16164	Fixed an issue where MCPSI displays the UEFI Version day and month reversed.

13.2.9 Documentation

None.

13.2.10 Hardware

None.

13.3 Known Issues

This MCP version has the following known issues:

13.3.1 Cyber Security

GE Vernova Internal Reference #	Description
D-14069	The MCP Settings GUI does not automatically log off after the inactivity timeout. It requires that the user click into the web page or hit refresh after the timeout occurs to trigger the Settings GUI to close the session. The mcpcfg utility will be locked out from use while the MCP Settings GUI session is open. If MCP Settings GUI was left open after the inactivity timeout has expired (maliciously or unintentionally), as a workaround, you can login and logout of the MCP Settings GUI in another browser to release the lockout of the mcpcfg utility.

For any additional known issues, please refer to Product & Cyber Security Advisories on the GE Vernova Grid Solutions web site.

13.3.2 Clients

GE Vernova Internal Reference #	Description
B-13475	SEL Binary Client doesn't support Double Precision Scaling Factors.
D-05002	ARRM file retrieval from SEL 1xx/2xx relays (using GENASCII) is not possible.
D-12834	Modbus Client could not process PRF events comes from SR 369 relay.
D-13075	D20A card in bad state can cause false behaviour/functionality when it is configured in warm or hot-hot redundancy.
D-13214	DNP3 Client doesn't support object types 31 and 33 for Frozen Analog Inputs (all variations).
D-14111	Cold Reboot Required DI (1) based on HDLC card faulty state will be reset on warm reboot also.
D-15320	With Auto Time Sync enabled, IEC103 DCA does not automatically perform a time sync when there is a change in local time.
D-15881	G100 D.20 DCA failed after some run time (long run setup)
D-16173	DNP3 propagation delay command executes also a time sync operation.

13.3.3 Servers

GE Vernova Internal Reference #	Description
D-12889 / B-16203	DNP DPA/Server takes high CPU if more than 5000 Analog Inputs are configured in Unbuffered mode.

GE Vernova Internal Reference #	Description
B-11967	No support for events in NVRAM in IEC101/104 Server. Events that have not been yet transmitted to Master (Clients) are lost if G500 is power cycled / restarted. However – the integrity polls will continue to provide accurate database representation.
B-11968	No support for events in NVRAM in DNP3 Server. Events that have not been yet transmitted to Master (Clients) are lost if G500 is power cycled / restarted. However – the integrity polls will continue to provide accurate database representation.
D-13134 / D-13135	RTS Post-amble time is not added to the data link confirm timeout or application timeout in DNP3 Serial Server.
D-12566	IEC101 DPA/Server in unbalanced mode sometimes reports duplicate Digital Input events to the Master if the event happens at the same time as General Interrogation response.
D-13996	IEC101/104 DPA buffer overflow DI events will be lost when set as discard newest.
D-12567	The time sync accuracy of G100 when IEC101 Server (Unbalanced/Balanced) is used as a time sync source is > +/- 4 msec.
D-15288	G500 time synch from serial masters (IEC101, DNP3) relies on the regular crystal clock (Linux clock) which drifts and is inaccurate.
E-05343 / R-01692 / DCSSUP-24550 / R-01693 / DCSSUP-24507	IEC61850 server does not support custom DOs from downstream IEC61850 IEDs.
D-15903	IEC61850 DPA is not functional if the user selects to include the real data points from downstream IEC61850 IEDs in the IEC61850 server configuration while generating CID file using CID Tool v9.1.5. (Check for a newer version of CID Tool for resolution)
D-16253	Modbus Server writes the configured Offline Analog Value in both words of a 32 bit register. As long as 0 (zero) is used as configured Offline Analog Value there is no impact.
N/A	In MCP-D2X MODBUS DPA (A068) > Port Configuration: for RS485-2 wires ports the "Modem Used" parameter must be set to "RTS Only".

13.3.4 Automation

GE Vernova Internal Reference #	Description
B-11969	DEM is responsible for handling alarms. Events/Alarms that have not been yet committed to the SQL database are lost if G500 is power cycled / restarted. However – the integrity polls will continue to provide accurate database representation.

GE Vernova Internal Reference #	Description
DCSSUP-19948 / D-12000 / R-01430	Restore the last value for variables configured in LogicLinx wizard does not work at runtime (starts at 0 always).
D-14100	In MCP Runtime HMI, data points in 'Online Trends' do not display 'underscore (_)' in Point description even though it is there in the configuration.
D-15945	When manual force quality "Comm Lost CX" is applied on any AI/DI/Acc points then it is not getting reported as "Old Data" quality to IEC61850DPA

13.3.5 Configuration/Settings

GE Vernova Internal Reference #	Description
D-10502	NOT A DEFECT. If client applications are configured in non-redundant mode and later the device properties are switched to a redundant mode where some applications are not enabled - their respective points are still available to be mapped, but at runtime will be offline. This is to retain the mappings in case the user decides to switch later back to single mode and the client applications are active again, as previously configured.
D-10388	TACACS+ remote authentication can be enabled and activated even if the TACACS+ Server is not available in that moment. This will conduct to a device that can only be accessed using Emergency Access process, if TACACS+ server is not available.
D-06168	FPGA needs to be restarted via Power Cycle for PTP/IRIGB configuration change. No functional impact. PTP/IRIG-B configuration will not be applied without reboot of G500.
D-13028	Add more protection for memory leaks in Apache webserver settings.
B-15613	The configuration through Bulk Editor is not supported for G500 after v2.10.
N/A	If filenames with characters other than ASCII are present in the MCP file system - the MCP device and associated configuration tools will not work correctly. Keep only ASCII characters in the filenames for Client Maps, Server Maps, OneLine.dra, OneLine Images, and other user files.

13.3.6 HMI

GE Vernova Internal Reference #	Description
B-15650	The following features of the Analog Report Viewer are not available: View online reports Save and view offline reports
B-14982	The product references in the Runtime (Local/Remote) HMI logs need to be changed as "MCP".

GE Vernova Internal Reference #	Description
D-05463	If a used point group is deleted from the systemwide configuration, then points belonging to that group are not visible in the point group summary. However, if user changes the point group allocation from the corresponding instantiated client map file(s) then points will be visible in the point group summary.

13.3.7 Pass-through

GE Vernova Internal Reference #	Description
D-12990	In LDAP authentication, after passthrough connection is timed out, auto logout event is not generated into user activity log by IEC 103 Client.

13.3.8 System

GE Vernova Internal Reference #	Description
E-04130	The USB FLASH drive used for the Firmware Upgrade must be FAT32 format. As a result of this, only USB FLASH drives of maximum 32 GB can be used. The minimum size, imposed by storage requirements, is 8 GB.
E-03041 D-10346	Input time source selection (PTP / IRIG-B / NTP) does not support dynamic failover between time sources at runtime. Only the configured time source is active at a time.
D-10227	Email does not send messages when an alarm is activated.
D-05714	Update of only Edge OS is not supported. If only Edge OS updates are required, the complete G500 firmware image needs to be updated.
D-06167	Full support for latest PTP power profiles: • IEEE C37.238-2017 • IEC61850-9-3 Ed.1 2016 Enhancement: G500 supports the following PTP profiles: • IEEE 1588-2008 J4 Peer-to-Peer Profile • IEEE C37.238-2011 Power System Profile (but this has been withdrawn) Limited IEC61850-9-3 Ed.1 2016 Power Utility Automation Profile.
D-13083	Add support for progress bar to be displayed during "Applying update" procedure through Predix Edge Technician Console (PETC).
D-13039	When both G500's are power cycled at the same time and if switch panel configured as a master, then one of the G500 can go to the failed state. Note: If switch panel is configured as Master and one of the G500 is power cycled with a delay then this issue will not be observed.
D-12984	Daisy chained secondary monitor shows always duplicate monitor, but it does not show the extended desktop.
D-15990	Wesmaint Screen does not allow user to login with the maximum characters when username has 22 characters and password has 64 characters

GE Vernova Internal Reference #	Description
R-01637 / DCSSUP-23735	Issue with Network Interfaces of G500, where the internal MAC address shows up in switching table when any rear port is connected to the Switch.
N/A	The following limitations exist for G100 Redundant LAN. Please refrain from using unsupported functionalities. 1. An Active IP cannot be configured on a Redundant LAN interface. 2. The Static IP of a Redundant LAN interface cannot be used as the PEER IP used for pairing a Hot-Hot MCP system. 3. VLAN's cannot be configured on a Redundant LAN interface. 4. DHCP cannot be configured on a Redundant LAN interface. 5. Only one Redundant LAN interface can be configured, either on Net 1/Net 2 or on Net 3/Net 4. Despite limitations 1 and 2, G100 Redundant LAN can be used in a Hot-Hot G100 system. For example, a valid configuration for a Hot-Hot G100 system would be the following. • Net 1 and Net 2 configured as Single LAN Interfaces, each having an Active and Static IP. • PEER IP using either Net 1 or Net 2 Static IP of the peer G100. • Net 3 and Net 4 configured as a Redundant LAN interface with only a Static IP. Note that limitations 1 and 2 imply that in a Hot-Hot G100 redundant system, only the following applications can communicate over the Redundant LAN interface. • DNP 3.0 Network Client • IEC 61850 Client and Server • Modbus TCP Client The reason is that these applications will use the Static IP of the interface when communicating in Hot-Hot mode. Typical failover time for G100 Redundant LAN is 3 seconds. Better performance can be expected with the G500 Redundant LAN.

13.3.9 Documentation

None.

13.3.10 Hardware

GE Vernova Internal Reference #	Description
D-06165	No functional impact. SFP Hot Plug in / Plug out detection. Points that represent the status of SFP IN/OUT will not be reflected until G500 is rebooted.
N/A (no reference)	G500 with Intel CPU have DP1 and DP2 swapped compared to G500 with AMD CPU. No functional impact.

Capability and Capacity for MCP

This MCP version supports the following limits when configured in Function S (MCP only).

Functions D (D2X) and C (MCP and D2X) offer infinite configuration scenarios. Due to this vast configurability, comprehensive limit testing for Functions D and C is impracticable. Users are advised to consult additional D2X documentation or guidelines for the optimal configuration and usage of Functions D and C.

The maximum number of IEDs or Masters is total across all connections.

The maximum size of the system is given by whichever limit comes first (groups vs members, number of Connections vs IEDs, number of Master instances vs LRUs in the Master etc.). User is responsible to ensure resource usage limits are not exceeded at runtime. For tested performance levels, refer to Table 13.1 and Table 13.2.

The G500 AMD 4 cores and Intel Xeon systems have a maximum of 500 IEDs, 200k points and 8 Masters (LRUs) unless otherwise restricted by system loading.

The G500 AMD 4 cores and Intel Xeon systems can have MCP and D2X enabled at same time ("Function C"), in which case the capability limits and performance test configuration are reduced by approximately 50% (half).

The G500 AMD 2 cores and Intel i3 system has a maximum of 250 IEDs, 100k points and 8 Masters (LRUs) unless otherwise restricted by system loading.

The G100 system has a maximum of 120 IEDs, 24k points and 8 Masters (LRUs) unless otherwise restricted by system loading.

Tejas V Master/LRU instances are not counted as part of 8 Masters or LRUs calculations.

Below are the limits for the Maximum number of Remote HMI sessions that can be connected simultaneously:

Application	G500 AMD 4-core, G500 Intel Xeon	G500 AMD 2-core, G500 Intel i3	G100
Remote HMI	8	4	2

Note: The Local HMI session and Online Editor session coming from DS Agile MCP Studio are not counted in the above-mentioned limits.

13.4 Application Limits

This G500 version supports the following application limits.

Application	Feature	Configuration Limits	
		G500	G100
Digital Event Manager	Alarms		
	Max Number of Alarm Groups	500	500
	Max number of members in an Alarm Group	1000	1000
Calculator	Expression Type		
	Evaluations	10000	10000
	Timers	1000	1000

Application	Feature	Configuration Limits	
		G500	G100
	Analog Assignments	2000	2000
	Digital Assignments	10000	10000
	Quality Conversions	1000	1000
	Type Conversions	1000	1000
	Averages	1000	1000
	Output to Input Conversions	1000	1000
Load Shed DTA	Number of Feeders and Zones		
	Max Zones	50	50
	Max Feeders	100	100
Analog Reports DTA	Analog Reports are not available starting with MCP V2.6 and newer	None	None
System Point Manager	Accumulator Freeze	250	250
	Analog Value Selection	250	250
	Control Lockout		
	• Remote Groups	8	8
	• Local Groups	10000	10000
	Double Points	1000	1000
	Input Point Suppression	10000	10000
	Control in Progress	256	256
	Redundant I/O	10000	10000
Analog Data Logger	Continuous Reports	1000	1000
	Periodic Reports	1000	1000
	Out of Range Reports	1000	1000
VPN Server	Number of VPN Clients	8	8
	Number of VPN Server Instances	1	1
SCADA – No. of Client or Server <u>connections</u> (Serial/Network/D.20)	Serial IED Connections		
	[Note: Total number of serial connections are limited by maximum number of physical and virtual serial ports (150)]		
	DNP Multidrop	80	80
	DNP Multidrop (Modem)	80	80
	Generic ASCII	80	80

Note 1: Indicates recommended value which can be exceeded with an increased level of event latency.

13.5 Performance

This MCP version meets the following performance test levels.

- MCP Hardware under test:
 - o G500 4 core AMD CPU / 16 GB RAM
 - o G500 2 core AMD CPU / 8 GB RAM
 - o G500 Intel Xeon CPU / 16 GB RAM
 - o G500 Intel i3 CPU / 8 GB RAM
 - o G100 8 GB RAM
- The following sections indicate the tested G500 and G100 values in different loading conditions.
- If the loading levels are lower, then the total number of IEDs and RTDB points can increase but no more than specified limits under the Capability and Capacity section above.

13.5.1 Performance Test Levels and Results

This MCP version provides the following performance capabilities when configured in different modes (Standalone and Hot-Hot Redundancy).

The performance of MCP was tested using the activity levels and configuration scenarios presented next:

Note:

- To see the performance tests results which were performed before V4.0 release, refer to the tables: Table 10.1 and Table 10.2.
- Performance test results in MCP Standalone mode for V5.0 release are in **Table 13.1**.
“NA” indicates a specific test and combination that was not performed in V5.0.

Table 13.1: Performance Test Results in Standalone Mode

Event latency in (msecs) Min, Max, Median	100.99, 363.182, 210.003
Control latency in (msecs) Min, Max, Median	11.951, 125.195, 24.427

13.5.2 Redundancy Fail Over Time

This MCP version supports below fail-over times (i.e., when active G500 / G100 is power cycled) in the Hot-Hot/Hybrid Redundancy with the default 300ms heart-beat rate and with default 3 retries.

Table 13.3: Hot-Hot Redundancy Fail Over Times

Hot-Hot Redundancy/D.20 Configuration	Maximum Fail-Over Time (msec)	
	G500	G100
D.20 is not configured	1250	1780
D.20 is configured	1450	1940

13.5.3 HMI Response Times

HMI Response Times were not tested in V5.00 – but are expected to be similar to V3.10. Please refer to [HMI Response Times](#) section.

Time Sync Accuracy (IRIG-B/PTP/NTP)

This MCP version supports Hardware based PTP/IRIG-B and Software based NTP Time Sync Accuracy.

This version does not support runtime dynamic failover across different time sources.

Time Sync Input	Accuracy		
	G500 (Intel i3)	G500 (AMD)	G100
IRIG-B IN	100% samples within 330 microseconds with an average of 30.9 microseconds and standard deviation of 4.64 microseconds - Total number of samples considered ~7457 Note: Tested in V5.00	100% samples within 991 microseconds with an average of 51 microseconds and standard deviation of 37 microseconds - Total number of samples considered ~4989 Note: Tested in V4.00	100% samples within 866 microseconds with an average of 90 microseconds and standard deviation of 76 microseconds - Total number of samples considered ~3758 Note: Tested in V3.10
PTP IN	100% samples within 363 microseconds with an average of 41.3 microseconds and standard deviation of 39.8 microseconds - Total number of samples considered ~5361 Note: Tested in V5.00	100% samples within 693 microseconds with an average of 40 microseconds and standard deviation of 31 microseconds - Total number of samples considered ~3457 Note: Tested in V3.10	NA
NTP IN	100% samples within 48 microseconds with an average of 7.2 microseconds and standard deviation of 5.6 microseconds - Total number of samples considered ~6857 Note: Tested in V5.00 after +24 hours of NTP Convergence time	100% samples within 700 microseconds with an average of 192 microseconds and standard deviation of 75 microseconds - Total number of samples considered ~3889 Note: Tested in V3.10	100% samples within 867 microseconds with an average of 92 microseconds and standard deviation of 81 microseconds - Total number of samples considered ~3259 Note: Tested in V3.10

NOTES:

- IRIG-B / PTP time accuracy is measured in a scenario where the hardware is fully loaded.

Timestamp Accuracy

This MCP version provides the following Timestamp Accuracy.

Protocol	Accuracy					
	% @ N = % of samples within +/- N milliseconds					
	G500				G500	G100
	Time sync source (IRIG-B)				Time sync source (DNP3 Serial IN)	Time sync source (DNP3 Serial IN)

GPIO	NA	NA	NA	NA	NA	96.5% @ 1 ms 99.92% @ 2 ms 100% @ 3 ms - Total number of samples considered ~33,000 - Measured the accuracy for every five seconds at the GPIO

Protocol	Accuracy					
	% @ N = % of samples within +/- N milliseconds					
	G500				G500	G100
	Time sync source (IRIG-B)				Time sync source (DNP3 Serial IN)	Time sync source (DNP3 Serial IN)
	MCP Container AMD 2 Core Function Type-S	MCP Container Intel i3 Function Type-S	D2x Container AMD 2 Core Function Type-D	D2x Container AMD 4 Core Function Type-C	MCP Container AMD 2 Core Function Type-S	MCP Container Function Type-S
DNP I/O	83.33% @ 1 ms 99.82% @ 2 ms 99.86% @ 3 ms 100% @ 4 ms - Total number of samples considered ~16476 - Measured the accuracy for every five seconds at a DNP I/O S peripheral Note: Tested in V3.10	74.97% @ +/- 1 ms 97.85% @ +/- 2 ms 100% @ +/- 3 ms - Total number of samples considered ~6500 - Measured the accuracy for every five seconds at a DNP I/O S peripheral Note: Tested in V5.00	90.5% @ +/- 2 ms 99.63% @ +/- 3 ms - Total number of samples considered ~4668 - Measured the accuracy for every second at a DNP I/O S peripheral Note: Tested in V4.10	Test results not available	Test results not available	3.4% @ 1 ms 80.14% @ 2 ms 96.15% @ 3ms 99.16% @ 4 ms 99.88% @ 5 ms 100% @ 6 ms - Total number of samples considered ~11790 - Measured the accuracy for every five seconds at a DNP I/O S peripheral Note: Tested in V3.10

Timestamp Accuracy in IEDs when MCP is syncing time over SCADA protocol

Notes:

- MCP device is receiving time via time sync when the source is IRIG-B.
- MCP device is sending time to downstream IEDs over SCADA protocol.

Time Sync Output	Accuracy		
	% @ N = % of samples within +/- N milliseconds		
	G500 AMD 2 core	G500 AMD 4 core	G100
	MCP Container Function Type-S	MCP Container Function Type-C	MCP Container Function Type-S
DNP3 Serial (DNP DCA)	• 97.65% @ +/- 2 ms • 100% @ +/- 3 ms • Total number of samples considered ~6499 • Measured the accuracy for every second at a D.20 S peripheral	• 85.79% @ +/- 1 ms • 99.95% @ +/- 2 ms • 100% @ +/- 3 ms • Total number of samples considered ~6501 • Measured the accuracy for every second at a D.20 S peripheral	• 99.21% @ +/- 2 ms • 100% @ +/- 3 ms • Total number of samples considered ~4781 • Measured the accuracy for every second at a D.20 S peripheral

14. Version 5.10 (07-January-2025)

Software Versions

The following table defines the software versions required for interaction with the MCP.

Package	Version	Notes
G500 Firmware	5.1.40	G500 Firmware Version.
G100 Firmware	5.1.40	G100 Firmware Version.
DS Agile MCP Studio	5.1.0	Minimum Supported DS Agile MCP Studio Software.
MCP HMI	510.20.15	MCP HMI Version.
MCP Dynamic Remote HMI	1.0.0.6	Minimum Remote HMI compatible with all MCP Versions, 64-bit Software.
MCP Utilities	1.2.6	Minimum Supported MCP Firmware Upgrade Utilities.
IEC61850 CID Tool	9.4.6	Minimum Supported CID configuration tool for automatically creating IEC 61850 Server map files.

Cross Compatibility Versions

The following table defines the compatibility between G500 firmware versions and SMX firmware versions.

Compatibility	G500 ≤ v3.10 (C1)	G500 v4.00 (D0)	G500 v4.10 (D1)	G500 v5.00 (E0)	G500 v5.10 (E1)
SMXnn.400 (RAM only, should not be used)	N	Y	Y	Y	Y
SMXnn.401	N	Y	Y	Y	Y
SMXnn.410	N	N	Y	Y	Y
SMXnn.411	N	N	Y	Y	Y

Predix Edge OS and Other Firmware Versions

The following table defines the package/firmware versions supported for Predix Edge Linux OS, FPGA, CPLD, UEFI and BCOM FPGA in this MCP version.

Package / Firmware	G100 Version	G500 AMD Version	G500 Intel Version	Notes
Predix Edge OS	2.9.0	2.9.0	2.9.0	Supported GE's Secured Linux Operating System Version.
FPGA	NA	1.03.00	1.03.00	Supported FPGA Version of Multi-Function Controller Platform (MCP).
CPLD	NA	1.2.3	2.0.2 (minimum)	Supported CPLD Version of Multi-Function Controller Platform (MCP).
UEFI	FLEBG100A0006V107	VX5D0007.C01	VB780242	Minimum Supported UEFI Version of Multi-Function Controller Platform (MCP).
BCOM FPGA	NA	2.3.0 or 2.4.0	2.5.0 (minimum)	Supported COM's Module FPGA Version of Multi-Function Controller Platform (MCP).
D2X	NA	SMXA0.411.0001	SMXA0.411.0001	General release.

Specific G500 D2x Characteristics and Limitations:

D2x has an associated Environment Type in the G500 which is equivalent to a hardware based CPU Board.

Only D2x configurations equivalent to Single Node D20/D200 or Single Partition D20MX are supported. Configurations using Multiple Nodes D200 or Multiple Partitions D20MX are not supported unless are first scaled down to a single node / partition.

G500 cannot use the exact same D20 Firmware from D20 based RTUs (SABxxxx or SANxxxx). The D2x Firmware running in G500 is specific to MCP platform (is similar to a CCU Base D20ME firmware but uses different applications). Existing configurations will go through a D2x Firmware Upgrade process for G500 D2x.

Redundant CCU option is not supported in D.20 Communication Parameters; use instead the D2X Application Communication Watchdog (A026-1S) to monitor the redundant CCU state.

Secondary IP Addressing in LAN Settings is not supported.

If changing or reloading D2x configuration while in "sa com" in 68k shell - the D2X doesn't start again. Requires reboot of the G500 and then deploy again the D2x configuration using "d2xload" command or "sync to" (D-16780).

Type **SMC-0001-11** ("G500-D20 Environment, RAM only, single partition, max 7 serial ports") has the following characteristics and limitations:

- NVRAM is not available in G500 as D2x RTU – even if D2x application settings are configured for NVRAM. This applies also to "Save Points on Power Fail" not being possible.
- Only COM1 to COM7 are available to D2x applications (same as in a single board D20 CPU).

Type **SMC-0001-01** ("G500-D20 Environment, single partition, max 7 serial ports") has the following characteristics and limitations:

- Enables NVRAM for G500-D2X Applications.
- Only COM1 to COM7 are available to D2x applications (same as in a single board D20 CPU).
- Requires New DSAS Firmware Library with SMXA0.401 or later.
- Requires New **D2x Firmware** Name and Version **SMXA0.401** or later.
- DSAS v4.10 contains these updates.
- For DSAS v4.00 users:
 - o Install above exhibits, packaged in a single "meta package" file:
"G500-D2X_SMXA0_401_20240430_NVRAM_MetaPackage.7zip".
 - o Technical Note **TN0128** describes how to install and enable the above.

Type **SMC-0001-02** ("G500-D20 Environment, single partition, max 20 serial ports ") has the following characteristics and limitations:

- Enables NVRAM for G500-D2X Applications.
- COM1-8, COMA1-4, COMB1-4, COMC1-4 are available to D2x applications.
- Requires **DSAS Firmware Library** with **SMXA0.411** or later.
- Requires **D2x Firmware** Name and Version **SMXA0.411** or later.
- Requires **DSAS v5.10** or later.

Starting with **DSAS v4.10** and **SMXA0.410** (using B014-1S V600 or later) - the D2x WESMAINT access Passwords are encrypted and cannot be visualized anymore in the B014-1S table. In addition – the following rules are enforced for WESMAINT users and passwords:

- User name cannot be blank.
- The rules for entering strong passwords are:
 - o Between 8 and 22 English characters.
 - o At least one English uppercase character (A through Z).
 - o At least one English lowercase character (a through z).
 - o At least one number, Base 10 digits (0 through 9).
 - o At least one non-alpha-numeric character.
- When creating a new device configuration – strong passwords must be entered.
- After importing D20MX configurations – strong passwords must be entered.
- After importing D20 (not D20MX) configurations – the original D20 passwords are retained as long as changes are not done again for the passwords. If password changes are required – then strong password rules are enforced and apply.

For more details, please refer to MCP Software Configuration Guide V500 R0 (SWM0101).

Key Functions and Changes

- SMXA0.411 is the general release D2x Firmware version, which adds support for up to 20 serial ports in D2x applications when used with SMC-0001-02 and DS Agile Studio v5.10.
- Added BITSTRING16/32 functionality in MCP Core Modbus Server.
- Confirmed D.20 Ring with GFO Layout (G500 & G100).

14.1 Enhancements

14.1.1 Cyber Security

Please refer to Product & Cyber Security Advisories on the GE Vernova Grid Solutions web site.

14.1.2 Clients

None.

14.1.3 Servers

GE Vernova Internal Reference #	Description
R-01749	Added Bitstring16/32 functionality in MCP Core Modbus Server.

14.1.4 Automation

None.

14.1.5 Configuration/Settings

None.

14.1.6 HMI

None.

14.1.7 Pass-through

None.

14.1.8 System

GE Vernova Internal Reference #	Description
E-05529	Added support for up to 20 serial ports in MCP-D2X applications. See section “ <i>Specific G500 D2x Characteristics and Limitations</i> ” for details and compatibility.

14.1.9 Documentation

GE Vernova Internal Reference #	Description
E-05514	Updated document [MIS-0109] MCP Firmware Release Notes (V510 R0) to include features related to Modbus DPA.
E-05512	Updated document [994-0152] G500 Substation Gateway Instruction Manual (V510 R0) to include G500 Order Code and G500 D.20 Ring with GFO Layout.
E-05511	Updated document [994-0155] G100 Substation Gateway Instruction Manual (V510 R0) to include G100 Order Code and G100 D.20 Ring with GFO Layout.
E-05513	Created document [994-0153] MCP Binder and ISO Image (V510 R0).
E-05515	Updated document [SWM0101] MCP Software Configuration Guide (V510 R0) for Modbus DPA Bitstring functionality and added SMC for 20 ports.
E-05545	Updated document [MIS-0110] Open Source License Information (V510 R0).
E-05554	Updated document [TN0125] MCP Firmware Upgrade via PETC (V300 R1).
E-05555	Updated document [SWM0124] IEC61850 Server User Guide (V500 R1) for CID Tool V9.4.6

14.1.10 Hardware

None.

14.2 Fixed defects

This version of MCP has the fixes for the following defects compared to MCP version 500.

14.2.1 Cyber Security

Please refer to Product & Cyber Security Advisories on the GE Vernova Grid Solutions web site.

14.2.2 Clients

GE Vernova Internal Reference #	Description
D-16219	Fixed an issue in MCP D2X B003 where it would crash with 101 peripheral setup when D.20 cable was disconnected.

14.2.3 Servers

GE Vernova Internal Reference #	Description
E-05343 / R-01692 / DCSSUP-24550 / R-01693 / DCSSUP-24507	Fixed an issue in IEC61850 server where it does not support custom DOs from downstream IEC61850 IEDs. The fix is available in CID tool 9.4.6 or higher version. Supported MCP firmware versions are 5.00 and 5.10.
D-15903	Fixed an issue in IEC61850 DPA where it is not functional if the user selects to include the real data points from downstream IEC61850 IEDs in the IEC61850 server configuration while generating CID file using CID Tool. The fix is available in CID tool 9.4.6 or higher version. Supported MCP firmware versions are 5.00 and 5.10.

14.2.4 Automation

None.

14.2.5 Configuration/Settings

None.

14.2.6 HMI

GE Vernova Internal Reference #	Description
R-01765 / DCSSUP-30023	Fixed an issue where the Dynamic Remote HMI cannot close after the prompt to trust a new unit. New version is 1.0.0.6.

14.2.7 Pass-through

None.

14.2.8 System

None.

14.2.9 Documentation

None.

14.2.10 Hardware

None.

14.3 Known Issues

This MCP version has the following known issues:

14.3.1 Cyber Security

GE Vernova Internal Reference #	Description
D-14069	The MCP Settings GUI does not automatically log off after the inactivity timeout. It requires that the user click into the web page or hit refresh after the timeout occurs to trigger the Settings GUI to close the session. The mcpcfg utility will be locked out from use while the MCP Settings GUI session is open. If MCP Settings GUI was left open after the inactivity timeout has expired (maliciously or unintentionally), as a workaround, you can login and logout of the MCP Settings GUI in another browser to release the lockout of the mcpcfg utility.

For any additional known issues, please refer to Product & Cyber Security Advisories on the GE Vernova Grid Solutions web site.

14.3.2 Clients

GE Vernova Internal Reference #	Description
B-13475	SEL Binary Client doesn't support Double Precision Scaling Factors.
D-05002	ARRM file retrieval from SEL 1xx/2xx relays (using GENASCII) is not possible.
D-12834	Modbus Client could not process PRF events comes from SR 369 relay.
D-13075	D20A card in bad state can cause false behaviour/functionality when it is configured in warm or hot-hot redundancy.
D-13214	DNP3 Client doesn't support object types 31 and 33 for Frozen Analog Inputs (all variations).
D-14111	Cold Reboot Required DI (1) based on HDLC card faulty state will be reset on warm reboot also.
D-15320	With Auto Time Sync enabled, IEC103 DCA does not automatically perform a time sync when there is a change in local time.
D-15881	G100 D.20 DCA failed after some run time (long run setup)
D-16173	DNP3 propagation delay command executes also a time sync operation.

14.3.3 Servers

GE Vernova Internal Reference #	Description
D-12889 / B-16203	DNP DPA/Server takes high CPU if more than 5000 Analog Inputs are configured in Unbuffered mode.
B-11967	No support for events in NVRAM in IEC101/104 Server. Events that have not been yet transmitted to Master (Clients) are lost if G500 is power cycled / restarted. However – the integrity polls will continue to provide accurate database representation.
B-11968	No support for events in NVRAM in DNP3 Server. Events that have not been yet transmitted to Master (Clients) are lost if G500 is power cycled / restarted. However – the integrity polls will continue to provide accurate database representation.
D-13134 / D-13135	RTS Post-amble time is not added to the data link confirm timeout or application timeout in DNP3 Serial Server.
D-12566	IEC101 DPA/Server in unbalanced mode sometimes reports duplicate Digital Input events to the Master if the event happens at the same time as General Interrogation response.
D-13996	IEC101/104 DPA buffer overflow DI events will be lost when set as discard newest.
D-12567	The time sync accuracy of G100 when IEC101 Server (Unbalanced/Balanced) is used as a time sync source is > +/- 4 msec.
D-15288	G500 time synch from serial masters (IEC101, DNP3) relies on the regular crystal clock (Linux clock) which drifts and is inaccurate.
D-16253	Modbus Server writes the configured Offline Analog Value in both words of a 32 bit register. As long as 0 (zero) is used as configured Offline Analog Value there is no impact.

GE Vernova Internal Reference #	Description
N/A	In MCP-D2X MODBUS DPA (A068) > Port Configuration: for RS485-2 wires ports the "Modem Used" parameter must be set to "RTS Only".

14.3.4 Automation

GE Vernova Internal Reference #	Description
B-11969	DEM is responsible for handling alarms. Events/Alarms that have not been yet committed to the SQL database are lost if G500 is power cycled / restarted. However – the integrity polls will continue to provide accurate database representation.
DCSSUP-19948 / D-12000 / R-01430	Restore the last value for variables configured in LogicLinx wizard does not work at runtime (starts at 0 always).
D-14100	In MCP Runtime HMI, data points in 'Online Trends' do not display 'underscore (_)' in Point description even though it is there in the configuration.
D-15945	When manual force quality "Comm Lost CX" is applied on any AI/DI/Acc points then it is not getting reported as "Old Data" quality to IEC61850DPA

14.3.5 Configuration/Settings

GE Vernova Internal Reference #	Description
D-10502	NOT A DEFECT. If client applications are configured in non-redundant mode and later the device properties are switched to a redundant mode where some applications are not enabled - their respective points are still available to be mapped, but at runtime will be offline. This is to retain the mappings in case the user decides to switch later back to single mode and the client applications are active again, as previously configured.
D-10388	TACACS+ remote authentication can be enabled and activated even if the TACACS+ Server is not available in that moment. This will conduct to a device that can only be accessed using Emergency Access process, if TACACS+ server is not available.
D-06168	FPGA needs to be restarted via Power Cycle for PTP/IRIGB configuration change. No functional impact. PTP/IRIG-B configuration will not be applied without reboot of G500.
D-13028	Add more protection for memory leaks in Apache webserver settings.
B-15613	The configuration through Bulk Editor is not supported for G500 after v2.10.
N/A	If filenames with characters other than ASCII are present in the MCP file system - the MCP device and associated configuration tools will not work correctly. Keep only ASCII characters in the filenames for Client Maps, Server Maps, OneLine.dra, OneLine Images, and other user files.

14.3.6 Pass-through

GE Vernova Internal Reference #	Description
D-12990	In LDAP authentication, after passthrough connection is timed out, auto logout event is not generated into user activity log by IEC 103 Client.

14.3.7 HMI

GE Vernova Internal Reference #	Description
B-15650	The following features of the Analog Report Viewer are not available: View online reports Save and view offline reports
B-14982	The product references in the Runtime (Local/Remote) HMI logs need to be changed as "MCP".
D-05463	If a used point group is deleted from the systemwide configuration, then points belonging to that group are not visible in the point group summary. However, if user changes the point group allocation from the corresponding instantiated client map file(s) then points will be visible in the point group summary.

14.3.8 System

GE Vernova Internal Reference #	Description
E-04130	The USB FLASH drive used for the Firmware Upgrade must be FAT32 format. As a result of this, only USB FLASH drives of maximum 32 GB can be used. The minimum size, imposed by storage requirements, is 8 GB.
E-03041 D-10346	Input time source selection (PTP / IRIG-B / NTP) does not support dynamic failover between time sources at runtime. Only the configured time source is active at a time.
D-10227	Email does not send messages when an alarm is activated.
D-05714	Update of only Edge OS is not supported. If only Edge OS updates are required, the complete G500 firmware image needs to be updated.
D-06167	Full support for latest PTP power profiles: - IEEE C37.238-2017 - IEC61850-9-3 Ed.1 2016 Enhancement: G500 supports the following PTP profiles: - IEEE 1588-2008 J4 Peer-to-Peer Profile - IEEE C37.238-2011 Power System Profile (but this has been withdrawn) Limited IEC61850-9-3 Ed.1 2016 Power Utility Automation Profile.
D-13083	Add support for progress bar to be displayed during "Applying update" procedure through Predix Edge Technician Console (PETC).

GE Vernova Internal Reference #	Description
D-13039	When both G500's are power cycled at the same time and if switch panel configured as a master, then one of the G500 can go to the failed state. Note: If switch panel is configured as Master and one of the G500 is power cycled with a delay then this issue will not be observed.
D-12984	Daisy chained secondary monitor shows always duplicate monitor, but it does not show the extended desktop.
D-15990	Wesmaint Screen does not allow user to login with the maximum characters when username has 22 characters and password has 64 characters
R-01637 / DCSSUP-23735	Issue with Network Interfaces of G500, where the internal MAC address shows up in switching table when any rear port is connected to the Switch.
N/A	The following limitations exist for G100 Redundant LAN. Please refrain from using unsupported functionalities. 1. An Active IP cannot be configured on a Redundant LAN interface. 2. The Static IP of a Redundant LAN interface cannot be used as the PEER IP used for pairing a Hot-Hot MCP system. 3. VLAN's cannot be configured on a Redundant LAN interface. 4. DHCP cannot be configured on a Redundant LAN interface. 5. Only one Redundant LAN interface can be configured, either on Net 1/Net 2 or on Net 3/Net 4. Despite limitations 1 and 2, G100 Redundant LAN can be used in a Hot-Hot G100 system. For example, a valid configuration for a Hot-Hot G100 system would be the following. • Net 1 and Net 2 configured as Single LAN Interfaces, each having an Active and Static IP. • PEER IP using either Net 1 or Net 2 Static IP of the peer G100. • Net 3 and Net 4 configured as a Redundant LAN interface with only a Static IP. Note that limitations 1 and 2 imply that in a Hot-Hot G100 redundant system, only the following applications can communicate over the Redundant LAN interface. • DNP 3.0 Network Client • IEC 61850 Client and Server • Modbus TCP Client The reason is that these applications will use the Static IP of the interface when communicating in Hot-Hot mode. Typical failover time for G100 Redundant LAN is 3 seconds. Better performance can be expected with the G500 Redundant LAN.

14.3.9 Documentation

None.

14.3.10 Hardware

GE Vernova Internal Reference #	Description
D-06165	No functional impact. SFP Hot Plug in / Plug out detection. Points that represent the status of SFP IN/OUT will not be reflected until G500 is rebooted.
N/A (no reference)	G500 with Intel CPU have DP1 and DP2 swapped compared to G500 with AMD CPU. No functional impact.

Capability and Capacity for MCP

This MCP version has identical Capability and Capacity as MCP [V5.00](#).

Please refer to [V5.00](#).

Time Sync Accuracy (IRIG-B/PTP/NTP)

This MCP version has identical Time Sync Accuracy as MCP [V5.00](#).

Please refer to [V5.00](#).

Timestamp Accuracy

This MCP version has identical Timestamp Accuracy as MCP [V5.00](#).

Please refer to [V5.00](#).

Application List

This MCP version has identical applications available as MCP [V5.00](#).

Please refer to [V5.00](#).

15. Version 5.20 (16-June-2025)

Software Versions

The following table defines the software versions required for interaction with the MCP.

Package	Version	Notes
G500 Firmware	5.2.216	G500 Firmware Version.
G100 Firmware	5.2.216	G100 Firmware Version.
DS Agile MCP Studio	5.2.0	Minimum Supported DS Agile MCP Studio Software.
MCP HMI	5.20.216.26	MCP HMI Version.
MCP Dynamic Remote HMI	1.0.0.6	Minimum Remote HMI compatible with all MCP Versions, 64-bit Software.
MCP Utilities	1.2.6	Minimum Supported MCP Firmware Upgrade Utilities.
IEC61850 CID Tool	9.4.6	Minimum Supported CID configuration tool for automatically creating IEC 61850 Server map files.

Cross Compatibility Versions

The following table defines the compatibility between G500 firmware versions and SMX firmware versions.

Compatibility	G500 <= v3.10 (C1)	G500 v4.00 (D0)	G500 v4.10 (D1)	G500 v5.00 (E0)	G500 v5.10 (E1)	G500 v5.20 (E2)
SMXnn.400 (RAM only, should not be used)	N	Y	Y	Y	Y	Y
SMXnn.401	N	Y	Y	Y	Y	Y
SMXnn.410	N	N	Y	Y	Y	Y
SMXnn.411	N	N	Y	Y	Y	Y

Predix Edge OS and Other Firmware Versions

The following table defines the package/firmware versions supported for Predix Edge Linux OS, FPGA, CPLD, UEFI and BCOM FPGA in this MCP version.

Package / Firmware	G100 Version	G500 AMD Version	G500 Intel Version	Notes
Predix Edge OS	2.9.0	2.9.0	2.9.0	Supported GE's Secured Linux Operating System Version.
FPGA	NA	1.03.00	1.03.00	Supported FPGA Version of Multi-Function Controller Platform (MCP).
CPLD	NA	1.2.3	2.1.0 (minimum)	Supported CPLD Version of Multi-Function Controller Platform (MCP).
UEFI	FLEBG100A0006V107	VX5D0007.C01	VB780244	Minimum Supported UEFI Version of Multi-Function Controller Platform (MCP).
BCOM FPGA	NA	2.3.0 or 2.4.0	2.5.0 (minimum)	Supported COM's Module FPGA Version of Multi-Function Controller Platform (MCP).
D2X	NA	SMXA0.411.0003	SMXA0.411.0003	General release.

Specific G500 D2x Characteristics and Limitations:

D2x has an associated Environment Type in the G500 which is equivalent to a hardware based CPU Board.

Only D2x configurations equivalent to Single Node D20/D200 or Single Partition D20MX are supported. Configurations using Multiple Nodes D200 or Multiple Partitions D20MX are not supported unless are first scaled down to a single node / partition.

G500 cannot use the exact same D20 Firmware from D20 based RTUs (SABxxxx or SANxxxx). The D2x Firmware running in G500 is specific to MCP platform (is similar to a CCU Base D20ME firmware but uses different applications). Existing configurations will go through a D2x Firmware Upgrade process for G500 D2x.

Redundant CCU option is not supported in D.20 Communication Parameters; use instead the D2X Application Communication Watchdog (A026-1S) to monitor the redundant CCU state.

Secondary IP Addressing in LAN Settings is not supported.

If changing or reloading D2x configuration while in "sa com" in 68k shell - the D2X doesn't start again. Requires reboot of the G500 and then deploy again the D2x configuration using "d2xload" command or "sync to" (D-16780).

Type **SMC-0001-11** ("G500-D20 Environment, RAM only, single partition, max 7 serial ports") has the following characteristics and limitations:

- NVRAM is not available in G500 as D2x RTU – even if D2x application settings are configured for NVRAM. This applies also to "Save Points on Power Fail" not being possible.
- Only COM1 to COM7 are available to D2x applications (same as in a single board D20 CPU).

Type **SMC-0001-01** ("G500-D20 Environment, single partition, max 7 serial ports") has the following characteristics and limitations:

- Enables NVRAM for G500-D2X Applications.
- Only COM1 to COM7 are available to D2x applications (same as in a single board D20 CPU).
- Requires New DSAS Firmware Library with SMXA0.401 or later.
- Requires New **D2x Firmware** Name and Version **SMXA0.401** or later.
- DSAS v4.10 contains these updates.
- For DSAS v4.00 users:

- o Install above exhibits, packaged in a single "meta package" file:

"G500-D2X_SMXA0_401_20240430_NVRAM_MetaPackage.7zip".

- o Technical Note **TN0128** describes how to install and enable the above.

Type **SMC-0001-02** ("G500-D20 Environment, single partition, max 20 serial ports ") has the following characteristics and limitations:

- Enables NVRAM for G500-D2X Applications.
- COM1-8, COMA1-4, COMB1-4, COMC1-4 are available to D2x applications.
- Requires **DSAS Firmware Library** with **SMXA0.411** or later.
- Requires **D2x Firmware** Name and Version **SMXA0.411** or later.
- Requires **DSAS v5.10** or later.

Starting with **DSAS v4.10** and **SMXA0.410** (using B014-1S V600 or later) - the D2x WESMAINT access Passwords are encrypted and cannot be visualized anymore in the B014-1S table. In addition – the following rules are enforced for WESMAINT users and passwords:

- User name cannot be blank.
- The rules for entering strong passwords are:
 - o Between 8 and 22 English characters.
 - o At least one English uppercase character (A through Z).
 - o At least one English lowercase character (a through z).

- o At least one number, Base 10 digits (0 through 9).
- o At least one non-alpha-numeric character.
- When creating a new device configuration – strong passwords must be entered.
- After importing D20MX configurations – strong passwords must be entered.
- After importing D20 (not D20MX) configurations – the original D20 passwords are retained as long as changes are not done again for the passwords. If password changes are required – then strong password rules are enforced and apply.

For more details, please refer to MCP Software Configuration Guide V500 R0 (SWM0101).

Key Functions and Changes

- Removed TACACS+ support.
- MCP Runtime HMI Trends improvements and fixes (see Enhancements > HMI, Fixed defects > HMI).
- Intel i3 CPU supports now MCP-D2x Combined “Function C” (in addition to AMD 4-cores and Intel Xeon).
- Added support for 1 TB SSD in G500 with Intel Xeon CPU (CPU option D).
- Updated Documentation to GE Vernova style.
- Cyber security updates (see document *Cyber Security Advisory for cyber changes / fixes in MCP V520*).

15.1 Enhancements

15.1.1 Cyber Security

Please refer to Product & Cyber Security Advisories on the GE Vernova Grid Solutions web site.

15.1.2 Clients

None.

15.1.3 Servers

None.

15.1.4 Automation

None.

15.1.5 Configuration/Settings

None.

15.1.6 HMI

GE Vernova Internal Reference #	Description
R-01772	HMI Trends: Allow user to read up to 100,000 (with 8GB RAM) or 500,000 (with 16GB RAM) data points in Trend selection dialog (previous was 10,000).
E-05003	HMI Trends: Retain last selected pens when navigating away and then back.

GE Vernova Internal Reference #	Description
B-20307	HMI Trends: Theme colors updates.
B-20224	HMI Trends: Show the values Y axis as normal "human" read outs instead of the scientific notation.
B-20223	HMI Trends: Make the Single Axis and Auto Scale as default options when pens are selected the first time.
B-20152	Local HMI: Added "/home/hmi/logs" to the File Explorer, to be available for copy to USB.

15.1.7 Pass-through

None.

15.1.8 System

GE Vernova Internal Reference #	Description
B-18825	Removed TACACS+ support for remote authentication due to lack of support for cyber security.

15.1.9 Documentation

GE Vernova Internal Reference #	Description
B-20207	In all v5.2 release documents, updated 'GE' to 'GE Vernova' styles, contact email addresses and document classification.
E-05520	Updated document [MIS-0109] MCP Firmware Release Notes (V520 R0) to include new SMXnn.411.0003 builds, clarified D.20 Import minimum version needed for B003 is 722 and CCU Base.
E-05518	Updated document [994-0152] G500 Substation Gateway Instruction Manual (V520 R0) to include G500 Order code, new MCP Spares, added support for new 1TB SED size.
E-05517	Updated document [994-0155] G100 Substation Gateway Instruction Manual (V520 R0) to include G100 Order Code, new MCP Spares.
E-05521	Updated document [SWM0101] MCP Software Configuration Guide (V520 R0) – see list of changes in SWM0101 document.
E-05520	Updated document [MIS-0110] Open Source License Information (V520 R0).
E-05588	Updated document [SWM0105] Secure Deployment Guide (V520 R0) and clarified TACACS+ is not available starting with V520.
E-05571	Updated DSAS help file for changes related V5.2.
E-05572	Updated DSAS Loader Help with re-import functionality.
E-05614	Updated MCP HMI help file for Trends and File Explorer.
B-20284	Create Cyber Security Advisory for cyber changes / fixes in V520.
E-05519	Created document [994-0153] MCP Binder and ISO Image (V520 R0).

15.1.10 Hardware

None.

15.2 Fixed defects

This version of MCP has the fixes for the following defects compared to MCP version 510.

15.2.1 Cyber Security

Please refer to Product & Cyber Security Advisories on the GE Vernova Grid Solutions web site.

15.2.2 Clients

GE Vernova Internal Reference #	Description
DCSSUP-25072 / R-01763	Fixed an issue in IEC103 Client where controls would not be executed.
DCSSUP-30284 / R-01787	Fixed multiple issues in SEL Client application: • SEL DCA doesn't communicate over Virtual Ports. • SEL DCA stops responding on some IED models. • Added support for different filenames depending on connection (Serial or VP) – to reflect some IEDs behaviour. • Improved startup and re-connection state machine.
D-16173	DNP3 propagation delay command executes also a time sync operation.
D-15881	Fixed an issue where G100 D.20 DCA failed after some run time (long run setup)

15.2.3 Servers

GE Vernova Internal Reference #	Description
D-16505	Fixed an issue where DNP3 LRU accepts any master address even when "Accept All Master" parameter is set as False for DNP3DPA.

15.2.4 Automation

None.

15.2.5 Configuration/Settings

GE Vernova Internal Reference #	Description
R-01797	Network assignment files are not updated correctly. One symptom could be errors when accessing: mcpcfg > Configure Network Interfaces > 8. Networking Summary.
D-16310	Cannot configure same UDP port if the DNP3 UDP LRUs have same name.
D-16386	In G100 could not configure RLAN in same subnet as Predix EdgeOS Host interface.

15.2.6 HMI

GE Vernova Internal Reference #	Description
D-16349, D-16374	HMI Trends: Manage Reports - the "Capacity" value is shown incorrect.
D-16291	HMI Trends: Trend object indicates message "Disconnected from report data".
D-16302	HMI Trends: Trending values are not retrieved correctly.
D-16344	HMI Trends: When selecting 'Manage Reports' the status is displayed as failed to load report data and the size is 0%.

15.2.7 Pass-through

None.

15.2.8 System

GE Vernova Internal Reference #	Description
D-16265	After restoring a clone snapshot taken from early G500 versions there was one entry in the firewall configuration file from previous version, no longer applicable to current one. Found in v5.10.
D-16426	When installing D2x firmware from DSAS – at the end there was a shell error message <i>“unary operator expected”</i> in the firmware update log. No actual malfunction happened.
DCSSUP-25045 / R-01752	Not able to use clone snapshot password that starts with \$ symbol.
DCSSUP-30103 / R-01778	IEC 101/104 Server reports incorrectly step position with time tag overflow flag.

15.2.9 Documentation

None.

15.2.10 Hardware

None.

15.3 Known Issues

This MCP version has the following known issues:

15.3.1 Cyber Security

GE Vernova Internal Reference #	Description
D-14069	The MCP Settings GUI does not automatically log off after the inactivity timeout. It requires that the user click into the web page or hit refresh after the timeout occurs to trigger the Settings GUI to close the session. The mcpcfg utility will be locked out from use while the MCP Settings GUI session is open. If MCP Settings GUI was left open after the inactivity timeout has expired (maliciously or unintentionally), as a workaround, you can login and logout of the MCP Settings GUI in another browser to release the lockout of the mcpcfg utility.

For any additional known issues, please refer to Product & Cyber Security Advisories on the GE Vernova Grid Solutions web site.

15.3.2 Clients

GE Vernova Internal Reference #	Description
B-13475	SEL Binary Client doesn't support Double Precision Scaling Factors.
D-05002	ARRM file retrieval from SEL 1xx/2xx relays (using GENASCII) is not possible.
D-12834	Modbus Client could not process PRF events comes from SR 369 relay.
D-13075	D20A card in bad state can cause false behaviour/functionality when it is configured in warm or hot-hot redundancy.
D-13214	DNP3 Client doesn't support object types 31 and 33 for Frozen Analog Inputs (all variations).
D-14111	Cold Reboot Required DI (1) based on HDLC card faulty state will be reset on warm reboot also.
D-15320	With Auto Time Sync enabled, IEC103 DCA does not automatically perform a time sync when there is a change in local time.

15.3.3 Servers

GE Vernova Internal Reference #	Description
D-12889 / B-16203	DNP DPA/Server takes high CPU if more than 5000 Analog Inputs are configured in Unbuffered mode.
B-11967	No support for events in NVRAM in IEC101/104 Server. Events that have not been yet transmitted to Master (Clients) are lost if G500 is power cycled / restarted. However – the integrity polls will continue to provide accurate database representation.

GE Vernova Internal Reference #	Description
B-11968	No support for events in NVRAM in DNP3 Server. Events that have not been yet transmitted to Master (Clients) are lost if G500 is power cycled / restarted. However – the integrity polls will continue to provide accurate database representation.
D-13134 / D-13135	RTS Post-amble time is not added to the data link confirm timeout or application timeout in DNP3 Serial Server.
D-12566	IEC101 DPA/Server in unbalanced mode sometimes reports duplicate Digital Input events to the Master if the event happens at the same time as General Interrogation response.
D-13996	IEC101/104 DPA buffer overflow DI events will be lost when set as discard newest.
D-12567	The time sync accuracy of G100 when IEC101 Server (Unbalanced/Balanced) is used as a time sync source is > +/- 4 msec.
D-15288	G500 time synch from serial masters (IEC101, DNP3) relies on the regular crystal clock (Linux clock) which drifts and is inaccurate.
D-16253	Modbus Server writes the configured Offline Analog Value in both words of a 32 bit register. As long as 0 (zero) is used as configured Offline Analog Value there is no impact.
N/A	In MCP-D2X MODBUS DPA (A068) > Port Configuration: for RS485-2 wires ports the "Modem Used" parameter must be set to "RTS Only".

15.3.4 Automation

GE Vernova Internal Reference #	Description
B-11969	DEM is responsible for handling alarms. Events/Alarms that have not been yet committed to the SQL database are lost if G500 is power cycled / restarted. However – the integrity polls will continue to provide accurate database representation.
DCSSUP-19948 / D-12000 / R-01430	Restore the last value for variables configured in LogicLinx wizard does not work at runtime (starts at 0 always).
D-14100	In MCP Runtime HMI, data points in 'Online Trends' do not display 'underscore (_)' in Point description even though it is there in the configuration.
D-15945	When manual force quality "Comm Lost CX" is applied on any AI/DI/Acc points then it is not getting reported as "Old Data" quality to IEC61850DPA

15.3.5 Configuration/Settings

GE Vernova Internal Reference #	Description
D-10502	NOT A DEFECT. If client applications are configured in non-redundant mode and later the device properties are switched to a redundant mode where some applications are not enabled - their respective points are still available to be mapped, but at runtime will be offline. This is to retain the mappings in case the user decides to switch later back to single mode and the client applications are active again, as previously configured.

GE Vernova Internal Reference #	Description
D-06168	FPGA needs to be restarted via Power Cycle for PTP/IRIGB configuration change. No functional impact. PTP/IRIG-B configuration will not be applied without reboot of G500.
D-13028	Add more protection for memory leaks in Apache webserver settings.
B-15613	The configuration through Bulk Editor is not supported for G500 after v2.10.
N/A	If filenames with characters other than ASCII are present in the MCP file system - the MCP device and associated configuration tools will not work correctly. Keep only ASCII characters in the filenames for Client Maps, Server Maps, OneLine .dra, OneLine Images, and other user files.

15.3.6 Pass-through

GE Vernova Internal Reference #	Description
D-12990	In LDAP authentication, after passthrough connection is timed out, auto logout event is not generated into user activity log by IEC 103 Client.

15.3.7 HMI

GE Vernova Internal Reference #	Description
B-15650	The following features of the Analog Report Viewer are not available: View online reports Save and view offline reports
B-14982	The product references in the Runtime (Local/Remote) HMI logs need to be changed as "MCP".
D-05463	If a used point group is deleted from the systemwide configuration, then points belonging to that group are not visible in the point group summary. However, if user changes the point group allocation from the corresponding instantiated client map file(s) then points will be visible in the point group summary.

15.3.8 System

GE Vernova Internal Reference #	Description
E-04130	The USB FLASH drive used for the Firmware Upgrade must be FAT32 format. As a result of this, only USB FLASH drives of maximum 32 GB can be used. The minimum size, imposed by storage requirements, is 8 GB.
E-03041 D-10346	Input time source selection (PTP / IRIG-B / NTP) does not support dynamic failover between time sources at runtime. Only the configured time source is active at a time.
D-10227	Email does not send messages when an alarm is activated.

GE Vernova Internal Reference #	Description
D-05714	Update of only Edge OS is not supported. If only Edge OS updates are required, the complete G500 firmware image needs to be updated.
D-06167	Full support for latest PTP power profiles: • IEEE C37.238-2017 • IEC61850-9-3 Ed.1 2016 Enhancement: G500 supports the following PTP profiles: • IEEE 1588-2008 J4 Peer-to-Peer Profile • IEEE C37.238-2011 Power System Profile (but this has been withdrawn) Limited IEC61850-9-3 Ed.1 2016 Power Utility Automation Profile.
D-13083	Add support for progress bar to be displayed during "Applying update" procedure through Predix Edge Technician Console (PETC).
D-13039	When both G500's are power cycled at the same time and if switch panel configured as a master, then one of the G500 can go to the failed state. Note: If switch panel is configured as Master and one of the G500 is power cycled with a delay then this issue will not be observed.
D-12984	Daisy chained secondary monitor shows always duplicate monitor, but it does not show the extended desktop.
D-15990	Wesmaint Screen does not allow user to login with the maximum characters when username has 22 characters and password has 64 characters
R-01637 / DCSSUP-23735	Issue with Network Interfaces of G500, where the internal MAC address shows up in switching table when any rear port is connected to the Switch.
N/A	The following limitations exist for G100 Redundant LAN. Please refrain from using unsupported functionalities. 1. An Active IP cannot be configured on a Redundant LAN interface. 2. The Static IP of a Redundant LAN interface cannot be used as the PEER IP used for pairing a Hot-Hot MCP system. 3. VLAN's cannot be configured on a Redundant LAN interface. 4. DHCP cannot be configured on a Redundant LAN interface. 5. Only one Redundant LAN interface can be configured, either on Net 1/Net 2 or on Net 3/Net 4. Despite limitations 1 and 2, G100 Redundant LAN can be used in a Hot-Hot G100 system. For example, a valid configuration for a Hot-Hot G100 system would be the following. • Net 1 and Net 2 configured as Single LAN Interfaces, each having an Active and Static IP. • PEER IP using either Net 1 or Net 2 Static IP of the peer G100. • Net 3 and Net 4 configured as a Redundant LAN interface with only a Static IP. Note that limitations 1 and 2 imply that in a Hot-Hot G100 redundant system, only the following applications can communicate over the Redundant LAN interface. • DNP 3.0 Network Client • IEC 61850 Client and Server • Modbus TCP Client The reason is that these applications will use the Static IP of the interface when communicating in Hot-Hot mode. Typical failover time for G100 Redundant LAN is 3 seconds. Better performance can be expected with the G500 Redundant LAN.

15.3.9 Documentation

None.

15.3.10 Hardware

GE Vernova Internal Reference #	Description
D-06165	No functional impact. SFP Hot Plug in / Plug out detection. Points that represent the status of SFP IN/OUT will not be reflected until G500 is rebooted.
N/A (no reference)	G500 with Intel CPU have DP1 and DP2 swapped compared to G500 with AMD CPU. No functional impact.

Capability and Capacity for MCP

This MCP version supports the following limits when configured in Function S (MCP only).

Functions D (D2X) and C (MCP and D2X) offer infinite configuration scenarios. Due to this vast configurability, comprehensive limit testing for Functions D and C is impracticable. Users are advised to consult additional D2X documentation or guidelines for the optimal configuration and usage of Functions D and C.

The maximum number of IEDs or Masters is total across all connections.

The maximum size of the system is given by whichever limit comes first (groups vs members, number of Connections vs IEDs, number of Master instances vs LRUs in the Master etc.). User is responsible to ensure resource usage limits are not exceeded at runtime. For tested performance levels, refer to Table 15.1.

The G500 AMD 4 cores, Intel i3 and Intel Xeon systems have a maximum of 500 IEDs, 200k points and 8 Masters (LRUs) unless otherwise restricted by system loading.

The G500 AMD 4 cores, Intel i3 and Intel Xeon systems can have MCP and D2X enabled at same time ("Function C"), in which case the capability limits and performance test configuration are reduced by approximately 50% (half).

The G500 AMD 2 cores system has a maximum of 250 IEDs, 100k points and 8 Masters (LRUs) unless otherwise restricted by system loading.

The G100 system has a maximum of 120 IEDs, 24k points and 8 Masters (LRUs) unless otherwise restricted by system loading.

Tejas V Master/LRU instances are not counted as part of 8 Masters or LRUs calculations.

Below are the limits for the Maximum number of Remote HMI sessions that can be connected simultaneously:

Application	G500 AMD 4-core, G500 Intel Xeon	G500 AMD 2-core, G500 Intel i3	G100
Remote HMI	8	4	2

Note: The Local HMI session and Online Editor session coming from DS Agile MCP Studio are not counted in the above-mentioned limits.

15.4 Application Limits

This MCP version has identical Application Limits as MCP [V5.00](#).

15.5 Performance

This MCP version meets the following performance test levels.

- MCP Hardware under test:
 - o G500 4 core AMD CPU / 16 GB RAM
 - o G500 2 core AMD CPU / 8 GB RAM
 - o G500 Intel Xeon CPU / 16 GB RAM
 - o G500 Intel i3 CPU / 8 GB RAM
 - o G100 8 GB RAM
- The following sections indicate the tested G500 and G100 values in different loading conditions.
- If the loading levels are lower, then the total number of IEDs and RTDB points can increase but no more than specified limits under the Capability and Capacity section above.

15.5.1 Startup Time

A G500 configured with factory default configuration is ready to carry communications within 3 minutes after power on.

A G100 configured with factory default configuration is ready to carry communications within 4 minutes after power on.

Depending on the system size and configuration loaded, number of IEDs, number of RCBs in each IED, number of datasets in each IED, total number of points in the database, time for each IED to come online, number of Server Instances and mapped points, size of configured Programmable Logic – the total time when the device is ready to carry communications may be increased in addition to the above by as much as 15 minutes for a maximum size configuration.

15.5.2 Performance Test Levels and Results

This MCP version provides the following performance capabilities when configured in different modes (Standalone and Hot-Hot Redundancy).

The performance of MCP was tested using the activity levels and configuration scenarios presented next:

Note:

- Performance test results with multi-protocol test setup in MCP Standalone mode for V5.0 release are in **Table 13.1**.
- Performance test results with DNP3 test setup in MCP Standalone mode for V5.2 release are in **Table 15.1**.
- Performance test results for G500 AMD (4 Core) multi-protocol in Hot-Hot mode are in **Table 13.2**.

“NA” indicates a specific test and combination that was not performed in V5.2.

Table 15.1: Performance Test Results in Standalone Mode for V5.2

Firmware Version	G500 V5.2	G500 V5.2	G500 V5.2	G500 V5.2	G100 V5.2
Standalone Activity	DNP3 (Client / Server)	DNP3 (Client / Server)	DNP3 (Client / Server)	DNP3 (Client / Server)	DNP3 (Client / Server)
Hardware	G500 Intel Xeon	G500 Intel i3	G500 AMD 4 Core	G500 AMD 2 Core	G100
Protocol – Client / Server	DNP3 / DNP3	DNP3 / DNP3	DNP3 / DNP3	DNP3 / DNP3	DNP3 / DNP3
RTDB Point count	200,000	200,000	200,000	60,000	24,000
DI & AI Simulation/Sec (Steady Load, not with large occasional peaks and then averaged)	100 DI/Sec, 10000 AI/Sec	100 DI/Sec, 5000 AI/Sec	100 DI/Sec, 5000 AI/Sec	48 DI/sec, 1280 AI/Sec	16 DI/sec, 1200 AI/Sec
Number of IEDs	500 DNP3 IEDs	500 DNP3 IEDs	500 DNP3 IEDs	150 DNP3 IEDs	120 DNP3 IEDs
Points / IED (AI + DI + AO + DO + ACC)	400 [AI-225, DI-125, DO-20, AO-20, ACC-10]	400 [AI-225, DI-125, DO-20, AO-20, ACC-10]	400 [AI-225, DI-125, DO-20, AO-20, ACC-10]	400 [AI-225, DI-125, DO-20, AO-20, ACC-10]	200 [AI-112, DI-63, DO-10, AO-10, ACC-5]
Number of RTDB points mapped to each LRU	25000	25000	25000	15200	6000
Number of Master connections Point Count / Server	8 AI-14063 DI-7812 DO-1250 AO-1250 ACC-625	8 AI-14063 DI-7812 DO-1250 AO-1250 ACC-625	8 AI-14063 DI-7812 DO-1250 AO-1250 ACC-625	4 AI-8550 DI-4750 DO-760 AO-760 ACC-380	4 AI-3360 DI-1890 DO-300 AO-300 ACC-150
Datalogger reports updated per sec	100 Periodic reports each with 5 AI points	100 Periodic reports each with 5 AI points	100 Periodic reports each with 5 AI points	NA	12 Datalogger reports each with 10 AI points
Alarms (Steady State)	100/sec	100/sec	100/sec	50/sec	12/sec
Remote / Local HMI connections	8 Remote / 1 Local HMI	4 Remote / 1 Local HMI	4 Remote / 1 Local HMI	4 Remote / 0 Local HMI	1 Remote / 1 Local HMI

Firmware Version	G500 V5.2	G500 V5.2	G500 V5.2	G500 V5.2	G100 V5.2
Standalone Activity	DNP3 (Client / Server)	DNP3 (Client / Server)	DNP3 (Client / Server)	DNP3 (Client / Server)	DNP3 (Client / Server)
Hardware	G500 Intel Xeon	G500 Intel i3	G500 AMD 4 Core	G500 AMD 2 Core	G100
CPU utilization (%) Min, Max, Median	38.60, 76.7, 49.3	69, 100, 85	52.2, 100, 80.6	52.7, 100, 81.40	24, 100, 85
Used Memory (GB) Min, Max, Median	2.95, 3.01, 2.97	2.8, 2.97, 2.9	2.89, 2.97, 2.91	1.58, 1.73, 1.61	1.105, 1.279, 1.204
Event latency in (msecs) Min, Max, Median	13.55, 1035.22, 523.22	12, 1152, 484	17.06, 1177.59, 603.08	13.315, 1152.1, 528.48	14, 1198, 500
Control latency in (msecs) Min, Max, Median	11.16, 88.04, 26.71	13, 184, 30	12.5, 205.592, 29.867	22.21, 151.63, 30.64	13, 227, 32

15.5.3 Redundancy Fail Over Time

Redundancy Fail Over Time were not tested in V5.20 – but are expected to be similar to V5.00. Please refer to [Redundancy Fail Over Time](#) section.

15.5.4 HMI Response Times

HMI Response Times were not tested in V5.20 – but are expected to be similar to V5.00. Please refer to [HMI Response Times](#) section.

Time Sync Accuracy (IRIG-B/PTP/NTP)

This MCP version has identical Time Sync Accuracy as MCP [V5.00](#).

Please refer to [V5.00](#).

Timestamp Accuracy

This MCP version has identical Timestamp Accuracy as MCP [V5.00](#).

Please refer to [V5.00](#).

Application List

This MCP version has identical applications available as MCP [V5.00](#).

Please refer to [V5.00](#).

16. Version 5.30 (15-October-2025) - Projects only

Software Versions

The following table defines the software versions required for interaction with the MCP.

Package	Version	Notes
G500 Firmware	5.3.167	G500 Firmware Version.
G100 Firmware	5.3.167	G100 Firmware Version.
DS Agile MCP Studio	5.3.0	Minimum Supported DS Agile MCP Studio Software.
MCP HMI	530.167.40	MCP HMI Version.
MCP Dynamic Remote HMI	1.2.0.0	Minimum Remote HMI compatible with all MCP Versions, 64-bit Software.
MCP Utilities	1.2.16	Minimum Supported MCP Firmware Upgrade Utilities.
IEC61850 CID Tool	9.6.10	Minimum Supported CID configuration tool for automatically creating IEC 61850 Server map files.

Cross Compatibility Versions

The following table defines the compatibility between G500 firmware versions and SMX firmware versions.

Compatibility	G500 ≤ v3.10 (C1)	G500 v4.00 (D0)	G500 v4.10 (D1)	G500 v5.00 (E0)	G500 v5.10 (E1)	G500 v5.20 (E2)	G500 v5.30 (E3)
SMXnn.400 (RAM only, should not be used)	N	Y	Y	Y	Y	Y	Y
SMXnn.401	N	Y	Y	Y	Y	Y	Y
SMXnn.410	N	N	Y	Y	Y	Y	Y
SMXnn.411	N	N	Y	Y	Y	Y	Y
SMXnn.412	N	N	Y	Y	Y	Y	Y

Predix Edge OS and Other Firmware Versions

The following table defines the package/firmware versions supported for Predix Edge Linux OS, FPGA, CPLD, UEFI and BCOM FPGA in this MCP version.

Package / Firmware	G100 Version	G500 AMD Version	G500 Intel Version	Notes
Predix Edge OS	2.9.0	2.9.0	2.9.0	Supported GE's Secured Linux Operating System Version.
FPGA	NA	1.03.00	1.03.00	Supported FPGA Version of Multi-Function Controller Platform (MCP).
CPLD	NA	1.2.3	2.1.0 (minimum)	Supported CPLD Version of Multi-Function Controller Platform (MCP).
UEFI	FLEBG100A0006V107	VX5D0007.C01	VB780244	Minimum Supported UEFI Version of Multi-Function Controller Platform (MCP).
BCOM FPGA	NA	2.3.0 or 2.4.0	2.5.0 (minimum)	Supported COM's Module FPGA Version of Multi-Function Controller Platform (MCP).
D2X	NA	SMXA0.412.0005	SMXA0.412.0005	General release.

Specific G500 D2x Characteristics and Limitations:

This MCP version has identical G500 D2x Characteristics and Limitations as MCP [V5.20](#).

Key Functions and Changes

- MCP version 5.30 is IST Projects targeted, which adds custom IST applications as Special Order.
- All other features are identical as MCP v5.20.
- SMXA0.412.0005 is a General Release which requires DS Agile MCP Studio v5.30.
- SMXA1.412.0005, SMXA5.412.0005, SMXAA.412.0005 are Variant Releases which require DS Agile MCP Studio v5.30.
- DS Agile MCP Studio v5.30 is a General Release.

16.1 Enhancements

16.1.1 Cyber Security

None.

16.2.10 Hardware

None.

16.3 Known Issues

This MCP version has the following known issues:

16.3.1 Cyber Security

GE Vernova Internal Reference #	Description
D-14069	The MCP Settings GUI does not automatically log off after the inactivity timeout. It requires that the user click into the web page or hit refresh after the timeout occurs to trigger the Settings GUI to close the session. The mcpcfg utility will be locked out from use while the MCP Settings GUI session is open. If MCP Settings GUI was left open after the inactivity timeout has expired (maliciously or unintentionally), as a workaround, you can login and logout of the MCP Settings GUI in another browser to release the lockout of the mcpcfg utility.

For any additional known issues, please refer to Product & Cyber Security Advisories on the GE Vernova Grid Solutions web site.

16.3.2 Clients

GE Vernova Internal Reference #	Description
B-13475	SEL Binary Client doesn't support Double Precision Scaling Factors.
D-05002	ARRM file retrieval from SEL 1xx/2xx relays (using GENASCII) is not possible.
D-12834	Modbus Client could not process PRF events comes from SR 369 relay.
D-13075	D20A card in bad state can cause false behaviour/functionality when it is configured in warm or hot-hot redundancy.
D-13214	DNP3 Client doesn't support object types 31 and 33 for Frozen Analog Inputs (all variations).
D-14111	Cold Reboot Required DI (1) based on HDLC card faulty state will be reset on warm reboot also.
D-15320	With Auto Time Sync enabled, IEC103 DCA does not automatically perform a time sync when there is a change in local time.

16.3.3 Servers

GE Vernova Internal Reference #	Description
D-12889 / B-16203	DNP DPA/Server takes high CPU if more than 5000 Analog Inputs are configured in Unbuffered mode.
B-11967	No support for events in NVRAM in IEC101/104 Server. Events that have not been yet transmitted to Master (Clients) are lost if G500 is power cycled / restarted. However – the integrity polls will continue to provide accurate database representation.
B-11968	No support for events in NVRAM in DNP3 Server. Events that have not been yet transmitted to Master (Clients) are lost if G500 is power cycled / restarted. However – the integrity polls will continue to provide accurate database representation.
D-13134 / D-13135	RTS Post-amble time is not added to the data link confirm timeout or application timeout in DNP3 Serial Server.
D-12566	IEC101 DPA/Server in unbalanced mode sometimes reports duplicate Digital Input events to the Master if the event happens at the same time as General Interrogation response.
D-13996	IEC101/104 DPA buffer overflow DI events will be lost when set as discard newest.
D-12567	The time sync accuracy of G100 when IEC101 Server (Unbalanced/Balanced) is used as a time sync source is > +/- 4 msec.
D-15288	G500 time synch from serial masters (IEC101, DNP3) relies on the regular crystal clock (Linux clock) which drifts and is inaccurate.
D-16253	Modbus Server writes the configured Offline Analog Value in both words of a 32 bit register. As long as 0 (zero) is used as configured Offline Analog Value there is no impact.
N/A	In MCP-D2X MODBUS DPA (A068) > Port Configuration: for RS485-2 wires ports the "Modem Used" parameter must be set to "RTS Only".

16.3.4 Automation

GE Vernova Internal Reference #	Description
B-11969	DEM is responsible for handling alarms. Events/Alarms that have not been yet committed to the SQL database are lost if G500 is power cycled / restarted. However – the integrity polls will continue to provide accurate database representation.
DCSSUP-19948 / D-12000 / R-01430	Restore the last value for variables configured in LogicLinx wizard does not work at runtime (starts at 0 always).
D-14100	In MCP Runtime HMI, data points in 'Online Trends' do not display 'underscore (_)' in Point description even though it is there in the configuration.
D-15945	When manual force quality "Comm Lost CX" is applied on any AI/DI/Acc points then it is not getting reported as "Old Data" quality to IEC61850DPA

16.3.5 Configuration/Settings

GE Vernova Internal Reference #	Description
D-10502	NOT A DEFECT. If client applications are configured in non-redundant mode and later the device properties are switched to a redundant mode where some applications are not enabled - their respective points are still available to be mapped, but at runtime will be offline. This is to retain the mappings in case the user decides to switch later back to single mode and the client applications are active again, as previously configured.
D-06168	FPGA needs to be restarted via Power Cycle for PTP/IRIGB configuration change. No functional impact. PTP/IRIG-B configuration will not be applied without reboot of G500.
D-13028	Add more protection for memory leaks in Apache webserver settings.
B-15613	The configuration through Bulk Editor is not supported for G500 after v2.10.
N/A	If filenames with characters other than ASCII are present in the MCP file system - the MCP device and associated configuration tools will not work correctly. Keep only ASCII characters in the filenames for Client Maps, Server Maps, OneLine .dra, OneLine Images, and other user files.

16.3.6 Pass-through

GE Vernova Internal Reference #	Description
D-12990	In LDAP authentication, after passthrough connection is timed out, auto logout event is not generated into user activity log by IEC 103 Client.

16.3.7 HMI

GE Vernova Internal Reference #	Description
B-15650	The following features of the Analog Report Viewer are not available: View online reports Save and view offline reports
B-14982	The product references in the Runtime (Local/Remote) HMI logs need to be changed as "MCP".
D-05463	If a used point group is deleted from the systemwide configuration, then points belonging to that group are not visible in the point group summary. However, if user changes the point group allocation from the corresponding instantiated client map file(s) then points will be visible in the point group summary.

16.3.8 System

GE Vernova Internal Reference #	Description
E-04130	The USB FLASH drive used for the Firmware Upgrade must be FAT32 format. As a result of this, only USB FLASH drives of maximum 32 GB can be used. The minimum size, imposed by storage requirements, is 8 GB.
E-03041 D-10346	Input time source selection (PTP / IRIG-B / NTP) does not support dynamic failover between time sources at runtime. Only the configured time source is active at a time.
D-10227	Email does not send messages when an alarm is activated.
D-05714	Update of only Edge OS is not supported. If only Edge OS updates are required, the complete G500 firmware image needs to be updated.
D-06167	Full support for latest PTP power profiles: • IEEE C37.238-2017 • IEC61850-9-3 Ed.1 2016 Enhancement: G500 supports the following PTP profiles: • IEEE 1588-2008 J4 Peer-to-Peer Profile • IEEE C37.238-2011 Power System Profile (but this has been withdrawn) Limited IEC61850-9-3 Ed.1 2016 Power Utility Automation Profile.
D-13083	Add support for progress bar to be displayed during "Applying update" procedure through Predix Edge Technician Console (PETC).
D-13039	When both G500's are power cycled at the same time and if switch panel configured as a master, then one of the G500 can go to the failed state. Note: If switch panel is configured as Master and one of the G500 is power cycled with a delay then this issue will not be observed.
D-12984	Daisy chained secondary monitor shows always duplicate monitor, but it does not show the extended desktop.
D-15990	Wesmaint Screen does not allow user to login with the maximum characters when username has 22 characters and password has 64 characters
R-01637 / DCSSUP- 23735	Issue with Network Interfaces of G500, where the internal MAC address shows up in switching table when any rear port is connected to the Switch.

GE Vernova Internal Reference #	Description
N/A	The following limitations exist for G100 Redundant LAN. Please refrain from using unsupported functionalities. 1. An Active IP cannot be configured on a Redundant LAN interface. 2. The Static IP of a Redundant LAN interface cannot be used as the PEER IP used for pairing a Hot-Hot MCP system. 3. VLAN's cannot be configured on a Redundant LAN interface. 4. DHCP cannot be configured on a Redundant LAN interface. 5. Only one Redundant LAN interface can be configured, either on Net 1/Net 2 or on Net 3/Net 4. Despite limitations 1 and 2, G100 Redundant LAN can be used in a Hot-Hot G100 system. For example, a valid configuration for a Hot-Hot G100 system would be the following. • Net 1 and Net 2 configured as Single LAN Interfaces, each having an Active and Static IP. • PEER IP using either Net 1 or Net 2 Static IP of the peer G100. • Net 3 and Net 4 configured as a Redundant LAN interface with only a Static IP. Note that limitations 1 and 2 imply that in a Hot-Hot G100 redundant system, only the following applications can communicate over the Redundant LAN interface. • DNP 3.0 Network Client • IEC 61850 Client and Server • Modbus TCP Client The reason is that these applications will use the Static IP of the interface when communicating in Hot-Hot mode. Typical failover time for G100 Redundant LAN is 3 seconds. Better performance can be expected with the G500 Redundant LAN.

16.3.9 Documentation

None.

16.3.10 Hardware

GE Vernova Internal Reference #	Description
D-06165	No functional impact. SFP Hot Plug in / Plug out detection. Points that represent the status of SFP IN/OUT will not be reflected until G500 is rebooted.
N/A (no reference)	G500 with Intel CPU have DP1 and DP2 swapped compared to G500 with AMD CPU. No functional impact.

Capability and Capacity for MCP

This MCP version has identical Capability and Capacity as MCP [V5.20](#).

Please refer to [V5.20](#).

Time Sync Accuracy (IRIG-B/PTP/NTP)

This MCP version has identical Time Sync Accuracy as MCP [V5.20](#).

Please refer to [V5.20](#).

Timestamp Accuracy

This MCP version has identical Timestamp Accuracy as MCP [V5.20](#).

Please refer to [V5.20](#).

Application List

This MCP version has identical applications available as MCP [V5.20](#).

Please refer to [V5.20](#).

17. Version 5.40 (05-February-2026)

Software Versions

The following table defines the software versions required for interaction with the MCP.

Package	Version	Notes
G500 Firmware	5.4.166	G500 Firmware Version.
G100 Firmware	5.4.166	G100 Firmware Version.
DS Agile MCP Studio	5.4.0	Minimum Supported DS Agile MCP Studio Software.
MCP HMI	540.166.45	MCP HMI Version.
MCP Dynamic Remote HMI	1.2.0.1	Minimum Remote HMI compatible with all MCP Versions, 64-bit Software.
MCP Utilities	1.2.16	Minimum Supported MCP Firmware Upgrade Utilities.
IEC61850 CID Tool	10.0.6	Minimum Supported CID configuration tool for automatically creating IEC 61850 Server map files.

Cross Compatibility Versions

The following table defines the compatibility between G500 firmware versions and SMX firmware versions.

Compatibility	G500 ≤ v3.10 (C1)	G500 v4.00 (D0)	G500 v4.10 (D1)	G500 v5.00 (E0)	G500 v5.10 (E1)	G500 v5.20 (E2)	G500 v5.30 (E3)	G500 v5.40 (E4)
SMXnn.400 (RAM only, should not be used)	N	Y	Y	Y	Y	Y	Y	Y
SMXnn.401	N	Y	Y	Y	Y	Y	Y	Y
SMXnn.410	N	N	Y	Y	Y	Y	Y	Y
SMXnn.411	N	N	Y	Y	Y	Y	Y	Y
SMXnn.412	N	N	Y	Y	Y	Y	Y	Y

Predix Edge OS and Other Firmware Versions

The following table defines the package/firmware versions supported for Predix Edge Linux OS, FPGA, CPLD, UEFI and BCOM FPGA in this MCP version.

Package / Firmware	G100 Version	G500 AMD Version	G500 Intel Version	Notes
Predix Edge OS	2.9.0	2.9.0	2.9.0	Supported GE's Secured Linux Operating System Version.
FPGA	NA	1.03.00	1.03.00	Supported FPGA Version of Multi-Function Controller Platform (MCP).
CPLD	NA	1.2.3	2.1.0 (minimum)	Supported CPLD Version of Multi-Function Controller Platform (MCP).
UEFI	FLEBG100A00006V107	VX5D0007.C01	VB780244	Minimum Supported UEFI Version of Multi-Function Controller Platform (MCP).
BCOM FPGA	NA	2.3.0 or 2.4.0	2.5.0 (minimum)	Supported COM's Module FPGA Version of Multi-Function Controller Platform (MCP).
D2X	NA	SMXA0.412.0005	SMXA0.412.0005	General release.

Specific G500 D2x Characteristics and Limitations:

D2x has an associated Environment Type in the G500 which is equivalent to a hardware based CPU Board.

Only D2x configurations equivalent to Single Node D20/D200 or Single Partition D20MX are supported. Configurations using Multiple Nodes D200 or Multiple Partitions D20MX are not supported unless are first scaled down to a single node / partition.

G500 cannot use the exact same D20 Firmware from D20 based RTUs (SABxxxx or SANxxxx). The D2x Firmware running in G500 is specific to MCP platform (is similar to a CCU Base D20ME firmware but uses different applications). Existing configurations will go through a D2x Firmware Upgrade process for G500 D2x.

Redundant CCU option is not supported in D.20 Communication Parameters; use instead the D2X Application Communication Watchdog (A026-1S) to monitor the redundant CCU state.

Secondary IP Addressing in LAN Settings is not supported.

If changing or reloading D2x configuration while in "sa com" in 68k shell - the D2X doesn't start again. Requires reboot of the G500 and then deploy again the D2x configuration using "d2xload" command or "sync to" (D-16780).

Type **SMC-0001-11** ("G500-D20 Environment, RAM only, single partition, max 7 serial ports") has the following characteristics and limitations, and should not be used (left for legacy reasons):

- NVRAM is not available in G500 as D2x RTU – even if D2x application settings are configured for NVRAM. This applies also to "Save Points on Power Fail" not being possible.
- Only COM1 to COM7 are available to D2x applications (same as in a single board D20 CPU).

Type **SMC-0001-01** ("G500-D20 Environment, single partition, max 7 serial ports") has the following characteristics and limitations:

- Enables NVRAM for G500-D2X Applications.
- Only COM1 to COM7 are available to D2x applications (same as in a single board D20 CPU).
- Requires New DSAS Firmware Library with SMXA0.401 or later.
- Requires New **D2x Firmware** Name and Version **SMXA0.401** or later.
- DSAS v4.10 contains these updates.
- For DSAS v4.00 users:

o Install above exhibits, packaged in a single "meta package" file:
"G500-D2X_SMXA0_401_20240430_NVRAM_MetaPackage.7zip".

- o Technical Note **TN0128** describes how to install and enable the above.

Type **SMC-0001-02** ("G500-D20 Environment, single partition, max 20 serial ports ") has the following characteristics and limitations:

- Enables NVRAM for G500-D2X Applications.
- COM1-8, COMA1-4, COMB1-4, COMC1-4 are available to D2x applications.
- Requires **DSAS Firmware Library** with **SMXA0.411** or later.
- Requires **D2x Firmware** Name and Version **SMXA0.411** or later.
- Requires **DSAS v5.10** or later.

Starting with **DSAS v4.10** and **SMXA0.410** (using B014-1S V600 or later) - the D2x WESMAINT access Passwords are encrypted and cannot be visualized anymore in the B014-1S table. In addition – the following rules are enforced for WESMAINT users and passwords:

- User name cannot be blank.

- The rules for entering strong passwords are:
 - o Between 8 and 22 English characters.
 - o At least one English uppercase character (A through Z).
 - o At least one English lowercase character (a through z).
 - o At least one number, Base 10 digits (0 through 9).
 - o At least one non-alpha-numeric character.
- When creating a new device configuration – strong passwords must be entered.
- After importing D20MX configurations – strong passwords must be entered.
- After importing D20 (not D20MX) configurations – the original D20 passwords are retained as long as changes are not done again for the passwords. If password changes are required – then strong password rules are enforced and apply.

For more details, please refer to MCP Software Configuration Guide V540 R0 (SWM0101).

Key Functions and Changes

- Upgraded MCP OS to an LTS version.
- Starting with this firmware version Intel i3 capabilities are same as AMD 4 cores
- VPN Server Changes:
Newer versions of OpenVPN do not recognize some older authentication algorithms. When users select these, they produce invalid OpenVPN configurations that fail silently or cause connection failures. Due to this the following unsupported OpenVPN authentication algorithms have been removed starting with this release. Existing configurations using these options will be changed to the default option after upgrade, and new OpenVPN files must be generated again.

17.1 Enhancements

17.1.1 Cyber Security

Please refer to Product & Cyber Security Advisories on the GE Vernova Grid Solutions web site.

17.1.2 Clients

GE Vernova Internal Reference #	Description
R-01811	In IEC 61850 DCA added support to apply Analog Input Offset to both "f" and "i" data types. This is a feature request that introduces non-61850 compliance when used for "f" (float is not subject to offset, only multiplier as per the standard). Users should exercise caution when applying offset to "f".
E-05669	Added SEL DCA pseudo points to indicate configuration state at runtime: - AI, DI: Configuration Status - Text: FID, CID and DEVID

17.1.3 Servers

None.

17.1.4 Automation

None.

17.1.5 Configuration/Settings

GE Vernova Internal Reference #	Description
DCSSUP-31032 / R-01870	Added checks to prevent importing into the MCP Editor of user files with filenames containing non-ASCII characters. Applies to Client Maps, Server Maps, OneLine .dra, OneLine Images.
E-05734	Implemented restrictions in DS Agile Studio to prevent the existence of user created files with non-ASCII file names in the MCP device.
B-20739	Removed option "Configure SSH Service" from Secure Access menu in mcpcfg and Settings GUI. Use Firewall rules to control SSH access.
B-20832	Removed option "Configure SFTP Service" from Secure Access menu in mcpcfg and Settings GUI. Use Firewall rules to control SFTP access.

17.1.6 HMI

GE Vernova Internal Reference #	Description
B-20702	Added AI Text Enumeration to OLD Value Boxes.

17.1.7 Pass-through

None.

17.1.8 System

GE Vernova Internal Reference #	Description
B-20548	Added new functionality to Local Control Groups: Need Manual Ownership.

17.1.9 Documentation

GE Vernova Internal Reference #	Description
R-01844	Added A027 CG to D2x App Documents.
E-05662	Updated document [MIS-0109] MCP Firmware Release Notes (V540 R0).
E-05628	Updated document [994-0152] G500 Substation Gateway Instruction Manual (V540 R0).
E-05627	Updated document [994-0155] G100 Substation Gateway Instruction Manual (V540 R0).
E-05625	Updated document [SWM0101] MCP Software Configuration Guide (V540 R0).
E-05663	Updated document [MIS-0110] Open Source License Information (V540 R0).
E-05753	Update document [SWM0103] Integration of MCP devices with OpenVPN Client (V540 R0).
E-05747	Updated document [SWM0111] Configuring the MCP for LDAP using Windows AD (V300 R3).
E-05670	Updated document [SWM0124] IEC 61850 Server User Guide (V540 R0).
E-05626	Created document [994-0153] MCP Binder and ISO Image (V540 R0).

17.1.10 Hardware

None.

17.2 Fixed defects

This version of MCP has the fixes for the following defects compared to MCP version 510.

17.2.1 Cyber Security

Please refer to Product & Cyber Security Advisories on the GE Vernova Grid Solutions web site.

17.2.2 Clients

GE Vernova Internal Reference #	Description
D-16674	Fixed an issue where DNP DCA doesn't immediately read back when an outstation device puts a DO back to online.
DCSSUP-30769 / R-01849	Fixed an issue where IEC 61850 Client used the EntryID for GI, leading to receive again the entire report buffer and causing duplicate events.
DCSSUP-30853 / R-01851	Fixed an issue where IEC61850 DCA had an issue enabling multiple Reports with RptID =NULL if ReportSettings.RptID value is "Fix".
DCSSUP-30414 / R-01852	Fixed a timing issue in MCP-D2X D.20 where D20A peripherals had high retries counts.

17.2.3 Servers

GE Vernova Internal Reference #	Description
DCSSUP-30127 / R-01774	Fixed an issue in IEC 101/104 DPA where Incorrect Sequence number was reported in integrated totals in response to counter interrogation.
DCSSUP-30637 / R-01826	Fixed an issue where IEC 61850 Server was sending 1970 timestamps on startup.

17.2.4 Automation

None.

17.2.5 Configuration/Settings

GE Vernova Internal Reference #	Description
D-16808	Fixed an issue where mcpcfg and Settings GUI allowed to use " _ underscore" character in host name (can't be used).

17.2.6 HMI

GE Vernova Internal Reference #	Description
D-16682	Fixed an issue where Alarm Sound is not getting played in Local and Remote HMI.
D-16749	Fixed an issue in Active Alarms window where Active Alarms stopped blinking after closing Alarm groups tabs.

17.2.7 Pass-through

None.

17.2.8 System

GE Vernova Internal Reference #	Description
R-01832	Fixed an issue in the MCP Online Editor where a racing condition may cause "Save / Commit changes" actions to take a long time or time out.
DCSSUP-30757 / R-01840	Fixed an issue where eth0/eth1 interfaces were incorrectly shown in firewall rules.
D-16696	Fixed an issue in G100 serial port 4 where internal termination between pins 1-2 was not activated when configured as RS485-2W mode. For serial ports 1,2,3 was working properly.
D-16775	Fixed an issue where NTP IN signal DI was incorrectly reported as "ON" when NTP out was enabled.

17.2.9 Documentation

None.

17.2.10 Hardware

None.

17.3 Known Issues

This MCP version has the following known issues:

17.3.1 Cyber Security

GE Vernova Internal Reference #	Description
D-14069	The MCP Settings GUI does not automatically log off after the inactivity timeout. It requires that the user click into the web page or hit refresh after the timeout occurs to trigger the Settings GUI to close the session. The mcpcfg utility will be locked out from use while the MCP Settings GUI session is open. If MCP Settings GUI was left open after the inactivity timeout has expired (maliciously or unintentionally), as a workaround, you can login and logout of the MCP Settings GUI in another browser to release the lockout of the mcpcfg utility.

For any additional known issues, please refer to Product & Cyber Security Advisories on the GE Vernova Grid Solutions web site.

17.3.2 Clients

GE Vernova Internal Reference #	Description
B-13475	SEL Binary Client doesn't support Double Precision Scaling Factors.
D-05002	ARRM file retrieval from SEL 1xx/2xx relays (using GENASCII) is not possible.
D-12834, D-16944	Modbus Client can't process PRF events from SR 369 and UR IEDs.
D-13075	D20A card in bad state can cause false behaviour/functionality when it is configured in warm or hot-hot redundancy.
D-13214	DNP3 Client doesn't support object types 31 and 33 for Frozen Analog Inputs (all variations).
D-14111	Cold Reboot Required DI (1) based on HDLC card faulty state will be reset on warm reboot also.
D-15320	With Auto Time Sync enabled, IEC103 DCA does not automatically perform a time sync when there is a change in local time.
D-16918	SEL DCA may create an incorrect self discovery map file when using a virtual port (defect exists in previous versions)
D-16919	SEL IED PRF Events are intermittently not displayed in SOE/PRF Display (defect exists in previous versions)
DCSSUP-31176 / R-01874	D20 Link shows retries and failures on Channel 2 even though is not configured.
DCSSUP-31177 / R-01880	When a D20K has L/R switch in local mode and is connected first time (at startup or power up) then its status is shown as Offline. After the L/R switch has been toggled with the connection and module on - the indication becomes online, as expected.

17.3.3 Servers

GE Vernova Internal Reference #	Description
D-12889 / B-16203	DNP DPA/Server takes high CPU if more than 5000 Analog Inputs are configured in Unbuffered mode.
B-11967	No support for events in NVRAM in IEC101/104 Server. Events that have not been yet transmitted to Master (Clients) are lost if G500 is power cycled / restarted. However – the integrity polls will continue to provide accurate database representation.
B-11968	No support for events in NVRAM in DNP3 Server. Events that have not been yet transmitted to Master (Clients) are lost if G500 is power cycled / restarted. However – the integrity polls will continue to provide accurate database representation.
D-13134 / D-13135	RTS Post-amble time is not added to the data link confirm timeout or application timeout in DNP3 Serial Server.
D-12566	IEC101 DPA/Server in unbalanced mode sometimes reports duplicate Digital Input events to the Master if the event happens at the same time as General Interrogation response.
D-13996	IEC101/104 DPA buffer overflow DI events will be lost when set as discard newest.
D-12567	The time sync accuracy of G100 when IEC101 Server (Unbalanced/Balanced) is used as a time sync source is > +/- 4 msec.
D-15288	G500 time synch from serial masters (IEC101, DNP3) relies on the regular crystal clock (Linux clock) which drifts and is inaccurate.
D-16253	Modbus Server writes the configured Offline Analog Value in both words of a 32 bit register. As long as 0 (zero) is used as configured Offline Analog Value there is no impact.
N/A	In MCP-D2X MODBUS DPA (A068) > Port Configuration: for RS485-2 wires ports the "Modem Used" parameter must be set to "RTS Only".

17.3.4 Automation

GE Vernova Internal Reference #	Description
B-11969	DEM is responsible for handling alarms. Events/Alarms that have not been yet committed to the SQL database are lost if G500 is power cycled / restarted. However – the integrity polls will continue to provide accurate database representation.
DCSSUP-19948 / D-12000 / R-01430	Restore the last value for variables configured in LogicLinx wizard does not work at runtime (starts at 0 always).
D-14100	In MCP Runtime HMI, data points in 'Online Trends' do not display 'underscore (_)' in Point description even though it is there in the configuration.
D-15945	When manual force quality "Comm Lost CX" is applied on any AI/DI/Acc points then it is not getting reported as "Old Data" quality to IEC61850DPA

17.3.5 Configuration/Settings

GE Vernova Internal Reference #	Description
D-10502	NOT A DEFECT. If client applications are configured in non-redundant mode and later the device properties are switched to a redundant mode where some applications are not enabled - their respective points are still available to be mapped, but at runtime will be offline. This is to retain the mappings in case the user decides to switch later back to single mode and the client applications are active again, as previously configured.
D-06168	FPGA needs to be restarted via Power Cycle for PTP/IRIGB configuration change. No functional impact. PTP/IRIG-B configuration will not be applied without reboot of G500.
D-13028	Add more protection for memory leaks in Apache webserver settings.
B-15613	The configuration through Bulk Editor is not supported for G500 after v2.10.
N/A	If filenames with characters other than ASCII are present in the MCP file system - the MCP device and associated configuration tools will not work correctly. Keep only ASCII characters in the filenames for Client Maps, Server Maps, OneLine .dra, OneLine Images, and other user files.

17.3.6 Pass-through

GE Vernova Internal Reference #	Description
D-12990	In LDAP authentication, after passthrough connection is timed out, auto logout event is not generated into user activity log by IEC 103 Client.

17.3.7 HMI

GE Vernova Internal Reference #	Description
B-15650	The following features of the Analog Report Viewer are not available: View online reports Save and view offline reports
B-14982	The product references in the Runtime (Local/Remote) HMI logs need to be changed as "MCP".
D-05463	If a used point group is deleted from the systemwide configuration, then points belonging to that group are not visible in the point group summary. However, if user changes the point group allocation from the corresponding instantiated client map file(s) then points will be visible in the point group summary.
D-16934	On update alarms are generated when DI points go offline and return back to online.

17.3.8 System

GE Vernova Internal Reference #	Description
E-04130	The USB FLASH drive used for the Firmware Upgrade must be FAT32 format. As a result of this, only USB FLASH drives of maximum 32 GB can be used. The minimum size, imposed by storage requirements, is 8 GB.
E-03041 D-10346	Input time source selection (PTP / IRIG-B / NTP) does not support dynamic failover between time sources at runtime. Only the configured time source is active at a time.
D-10227	Email does not send messages when an alarm is activated.
D-05714	Update of only Edge OS is not supported. If only Edge OS updates are required, the complete G500 firmware image needs to be updated.
D-06167	Full support for latest PTP power profiles: • IEEE C37.238-2017 • IEC61850-9-3 Ed.1 2016 Enhancement: G500 supports the following PTP profiles: • IEEE 1588-2008 J4 Peer-to-Peer Profile • IEEE C37.238-2011 Power System Profile (but this has been withdrawn) Limited IEC61850-9-3 Ed.1 2016 Power Utility Automation Profile.
D-13083	Add support for progress bar to be displayed during "Applying update" procedure through Predix Edge Technician Console (PETC).
D-13039	When both G500's are power cycled at the same time and if switch panel configured as a master, then one of the G500 can go to the failed state. Note: If switch panel is configured as Master and one of the G500 is power cycled with a delay then this issue will not be observed.
D-12984	Daisy chained secondary monitor shows always duplicate monitor, but it does not show the extended desktop.
D-15990	Wesmaint Screen does not allow user to login with the maximum characters when username has 22 characters and password has 64 characters
R-01637 / DCSSUP- 23735	Issue with Network Interfaces of G500, where the internal MAC address shows up in switching table when any rear port is connected to the Switch.

GE Vernova Internal Reference #	Description
N/A	The following limitations exist for G100 Redundant LAN. Please refrain from using unsupported functionalities. 1. An Active IP cannot be configured on a Redundant LAN interface. 2. The Static IP of a Redundant LAN interface cannot be used as the PEER IP used for pairing a Hot-Hot MCP system. 3. VLAN's cannot be configured on a Redundant LAN interface. 4. DHCP cannot be configured on a Redundant LAN interface. 5. Only one Redundant LAN interface can be configured, either on Net 1/Net 2 or on Net 3/Net 4. Despite limitations 1 and 2, G100 Redundant LAN can be used in a Hot-Hot G100 system. For example, a valid configuration for a Hot-Hot G100 system would be the following. • Net 1 and Net 2 configured as Single LAN Interfaces, each having an Active and Static IP. • PEER IP using either Net 1 or Net 2 Static IP of the peer G100. • Net 3 and Net 4 configured as a Redundant LAN interface with only a Static IP. Note that limitations 1 and 2 imply that in a Hot-Hot G100 redundant system, only the following applications can communicate over the Redundant LAN interface. • DNP 3.0 Network Client • IEC 61850 Client and Server • Modbus TCP Client The reason is that these applications will use the Static IP of the interface when communicating in Hot-Hot mode. Typical failover time for G100 Redundant LAN is 3 seconds. Better performance can be expected with the G500 Redundant LAN.

17.3.9 Documentation

None.

17.3.10 Hardware

GE Vernova Internal Reference #	Description
D-06165	No functional impact. SFP Hot Plug in / Plug out detection. Points that represent the status of SFP IN/OUT will not be reflected until G500 is rebooted.
N/A (no reference)	G500 with Intel CPU have DP1 and DP2 swapped compared to G500 with AMD CPU. No functional impact.

Capability and Capacity for MCP

This MCP version supports the following limits when configured in Function S (MCP only).

Functions D (D2X) and C (MCP and D2X) offer infinite configuration scenarios. Due to this vast configurability, comprehensive limit testing for Functions D and C is impracticable. Users are advised to consult additional D2X documentation or guidelines for the optimal configuration and usage of Functions D and C.

The maximum number of IEDs or Masters is total across all connections.

The maximum size of the system is given by whichever limit comes first (groups vs members, number of Connections vs IEDs, number of Master instances vs LRUs in the Master etc.). User is responsible to ensure resource usage limits are not exceeded at runtime. For tested performance levels, refer to **Table 17.1**.

The G500 AMD 4 cores, Intel i3 and Intel Xeon systems have a maximum of 500 IEDs, 200k points and 8 Masters (LRUs) unless otherwise restricted by system loading.

The G500 AMD 4 cores, Intel i3 and Intel Xeon systems can have MCP and D2X enabled at same time ("Function C"), in which case the capability limits and performance test configuration are reduced by approximately 50% (half).

The G500 AMD 2 cores system has a maximum of 250 IEDs, 100k points and 8 Masters (LRUs) unless otherwise restricted by system loading.

The G100 system has a maximum of 120 IEDs, 24k points and 8 Masters (LRUs) unless otherwise restricted by system loading.

Tejas V Master/LRU instances are not counted as part of 8 Masters or LRUs calculations.

Below are the limits for the Maximum number of Remote HMI sessions that can be connected simultaneously:

Application	G500 AMD 4-core, G500 Intel Xeon	G500 AMD 2-core, G500 Intel i3	G100
Remote HMI	8	4	2

Note: The Local HMI session and Online Editor session coming from DS Agile MCP Studio are not counted in the above-mentioned limits.

17.4 Application Limits

This G500 version supports the following application limits.

Application	Feature	Configuration Limits	
		G500	G100
Digital Event Manager	Alarms		
	Max Number of Alarm Groups	500	500
	Max number of members in an Alarm Group	1000	1000
Calculator	Expression Type		
	Evaluations	10000	10000
	Timers	1000	1000
	Analog Assignments	2000	2000

Application	Feature	Configuration Limits	
		G500	G100
	Digital Assignments	10000	10000
	Quality Conversions	1000	1000
	Type Conversions	1000	1000
	Averages	1000	1000
	Output to Input Conversions	1000	1000
Load Shed DTA	Number of Feeders and Zones		
	Max Zones	50	50
	Max Feeders	100	100
Analog Reports DTA	Analog Reports are not available starting with MCP V2.6 and newer	None	None
System Point Manager	Accumulator Freeze	250	250
	Analog Value Selection	250	250
	Control Lockout		
	• Remote Groups	8	8
	• Local Groups	10000	10000
	Double Points	1000	1000
	Input Point Suppression	10000	10000
	Control in Progress	256	256
	Redundant I/O	10000	10000
Analog Data Logger	Continuous Reports	1000	1000
	Periodic Reports	1000	1000
	Out of Range Reports	1000	1000
VPN Server	Number of VPN Clients	8	8
	Number of VPN Server Instances	1	1
SCADA – No. of Client or Server <u>connections</u> (Serial/Network/D.20)	Serial IED Connections		
	[Note: Total number of serial connections are limited by maximum number of physical and virtual serial ports (150)]		
	DNP Multidrop	80	80
	DNP Multidrop (Modem)	80	80
	Generic ASCII	80	80
	SEL Binary IED	80	80
	IEC 60870-5-101 Multidrop	80	80
	IEC60870-5-103 Multidrop	80	80
	Modbus Multidrop	80	80
	D.20	1	1

Application	Feature	Configuration Limits	
		G500	G100
	Network IED Connections		
	DNP3 TCP	50	50
	Modbus TCP/Modbus TCP-SSH	50	50
	IEC60870-5 104	50	50
	IEC61850	Calculated by Loader based on system size	Calculated by Loader based on system size
	SNMP	1	1
	Serial Master Connections		
	DNP3 Serial Master	8	8
	IEC 60870-5-101 Master	8	8
	Modbus Serial Master	8	8
	Network Master Connections		
	DNP3 Network Master	8	8
	IEC 60870-5-104 Master	8	8
	Modbus Network Master	8	8
	IEC 61850 Server	8	8
SCADA - No. of IEDs or Master station LRUs in each connection	Serial /Network IEDs		
	IEC60870-5-103 Multidrop	255	255
	DNP3 Multidrop/Network	10 (Note 1)	10 (Note 1)
	Modbus Multidrop/TCP	20 (Note 1)	20 (Note 1)
	IEC60870-5 101 Multidrop	1000	1000
	IEC60870-5 104	10 (Note 1)	10 (Note 1)
	SNMP Client	100	100
	GenASCII Client	120	120
	IEC61850 Client	Calculated by Loader based on system size (maximum 500 in total)	Calculated by Loader based on system size (maximum 120 in total)
	SEL Binary Client	1	1
	D.20 Client	120	120
	Serial/Network Masters		
	DNP3 Serial Master	8	8
	Modbus Serial Master	8	8
	IEC 60870-1 101 Master	8	8

Application	Feature	Configuration Limits	
		G500	G100
	Tejas V Master	The maximum number of LRUs is 99 per serial port, regardless of 2/4 cores.	The maximum number of LRUs is 99 per serial port
	DNP3 TCP Master	1	1
	Modbus TCP Master	1	1
	IEC 60870-1 104 Master	1	1
	IEC 61850 Server (This is number of maximum concurrent IEC 61850 Clients for same Server Instance / LRU in CID file)	3	3
SCADA - No. of points configured in each IED/Peripheral mapfile	DNP3 Multi-Drop/Network IEDs	Limited by protocol	Limited by protocol
	Modbus Multi-Drop/Network IEDs	Limited by protocol	Limited by protocol

Optional DI indication for local / remote status. Optional DI indication for accumulator freeze indication.

Note 1: Indicates recommended value which can be exceeded with an increased level of event latency.

17.5 Performance

This MCP version meets the following performance test levels.

- MCP Hardware under test:
 - o G500 4 core AMD CPU / 16 GB RAM
 - o G500 2 core AMD CPU / 8 GB RAM
 - o G500 Intel Xeon CPU / 16 GB RAM
 - o G500 Intel i3 CPU / 8 GB RAM
 - o G100 8 GB RAM
- The following sections indicate the tested G500 and G100 values in different loading conditions.
- If the loading levels are lower, then the total number of IEDs and RTDB points can increase but no more than specified limits under the Capability and Capacity section above.

17.5.1 Startup Time

A G500 configured with factory default configuration is ready to carry communications within 3 minutes after power on.

A G100 configured with factory default configuration is ready to carry communications within 4 minutes after power on.

Depending on the system size and configuration loaded, number of IEDs, number of RCBs in each IED, number of datasets in each IED, total number of points in the database, time for each IED to come online, number of Server Instances and mapped points, size of configured Programmable Logic – the total time when the device is ready to carry communications may be increased in addition to the above by as much as 15 minutes for a maximum size configuration.

17.5.2 Performance Test Levels and Results

This MCP version provides the following performance capabilities when configured in different modes (Standalone and Hot-Hot Redundancy).

The performance of MCP was tested using the activity levels and disturbance scenarios presented next:

Note:

- Performance test results for DNP3 test setup in MCP Standalone mode for V5.4 release are in **Table 17.1**.

“NA” indicates a specific test and combination that was not performed in V5.4.

Table 17.1: Performance Test Results in Standalone Mode for V5.4

Firmware Version	G500 V5.4	G500 V5.4	G100 V5.4
Standalone Activity	DNP3 / DNP3 (Client / Server)	DNP3 / DNP3 (Client / Server)	DNP3 / DNP3 (Client / Server)
Hardware	G500 Intel i3	G500 AMD 4 Core (S-type)	G100
Protocol – Client / Server	DNP3 / DNP3	DNP3 / DNP3	DNP3 / DNP3
RTDB Point count	200,000	200,000	24,000
DI & AI Simulation/Sec (Steady Load, not with large occasional peaks and then averaged)	100 DI/Sec, 5000 AI/Sec	100 DI/Sec, 5000 AI/Sec	12 DI/sec, 1200 AI/Sec
Number of IEDs	500 DNP3 IEDs	500 DNP3 IEDs	120 DNP3 IEDs
Points / IED (AI + DI + AO + DO + ACC)	400 [AI-225, DI-125, DO-20, AO-20, ACC-10]	400 [AI-225, DI-125, DO-20, AO-20, ACC-10]	200 [AI-112, DI-63, DO-10, AO-10, ACC-5]
Number of RTDB points mapped to each LRU	25000	25000	6000
Number of Master connections Point Count / Server	8 AI-14063 DI-7812 DO-1250 AO-1250 ACC-625	8 AI-14063 DI-7812 DO-1250 AO-1250 ACC-625	4 AI-3360 DI-1890 DO-300 AO-300 ACC-150

Firmware Version	G500 V5.4	G500 V5.4	G100 V5.4
Standalone Activity	DNP3 / DNP3 (Client / Server)	DNP3 / DNP3 (Client / Server)	DNP3 / DNP3 (Client / Server)
Hardware	G500 Intel i3	G500 AMD 4 Core (S-type)	G100
Datalogger reports updated per sec	100 Periodic reports each with 5 AI points	100 Periodic reports each with 5 AI points	12 Datalogger reports each with 10 AI points
Alarms (Steady State)	100/sec	100/sec	12/sec
Remote / Local HMI connections	4 Remote / 1 Local HMI	4 Remote / 1 Local HMI	1 Remote / 1 Local HMI
CPU utilization (%) Min, Max, Median	26.8, 100, 68.4	30.7, 100, 80.1	20.90, 100, 81
Used Memory (GB) Min, Max, Median	3.33, 3.83, 3.49	3.677, 3.724, 3.685	1.697, 1.911, 1.820
Event latency (in msec) Min, Max, Median	13.64, 1139.48, 483.61	5.4, 2902.86, 529.52	17.04, 1206.62, 486.09
Control latency (in msec) Min, Max, Median	12.03, 161.48, 28.23	12.12, 291.4, 30.18	14.54, 69.11, 14.54

System stability was tested during Avalanche Loading where ALL signals changed over 2 secs and there were NO Application restarts observed.

17.5.3 Redundancy Fail Over Time

This MCP version supports below fail-over times (i.e., when active G500 / G100 is power cycled) in the Hot-Hot/Hybrid Redundancy with the default 300ms heart-beat rate and with default 3 retries.

Table 17.2: Hot-Hot Redundancy Fail Over Times

Hot-Hot Redundancy/D.20 Configuration	Maximum Fail-Over Time (msec)	
	G500	G100
D.20 is not configured	1460	1580
D.20 is configured	1535	1780

17.5.4 HMI Response Times

Under steady state loading conditions, this version of G500 provides the HMI response times listed in the below **Table 17.3**.

Table 17.3: User Interface Response Times – Steady State Normal Conditions

Activity	G500 (Xeon)	G100
Screen Access (Point Summary) (in seconds) Min, Max, Median	0.6, 0.9, 0.7	0.9, 2, 1.2
Screen Access (One-Line Viewer) (in seconds) Min, Max, Median	3.7, 4.4, 3.9	7, 15, 14
System Logs (in seconds) Min, Max, Median	1.9, 2.8, 2.1	1.9, 3.9, 2
Alarm ACK Delay (Single Alarm)	< 1 sec	< 1 sec
Alarm ACK Delay (20,000 Alarms)	< 2 sec	< 12 sec *
DI/AI Update to Point Summary Screen	< 1 sec	< 1 sec

NOTE: Under steady state loading conditions, the control latency was measured by simulating one control in every 5 seconds continuously from the Master station.

Screen Access time was measured under heavy loading condition.

* Under heavy loading conditions, to acknowledge ALL active alarms in DEM > 19000 alarms, the time taken to “Acknowledge ALL” alarms is < 12 seconds.

Time Sync Accuracy (IRIG-B IN / PTP IN / NTP IN)

This MCP version supports Hardware based PTP/IRIG-B and Software based NTP Time Sync.

This version does not support runtime dynamic failover across different time sources.

Time Sync Input	Accuracy		
	G500 (Intel i3)	G500 (AMD 2 cores)	G100
IRIG-B IN 100% samples within Max (in microsec)	Max 558, Average 71.95, Median 68, Standard deviation 23.52 Total number of samples considered ~6000	Max 429, Average 116.79, Median 106, Standard deviation 42.19 Total number of samples considered ~4000	Max 1094, Average 140.20, Median 87, Standard deviation 164.87 Total number of samples considered ~4000
PTP IN 100% samples within Max (in microsec)	Max 526, Average 63.05, Median 53, Standard deviation 48 Total number of samples considered ~6000	Max 342, Average 89.42, Median 87, Standard deviation 49.58 Total number of samples considered ~5000	NA
NTP IN 100% samples within Max (in microsec)	Max 244, Average 212.16, Median 218, Standard deviation 19.62 Total number of samples considered ~6000	Max 232, Average 162.39, Median 163, Standard deviation 28.37 Total number of samples considered ~6000	Max 636, Average 268.32, Median 274, Standard deviation 26.77 Total number of samples considered ~3600

NOTES:

- IRIG-B IN / PTP IN time accuracy is measured in a scenario where the hardware is fully loaded.

Timestamp Accuracy

This MCP version provides the following Timestamp Accuracy.

Protocol	Accuracy					
	% @ N = % of samples within +/- N milliseconds					
	G500				G500	G100
	Time sync source (IRIG-B IN)				Time sync source (DNP3 Serial IN)	Time sync source (DNP3 Serial IN)
	MCP Container AMD 2 Core Function Type-S	MCP Container Intel i3 Function Type-S	D2x Container AMD 2 Core Function Type-D	G100 Function Type-S	MCP Container Intel i3 Function Type-S	MCP Container Function Type-S
D.20 HDLC	99.97% @ 1 ms 0.03% @ 2 ms - Total number of samples considered ~7200 - Measured the accuracy for every half-second at a D.20 S peripheral	99.19% @ 1 ms 0.81% @ 2 ms - Total number of samples considered ~7200 - Measured the accuracy for every half-second at a D.20 S peripheral	94.8% @ 1 ms 5.2% @ 2 ms - Total number of samples considered ~7200 - Measured the accuracy for every half-second at a D.20 S peripheral	99.83% @ 1 ms 0.17% @ 2 ms - Total number of samples considered ~7200 - Measured the accuracy for every half-second at a D.20 S peripheral	80.9% @ 1 ms 17.41% @ 2 ms 1.65% @ 3 ms 0.04% @ 4 ms - Total number of samples considered ~7200 - Measured the accuracy for every half-second at a D.20 S peripheral	78.05% @ 1 ms 19.28% @ 2 ms 2.66% @ 3 ms 0.01% @ 4 ms - Total number of samples considered ~7200 - Measured the accuracy for every half-second at a D.20 S peripheral
GPIO	NA	NA	NA	100% @ 1 ms - Total number of samples considered ~7200 - Measured the accuracy for every half-second at the GPIO	NA	80.14% @ 1 ms 19.23% @ 2 ms 0.63% @ 3 ms - Total number of samples considered ~7200 - Measured the accuracy for every half-second at the GPIO

Timestamp Accuracy in IEDs when MCP is syncing time over SCADA protocol

Notes:

- MCP device is receiving time via **IRIG-B**.
- MCP device is sending time to downstream IEDs over SCADA protocol.

Time Sync Output	Accuracy		
	% @ N = % of samples within +/- N milliseconds		
	G500 AMD 2 core	G500 AMD 2 core	G100
	MCP Container Function Type-S	D2X Container Function Type-D	MCP Container Function Type-S
DNP3 Serial IN (DNP DCA)	• 98.19% @ 1 ms • 1.81% @ 2 ms • Total number of samples considered ~7200 • Measured the accuracy for every half-second at a D.20 S peripheral	• 81.28% @ 1 ms • 17.9% @ 2 ms • 0.82% @ 3 ms • Total number of samples considered ~7200 • Measured the accuracy for every half-second at a D.20 S peripheral	• 96.58% @ 1 ms • 3.42% @ 2 ms • Total number of samples considered ~7200 • Measured the accuracy for every half-second at a D.20 S peripheral

Timestamp Accuracy with 101 Peripherals

Timestamp Accuracy in AMD 4 Core Hardware with 101 D.20 Peripherals plus 400 DNP LAN IEDs with time source being IRIG-B:

D.20 Layout	MAX Timestamp Error	Timestamp Error of 2ms and above	Timestamp Error of 3ms and above
MCP with 1CH D.20	3ms	0.45%	0.03%
MCP with 2CH D.20	3ms	3.1%	0.018%
MCP-D2X SMXA0.412.0005 with 1CH D.20	4ms	17%	0.22%
MCP-D2X SMXA0.412.0005 with 2CH D.20	4ms	25%	0.67%

Application List

This MCP Core version has the following applications available depending on configured redundancy mode.

Application	Support in Standalone	Support in Hot-Hot/Hybrid	Support in Warm Standby	Support in Hot Standby
Runtime HMI	✓ Available	✓ Available	✓ Available	✓ Available
One-Line Viewer	✓ Available	✓ Available	✓ Available	✓ Available
Config GUI / Schemas	✓ Available	✓ Available	✓ Available	✓ Available
System Library	✓ Available	✓ Available	✓ Available	✓ Available
C++ System Library	✓ Available	✓ Available	✓ Available	✓ Available
Connection Parser	✓ Available	✓ Available	✓ Available	✓ Available
Calculator	✓ Available	✓ Available	✓ Available	✓ Available
Hardware Asset Management Application (HAMA)	✓ Available	✓ Available	✓ Available	✓ Available
PTP/IRIG-B Time Sync	✓ Available	✓ Available	✓ Available	✓ Available

SMXA0.411.0001

Updated for up to 20 serial ports, based on SMXA0.410.0005 with below changes.

SMXA0.411.0003

Same applications as SMXA0.411.0001. Resolved MIMIC translation layer issue (D-16298) where the lack of proper synchronization mechanisms cause a deadlock of serial communication. This could include impacts to communication protocols, as well as WESMAINT (e.g. d2xcon not responding to key input). BOOT.BIN and MIMIC were changed.

SMXA5.412.0005

Based on SMXA5.411.0003 with below changes.

Fixed “sa com” issues (DCSSUP-30781/R-01842, DCSSUP-30858/R-01853),

Added Configuration Sequence Number and Device Name to “si” command (R-01836)

SMXAA.411.0001

Created variant of SMXA0.411.0001 with below changes.

SMXAA.411.0003

Same applications as SMXAA.411.0001. Resolved MIMIC translation layer issue (D-16298) where the lack of proper synchronization mechanisms cause a deadlock of serial communication. This could include impacts to communication protocols, as well as WESMAINT (e.g. d2xcon not responding to key input). BOOT.BIN and MIMIC were changed.

Modification Record

Version	Rev.	Date	Change description
1.00	0	27 th February, 2019	Created for G500 Firmware Version 1.00.
	1	31 st May, 2019	Updated for Defect D-06458: Audio Output Port is not working.
1.10	0	06 th March, 2020	Updated for G500 Firmware Version 1.10.
2.00	0	27 th May, 2020	Updated for G500 Firmware Version 2.00. Updated and removed feature requests from known issues and document sub-sections throughout for consistency.
2.10	0	14 th Dec, 2020	Updated for G500 Firmware Version 2.10. Updated with D.20 HDLC Perf Test Capabilities.
	1	27 th Jan, 2021	Updated Key features (Hardware Based IRIG-B Input Support) section for G500 Firmware Version 1.00.
	2	10 th May, 2022	Added D-10906.
2.50	0	18 th Oct, 2021	Updated for G500 Firmware Version 2.50.
2.60	0	17 th Dec, 2021	Updated for G500 Firmware Version 2.60.
2.70	0	4 th Mar, 2022	Updated for G500 Firmware Version 2.70 (projects release).
	1	10 th May, 2022	Added D-10906.
2.80	0	18 th July, 2022	Updated for G500 Firmware Version 2.80.
3.00	0	28 th April, 2023	Updated for MCP Firmware Version 3.00.
3.10	0	23 rd August, 2023	Updated for MCP Firmware Version 3.10.
	1	12 th February, 2024	In the Capability and Capacity section, added a clarification to show the maximum number of Remote HMI sessions that can be connected.
4.00	0	05 th April, 2024	Updated for MCP Firmware Version 4.00.
	1	12 th April, 2024	Updated the Software Versions table.
	2	13 th November, 2024	Clarified PEOS as RT in Version 4.00.
4.10	0	8 th October, 2024	Updated for MCP Firmware Version 4.10.
	1	18 th October, 2024	Updated the section 12.1.8
	2	13 th November, 2024	Clarified PEOS as RT in Version 4.00.
5.00	0	21 st November, 2024	Updated for MCP Firmware Version 5.00. Added MCP-D2X Applications (SMX) section.
5.10	0	07 th January, 2025	Updated for MCP Firmware Version 5.10.

Version	Rev.	Date	Change description
5.20	0	03 rd June, 2025	Updated for MCP Firmware Version 5.20.
	1	16 th June, 2025	Updated Performance Test Results for G500 Intel i3 hardware with 500 IEDs.
5.30	0	15 th October, 2025	Updated for MCP Firmware Version 5.30 (projects release).
5.40	0	11 th February, 2026	Updated for MCP Firmware Version 5.40.

G500 Substation Gateway

Product Support

If you need help with any aspect of your G500 product, you can:

- Access the G500 Web site
- Search the GE Vernova Technical Support library
- Contact Technical Support

Also covered are:

- The GE Vernova Grid Solutions address
- Instructions on returning a G500

Access the GE Vernova Grid Solutions web site

The G500 Web site provides fast access to technical information, such as manuals, release notes and knowledge base topics.

Visit us on the Web at: <https://www.gevernova.com/grid-solutions/>

Search GE Vernova Grid Solutions technical support library

This site serves as a document repository for post-sales requests. To get access to the Technical Support Web site, go to:

<https://www.gevernova.com/grid-solutions/events/signup.asp?sid=208>

Contact Technical Support

GE Vernova Grid Solution Technical Support is open 24 hours a day, seven days a week for you to talk directly to a GE Vernova representative.

Region	E-mail	Telephone

Have the following information ready to give to Technical Support:

- Ship to address (the address that the product is to be returned to)
- Bill to address (the address that the invoice is to be sent to)
- Contact name
- Contact phone number
- Contact fax number
- Contact e-mail address
- Product number / serial number
- Description of problem

Technical Support will provide you with a case number for your reference.

GE Vernova Grid Solutions address

The GE Vernova Grid Solutions company address is:

GE Vernova Grid Solutions
650 Markland Street
Markham, Ontario
Canada L6C 0M1

Product returns

A Return Merchandise Authorization (RMA) number must accompany all equipment being returned for repair, servicing, or for any other reason. Before you return a product, please contact GE Vernova Grid Solutions to obtain an RMA number and instructions for return shipments.

You are sent the RMA number and RMA documents via fax or e-mail. Once you receive the RMA documents, attach them to the outside of the shipping package and ship to GE Vernova Grid Solutions.

Product returns are not accepted unless accompanied by the Return Merchandise Authorization number.

G500 Substation Gateway

About this Document

Purpose

This manual provides information about installing, setting up, using and maintaining your G500 Substation Gateway. This manual does not provide any procedures for configuring the G500 software.

Intended audience

This manual is intended for use by field technicians and maintenance personnel who are responsible for the installation, wiring and maintenance of SCADA equipment. This guide assumes that the user is experienced in:

- Electrical utility applications
- Electrical wiring and safety procedures
- Related other manufacturers' products, such as protective relays and communications equipment

Additional documentation

For further information about the G500, refer to the following documents.

- G500 Online Help
- Module layouts, as available
- MCP Software Configuration Guide (GE Vernova part number SWM0101)

For the current version of the G500 Instruction Manual, please download a copy from:

<https://www.gevernova.com/grid-solutions/app/viewfiles.aspx?prod=G500&type=3>

How to use this guide

This guide describes how to install the G500.

Procedures are provided for all component options available for the G500. The components included in your G500 depend on what was ordered for your substation application. Follow only the procedures that apply to your G500 model. To check what options are included in your G500, see [Order code](#) on page 17.

Safety words and definitions

Before attempting to install or use the device, review all safety indicators in this document to help prevent injury, equipment damage or downtime.

The following safety and equipment symbols are used in this document:

Indicates a hazardous situation which, if not avoided, result in death or serious injury.

Indicates a hazardous situation which, if not avoided, could result in death or serious injury.

Indicates a hazardous situation which, if not avoided, could result in minor or moderate injury.

Indicates practices that are not related to personal injury.

G500 Substation Gateway

Chapter 1: Introduction

Before you begin installing and using the G500, review the information in this chapter, including the following topics:

- Safety precautions
- Warning symbols
- Hardware overview
- Order code. For order code details, see <https://store.gegridsolutions.com/ViewProduct.aspx?Model=G500>

Read and thoroughly understand this guide before installing and operating the unit. Save these instructions for later use and reference.

Failure to observe the instructions in this manual may result in serious injury or death.

Disclaimer

It is the responsibility of the user to verify and validate the suitability of all GE Vernova Grid Automation products. This equipment must be used within its design limits. The proper application including the configuration and setting of this product to suit the power system assets is the responsibility of the user, who is also required to ensure that all local or regional safety guidelines are adhered to. Incorrect application of this product could risk damage to property/the environment, personal injuries or fatalities and shall be the sole responsibility of the person/entity applying and qualifying the product for use.

The content of this document has been developed to provide guidance to properly install, configure and maintain this product for its intended applications. This guidance is not intended to cover every possible contingency that may arise during commissioning, operation, service, or maintenance activities. Should you encounter any circumstances not clearly addressed in this document, please contact your local GE Vernova service site. The information contained in this document is subject to change without notice.

IT IS THE SOLE RESPONSIBILITY OF THE USER TO SECURE THEIR NETWORK AND ASSOCIATED DEVICES AGAINST CYBER SECURITY INTRUSIONS OR ATTACKS. GE VERNOVA GRID AUTOMATION AND ITS AFFILIATES ARE NOT LIABLE FOR ANY DAMAGES AND/OR LOSSES ARISING FROM OR RELATED TO SUCH SECURITY INTRUSION OR ATTACKS.

Safety precautions

Follow all safety precautions and instructions in this manual.

Only qualified personnel should work on the G500. Maintenance personnel should be familiar with the technology and the hazards associated with electrical equipment.

- Never work alone.
- Before performing visual inspections, tests, or maintenance on this equipment, isolate or disconnect all hazardous live circuits and sources of electric power. Assume that all circuits are live until they have been completely de-energized, tested, and tagged. Pay particular attention to the design of the power system. Consider all sources of power, including the possibility of back feed.
- Turn off all power supplying the equipment in which the G500 is to be installed before installing and wiring the G500.
- Operate only from the power source specified on the installed power supply module.
- Beware of potential hazards and wear personal protective equipment.
- The successful operation of this equipment depends upon proper handling, installation, and operation. Neglecting fundamental installation requirements may lead to personal injury as well as damage to electrical equipment or other property.
- All electronic components within the G500 are susceptible to damage from electrostatic discharge. To prevent damage when handling this product use approved static control procedures.
- Hazardous voltages can cause shock, burns or death. To prevent exposure to hazardous voltages, disconnect and lock out all power sources before servicing and removing components.
- If the G500 is used in a manner not specified in this manual, the protection provided by the equipment may be impaired.
- Changes or modifications made to the unit not authorized by GE Vernova could void the warranty.

Warning symbols

Table 1 explains the meaning of warning symbols that may appear on the G500 or in this manual.

Table 1: Warning symbols that appear on the G500 and in this manual

Symbol	Description
— — —	The relevant circuit is direct current.
~	The relevant circuit is alternating current.

Symbol	Description
	Caution: Refer to the documentation for important operation and maintenance instructions. Failure to take or avoid specified actions could result in loss of data or physical damage.
	Warning: Dangerous voltage constituting risk of electric shock is present within the unit. Failure to take or avoid specified actions could result in physical harm to the user.
	Earth/Ground Terminal
	Protective Ground Terminal
	Caution: Hot Surface

Hardware overview

The G500 is built on a flexible, high-performance, upgradeable COM express platform powered by one of the following CPU modules:

- Option A: AMD RX-225FB 2 core 2.2 GHz (max turbo frequency 3.0 GHz) CPU with 8 Gigabytes of soldered on DDR3 ECC for a wider operating temperature (+70°C).
- Option B: AMD RX-427BB 4 core 2.7GHz (max turbo frequency 3.6 GHz) CPU with 16 Gigabytes of soldered on DDR3 ECC memory for best performance at a limited (+60°C) maximum operating temperature,
- Option C: Intel i3-7102E 2 cores 4 threads 2.1 GHz (no turbo) CPU with 8 Gigabytes of soldered on DDR4 ECC for a wider operating temperature (+70°C).
- Option D: Intel E3-1505Lv6 (Xeon) 4 cores 8 threads 2.2GHz (max turbo frequency 3.0 GHz) CPU with 16 Gigabytes of soldered on DDR4 ECC memory for best performance at a limited (+60°C) maximum operating temperature.

The G500 is distinguished by the noticeable lack of a hard drive and fan, employing instead the rugged and reliable Solid State Drive (SSD) mass storage and engineered heat sink.

The G500 supports various communication media types through a choice of input/output (I/O):

- Serial: 8 factory installed ports, expandable up to 20 ports, RS-232 and RS-485 are accessible via individual RJ45 connectors.
- Ethernet: Six Ethernet interfaces available through SFP cages. Each cage supports: 100/1000BaseT, 100BaseFX or 1000BaseSX.
- D.20 Link HDLC ports: A dual channel card for communication with up to 120 - D20 Peripherals per channel or in redundant configuration.

Figure 1: G500

Ordering guides

The latest ordering guides are available on the GE Vernova Grid Solutions website:

<https://www.gevernova.com/grid-solutions/multilin/catalog/g500.htm>

You can select the required options from the available Product Option items. The Order Code automatically updates as each option is selected.

Intel CPU Options C and D require firmware version 5.00 and later.

The following ordering guides are available:

- Order code on page 17
- MCP Spares and Accessories on page 21
- MCP Redundancy Kit (K) - Single RS 232 SWITCH PANEL (SW PNL) for firmware v2.80 and lower and G500 D2X in Function D on page 23
- MCP Redundancy Kit (N) - Single RS 232 SWITCH PANEL (SW PNL) for firmware v3.00 and higher on page 25

The Ordering Guide information provided in this manual does not reflect the full complexity of the ordering options provided on the GE Vernova Grid Solutions Online Store; the Online Store provides the full set of G500 options and their sub-option interdependencies while this manual shows all sub-options, regardless of the parent option chosen.

Order code

Changes to G500 Model Number

G500 model number always had the functional designation “S” and the last digits present and set to UUUUUUUU.

Starting with V4.00 – the G500 model number and order code makes use of the last group of digits for the purpose of tracking the D2x function attributes as below:

G500-BHU8-TTUUUU-BUUU-UUD-UUU-**S**-CAD0094-**NNVVVLL**

G500 as MCP Function

S indicates MCP functionality and in this case NNVVVLL == “UUUUUUUU” (i.e. D2x part is not used).

This is identical to previous G500 model number structure, ensuring backwards compatibility.

For e.g.:

G500-BHU8-TTUUUU-BUUU-UUD-UUU-S-CAD0094-UUUUUUUU

G500 as D2x Function

D indicates D2x functionality, and in this case:

- **NN** denotes the NAME of the D2x SMX firmware (equivalent to SAN0001 in D20MX). First public release is A0.
- **VVV** denotes the VERSION of the SMX firmware (equivalent to 00 or 2.10 in D20MX). First public release is 400.
- **LL** denotes the two digit number associated with D2x licenses.

For e.g.:

G500-BHL8-TTUUUU-BUUU-UUD-UUU-D-CAD0000-A010003

G500 as MCP/D2x Function

This is available only on G500 with CPU options B and D.

- **C** indicates both MCP and D2x (Combined) functionality, and in this case:
- **NN** denotes the NAME of the D2x SMX firmware (equivalent to SAN0001 in D20MX). First public release is A0.
- **VVV** denotes the VERSION of the SMX firmware (equivalent to 00 or 2.10 in D20MX). First public release is 400.
- **LL** denotes the two digit number associated with D2x licenses.

For e.g.:

G500-BHU8-TTUUUU-BUUU-UUD-UUU-C-CAD0095-A010003

As-Built model number digits

The “as built” model number remains always the one set from factory.

As-Is model number

An embedded MCP application runs every time when the MCP and D2x applications start and updates the “As-Is” MCP Model number to reflect what is installed and configured in the device – regardless of the functional personality.

The generation of **HW digits** is according to the Instruction Manual.

G500-BHU8-TUUUUF-BUUU-UUD-UUU-S-CAD0000-UUUUUUU

The Function Type (S, C, D) is read from the set Function.

G500-BHU8-TUUUUF-BUUU-UUD-UUU-**S**-CAD0000-UUUUUUU

The generation of **SW digits related to MCP function** is according to the Instruction Manual.

G500-BHU8-TUUUUF-BUUU-UUD-UUU-S-**CAD0000**-UUUUUUUU

The generation of **SW digits related to D2x function** is always performed regardless of the function type and follows the rules below (all CAPS letters for the digits).

G500 v4.00 has the following possible combinations for the last group of 7 digits:

G500-BHU8-TUUUUF-BUUU-UUD-UUU-S-CAD0000-**UUUUUUUU**

To know the Order Code of your G500, run “**mcpsi**” command through MCP Shell utility.

G500 Substation Gateway

Chapter 2: Unpacking and Inspection

This chapter covers the suggested inspection and preparation considerations and background information necessary prior to using the G500. Unpacking, initial inspection, and first time operation of the G500 are covered. Following the procedures given in the chapter is recommended, and they will verify proper operation before the product is integrated into your system.

Hot Surface: During operation of the G500 the surface of the heat sink, can reach a temperature of 60°C and above. Therefore, be careful and do not touch it with bare fingers.

Electro Static Discharge - ESD

The discharge of static electricity, known as Electro Static Discharge or ESD, is a major cause of electronic component failure. The Industrial Computer has been packed in a static-safe bag which protects it from ESD while it is in the bag. Before removing the Boards or any other electronic product from its static-safe bag, be prepared to handle it in a static-safe environment.

You should wear a properly-functioning anti-static strap and ensure you are fully grounded. Any surface upon which you place on the unprotected G500 should be static-safe, usually facilitated by the use of anti-static mats. From the time the board is removed from the anti-static bag until it is in the card cage and functioning properly, extreme care should be taken to avoid “zapping” the board with ESD. You should be aware that you could “zap” the board without you knowing it; a small discharge, imperceptible to the eye and touch, can often be enough to damage electronic components. Extra caution should be taken in cold and dry weather when electrostatic charge easily builds up.

Only after ensuring that both you and the surrounding area are protected from ESD, carefully remove the board or module from the shipping carton by grasping the module on its edges. Place the board, in its anti-static bag, flat down on a suitable surface. You may then remove the board from the anti-static bag by tearing the ESD warning labels.

Initial inspection

After unpacking the products, you should inspect it for visible damage that could have occurred during shipping or unpacking. If damage is observed (usually in the form of bent component leads or loose socketed components), contact GE Vernova Technical Support for additional instructions. Depending on the severity of the damage, it may be necessary to return the product to the factory for repair.

DO NOT apply power to the board if it has visible damage!

Doing so may cause further, possibly irreparable damage, as well as introduce a fire or shock hazard.

Unpacking

Please read the manual carefully before unpacking the board or module or fitting the device into your system. Also adhere to the following:

- Observe all precautions for electrostatic sensitive modules
- Do not place the board on conductive surfaces, anti-static plastic, or sponge, which can cause shocks and lead to board trace damage.
- Do not exceed the specified operational temperatures.
- Keep all original packaging material for future storage or warranty shipments of the board.

Although the products are carefully packaged to protect against the rigors of shipping, it is still possible that shipping damage can occur. Careful inspection of the shipping carton should reveal some information about how the package was handled by the shipping service. If evidence of damage or rough handling is found, you should notify the shipping service and GE Vernova Technical Support as soon as possible.

PCIe Cards and storage devices may also have temperature restrictions

Retain all packing material in case of future need.

Before installing or removing any board, please ensure that the system power and external supplies have been turned off!

G500 Substation Gateway

Chapter 3: Installing the G500

This chapter covers the installation of the Industrial Computer and initial power-on operations.

Before you install and operate the G500, read and follow the safety guidelines and instructions in Safety precautions on page 14.

Installation

Mounting instructions

The G500 is mounted in 3U slot of a 19" rack by use of 6 screws compliant to IEC60297-3 with STD hole Pattern.

Screws Use screws with a shaft diameter ranging from M5 to M6, or SAE screws UNF 10-32 to UNC 12-24.

Mounting Diagram

1. Mount the brackets on the unit:

For screw torque specification, refer to General Torque Values for Screws on page 133.

2. Install 2 of the screws at the same height in the 19" rack. The screws should be screwed in to a distance of about 3 mm between screw head and rack.

3. Attach the unit by aligning the two screws with the keyhole mounting points of the brackets.

4. Once aligned, set down the unit and then tighten the screws.

The recommended tool torque settings for zinc-plated mounting screws are:

- 10-32 UNF screws use 22.2 in-lb [2.50 Nm]
- 12-24 UNC screws use 31.0 in-lb [3.51 Nm]
- M5x0.45 screws use 18.1 in-lb [2.04 Nm]

- M6x0.5 screws use 33.3 in-lb [3.76 Nm]

It is not recommended to ship the G500 installed in a rack without support brackets and adequate conductive foam blocking in place.

5. Install the 4 other screws and tighten to recommended torque.

Spacing for air circulation

To guarantee sufficient air circulation, the specified spacing above, below, to the sides, in front and behind the G500 must be met or exceeded. The thermal impact on devices next to each other is negligible (1°C) with the mounting spaces below, assuming the adjacent devices are also G500s or devices dissipating a similar amount of power.

The minimum specified spacing to the front and behind the G500 is 5cm (2"). Other spacing requirements are indicated in the following diagram. These requirements are met when the G500 is installed using the provided rack mounting kit.

NOTE

The spacing specifications for air circulation are based on the worst-case scenario for operation at the maximum specified ambient temperature.

If the spacing specifications for air circulation cannot be adhered to, then the maximum specified temperatures cannot be guaranteed.

General advice

Please observe all safety procedures to avoid damaging system and protect operators and users.

Electric shock can cause injury and may be fatal.

Before installing or removing any board, please ensure that the system power and external supplies as well as power to devices connected to the ALARM Relay output have been turned off and/or are unplugged from the device.

Grounding

It is required to connect the chassis to cabinet ground, which then MUST BE CONNECTED TO Building Protective Earth (PE) ground using at minimum the M5 ground connection screw in point located near the G500 power supply. The second screw in point can also be connected to cabinet ground. For proper connection, the recommended tool torque settings for ground terminal screws are 18 in-lb [2.0 Nm]. A Phillips (#1) screwdriver tip is recommended.

The cabinet grounding wire should be AWG 12 or lower and not longer than 1 meter.

Power input connector

The mating connector is the 5-pin "Phoenix 1942293". This connector type is required for IP30 compliance. Alternate connector (GE Vernova Item) with back shell (GE Vernova Item) may be requested.

Power Supply Unit (PSU)

The G500 can be powered by one or by two redundant power supplies. The maximum power requirement is 170 VA.

There are two different power supplies available:

1. High Voltage Power Supply
2. Low Voltage Power Supply

The power supply units are secured to the chassis using two M3 screws in opposite corners on the power supply faceplate. The recommended torque setting for the screws on the power supplies are 5.3 in-lb [0.6 Nm].

High Voltage Power Supply

The High Voltage Power Supply handles both AC and DC input.

The AC input voltage range is 100 to 240V @50 to 60 Hz. The PSU tolerates a 10% variation in these values (90 to 265V @ 47 to 63Hz).

With AC input, the PSU has a maximum current consumption of 2.1A.

The DC input voltage is 100 to 300V. The PSU tolerates a +10%/-12% variation in these values (88 to 330V).

With DC input, the PSU has a maximum current consumption of 1.8A.

When using AC power, connect the “~”, “N” and “GND” wires according to the following figure.

When using DC power, connect the “+” and “-” wires according to the following figure. The GND wire is optional.

The inrush current is typically limited to 35A when powering up.

Wires

The conductor size is from 16 AWG to 12 AWG and strip length is 10mm.

When using ferrules, 16 AWG to 20 AWG ferrules are recommended by Phoenix Contact, no larger. When properly inserted, the connector has been demonstrated to exceed the 10N (~1kg) pull requirement.

After plugging cable lines into the mating connector, plug the mating connector to the product and secure the mating connector using the two screws. For proper connection, the recommended tool torque settings for connector flange screws are 2.7 in-lb [0.3 Nm]. A Flathead screwdriver with 0.4 mm by 2.5 mm blade is recommended.

Breaker Circuit

A 16A IEC or 20A USA/Canada breaker circuit is required as a pre-fuse.

Disconnect Device

A readily accessible disconnect device shall be incorporated external to the unit.

Overcurrent protection

The overcurrent protection function interrupts an uncontrolled fault current or overcurrent before serious damage can occur, such as overheating of the equipment.

The PSU included fuse is rated for 6.3A continuous current. If that current is exceeded by factor 10 the fuse will blow in between 10ms and 100ms.

The fuse is placed in “N”/ “-” connection of the power supply.

The fuse is soldered directly onto the product. There is no fuse holder. The fuse should only be replaced by GE Vernova personnel.

NOTE

Overvoltage protection

The voltage to the inner loads is protected by a varistor. High increase of the voltage will cause the internal current fuse to blow and/or the Varistor to break.

The varistor is soldered directly on the product. There is no fuse holder. The varistor should only be replaced by GE Vernova personnel.

Low Voltage Power Supply

The Low Voltage Power Supply only handles DC input, with DC input voltage from 20 to 54V. The PSU tolerates a 10% variation in these values (18 to 60V).

The PSU has a maximum current consumption of 10.2A.

Connect the “+” and “-” wires according to the following figure. The GND wire is optional.

**Wires**

The conductor size is from 16 AWG to 12 AWG and Strip Length is 7mm.

After plugging cable lines into the mating connector, plug the mating connector to the product and secure the plug with the two screws.

Breaker circuit

A 20A IEC/USA/Canada breaker circuit is required as pre fuse.

Disconnect device	A readily accessible disconnect device shall be incorporated external to the unit.
Inrush current	The inrush current is typically 13A when powering up.
Reverse polarity protection	The product is equipped with built-in reverse polarity protection. If + and - are swapped the unit will not power-up and harm to neither the power supply nor the unit will occur.
Overcurrent protection	The overcurrent protection function interrupts an uncontrolled fault current or overcurrent before serious damage can occur, such as overheating of the equipment. The PSU included fuse is rated for 16A continuous current. If that current is exceeded by factor 10 the fuse will blow in between 10ms and 100ms. The fuse is placed in"-connection of the power supply. The fuse is soldered directly onto the product. There is no fuse holder. The fuse should only be replaced by GE Vernova personnel.
	
Overvoltage protection	The voltage to the inner loads is protected by a varistor. High increase of the voltage will cause the internal current fuse to blow and/or the Varistor to break. The varistor is soldered directly onto the product. There is no fuse holder. The varistor should only be replaced by GE Vernova personnel.
	

Power-On Self-Test (POST)

Each time the G500 boots up it must pass the POST (Power-On Self-Test). The following tests make up the POST:

- CPU must exit the reset status and be able to execute instructions
- SPI Flash ROM and NVRAM is accessible
- Checksum must be valid
- CMOS is readable, CMOS checksum must be valid
- CPU must be able to access all forms of memory such as the memory controller, memory bus, and memory module
- The first 64 KB of memory must be operational and must be capable of holding the POST code
- I/O bus / controller must be accessible
- I/O bus must be able to write / read from the video subsystem and be able to access all video RAM

If the G500 does not pass one or more of the above tests, the board will fail the POST and display a hexadecimal value on the lower right corner of the screen. Please contact GE Vernova Grid Solution support with the hexadecimal code in this case.

To interrupt the POST process and to access UEFI settings - please refer to documents "SWM0110 Configuring UEFI Settings on G500 User Guide" or "SWM0125 Configuring UEFI Settings on G500 with Intel Hardware User Guide".

To interrupt the POST process and to boot from an already inserted USB drive - please refer to document "TN0116 MCP Firmware Upgrade and Restore to Defaults Workflows".

POST messages are shown only on the DisplayPort™.

First time after a firmware upgrade - full completion of the POST may take up to 10 minutes. This is why is recommended to perform this process via KVM, or - if the serial maintenance port was used for the firmware upgrade - to connect a monitor to the DisplayPort™.

Full completion of the POST may take up to 4 minutes after a first boot.

Super Capacitor

The G500 does not include a battery. Instead, the G500 contains two super capacitors.

The real-time clock (RTC) is powered by one of the super capacitors. This super capacitor will power the RTC for at least 7 days with no connection to power. After this super capacitor discharges, the RTC will be reset to an invalid time (e.g. 12:00 AM, 01-10-2000). When the system is subsequently powered up, the system time will be initialized to the RTC time and require re-adjustment.

The chassis intrusion detection circuit is powered by the other super capacitor. Chassis intrusion will only be detected if this super capacitor is charged. The charge will be retained for at least 10 days with no connection to power. After this time, a chassis intrusion event will not be detected. However, if the event was detected prior to this time, it will be held indefinitely and reported on power up.

D.20 Link Connections

D.20 Communications between the G500 D.20 HDLC PCIe card and the D20 peripheral I/O modules are carried over a proprietary high-speed, high-level data link control (HDLC) protocol called the D.20 Link. To communicate with D20 peripheral I/O modules the G500 requires the installation and configuration of the D.20 HDLC PCIe card.

The D.20 HDLC PCIe card supports two D.20 Link communications ports which are accessible from the rear of the G500 chassis. The G500 system can be ordered from the factory with the D.20 HDLC PCIe card pre-installed using the Product configurator through the Online Store or can be installed infield by ordering the D.20 HDLC PCIe card as an accessory from the MCP Substation Gateway Spare Parts and following the PCIe Installation on page 116.

G500 D.20 HDLC PCIe card

The G500 D.20 HDLC PCIe card is installed in G500 Expansion slot 3 and is equipped with a Power Pass Through connector, two D.20 ports and four LEDs.

The Power Pass Through connector allows the D.20 peripheral connected to the D.20 Link to be powered through the D.20 port. The Power Pass Through requires one or two external power supplies to be connected. Refer to Supplying power through the D.20 Link on page 40 section for further details.

Two sets of LEDs are present on the D.20 HDLC PCIe card to indicate activity status. The first set of LEDs, on the left labeled D.20 1 Act, shows the transmit and receive activity on D.20 Channel 1 and the second set to show activity on D.20 Channel 2 on the right labeled D.20 2 Act. The receive LEDs will flash red and the transmit LEDs will flash green.

The G500 D.20 HDLC PCIe card has two D.20 ports. Each port contains D.20 Channel 1, D.20 Channel 2, DC Supply 1, and DC Supply 2. For D.20 port A, the above signals are always available. For D.20 port B, D.20 Channel 1 and D.20 Channel 2 are configurable but DC Supply 1 and DC Supply 2 are always available. Refer to Table 1: D.20 Port A and B pin out and configuration options and Table 2: Default D.20 Relay settings. D.20 Port B settings are software controlled and are accessible through the Settings GUI on your G500. Refer to SWM0101 for further details on configuration.

Table 1: D.20 Port A and B pin out and configuration options

Pin Number	D.20 port A	D.20 Port B	
1	No Connection	No Connection	
2	D.20 Channel 1 TX/RX +	D.20 Channel 2 TX/RX +	OPEN
3	D.20 Channel 1 TX/RX -	D.20 Channel 2 TX/RX -	OPEN
4	V _{DC1} +	V _{DC1} +	
5	V _{DC1} -	V _{DC1} -	
6	D.20 Channel 2 TX/RX +	D.20 Channel 1 TX/RX +	OPEN
7	D.20 Channel 2 TX/RX -	D.20 Channel 1 TX/RX -	OPEN
8	V _{DC2} +	V _{DC2} +	
9	V _{DC2} -	V _{DC2} -	

End of link termination is required at each end of the D.20 Link and is critical for proper operation. The G500 D.20 HDLC PCIe card has two relays which control the End of Link termination, one for each D.20 Channel. Refer to Table 2: Default D.20 Relay settings. End of Link termination settings are software controlled and are accessible through the Settings GUI on your G500. Refer to SWM0101 for further details on configuration.

Table 2: Default D.20 Relay settings

D.20 Relay setting	Default setting
End of Link termination on channel 1	Enabled
End of Link termination on channel 2	Enabled
D.20 channel 1 to D.20 port B connection	Disabled
D.20 channel 2 to D.20 port B connection	Disabled

Supplying power through the D.20 Link

Power is typically supplied to peripheral devices directly through the WESTERM boards or inject power into the D.20 link using the D.20 DC Interface module (520-0154). However, with the G500 D.20 HDLC PCIe card the Power Pass Through connections can be utilized to inject power into the D.20 link to supply power to peripheral devices through the D.20 ports.

One or two independent power supplies can be connected to DC Supply 1 (V_{DC1}) and DC Supply 2 (V_{DC2}). DC Supply 1 (V_{DC1}) is connected through to pins 4 and 5 on both D.20 ports (DB9 connector), respectively DC Supply 2 (V_{DC2}) is connected to pins 8 and 9.

The DC supply load on the D.20 port by the peripheral link must not to exceed 2.5A and 20-60 V_{DC}

The Power Pass Through connections are protected to 2.5A.

The mating connector is the 4-pin “Phoenix 1827729”. This connector type is required for IP30 compliance.

D.20 Link features

The D.20 Link has the following features:

- D.20 frame using HDLC protocol format with Manchester encoding.
- RS-485 typical cable is p/n 977-0089, half duplex at 250 kbps, 24 AWG twisted pair, for applications up to 330 meters, and maximum 32 devices in total:
 - one single G500 counts as one device,
 - redundant G500 count as two devices,
 - each I/O Peripheral module counts as one device.
- Repeater/extension modules may be used to extend this limit to a maximum of 100 peripheral I/O modules, considering the RS-485 serial link limits listed above.
 - Multi-Mode Glass Fiber (GFO), up to 2 km (each GFO counts as one device in the RS-485 serial link).

- Each set of RS-485 D.20 Link wiring must be terminated at both ends (the termination does not count as a device).

D.20 Communications Interface

Use the D.20 Communication Interface module (520-0117) when you require one-to-one communication links with peripherals.

D.20 Termination

Use the D.20 Termination (977-0049) when you need to terminate the RS-485 serial links outside of the G500.

D.20 Fiber Optic Splitter

Use the D.20 Fiber Optic Splitter (520-0118) when you require one-to-four communication links with peripherals, especially if peripherals are clustered in different areas of the substation.

GFO adapters

Glass Fiber Optic (GFO, 520-0148) adapters are used to provide glass fiber optical cable extensions to the D.20 Link. These allow interference free links to peripherals that are sited at a remote distance from the main D20 installation.

D.20 DC interface

When power requirements for multiple peripherals exceed the basic system limitations, or when necessary to power peripherals connected via GFO use the D.20 DC Interface module (520-0154).

Peripherals

D.20 Peripheral I/O modules are intelligent modules containing an on-board microprocessor. They are configured as slaves to the G500. In this way, specific I/O processing is distributed throughout the G500 to the appropriate I/O module.

There are four types of I/O peripherals supported by the G500:

- D20A analog input
- D20S digital inputs
- D20K digital output
- D20C combination input/output

Optional high-voltage peripherals are also available.

Redundant D.20 communication channels are available on all peripherals. To utilize this function redundant D.20 LAN cards are required to be installed on the D.20 Peripheral I/O modules. D.20 A, S and K Peripheral I/O modules require 540-0207 and D.20 C requires 540-0209.

The G500 D.20 HDLC PCIe card is only compatible with CCU BASE and PCOMMON v3.00 or higher.

NOTE

Refer to Peripheral compatibility with the G500 D.20 HDLC PCIe card section in this manual for complete list of D.20 Peripheral I/O compatibility.

For further information on I/O peripherals, see the D20/D200 Installation and Operations Guide (part number 994-0078); see section: Connections and Configuration.

Peripheral compatibility with the G500 D.20 HDLC PCIe card

Use the tables in this section to check compatibility with existing D.20 Peripheral I/O modules and devices.

Connection Scenarios

G500 with the D.20 HDLC PCIe card will support the below D.20 architectures:

- Single D.20 terminated, single link
- Dual D.20 link terminated
- Dual D.20 terminated, Ch 1 only
- Single D.20 link, redundant LAN
- Redundant D.20 link, redundant LAN
- Single D.20 link with redundant G500
- Dual D.20 terminated, with redundant G500
- Single D.20 link, redundant LAN with redundant G500
- Single Ring and Fiber Optic (FO) D.20 link with redundant G500

- Single Ring and Fiber Optic (FO) D.20 link, redundant LAN with redundant G500
- G500 system redundancy

Single D.20 terminated, single link

Up to 31 D.20 Peripherals in total can be present.

D.20 redundant LAN daughter card can optionally be installed with the corresponding configuration (Single Link) in DSAS.

The last D.20 peripheral must be terminated with D.20 terminator (GE Vernova part number 977-0049)

Table 8: Single D.20 terminated, Single Link - Default settings

Function	State
End of Link - D.20 Channel 1	ON
End of Link - D.20 Channel 2	ON
Port B - D.20 Channel 1 (pin 6/7)	OFF
Port B - D.20 Channel 2 (pin 2/3)	OFF

Dual D.20 link terminated

Up to 30 D.20 Peripherals in total can be present.

D.20 redundant LAN daughter card can optionally be installed with the corresponding configuration (Redundant Link) in DSAS.

The last D.20 peripheral must be terminated with D.20 terminator (GE Vernova part number 977-0049)

Table 9: Single D.20 terminated, Dual Link - Default settings

Function	State
End of Link - D.20 Channel 1	ON
End of Link - D.20 Channel 2	ON
Port B - D.20 Channel 1 (pin 6/7)	OFF
Port B - D.20 Channel 2 (pin 2/3)	ON

Dual D.20
terminated, Ch 1
only

Up to 30 D.20 Peripherals in total can be present.

The last D.20 peripheral must be terminated with D.20 terminator (GE Vernova part number 977-0049)

Table 10: Dual D.20 terminated, Ch 1 only - Default settings

Function	State
End of Link - D.20 Channel 1	OFF
End of Link - D.20 Channel 2	OFF
Port B - D.20 Channel 1 (pin 6/7)	OFF
Port B - D.20 Channel 2 (pin 2/3)	ON

Single D.20 link, redundant LAN

Up to 31 D.20 Peripherals in total can be present.

D.20 redundant LAN daughter card (GE Vernova part number 540-0209 for D.20C and GE Vernova part number 540-0207 for D.20A,S,K) must be installed with the corresponding configuration (Redundant Link) in DSAS.

The last D.20 peripheral must be terminated with D.20 terminator (GE Vernova part number 977-0049)

Table 11: Single D.20 link, redundant LAN - Default settings

Function	State
End of Link - D.20 Channel 1	ON
End of Link - D.20 Channel 2	ON
Port B - D.20 Channel 1 (pin 6/7)	OFF
Port B - D.20 Channel 2 (pin 2/3)	OFF

Redundant D.20 link, redundant LAN

Up to 30 D.20 Peripherals in total can be present.

D.20 redundant LAN daughter card (GE Vernova part number 540-0209 for D.20C and GE Vernova part number 540-0207 for D.20A,S,K) must be installed.

D.20 link adapter must be installed on each D.20 peripheral (GE Vernova part number 540-0313)

The D.20 Link crossover cable must be installed from CCU D.20 Port B to peripheral link (GE Vernova part number 977-0561)

The last D.20 peripheral must be terminated with D.20 terminator (GE Vernova part number 977-0049)

Table 12: Redundant D.20 Link, Redundant LAN - Default settings

Function	State
End of Link - D.20 Channel 1	ON
End of Link - D.20 Channel 2	ON
Port B - D.20 Channel 1 (pin 6/7)	ON
Port B - D.20 Channel 2 (pin 2/3)	ON

Single D.20 link with redundant G500

Up to 30 D.20 Peripherals in total can be present.

D.20 redundant LAN daughter card are not supported in Loop mode and must NOT be installed.

Table 13: Single D.20 link with redundant G500 - Default settings

Function	State MCP A	State MCP B

G500 system redundancy

A redundant G500 setup allows a secondary G500 to automatically take over operations from a paired G500 unit that has failed.

G500 redundancy requires two identical model and configuration G500 units and zero, one, or two RS232 switch panels when connecting to RS232 devices. RS232 switch panels are not required when connecting to RS-485 devices. For RS-485 redundant wiring approaches, refer to RS485 Connections on page 93.

When using the G500 in redundant mode, and wiring the RS232 switch panel, you must ensure the switch panel cables connected to A and B units match the A and B designations in software.

The RS-232 switch panel and associated connected wiring is optional for Warm-Standby, Hot-Standby and Hot-Hot redundancy.

Using the redundancy configurations given in this section, a pair of LEDs on the RS232 switch panel marked *CCU A* and *CCU B* indicate which of the G500 unit is currently active. A toggle switch on the RS232 switch panel can be used to manually switch the G500 devices between active and standby states, if the switch panel is configured as Master.

To view the Redundancy statuses, refer to Status 1 and Status 2 LED Indicators on page 124.

Starting with MCP **V4.00** release, **Warm-Standby** and **Hot-Standby** redundancy modes are no longer available and have been superseded by **Hot-Hot** redundancy mode. **Hot-Hot** redundancy mode has the same functionality as the superseded modes.

MCP Redundancy Operation

Please refer to **SWM0101 MCP Software Configuration Guide**, section **MCP System Redundancy** for a detailed explanation of MCP redundant modes.

RS232 Switch Panel(s) may be installed for the purpose of switching serial communications to external devices from the active MCP device. The RS232 Switch Panel is either in state (position) A or B and cannot be physically in both states.

At runtime, with a correctly configured G500 redundant system: only one MCP device is in an “active” state, the other MCP device is considered to be in “standby” state. Even when configured as hot-hot redundancy - the “standby” state and designation still applies for all subsystems not running as hot-hot.

Active vs. Standby States

If RS232 Switch Panel is not installed, or if is installed and configured as Slave: the runtime active and standby states are given by mutual arbitration in software.

If RS232 Switch Panel is installed and configured as Master: the runtime active and standby states are given by the DCD signal (STATUS, BROWN wire) on the watchdog cable serial port. When DCD is positive voltage level - the device is in Active state.

There is no functional preference on which MCP device should be active; this is a function of what was the last negotiated value.

A vs B Designation

For MCP versions up to and including 2.80: The runtime A and B designation in the MCP database is given by the CTS signal (ORANGE wire) on the watchdog cable serial port if RS232 Switch Panel is installed and in addition the configured A and B setting must match the connected watchdog cable type. When CTS is positive voltage level - the device is assigned as A, this is tied internally to the +12 V pin inside cable 977-0557. This is also the reason why watchdog cables are different for devices A and B and must be connected to serial ports that provide internal +12 V.

For redundant MCP devices without RS232 Switch Panel installed - the runtime A and B designation in the MCP database is given by the configured A and B setting in the redundancy configuration.

For MCP versions 3.00 and after: The runtime A and B designation in the MCP database is given by the configured A and B setting in the redundancy configuration regardless of RS232 Switch Panel being installed or not. This simplifies the RS232 Switch Panel connections, allows usage of the same watchdog cable for both devices A and B, and removes the restriction to connect only to serial ports that provide internal +12 V.

Upgrading from a previous G500 version to v3.00 does not require redundancy RS232 watchdog cable changes, however the A and B designation assignment is now mandatory.

Pinout of watchdog cable 977-0557:

Pinout of watchdog cable 977-0558:

Pinout of watchdog cable 977-0568:

Runtime behavior

MCP devices A and B communicate constantly with each other to confirm each one's state, using what we call a "heartbeat" signal. If this communication stops - it triggers the standby device to become active. This is why it is critical that Heart Beat Communication does not have a single point of failure in itself and is implemented using at least two separate mediums: **Serial PING** and **LAN**. If serial is not possible, then implement **LAN1** and **LAN2**.

Disconnecting **all** Heart Beat Communications while both MCP devices are healthy and powered on will result in either of:

- One MCP will fail if RS232 Switch Panel is present and configured as Master.
 - In this case Human Intervention is required to restore the MCP redundancy after the Heart Beat Communications are restored.
- Both MCP devices become active if RS232 Switch Panel is present and configured as Slave, with serial communications being questionable since the RS232 Switch Panel cannot switch and follow both units as active.
 - In this case MCP redundancy should recover itself after the Heart Beat Communications are restored, with the last active MCP before the interruption remaining active, and the RS232 Switch Panel switched towards the active MCP.
- Both MCP devices become active if an RS232 Switch Panel is not present.
 - In this case MCP redundancy should recover itself after the Heart Beat Communications are restored, with the last active MCP before the interruption remaining active.

After experiencing both MCP being in active state, and after correcting the Heart Beat communication defects, and if the D.20 IO is configured: it is required to power cycle both MCP devices to clear this state on the D.20 PCIe card.

In general, after recovering from any redundancy failures there should be comprehensive checks performed to ensure the active device is operating as required, D.20 IO (if configured) are online and the standby device shows online in the active device. And then same checks should be performed after a switchover, with the second device being active.

Switchover initiated in database

Switchover initiated in database is when both MCP devices operate as Active-Standby and there is a database initiated request to change the Active MCP device, e.g. using the Redundancy Manager DO point "Start Change Over".

In this case, the Active MCP sends to the Standby a request to become active, over the Heartbeat Communication channel(s).

This is followed by different actions, depending on the RS232 Switch Panel configuration - see next:

If an RS232 Switch Panel is configured as Master and installed:

The Standby MCP device asserts both TX (SET 1) and RTS (SET 2) signals on the serial port connected to the watchdog cable, for a duration of approximately 50 ms.

As a result, the RS232 Switch Panel will change positions (should occur within 25 ms and with a maximum timeout of 50 ms), resulting in a swap of the STATUS A and STATUS B signal levels. The Standby MCP device confirms this change by monitoring the DCD (STATUS) signal, de-asserts the TX (SET 1) and RTS (SET 2) signals and initiates the actions to run the applications as Active.

The RS232 Switch Panel transfers all serial field connections to the new Active MCP.

If the DCD (STATUS) signal did not change to reflect the new RS232 Switch Position even after the duration 50 ms - the Standby MCP will fail and will not become active.

If the Standby MCP confirms becoming active and communicates this to the former Active MCP which made the request - the former Active MCP will have its applications restart in standby mode or change the applications to standby mode, as a result of the agreements exchanged over the Heartbeat Communication channel(s).

The switchover is finalized.

If an RS232 Switch Panel is configured as Slave and installed:

The Standby MCP device acknowledge the request and initiates the actions to run the applications as Active, without checking the DCD (STATUS) signal.

Once the Standby MCP confirms becoming active and communicates this to the former Active MCP which made the request - the former Active MCP will have its applications restart in standby mode, as a result of the agreements exchanged over the Heartbeat Communication channel(s).

The Standby MCP device also asserts both TX (SET 1) and RTS (SET 2) signals on the serial port connected to the watchdog cable, for a duration of approximately 50 ms. As a result, the RS232 Switch Panel will change positions, resulting in a swap of the STATUS A and STATUS B signal levels. The Standby MCP device confirms this change by monitoring the DCD (STATUS) signal.

If the DCD (STATUS) signal did not change to reflect the new RS232 Switch Position even after the duration of 50 ms - the Standby MCP will log an error and continue to operate as Active now. The RS232 Switch Panel did not transfer the serial field connections to the new Active MCP.

If the Standby MCP confirms becoming active and communicates this to the former Active MCP which made the request - the former Active MCP will have its applications restart in standby mode or change the applications to standby mode, as a result of the agreements exchanged over the Heartbeat Communication channel(s).

The switchover is finalized.

If an RS232 Switch Panel is not present:

The Standby MCP device acknowledge the request and initiates the actions to run the applications as Active, without checking the DCD (STATUS) signal.

Once the Standby MCP confirms becoming active and communicates this to the former Active MCP which made the request - the former Active MCP will have its applications restart in standby mode or change the applications to standby mode, as a result of the agreements exchanged over the Heartbeat Communication channel(s).

The switchover is finalized.

Switchover initiated from RS232 Switch Panel

Switchover initiated from the button located on the RS232 Switch Panel applies only when an RS232 Switch Panel is configured as Master and installed.

In this case the DCD (STATUS) signal swaps the STATUS A and STATUS B signal levels as a result of the RS232 Switch Panel initiated action.

The Standby MCP device observes this change by monitoring the DCD (STATUS) signal and initiates the actions to run the applications as Active.

The Active MCP device observes this change by monitoring the DCD (STATUS) signal and initiates the actions to have its applications restart in Standby mode or change the applications to Standby mode.

The two MCP devices also confirm the switchover to each other over the Heartbeat Communication channel(s).

The RS232 Switch Panel transfers all serial field connections to the new Active MCP.

The switchover is finalized.

Failover event

A Failover event occurs when the Standby MCP can no longer communicate with the Active MCP.

In this case, after exhausting the configured number of retries over the Heartbeat Communication channel(s) - the following actions occur, depending on the RS232 Switch Panel configuration:

If an RS232 Switch Panel is configured as Master and installed:

The Standby MCP device asserts both TX (SET 1) and RTS (SET 2) signals on the serial port connected to the watchdog cable, for a duration of approximately 50 ms.

As a result, the RS232 Switch Panel will change positions (should occur within 25 ms and with a maximum timeout of 50 ms), resulting in a swap of the STATUS A and STATUS B signal levels. The Standby MCP device confirms this change by monitoring the DCD (STATUS) signal, de-asserts the TX (SET 1) and RTS (SET 2) signals and initiates the actions to run the applications as Active.

The RS232 Switch Panel transfers all serial field connections to the new Active MCP.

If the DCD (STATUS) signal did not change to reflect the new RS232 Switch Position - the Standby MCP will fail and will not become active.

The failover is finalized.

If an RS232 Switch Panel is configured as Slave and installed:

The Standby MCP device initiates the actions to run the applications as Active, without checking the DCD (STATUS) signal.

The Standby MCP device also asserts both TX (SET 1) and RTS (SET 2) signals on the serial port connected to the watchdog cable, for a duration of approximately 50 ms. As a result, the RS232 Switch Panel will change positions, resulting in a swap of the STATUS A and STATUS B signal levels. The Standby MCP device confirms this change by monitoring the DCD (STATUS) signal.

The RS232 Switch Panel transfers all serial field connections to the new Active MCP.

If the DCD (STATUS) signal did not change to reflect the new RS232 Switch Position - the Standby MCP will log an error and continue to operate as Active now. The RS232 Switch Panel did not transfer the serial field connections to the new Active MCP.

The failover is finalized.

If an RS232 Switch Panel is not present:

The Standby MCP device initiates the actions to run the applications as Active, without checking the DCD (STATUS) signal.

The failover is finalized.

NOTE

To provide robustness against accidental switchovers during transient MCP device states - there are two signals TX (SET 1) and RTS (SET 2). In addition, by routing SET 1 signal through the ALARM N.O. contact of the MCP device requesting the RS232 Switch change - a successful RS232 Switch request is fulfilled only if the MCP device operates normally and ALARM relay is energized.

G500 versions up to and including v2.80

Required components

To implement a redundant G500 system, you need the following components:

Component	Function	GE Vernova part number
RS232 Switch Panel	Communications switch.	517-0247
Power Supply	Power supply to power the RS232 switch panel. Input: 85 – 264 VAC or 90 – 350 VDC.	580-0046
G500 RJ45 to RS232 Serial Cable	Connects the G500 to the RS232 switch panel which is then connected to external field devices.	977-0556/LLL
Watchdog Cable Assembly	Connects G500 A to the RS232 switch panel.	977-0557/LLL
	Connects G500 B to the RS232 switch panel.	977-0558/LLL
Ping Cable Assembly	Links both G500 units to facilitate a heartbeat message that determines the status of the active unit.	977-0559/LLL
G500 A/B RS232 Switch panel Jumper (P1/P9)	Connects the isolates common of serial port to the signal used in switch panel so G500 (A or B) can make itself the active unit.	977-0562
Power/ALARM Cable	Connects the RS232 switch panel to an external power supply and to the G500 ALARM terminal block.	970-0161
Ground Cable	Provides a ground connection for the RS232 switch panel.	970-0182

(/LLL) is length of the cable in inches, i.e. 36inches is /036.

The G500 A and G500 B Watchdog cables are not interchangeable and must be connected to the correct G500 unit.

The serial ports on the G500 are galvanically isolated from each other, however, when the RS232 switch panel is used, the serial common of all ports are tied together. CCU A ports are tied together, CCU B ports are tied together, CCU A and CCU B remain separate.

Pins 4 on switch panel connectors J2 through J8 are tied together and to the panel's power supply. Any loading from field devices on these pins, loads the RS232 panel power supply and should be taken into consideration when sizing power supplies.

The G500 watchdog (control) port must be configured for port 4 or 8 on the Built-in ports or port 4 on the Expansion port. The watchdog (control) must be configured to be the same port number on both G500A and G500B.

The G500 heartbeat (ping) port is software configurable, but must be configured to the same port number on both G500A and G500B.

For serial heartbeat interconnection of 2 redundant G500, a half crossed Ethernet cable can be used, in either RS-232 or RS-485-4W modes. RS-485-2W mode is not allowed. Do not use ports 4 or 8.

To set up a redundant system:

It is recommended that you install and configure one standalone G500 unit to ensure that your configuration is valid and that device communications are operating properly. Once this is done, proceed with the installation of the redundant system as shown in Figure 1 on page 63.

1. Mount the G500 units in a rack and connect power and ground.
2. Mount the RS232 switch panel.
3. Plug the connector of watchdog cable A (GE Vernova part number 977-0557/LLL) to the watchdog (control) serial port 4 or 8, RJ45 connector) on the first G500 (CCU A).
4. Plug the connector of watchdog cable B (GE Vernova part number 977-0558/LLL) to the watchdog (control) serial port (4 or 8, RJ45 connector) on the second G500 (CCU B). This cable must be connected to the same watchdog (control) serial port number (4 or 8) on both G500 units.
5. Connect the bare leads of both watchdog cables to TB1 on the RS232 switch panel as shown in Figure 1 on page 63.
6. Connect one end of the ping cable to the first G500 and the other end to the second G500. This ping cable must be connected to the same serial port number on both units.
7. Use G500 RJ45 to RS232 Serial Cable (977-0556/LLL) to connect the G500 serial communication ports to the serial ports on the RS232 switch panel. P2 through P8 are connected to the first G500, P10 through P16 are connected to the second G500. Connections from the switch panel to both G500 units should be made in the same order. For example, if P2 is connected to port 3 on the first G500, P10 should also be connected to port 3 on the second G500.
8. Use two RS232 DB9F SWITCH JUMPER A/B 977-0562 installed on P1 and P8 to connect the switched CCU ground for control and detection to the Currently active CCU.
9. Connect field devices to J2 through J8 on the RS232 switch panel.

To set up a redundant system with two RS232 switch panels:

In cases where more than 7 serial connection ports are required, a second RS232 panel can be added to the redundancy setup as shown in Figure 2 on page 64.

1. Mount the G500 units in a rack and connect power and ground.
2. Mount the two RS232 switch panels.
3. Plug the connector of watchdog cable A (GE Vernova part number 977-0557/LLL) to the watchdog (control) serial port 4 or 8, RJ45 connector) on the first G500 (CCU A).
4. Plug the connector of watchdog cable B (GE Vernova part number 977-0558/LLL) to the watchdog (control) serial port (4 or 8, RJ45 connector) on the second G500 (CCU B). This cable must be connected to the same watchdog (control) serial port number (4 or 8) on both G500 units.
5. Connect the bare leads of both watchdog cables to TB1 on the master RS232 switch panel as shown in Figure 2 on page 64.
6. Connect TB4 pins 1 (SET) and 2 (RESET) on the master RS232 switch panel to TB2 pins 1 and 2 on the slave RS232 switch panel using the cable specified (GE Vernova part number 970-0161) or similar.
7. Remove jumpers Z1 and Z2 from the slave RS232 switch panel.
8. Connect one end of the ping cable to the first G500 and the other end to the second G500. This ping cable must be connected to the same serial port number on both units.
9. Use G500 RJ45 to RS232 Serial Cable (977-0556/LLL) to connect the G500 serial communication ports to the serial ports on the RS232 switch panels. P2 through P8 are connected to the first G500, P10 through P16 are connected to the second G500. Connections from the switch panel to both G500 units should be made in the same order. For example, if P2 is connected to port 3 on the first G500, P10 should also be connected to port 3 on the second G500.

10. Use two RS232 DB9F SWITCH JUMPER A/B 977-0562 installed on P1 and P8 to connect the switched CCU ground for control and detection to the Currently active CCU. Only one panel required these jumpers, either panel can contain the jumpers.
11. Connect field devices to J2 through J8 on the first RS232 switch panel and to J1 through J8 on the second panel.

RS232 switch panel

The RS232 switch panel has two sets of indicator LEDs:

- PWR A/PWR B: When lit, power and communications are received from the connected units. Normally, both LEDs are lit.
- CCU A/CCU B: Normally, one LED is lit, indicating which unit is active.

The active/standby switch on the front of the RS232 switch panel is used to:

- Restore a previously failed unit to active status once it has been repaired.
- Manually force a unit to active status so that routine maintenance can be performed on the other unit.

To manually operate the RS232 switch as Master:

1. Pull the active/standby switch straight out to release it from the locked position.
2. Switch it up to make unit A active or down to make unit B active.

The CCU A/CCU B LED indicator indicates which unit has been activated.

Redundancy wiring diagrams

The following diagrams illustrate how to wire the G500 units and RS232 switch panels to enable system redundancy:

- Redundancy Wiring - Single RS232 Switch Panel see “Redundancy Wiring - Single RS232 Switch Panel” on page 63.
- Redundancy Wiring - Dual RS232 Switch Panel. The wiring drawing is provided in two parts: left and right.
 - For the left side of the drawing, see “Redundancy Wiring - Dual RS232 Switch Panel (1 of 2)” on page 64.
 - For the right side of the drawing, see “Redundancy Wiring - Dual RS232 Switch Panel (2 of 2)” on page 65.

This configuration is used to provide up to 15 serial connections to the redundant G500 units.

- Redundancy Wiring - Redundant RS232 Switch Panel. The wiring drawing is provided in two parts: left and right.
 - For the left side of the drawing, see “Redundancy Wiring - Redundant RS232 Switch Panel (1 of 2)” on page 66.
 - For the left side of the drawing, see “Redundancy Wiring - Redundant RS232 Switch Panel (2 of 2)” on page 67.

This configuration is used to provide RS232 panel redundancy for up to 7 serial connections.

When connecting to more than 8 field devices, you must double the number of RS232 switch panels used. When using this configuration, follow the instructions in To set up a redundant system with two RS232 switch panels: on page 61.

Figure 1: Redundancy Wiring - Single RS232 Switch Panel

Figure 5: Redundancy Wiring - Redundant RS232 Switch Panel (2 of 2)

G500 versions v3.00

Required components

To implement a redundant G500 system, you need the following components:

Component	Function	GE Vernova part number
RS232 Switch Panel	Communications switch.	517-0247
Power Supply	Power supply to power the RS232 switch panel. Input: 85 – 264 VAC or 90 – 350 VDC.	580-0046
G500 RJ45 to RS232 Serial Cable	Connects the G500 to the RS232 switch panel which is then connected to external field devices.	977-0556/LLL
Watchdog Cable Assembly	Connects G500 A to the RS232 switch panel.	977-0568/LLL
	Connects G500 B to the RS232 switch panel.	977-0568/LLL
Ping Cable Assembly	Links both G500 units to facilitate a heartbeat message that determines the status of the active unit.	977-0559/LLL
G500 A/B RS232 Switch panel Jumper (P1/P9)	Connects the isolates common of serial port to the signal used in switch panel so G500 (A or B) can make itself the active unit.	977-0562
Power/ALARM Cable	Connects the RS232 switch panel to an external power supply and to the G500 ALARM terminal block.	970-0161
Ground Cable	Provides a ground connection for the RS232 switch panel.	970-0182

(/LLL) is length of the cable in inches, i.e. 36inches is /036.

The serial ports on the G500 are galvanically isolated from each other, however, when the RS232 switch panel is used, the serial common of all ports are tied together. CCU A ports are tied together, CCU B ports are tied together, CCU A and CCU B remain separate.

Pins 4 on switch panel connectors J2 through J8 are tied together and to the panel's power supply. Any loading from field devices on these pins, loads the RS232 panel power supply and should be taken into consideration when sizing power supplies.

The watchdog (control) must be configured to be the same port number on both G500A and G500B.

The G500 heartbeat (ping) port is software configurable, but must be configured to the same port number on both G500A and G500B.

For serial heartbeat interconnection of 2 redundant G500, a half crossed Ethernet cable can be used, in either RS-232 or RS-485-4W modes. RS-485-2W mode is not allowed. Do not use ports 4 or 8.

The assignment of G500A and G500B must be done in Settings.

To set up a redundant system:

It is recommended that you install and configure one standalone G500 unit to ensure that your configuration is valid and that device communications are operating properly. Once this is done, proceed with the installation of the redundant system as shown in Figure 6 on page 71.

1. Mount the G500 units in a rack and connect power and ground.
2. Mount the RS232 switch panel.
3. Plug the connector of watchdog cable A (GE Vernova part number 977-0568/LLL) to the watchdog (control) serial port RJ45 connector on the first G500 (CCU A).
4. Plug the connector of watchdog cable B (GE Vernova part number 977-0568/LLL) to the watchdog (control) serial port RJ45 connector on the second G500 (CCU B). This cable must be connected to the same watchdog (control) serial port number on both G500 units.
5. Connect the bare leads of both watchdog cables to TB1 on the RS232 switch panel as shown in Figure 6 on page 71.
6. Connect one end of the ping cable to the first G500 and the other end to the second G500. This ping cable must be connected to the same serial port number on both units.
7. Use G500 RJ45 to RS232 Serial Cable (977-0556/LLL) to connect the G500 serial communication ports to the serial ports on the RS232 switch panel. P2 through P8 are connected to the first G500, P10 through P16 are connected to the second G500. Connections from the switch panel to both G500 units should be made in the same order. For example, if P2 is connected to port 3 on the first G500, P10 should also be connected to port 3 on the second G500.
8. Use two RS232 DB9F SWITCH JUMPER A/B 977-0562 installed on P1 and P8 to connect the switched CCU ground for control and detection to the Currently active CCU.
9. Connect field devices to J2 through J8 on the RS232 switch panel.

To set up a redundant system with two RS232 switch panels:

In cases where more than 7 serial connection ports are required, a second RS232 panel can be added to the redundancy setup as shown in Figure 7 on page 72.

1. Mount the G500 units in a rack and connect power and ground.
2. Mount the two RS232 switch panels.
3. Plug the connector of watchdog cable A (GE Vernova part number 977-0568/LLL) to the watchdog (control) serial port RJ45 connector on the first G500 (CCU A).
4. Plug the connector of watchdog cable B (GE Vernova part number 977-0568/LLL) to the watchdog (control) serial port RJ45 connector on the second G500 (CCU B). This cable must be connected to the same watchdog (control) serial port number on both G500 units.
5. Connect the bare leads of both watchdog cables to TB1 on the master RS232 switch panel as shown in Figure 7 on page 72.
6. Connect TB4 pins 1 (SET) and 2 (RESET) on the master RS232 switch panel to TB2 pins 1 and 2 on the slave RS232 switch panel using the cable specified (GE Vernova part number 970-0161) or similar.
7. Remove jumpers Z1 and Z2 from the slave RS232 switch panel.
8. Connect one end of the ping cable to the first G500 and the other end to the second G500. This ping cable must be connected to the same serial port number on both units.
9. Use G500 RJ45 to RS232 Serial Cable (977-0556/LLL) to connect the G500 serial communication ports to the serial ports on the RS232 switch panels. P2 through P8 are connected to the first G500, P10 through P16 are connected to the second

G500. Connections from the switch panel to both G500 units should be made in the same order. For example, if P2 is connected to port 3 on the first G500, P10 should also be connected to port 3 on the second G500.

10. Use two RS232 DB9F SWITCH JUMPER A/B 977-0562 installed on P1 and P8 to connect the switched CCU ground for control and detection to the Currently active CCU. Only one panel required these jumpers, either panel can contain the jumpers.
11. Connect field devices to J2 through J8 on the first RS232 switch panel and to J1 through J8 on the second panel.

RS232 switch panel

The RS232 switch panel has two sets of indicator LEDs:

- PWR A/PWR B: When lit, power and communications are received from the connected units. Normally, both LEDs are lit.
- CCU A/CCU B: Normally, one LED is lit, indicating which unit is active.

The active/standby switch on the front of the RS232 switch panel is used to:

- Restore a previously failed unit to active status once it has been repaired.
- Manually force a unit to active status so that routine maintenance can be performed on the other unit.

To manually operate the RS232 switch as Master:

1. Pull the active/standby switch straight out to release it from the locked position.
2. Switch it up to make unit A active or down to make unit B active.

The CCU A/CCU B LED indicator indicates which unit has been activated.

Redundancy wiring diagrams

The following diagrams illustrate how to wire the G500 units and RS232 switch panels to enable system redundancy:

- Redundancy Wiring - Single RS232 Switch Panel see "Redundancy Wiring - Single RS232 Switch Panel" on page 71.
- Redundancy Wiring - Dual RS232 Switch Panel. The wiring drawing is provided in two parts: left and right.
 - For the left side of the drawing, see "Redundancy Wiring - Dual RS232 Switch Panel (1 of 2)" on page 72.
 - For the right side of the drawing, see "Redundancy Wiring - Dual RS232 Switch Panel (2 of 2)" on page 73.

This configuration is used to provide up to 15 serial connections to the redundant G500 units.

- Redundancy Wiring - Redundant RS232 Switch Panel. The wiring drawing is provided in two parts: left and right.
 - For the left side of the drawing, see "Redundancy Wiring - Redundant RS232 Switch Panel (1 of 2)" on page 74.
 - For the left side of the drawing, see "Redundancy Wiring - Redundant RS232 Switch Panel (2 of 2)" on page 75.

This configuration is used to provide RS232 panel redundancy for up to 7 serial connections.

When connecting to more than 8 field devices, you must double the number of RS232 switch panels used. When using this configuration, follow the instructions in To set up a redundant system with two RS232 switch panels: on page 69.

Figure 10: Redundancy Wiring - Redundant RS232 Switch Panel (2 of 2)

G500 running as D2x system redundancy

G500 running as D2x includes:

- G500 with “D” function that runs only D2x functionality on the MCP platform
- G500 with “C” function that runs both MCP and D2x functionality on the MCP platform

For G500 with “C” function, please refer to “G500 versions v3.00” on page 68 in previous G500 System Redundancy section

In the context of this section, G500-D refers to G500 with “D” function.

A redundant G500-D setup allows a secondary G500-D to automatically take over operations from a paired G500-D unit that has failed. This functionality is same as a D20 or D20MX RTU and is labelled as “Warm-Standby D2x” in the DS Agile MCP Studio Device Properties.

G500-D redundancy requires two identical model and configuration G500-D units and one RS232 switch panel.

An RS-232 switch panel and associated connected wiring are mandatory for G500-D redundancy (“Warm-Standby D2x”).

When using the G500-D in redundant mode, and wiring the RS232 switch panel, you must ensure the switch panel cables connected to A and B units match the A and B designations in your setup.

Using the redundancy configurations given in this section, a pair of LEDs on the RS232 switch panel marked *CCU A* and *CCU B* indicate which of the G500-D unit is currently active. A toggle switch on the RS232 switch panel can be used to manually switch the G500-D devices between active and standby states, if the switch panel Z2 jumper is inserted to enable this.

G500-D Redundancy Operation

An RS232 Switch Panel must be installed for the purpose of arbitrating active and standby G500-D states and for switching serial communications to external devices from the active G500-D device. The RS232 Switch Panel is either in state (position) A or B and cannot be physically in both states.

At runtime, with a correctly configured G500-D redundant system: only one G500-D device is in an “active” state, the other G500-D device is considered to be in “standby” state.

Active vs. Standby States

The runtime active and standby states are given by the DCD signal (STATUS, BROWN wire) on the watchdog cable serial port. When DCD is positive voltage level - the device is in Active state.

There is no functional preference on which G500-D device should be active; this is a function of what was the last negotiated value.

You can select which of the G500-D devices is Active via the toggle switch located on the RS232 Switch Panel, if the switch panel Z2 jumper is inserted to enable this.

A vs B Designation

The runtime A and B designation in the database is given by the CTS signal (ORANGE wire) on the watchdog cable serial port. When CTS is positive voltage level - the device is assigned as A, this is tied internally to the +12 V pin inside cable 977-0557. When CTS is common voltage level - the device is assigned as B, this is tied to the RS232 Switch Panel COMB (TB5-1).

This is the reason why watchdog cables are different for devices A and B and both must be connected to **Serial Port 8** which provides internal +12 V.

The G500-D device using watchdog cable 977-0557 will have A designation; the G500-D device using watchdog cable 977-0558 will have B designation.

1. Redundant G500-D (as MCP “D” function) uses always **Serial Port 8** for RS232 Switch Panel control and this port assignment cannot be changed in configuration.
2. The G500-D watchdog cables can be used in backward compatible mode with MCP functions “S” or “C” redundancy - however the A and B designation assignment in mcpcfg / Settings GUI must be done.
3. If the watchdog cables associated with MCP v3.00 and later are used in G500-D redundancy - then the G500-D database will not set the A and B designations, and both devices will show the same designation at runtime.

Runtime behavior

G500-D devices A and B communicate constantly with each other to confirm each one's state, using what we call a “heartbeat” signal (called also “PING” in D20 terminology), configured in the D2x application Redundant Monitor (B034-0S) - and assigned to one of the G500-D serial ports. If PING communication stops - it triggers the standby device to request to become active.

Disconnecting the Heart Beat Communication while both G500-D devices are healthy and powered on will result in one of the G500-D devices to fail (there can be only one active device set by the relay in the RS232 Switch Panel). In this case, G500-D redundancy requires user intervention to recover, after the Heart Beat Communications are restored.

In general, after recovering from any redundancy failures there should be comprehensive checks performed to ensure the active device is operating as required, D.20 IO (if configured) are online and the standby device shows online in the active device. And then same checks should be performed after a switchover, with the second device being active.

Switchover initiated in database

Switchover initiated in database is when both G500-D devices operate as Active-Standby and there is a database initiated request to switchover the Active G500-D device, using the D2x application Failover DTA (A118).

In this case, the Active G500-D sends to the Standby a request for the Standby to become active, over the PING Heartbeat Communication channel.

The Standby G500-D device asserts both TX (SET 1) and RTS (SET 2) signals on the serial port connected to the watchdog cable, for a duration of approximately 50 ms.

As a result, the RS232 Switch Panel will change positions (should occur within 25 ms and with a maximum timeout of 50 ms), resulting in a swap of the STATUS A and STATUS B signal levels. The Standby G500-D device confirms this change by monitoring the DCD (STATUS) signal, de-asserts the TX (SET 1) and RTS (SET 2) signals and initiates the actions to run the applications as Active.

The RS232 Switch Panel transfers all serial field connections to the new Active G500-D.

If the DCD (STATUS) signal did not change to reflect the new RS232 Switch Position even after the duration 50 ms - the Standby G500-D will fail and will not become active.

If the Standby G500-D confirms becoming active and communicates this to the former Active G500-D which made the request - the former Active G500-D will have its applications restart in standby mode.

The switchover is finalized.

Switchover initiated from RS232 Switch Panel

Switchover can be initiated from the toggle switch located on the RS232 Switch Panel if the Z2 jumper is inserted to allow this.

In this case the DCD (STATUS) signal swaps the STATUS A and STATUS B signal levels as a result of the RS232 Switch Panel initiated action.

The Standby G500-D device observes this change by monitoring the DCD (STATUS) signal and initiates the actions to run the applications as Active.

The Active G500-D device observes this change by monitoring the DCD (STATUS) signal and initiates the actions to have its applications restart in Standby mode.

The two G500-D devices also confirm the switchover to each other over the PING Heartbeat Communication channel.

The RS232 Switch Panel transfers all serial field connections to the new Active G500-D.

The switchover is finalized.

Failover event

A Failover event occurs when the Standby G500-D can no longer communicate with the Active G500-D via the PING serial cable.

In this case, after exhausting the configured number of retries over the PING Heartbeat Communication channel (configured in the D2x application Redundant Monitor B034-0S) - the following actions occur:

- The Standby G500-D device asserts both TX (SET 1) and RTS (SET 2) signals on the serial port connected to the watchdog cable, for a duration of approximately 50 ms.
- As a result, the RS232 Switch Panel will change positions (should occur within 25 ms and with a maximum timeout of 50 ms), resulting in a swap of the STATUS A and STATUS B signal levels. The Standby G500-D device confirms this change by monitoring the DCD (STATUS) signal, de-asserts the TX (SET 1) and RTS (SET 2) signals and initiates the actions to run the applications as Active.
- The RS232 Switch Panel transfers all serial field connections to the new Active G500-D.

If the DCD (STATUS) signal did not change to reflect the new RS232 Switch Position even after the duration 50 ms - the Standby G500-D will fail and will not become active; this typically indicates wiring issues.

The failover is finalized.

To provide robustness against accidental switchovers during transient G500-D device states at power up - there are two signals TX (SET 1) and RTS (SET 2). In addition, by routing SET 1 signal through the ALARM N.O. contact of the G500-D device requesting the RS232 Switch change - a successful RS232 Switch request is fulfilled only if the G500-D device operates normally and ALARM relay is energized.

Required components

To implement a redundant G500-D system, you need the following components:

Component	Function	GE Vernova part number
RS232 Switch Panel	Communications switch.	517-0247
Power Supply	Power supply to power the RS232 switch panel. Input: 85 – 264 VAC or 90 – 350 VDC.	580-0046
G500 RJ45 to RS232 Serial Cable	Connects the G500 to the RS232 switch panel which is then connected to external field devices.	977-0556/LLL
Watchdog Cable Assembly	Connects G500-D A COM8 to the RS232 switch panel.	977-0557/LLL
	Connects G500-D B COM8 to the RS232 switch panel.	977-0558/LLL
Ping Cable Assembly	Links both G500 units to facilitate a heartbeat message that determines the status of the active unit.	977-0559/LLL
G500 A/B RS232 Switch panel Jumper (P1/P9)	Connects the isolates common of serial port to the signal used in switch panel so G500 (A or B) can make itself the active unit.	977-0562
Power/ALARM Cable	Connects the RS232 switch panel to an external power supply and to the G500 ALARM terminal block.	970-0161
Ground Cable	Provides a ground connection for the RS232 switch panel.	970-0182

(/LLL) is length of the cable in inches, i.e. 36inches is /036.

The G500-D A and G500-D B Watchdog cables are not interchangeable and must be connected to the correct G500-D unit.

The serial ports on the G500-D are galvanically isolated from each other, however, when the RS232 switch panel is used, the serial common of all ports are tied together. CCU A ports are tied together, CCU B ports are tied together, CCU A and CCU B remain separate.

Pins 4 on switch panel connectors J2 through J8 are tied together and to the panel's power supply. Any loading from field devices on these pins, loads the RS232 panel power supply and should be taken into consideration when sizing power supplies.

The G500-D watchdog (control) port must be wired for port 8 on the Built-in ports on both G500-D A and G500-D B.

For serial heartbeat interconnection of 2 redundant G500-D, a half crossed Ethernet cable can be used, in either RS-232 or RS-485-4W modes. RS-485-2W mode is not allowed. Do not use port 4 due to its internal power supply being connected across.

To set up a redundant system:

It is recommended that you install and configure one standalone G500-D unit to ensure that your configuration is valid and that device communications are operating properly. Once this is done, proceed with the installation of the redundant system.

1. Mount the G500-D units in a rack and connect power and ground.
2. Mount the RS232 switch panel.
3. Plug the connector of watchdog cable A (GE Vernova part number 977-0557/LLL) to the watchdog (control) serial port 8, (RJ45 connector) on the first G500-D (CCU A).
4. Plug the connector of watchdog cable B (GE Vernova part number 977-0558/LLL) to the watchdog (control) serial port 8, (RJ45 connector) on the second G500-D (CCU B).
5. Connect the bare leads of both watchdog cables to TB1 on the RS232 switch panel as shown in "G500-D Redundancy Wiring - Single RS232 Switch Panel" on page 81.
6. Connect one end of the ping cable to the first G500-D and the other end to the second G500-D. This ping cable must be connected to the same serial port number on both units, as configured in D2x application B034-0S.
7. Use G500-D RJ45 to RS232 Serial Cables (977-0556/LLL) to connect the G500 serial communication ports to the serial ports on the RS232 switch panel. P2 through P8 are connected to the first G500-D, P10 through P16 are connected to the second G500-D. Connections from the switch panel to both G500-D units should be made in the same order. For example, if P2 is connected to port 3 on the first G500-D, P10 should also be connected to port 3 on the second G500-D.
8. Use two RS232 DB9F SWITCH JUMPER A/B 977-0562 installed on P1 and P8 to connect the switched CCU ground for control and detection to the Currently active CCU.
9. Connect field devices to J2 through J8 on the RS232 switch panel

RS232 switch panel operation

The RS232 switch panel has two sets of indicator LEDs:

- PWR A/PWR B: When lit, power and communications are received from the connected units. Normally, both LEDs are lit.
- CCU A/CCU B: Normally, one LED is lit, indicating which unit is active.

If enabled by the jumper Z2 on the RS232 Switch Panel - the active/standby switch on the front of the RS232 switch panel is used to:

- Restore a previously failed unit to active status once it has been repaired.
- Manually force a unit to active status so that routine maintenance can be performed on the other unit.

To manually operate the RS232 switch:

1. Pull the active/standby switch straight out to release it from the locked position.
2. Switch it up to make unit A active or down to make unit B active.

The CCU A/CCU B LED indicator indicates which unit has been activated.

Redundancy wiring diagrams

The following diagram illustrate how to wire the G500-D units and RS232 switch panel to enable system redundancy:

Figure 11: G500-D Redundancy Wiring - Single RS232 Switch Panel

G500 Substation Gateway

Chapter 4: Interfaces

This chapter covers the interfaces of the Multilin™ G500 Substation Gateway.

First look at the G500

Front panel

The front panel of the G500 provides easy access to the status indicators, user connections and power supply units.

Figure 1: G500 front panel

Rear panel

The rear panel provides access to the communication ports, field wiring connections and power connections.

Figure 2: G500 rear panel

The G500 contains serial (8 factory-installed and expandable to 20 through PCIe expandable cards) ports for the communication cards. The communication cards are powered from the G500. The types of communication cards included in your G500 depend on what was ordered for your substation application.

External Interfaces

These interfaces are directly accessible from front or rear of the Unit.

USB Slave

The front of the unit includes a USB B port. The G500 behaves as a USB Serial device on this port. This is to connect a debug device, for example a service personnel laptop. If enabled this port can show boot and OS output to Serial console. Configure the Host device to the same parameters as the G500.

The USB serial port can, when enabled in UEFI-Setup, redirect the UEFI-Setup screen. This is useful in cases where no display is available or the DisplayPort™ is disabled.

The USB serial port default settings are 115 kBaud, 8 data bits, no parity and 1 stop bit (abbreviated as 115200 8N1).

Ethernet Port

The front of the unit includes a single RJ45 Ethernet connector, used to connect the management network. If enabled the DASH functionality is available via this connection.

- DASH:**
- SOL port
 - Remote USB
 - Remote power control
 - Remote board info

The port uses an RTL8111EP network. Drivers are freely available for several operating systems on the Realtek website.

Reset Button

The G500 has a Reset Button located on the rear of the unit. The reset button is recessed to prevent accidental pressing of the button and can only be activated by inserting a pin through the opening in the chassis.

A momentary press (1 second) of the reset button will gracefully shutdown the G500 and remain off for 120 seconds, the front CPU LED will be orange for this duration. After 120 seconds the G500 will automatically restart and the front CPU LED will turn green. The 120 seconds off period is to allow users time to disconnect power from the G500.

A press and hold (5 second) of the reset button will abruptly shutdown the G500 and remain off for 120 seconds, the front CPU LED will be orange for this duration. After 120 seconds the G500 will automatically restart and the front CPU LED will turn green.

USB 3.0

The front of the unit includes two USB 3.0 A connectors mainly used to enable maintenance personnel to connect their equipment and storage devices for software updates.

Each USB 3.0 A port is fused separately. For normal operation don't exceed 0.9 A per connector. The cumulative current draw of both ports is limited to 1A due to thermal and power budget restrictions.

The maximum cable length for USB 3.0 cables is 3m (=118in).

Using longer cables than specified for each port might result in data loss.

SD Card

At the front of the unit a SD card slot is available.

The SD card slot supports SD, SDHC and SDXC SD-Cards according to Version 1.0, Version 2.0 and Version 3.0.

The SD-Card slot has a push-pull mechanism. Put the card into slot and push it until you feel some resistance. Push the card again, if you want to remove it from the slot.

The SD Card is supported only for the Windows Operating System.

USB 2.0

At the rear of the unit four USB 2.0 A connectors are located. Main purpose of these connectors is to enable installation personnel to connect Mouse, Keyboard and equivalent equipment for initial configuration of the device.

Each USB 2.0 A connector is fused separately. For normal operation don't exceed 0.9 A per connector. The cumulative current draw of all four ports is limited to 1A due to thermal and power budget restrictions.

The maximum cable length for USB 2.0 cables is 3m (=118in).

DisplayPort™

At the rear of the unit two DisplayPort™ connectors are located. The interfaces are DisplayPort™ Version 1.2 and DP++ compliant which are used mainly to enable installation personnel to connect a display for the initial configuration of the device.

Each DisplayPort™ is capable of supporting two suitable displays via Multi-Stream Transport (MST) - up to 4 in total for AMD CPU Options and up to 3 in total for Intel CPU Options.

The Multi-Stream Transport (MST) feature in DisplayPort™, for daisy-chaining monitors, is supported only for the Windows Operating System.

In some cases, when using monitors which support MST, the G500 may not wake up the connected monitor after the screen saver went on. If this occurs - change the MST setting in the Display Monitor Menu from OFF to SECONDARY.

Each DisplayPort™ is fused separately. For normal operation don't exceed 0.5 A per connector. The cumulative current draw of the two ports is limited to 0.5A due to Thermal and power budget restrictions.

Users are recommended to use passive DP++ to HDMI and passive DP++ to DVI-D. Use of active adapters is not encouraged as they limit higher frequency refresh rates, and limit display sizes.

Refer: DP-Marketing Guidelines for more details.

G500 doesn't support Touch Screen Panel controls due to the absence of external vendor USB drivers. It's recommended to use Windows Panel PC and the Remote HMI application instead.

Alarm

At the rear of the unit an Alarm output connector is located.

This connector has three contacts NO, C and NC. These are the contacts of a solid state relay controlled by the watchdog and software. The relay voltage should be limited to switching up to 48VAC or 75VDC with maximum 100mA to comply with IEC 61850-3. If 61850-3 Compliance is not required, the relay may switch up to 300VAC or 300VDC.

This Port is isolated from the rest of system in accordance to IEC62368/IEC60950 for use with mains.

The mating connector is the 3-pin "Phoenix 1748367". This connector type is required for IP30 compliance.

Please observe all safety procedures to avoid damaging the system and to protect operators and users.

Electric shock can cause injury and may be fatal.

Before installing, removing or wiring this connector, please ensure that the external device is power off.

After the G500 starts up, the hardware watchdog will be enabled. The Status 1 LED will be GREEN and NO of the alarm output will be closed. After a critical failure is detected, the Status 1 LED will be RED and the NO of the alarm output will be opened to indicate system failure. Examples of critical failures are:

- Too many child restarts of a critical process
- Out of memory

If the system operating system freezes, the system will reboot after 10 seconds. Six seconds prior to reboot, the Status 1 LED will be ORANGE.

The Status 1 LED and Alarm Relay are controlled by the MCP Core watchdog application, even if the configured G500 functions is "C" or "D". This means that D2x Applications are not monitored by Status 1 LED or Alarm Relay - and alternate monitoring should be implemented (e.g., use of separate DO under the control of D2x applications).

IRIG - IN

There is a IRIG-B input connector available at the rear of the unit. This input can be used to synchronize the precision timer of the unit. The supported IRIG-B formats are 002 and 006. When configured as B002, the INPUT LED will show Orange when valid IRIG signal is present.

When configured as B006, the INPUT LED will show Green when valid IRIG signal is present and the clock requires a corresponding configuration where the year and quality are included in the IRIG-B signal. If the clock is not configured to provide the year the G500 will show the year 2000.

The supported levels are compliant to TTL.

This Port is isolated from the rest of system with an isolation voltage of 2kV AC.

The mating connector is the 3-pin “Phoenix 1732975”. This connector type is required for IP30 compliance.

A shielded twisted pair cabling shall be used for wiring.

IRIG - OUT

There is a IRIG-B output connector available at the rear of the unit. This output can be used to synchronize external equipment or other units to this unit. The supported IRIG-B formats are 002 and 006. The supported levels are compliant to TTL by a load of 250hm or higher.

This port is current limited and protected against damage by short of both contacts.

This Port is isolated to the rest of system with an isolation voltage of 2kV AC. The current carrying capacity of IRIG-B OUT is 120mA and it's capable of supplying up to 16 IED's.

The mating connector is the 3-pin “Phoenix 1732975”. This type is required to use for IP30 compliance.

For proper connection, the recommended tool torque settings for connector flange screws are 2.7 in-lb [0.3 Nm]. A Flathead screwdriver with 0.4 mm by 2.5 mm blade is recommended.

NOTE

A shielded twisted pair cabling shall be used for wiring.

Serial Ports

The G500 has 8 Built-in Serial ports available as RJ45 connectors on the rear of the unit and an additional 4, 8 or 12 can be configured through the PCIe Expansion slots. The physical communication ports are shown in the figure below and the corresponding configuration tool references in the table below. The Ports are isolated from the rest of the system and from each other by a 2 kV isolation Voltage.

DS Agile Studio Port range	Slot	Physical Com Ports
1 through 4	Built-in	1 through 4
5 through 8	Built-in	5 through 8
9 through 12	Expansion Slot 1	1 through 4
13 through 16	Expansion Slot 2	1 through 4
17 through 20	Expansion Slot 3	1 through 4

The serial ports support 4 communication modes

- RS232
- RS422
- RS485 4-Wire
- RS485 2-Wire

For every port an Rx Termination Resistor of 120 Ohms can be enabled through the software interface. This termination persists even when power is lost.

Figure 3: G500 rear view with UART and expansion slots

The pin assignment of the Serial Interfaces is dependent on the operation mode selected for the interface:

Table 1: RJ45 Pin outs for Serial Port Signals

EIA568	TIA/EIA 568A	RJ45 Pin out	RS232	RS422	RS485 4-Wire	RS485 2-Wire
		1	Rx	Rx-	Rx-	D-
		2	CTS	Rx+	Rx+	D+
		3	Tx	Tx-	Tx-	-
		4	GND	GND	GND	GND
		5	IRIG-B	IRIG-B	IRIG-B	IRIG-B
		6	RTS	Tx+	Tx+	-
		7	VCC*	VCC*	VCC*	VCC*
		8	DCD	-	-	-
*only on port 4 and 8						

Figure 4: Modular connector 8P8C (RJ45) pin

The VCC (Pin 7) is available on port 4 and port 8 from the Built-in slots and port 4 of each PCIe Expansion card installed in Expansion slots 1, 2 and 3. It is a 12V power output that is limited to 6W. If a higher load is applied to the output the output shuts down.

The IRIG-B (Pin 5) is available on ports 1 through 8 of the Built-in slots and is not available on any of the ports from the Expansion slots. The IRIG-B signal is a copy of the IRIG-B time signal output on the rear of the system. This output can be used to synchronize external equipment or other units to this unit. The supported levels are compliant to TTL by a load of 120Ohm or higher. It is current limited and protected against damage by short to GND (Pin 4).

For interconnection of 2 G500 in 485-2W mode a standard 1:1 patch cable can be used. For all other modes a standard crossover is suitable.

Shielded twisted pair cables shall be used for wiring. For users preferring to or requiring to terminate using D-Sub miniature 9 pin-female connectors, please refer to G500 system redundancy on page 54.

RS485 Connections

The G500 can be configured to communicate with RS-485 2-wire or 4-wire type devices using the 8 Built-in Serial Ports or additional serial ports installed in the PCIe Expansion slots. Each serial port can be independently configured through the Settings GUI and is galvanically isolated. All port configurations persist through a power cycle and when power is lost.

In RS-485 mode End of Link Termination (120 Ohm) can be enabled through the Settings GUI.

In RS-485 mode, it is important to configure the end of link termination option depending on the RS-485 wiring approach.

The RJ45 pin out for the corresponding communication protocol can be viewed from Table 1 on page 92.

The cables must be shielded and the shield of each RS-485 cable section should be grounded at one end only. This prevents circulating currents and can reduce surge-induced current on long communication lines.

Signal ground on pin4 is to be considered different then shield on cable.

When creating custom cables, it is recommended to only wire the required pins.

When a serial port is configured for RS485, modem control handshaking signals (RTS, CTS and DCD) generally do not apply. The exception is with the DNP Server where the RTS Pre-Trans Delay can be used to slow down the server response. This is sometimes necessary in 2-wire setups to prevent the DNP Server from responding while the master is still driving the line.

RS-485 4-wire mode should only be used for point to point connections, not for serial port redundancy or CCU redundancy.

RS-485 Splitter

The RS-485/RJ45 splitter or Y splitter referred to in this Instruction Manual (994-0152) must be of the type where all signals are connected straight through from the plug to all jacks as shown in Figure 5.

To eliminate ground loops, the RJ45 splitter cannot have the cable shields connected. The cable length from the RJ45 splitter to the G500 serial port should be kept short.

Figure 5: RS-485 splitter

RS-485 2-wire mode wiring approaches

The following diagrams illustrate how to wire the G500 units and RS485 2-wire:

Figure 6: RS-485 (2-wire) - Single Link

Figure 7: RS-485 (2-wire) - Single Loop

Figure 8: RS-485 (2-wire) - Single Loop with Redundancy

Figure 9: RS-485 (2-wire) - Redundant Link with Redundant CCU

Figure 10: RS-485 (2-wire) - Redundant Loop with Redundant CCU

High-voltage installations

To provide higher EMC immunity and maintain CE Mark radiated emission compliance, the serial cables used for permanent RS-232 and RS-485 connections must comply with the following requirements:

- Cables must be shielded.
- D-type connector covers must provide EMC shielding (e.g. metalized plastic or die cast metal covers).

Service of serial (UART) modules

⚠ CAUTION

The information described in this section is for service technicians only!

The built-in Serial (UART) modules are field replaceable. It is not allowed to increase or decrease number of Serial (UART) ports by this method.

1. Power down system gracefully.
2. Disconnect all hazardous live circuits and sources of electrical power.
3. Remove both power supplies.
4. Remove screws and push lid to the rear until markings on lid and chassis align.

5. Pull lid to outside until second marking aligns.

6. Lift lid to remove.

7. Remove attachment screws.

8. Pull UART package out of slots (be careful, do not to damage ESD gasket at the rear).

9. Exchange the UART module.

10. Check that the thermal connector pads on the PCB are still in place. If the thermal pads are damaged or missing, contact GE Vernova for replacements.

11. Insert the UART module into slots and attach the UART module by re-installing the screws from the power supply bay.

Be careful, do not damage the EMI gasket on the rear of the unit. Otherwise, since damage may result in reduced ESD protection.

12. Attach the lid a little to the rear and out of position (In the right position both lid and chassis markings align).

13. Push the lid inwards.

14. Push the lid to the front and attach all screws.

For screw torque specification, refer to General Torque Values for Screws on page 133.

Ethernet Ports

There are six SFP slots available for Ethernet Interfaces at the rear of the G500 unit. Into each slot an SFP module can be inserted.

For corresponding SFP modules and order codes, see G500 external accessories on page 107

Inserting an SFP module selects the appropriate transmitter protocol for the corresponding switch port.

G500 external accessories

The following SFP modules are supported by the G500:

Item	Description	Manufacturer	Mfg Part number
580-3784	SFP Module 100BASE-FX LC TRANSCEIVER OPTICAL	BROADCOM (FOXCONN, AVAGO)	HFBR-57E0APZ
		AXCEN	AXFE-1314-0523
580-3785	SFP Module 1000BASE-SX LC TRANSCEIVER OPTICAL	BROADCOM (FOXCONN, AVAGO)	AFBR-5710ALZ
		Coherent (FINISAR)	FTLF8519P3BTL
		AXCEN	AXGE-5854-0513
580-3786	SFP Module 100/1000BASE-T RJ45 TRANSCEIVER COPPER	Coherent (FINISAR)	FCLF8522P2BTL
		BROADCOM (FOXCONN, AVAGO)	ABCU-5730ARZ
		BROADCOM (FOXCONN, AVAGO)	ABCU-5731ARZ
580-3787	SFP Module 1000Base-LX LC TRANSCEIVER OPTICAL SINGLE-MODE 5km 1310nm -40 to 85C	BROADCOM (FOXCONN, AVAGO)	AFCT-5715ALZ
		Gigalight	GP-3124-L2TD

General cable requirements

The cables required to make physical connections to the G500 are as follows:

Media	Designation	Cable	Connector
Twisted Pair Ethernet	100/1000Base-T	STP (Shielded Twisted Pair) – CAT 5 or better	RJ45
Fiber optic	100BASE-FX	Fiber optic cable multimode	LC
Fiber optic	1000BASE-SX	Fiber optic cable multimode	LC

Internal Interfaces

The G500 has internal installation options for three M.2 SSD's, three PCIe Cards and a USB Dongle Slot.

Electric shock can cause injury and may be fatal.

The ALARM connector and the both power supply connectors have to be disconnected before housing is opened!

Opening cover

To change or add the cards open the chassis by performing following steps:

1. Undo the PCIe heat sink screws if tightened.

2. Remove the screws and push the cover to the rear until markings on the lid and chassis align.

3. Pull the cover outwards until the second markings on the lid and chassis align.

4. Lift the lid to remove.

Electric shock can cause injury and may be fatal.

The ALARM connector can be connected to voltages up to 300V and its contacts are accessible if chassis is open. The dangerous area is marked with the electric hazard symbol.

This Unit is to be serviced by trained personnel only.

Closing cover

1. Attach the lid a little to the rear and out of position (In the right Position both lid and chassis markings align).

2. Then push lid inwards.

3. Push the lid to the front and attach all screws.

For screw torque specification, refer to General Torque Values for Screws on page 133.

M.2 SSD

G500 comes with a 128GB or 256GB or 1TB M.2 SSD pre-installed.

G500 Units manufactured before 2025 were shipped with a default SSD user password u123@MCPGE applied in the UEFI.

G500 Units manufactured starting in 2025 have no default SSD password applied..

For additional information, please refer to “SWM0105 G500 Secure Deployment User Guide”.

For normal operation don't exceed 1 A per slot due to Thermal and power budget restrictions.

Installation of M.2 device

Open the cover by following the steps from Opening cover on page 108:

1. Loosen the M.2 heat sink screws, pull heat sink up until the keyholes allow removal of the heat sink.

2. Unscrew the M.2 module and remove the module.

3. Attach the piggyback gap pads on the top of the new module. Use an M2.5 screw to fasten the M.2 module in the empty G500 slot.

4. Align the heat sink keyholes with the screws and push the heat sink keyholes over the screws.

5. Partially fasten the lower screws and push the heat sink down until marking align before fastening all screws completely.

If no further changes are required, install the G500 cover following the steps from Closing cover on page 111.

PCIe Slots

By default the G500 comes without any PCIe extension cards installed. Additional PCIe cards can be configured, refer the Order code on page 17.

The G500 supports up to three PCIe cards.

Only PCIe cards supplied with the G500 or ordered from GE Vernova should be used.

Use of non-G500 PCIe cards can result in unexpected behavior and may cause permanent damage to the equipment.

For normal operation do not exceed 10W per slot OR 25W in one slot with the other slots empty, due to thermal and power budget restrictions.

SLOT 1 – GEN2 by 4

PCIe Slot 1 is the upper slot and can carry a $\frac{3}{4}$ length, full height PCIe Card. It is possible to insert cards with up to 16 lanes but only 4 lanes are supported with PCIe Generation 2 speed.

SLOT 2 – GEN2 by 2

PCIe Slot 2 is the middle slot and can carry a $\frac{3}{4}$ length, full height PCIe Card. It is possible to insert cards with up to 4 lanes but only 2 lanes are supported with PCIe Generation 2 speed.

SLOT 3 – GEN2 by 1

PCIe Slot 3 is the bottom slot and can carry a $\frac{3}{4}$ length, full height PCIe Card. It is possible to insert cards with up to 4 lanes but only 1 lane is supported with PCIe Generation 2 speed.

PCIe Installation

Extension cards can be added as follows:

1. Open the cover following the steps from Opening cover on page 108. Plug the PCIe card into the appropriate PCIe slot and fasten in place using the PCIe faceplate screws.

2. If no further changes are required, install the G500 cover following the steps from Closing cover on page 111.

3. After closing the G500 cover, tighten all heat contact screws that now correspond to occupied PCIe slots.

For screw torque specification, refer to General Torque Values for Screws on page 133.

USB 2 dongle slot

The G500 includes one USB 2.0 A dongle slot.

The dongle slot is fused. For normal operation don't exceed 0.5 A in this slot due to power budget restrictions. The dongle must be capable of operating at an ambient temperature of 85°C.

Installation of USB dongle

For the mounting position of a USB dongle (maximum dimensions: 53mmx22mmx13mm) see the figure below.

In order to withstand standard shock and vibration levels the dongle must be tie-wrapped to the pre-installed mounting structure as shown above.

G500 Substation Gateway

Chapter 5: Indicators

The G500 includes LED indicators for communication interfaces as well as additional indicators for different operational states.

Front Indicators

Ethernet

Orange and green LEDs located on the front of the unit in the Ethernet connector housing indicate the status of the Ethernet link:

STATUS	INDICATOR
No Link	Off
100 MBit no activity	Orange
100 MBit with activity	Orange blinking
1000 MBit no activity	Green
1000 MBit with activity	Green blinking

Ethernet Port (SFP) LEDs

There are six LEDs located on the front of the unit indicate the status of the corresponding rear SFP links:

STATUS	INDICATOR
No Link	Off
100 MBit no activity	Orange
100 MBit with activity	Orange blinking
1000 MBit no activity	Green
1000 MBit with activity	Green blinking

Serial Port LEDs

Up to 8 numbered LEDs located on the front of the unit indicate the status of the corresponding rear UART ports:

STATUS	INDICATOR
No traffic	Off
Transmitting	Green
Receiving	Red
Transmitting and receiving	Orange

IRIG-B input

STATUS	INDICATOR
A valid IRIG-B signal is present at input	Green
No IRIG-B signal is present at input	Off
A valid IRIG-B signal is present at input, but the flag indicating “out of synch” is set or the G500 is configured as B002 with valid signal present.	Orange
IRIG-B input invalid signal	Red

IRIG-B output

STATUS	INDICATOR
IRIG-B output is present and the internal clock is synch'ed from an external source	Green
No IRIG-B output is present (disabled)	Off
Time synchronization for selected input is lost and there is IRIG-B output present	Orange

CPU

STATUS	INDICATOR
All power rails OK, CPU running	Green
All power rails OK, CPU standby/off	Orange
One or more power rails has failed	Red

TEMP

STATUS	INDICATOR
No thermal alert	Off
Application controlled (temperature warning)	Orange
Critical temperature	Red

**SSD**

Green light indicates activity

**STATUS**

Status 1 - This Gateway

Status 2 - Peer Gateway (when redundant)

Status 1 and Status 2 LED Indicators

G500 Status	G500 System State	Status 1 LED "State of This Gateway"			Status 2 LED "State of Peer Gateway"		
		Color 1	Color 2	Blinking	Color 1	Color 2	Blinking
	None / powered off	OFF	OFF		OFF	OFF	
Not redundant	This is Active and Not Redundant	G			OFF	OFF	
This is Active	This is Active in redundant mode, peer is Standby and all else OK	G			O		
	This is Active in redundant mode, peer is Standby and DB/Code are not in synch	G			O	OFF	SLOW 2s / 2s
	This is Active and Config Synch is in Progress	G			O	G	NORMAL 1s / 1s
	This is Active and Database synch is not yet finalized (for hot-standby/hot-hot)	G			O	G	NORMAL 1s / 1s
	This is Active in redundant mode and Comm Failed with Standby	G			R	OFF	NORMAL 1s / 1s
This is Standby	This is Standby in redundant mode, peer is Active and all else OK	O			G		
	This is Standby in redundant mode, peer is Active and DB/Code are not in synch	O	OFF	SLOW 2s / 2s	G		
	This is Standby and Config Synch is in Progress	O	G	NORMAL 1s / 1s	G		
	This is Standby and Database synch is not yet finalized (for hot-standby/hot-hot)	O	G	NORMAL 1s / 1s	G		
Other modes	This is Failed	R			ANY		
	This has HW Suspended	R			ANY		
	This unit is in Service mode	R	O	SLOW 2s / 2s	ANY		
	This unit requires cold restart	G	R	FAST 0.5s / 0.5s	ANY		
Note	G - Green						
	R - Red						
	O - Orange						

Power

Green light indicates output 12Vd.c. is within acceptable range for proper operation of the power supply.

OLED Display

The G500 provides a monochrome/white OLED display. The OLED display will show the model number "G500" when any button is pressed for five minutes and then will turn off. The OLED display incorporates four buttons which are not supported in current G500 releases.

Rear indicators

If PCIe cards are installed which support indicator lights, the status lights are visible through the holes at the rear of the G500 unit.

G500 Substation Gateway

Chapter 6: Specifications

This chapter gives some useful information when using a G500 for the first time. It might be also useful to read this chapter carefully, when problems arise using the G500.

Product specifications

System

Processor	CPU Option A: 2-Core Variant AMD RE225FECH23JA CPU 2x x86 cores @ 3.0 GHz max turbo frequency, 2.2 GHz base 3x GPUs @ 533 MHz max, 464 MHz base 2 shared L2 cache, 2MB total CPU Option B: Multi-core AMD Embedded R-Series Bald Eagle APU 4-Core Variant AMD RE427BDGH44JA CPU 4x x86 cores @ 3.6 GHz max turbo frequency, 2.7 GHz base 8x GPUs @ 686 MHz max, 600 MHz base 4 shared L2 cache, 4MB total CPU Option C: Intel i3-7102E CPU 2 Cores 4 Threads 2 x86 cores @ 2.1 GHz frequency, no turbo Intel HD 630 GPU @ 950 MHz max, 350 MHz base 3 MB shared L3 cache, 2x 256KB L2 CPU Option D: Intel E3-1505Lv6 (Xeon) CPU 4 Cores 8 Threads 4 x86 cores @ 3.0 GHz max turbo frequency, 2.2 GHz base Intel HD P630 GPU @ 1.0 GHz max, 350 MHz base 8 MB shared L3 cache, 4x 256 KB L2
-----------	--

Memory	DDR3 ECC SDRAM [8GB (AMD Dual core) / 16GB (AMD Quad core)] soldered on board for improved reliability. DDR4-2400 ECC SDRAM [8GB (Intel i3 Dual core) / 16GB (Intel E3 Xeon Quad core)] soldered on board for improved reliability. NVRAM - 2Mbyte nvSRAM with 8bit parallel interface. (HW available but not enabled in G500)
Storage	Self-encrypted Solid State Drive (128GB / 256GB) expandable to 3.1TB available with CPU Option D and v5.2 minimum.
Real Time Clock	When powered off, the real-time clock remains active for 7 days On power down, last known real time is stored in non-volatile. When configured for PTP / IRIG-B - the real time clock provides no more than 0.4 second drift in 24 hours when not synchronized with an external source.
Operating system	Predix Edge OS
LED indicators	Power supply indicators, CPU Status indicator, Unit Temperature indicator, IRIG-B Input indicators, Ethernet port indicators, 8X Serial port indicators, Power Supplies Power on (Green)
Physical Presence	The physical presence button (recessed on front of the unit) and optionally configured password shall be required to enter UEFI mode. The timeout time for flashing the Physical Presence LED's is four hours, but the user can again press the button to disable it anytime.

Communications

Ethernet connections	6 Rear Ethernet ports, accessible via SFP modules: 100/1000BASE-TX (RJ45 copper medium, Cat-5 or better) 100BASE-FX 1300nm (LC fiber multimode) 1000BASE-SX 850nm (LC fiber multimode) 1000BASE-LX 1310nm (LC fiber single-mode)
Serial communications	8x serial interfaces accessible via individual RJ45 connectors on rear of the unit. Additional serial interfaces can be adding using PCIe expansion cards. Serial interfaces use 16550 compatible UART. Support baud rates 200, 300, 600, 1200, 2400, 4800, 9600, 19.2k, 38.4k, 57.6k, 115.2k. RS232 mode supports flow control and handshaking signals. Software controlled mode of operation between RS232 or RS485. Software controlled termination resistor (120 ohm) for RS485 mode. All software selection persist when power cycled. IRIG-B available on all serial interfaces. +12V output available on 2x serial interfaces Port 4 and Port 8. It is limited to 0.5A (6W) with short circuit protection and auto recovery.
D.20 Link HDLC communications	A dual channel card is available to communicate D.20 Link protocol to up 100 D20 Peripherals per channel. Each channel communicates at 250kbps. Channels are isolated from each other by 1000VAC and from other internal circuits. - RS-485 serial link, half duplex at 250 kbps, 24 AWG twisted pair, for applications up to 330 meters, and maximum 32 devices in total: - one single G500 counts as one device, - redundant G500 count as two devices, - each I/O Peripheral module counts as one device.
Time synchronization	Precision Time Protocol Can be configured for IEEE 1588 PTP, IRIG-B or NTP IRIG-B Input Connector Available as 3 positions removable Phoenix terminal block on rear of the unit IRIG-B Output Connector Can be configured and enabled only when the IRIG-B Input is enabled.

Video Output	DisplayPort (DP) 2x DP++ (Dual-mode DisplayPort) with Multi-Stream Transport (MST), available on the rear of the chassis. Each DP++ supports up to two multi-stream Dell P2415Q monitor or similar displays, for up to 4 in total with AMD CPU Options and up to 3 in total with Intel CPU Options (MST is available only in Windows OS). Linux OS units allow for only one display to be connected to each DP++ port, and do not support MST. Resolution: Up to UHD (4k, 3840x2160) for single displays connected to each port. Up to QHD (2560x1440) for 2x multi-stream connected displays. Up to FHD (1920x1080) for more than 2x multi-stream connected displays. G500 doesn't support Touch Screen Panel controls.
Audio Output	3.5 mm audio jack for substation alarms Built in high (+90dB) pitch audio buzzer
USB Ports	2x USB 3.0 Type A (male) on front of the unit 4x USB 2.0 Type A (male) on rear of the unit 1x USB 2.0 Type A internal - for software license keys
SD Card	SD, SDHC and SDXC SD-Cards according to Version 1.0, Version 2.0 and Version 3.0 (Windows only). Maximum SDXC size 64GB. SD card slot accessible on front of the unit, uses push-pull mechanism.
Maintenance Ports	Console port 1x USB 2.0 Type B port on front of chassis connected to internal USB to Serial bridge, allows access to Console for debug. Local Ethernet 100/1000BASE-T maintenance Ethernet port accessible via front of the unit, separate from 6 Ethernet ports on the back.

Electrical

Power Supply	Dual/ Redundant hot-swappable power supplies each with individual removable Phoenix 1942293 terminal block Low Voltage power supply: 20-54VDC Nominal $\pm 10\%$, 10.2A Max High Voltage power supply: 100-300VDC Nominal $+10\%/-12\%$, 1.8A Max 100-240VAC Nominal $\pm 10\%$, 2.1A Max NOTE: To meet 61850-3 compliance, LV power supply must be supplied by 48V nominal to meet 50ms hold up time.
---------------------	---

Environmental specifications

Temperature and Humidity

Relative Humidity for operation is up to 95%, non condensing. Ambient temperature values for the product:

Operation Condition	
Storage	-40°C to 85°C
Operation 2 core	-40°C to 70°C
Operation 4 core	-40°C to 60°C
Operation with PCIe Cards installed *	-40°C to 60°C

* If PCIe Cards are installed the operating temperature of the system is reduced to 60°C. If non-compliant PCIe Cards are used the user has to take care of proper operation of the plug-in card and the operating temperature of the System may be decreased.

These tests were conducted with all interfaces loaded at typical load conditions.

Altitude

Maximum operating altitude is 2000m.

Above this altitude the isolation requirements must be de-rated by dividing by factor in EN/ IEC 60255-27 Table C11.

Table 1: Voltage de-rating due to altitude

Altitude	Insulation Voltage De-rating Multiplier
2000m	1
3000m	0.87
4000m	0.77
5000m	0.67

Table 2: Thermal de-rating due to altitude

Altitude	Temperature de-rating
2500m	5°C
3000m	10°C
4500m	15°C

Ingress Protection (IEC 60529)

IP30 (protected from tools and wires greater than 2.5 millimeters).

Liquid Protection

The G500 is designed to protect the internal electronics from small amounts of liquid falling vertically or which may accumulate on the top surface of the chassis.

Mechanical Specifications

Weight

Part	Weight in kg
G500, 0 serial ports, without PSU	9.1
G500, 4 serial ports	9.3
G500, 8 serial ports	9.5
Mounting bracket	1.6
HV PSU	1.0
LV PSU	0.9

Part	Weight in kg
4 port Serial PCIe Card	0.27
D.20 Link HDLC PCIe Card	0.18

Dimensions

All dimensions in mm [inch]

General Torque Values for Screws

Use Phillips PH1 screw driver for screws of the G500. Unless otherwise specified, use the following torque values when tightening screws:

Screw Size	Torque in Nm	Torque in lbf in
M2.5	0.6	5.3
M3	0.6	5.3
M4	1	8.8
M5	1.5	13.3

NOTE

Screws with Torx head are not for service and shall not be unscrewed.

Storage recommendations

Storage conditions

Always store the G500 in an environment compatible with operating conditions. Recommended environmental conditions for storage are:

- Temperature: -40°C to $+85^{\circ}\text{C}$
- Relative humidity: 5% to 95%, non-condensing

Exposure to excessive temperature or other extreme environmental conditions might cause damage and/or unreliable operation.

To avoid deterioration and early failure of electrolytic capacitors, power up units that are stored in a de-energized state once every 12 months, for one hour continuously.

G500 Substation Gateway

Chapter 7: Removing the G500 from Service

When the G500 is to be removed from service, it is necessary to:

- Remove the configuration data and sensitive information from:
 - The G500
 - The PC used to remotely configure the G500
- Dispose of the equipment.

Remove configuration data and sensitive information from the G500

In the event that it is necessary to remove the configuration data and sensitive information from the G500 (for example, the G500 is being disposed of or being returned for maintenance [i.e., RMA]), this chapter provides the data removal procedure.

G500 Units manufactured before 2025 were shipped with a default SSD user password u123@MCPGE applied in the UEFI.

G500 Units manufactured starting in 2025 have no default SSD password applied.

For additional information, please refer to “SWM0105 G500 Secure Deployment User Guide”.

To remove configuration data and sensitive information from the G500:

1. **For an RMA:** Remove the Solid State Drive (SSD) from the G500 using the reverse of the SSD installation procedure found earlier in this manual; send the G500 unit to GE Vernova and safekeep the drive. If the drive is faulty, GE Vernova recommends destroying the old drive as per NIST* recommendations.
2. **For hardware decommissioning and disposal:** Remove the G500 Solid State Drive. GE Vernova recommends that you destroy the drive as per NIST* recommendations.

* Publication 800-88 Revision 1. Guidelines for Media Sanitization, Recommendations of the National Institute of Standards and Technology:

<https://nvlpubs.nist.gov/nistpubs/SpecialPublications/NIST.SP.800-88r1.pdf>

Removing configuration data on a PC

When a PC application is used to configure the G500, configuration data resides on the data storage media (e.g., hard drives, memory cards, etc.) of the PC running the configuration application.

The G500 configuration data can be removed from the PC by either:

- Recommended: Physically removing and destroying the data storage media, or
- Using a program to securely wipe (that is, completely erase) the data storage media (that is, not just reformat or remove the names of the files from the file allocation table).

G500 Substation Gateway

Appendix A: Standards & Compliance

Compliance Standards

The G500 complies with the tests listed below. The test methods covered, provide compliance to IEC61850-3 Location H or G when equipped with a Low voltage power supply (48Vdc) or High voltage power supply (full nominal range). The G500 is also fully compliant to IEEE1613: Class 1.

TEST	REFERENCE STANDARD	TEST LEVEL
Gradual shutdown/start-up (for d.c. power supply)	EN60255-27 SS 4.8/TP.7.2.13	Criteria B, Shutdown at 69Vd.c., startup 78Vd.c.
Insulation Resistance Test	EN 60255-27	500 Vdc
Dielectric voltage withstand	EN 60255-27	2.0 kV

cUL

CERTIFICATE OF COMPLIANCE

Certificate Number
Report Reference
Issue Date

20190130-E355166
E355166-A2-UL
2019-January-30

Issued to:

GE MULTILIN
650 MARKLAND ST
MARKHAM
ON L6C 0M1 CANADA

This certificate confirms that
representative samples of

COMPONENT - INFORMATION TECHNOLOGY
EQUIPMENT INCLUDING ELECTRICAL BUSINESS
EQUIPMENT
Industrial PC
G500, M500, P500, X500, C500, H500 and A500

Have been investigated by UL in accordance with the
component requirements in the Standard(s) indicated on
this Certificate. UL Recognized components are incomplete
in certain constructional features or restricted in
performance capabilities and are intended for installation in
complete equipment submitted for investigation to UL LLC.

Standard(s) for Safety:

UL 60950-1 and CAN/CSA C22.2 No. 60950-1-07-
Information Technology Equipment - Safety - Part 1:
General Requirements

Additional Information:

See the UL Online Certifications Directory at
<https://iq.ulprospector.com> for additional information.

This Certificate of Compliance does not provide authorization to apply the UL Recognized Component Mark.
Only those products bearing the UL Recognized Component Mark should be considered as being UL Certified
and covered under UL's Follow-Up Services.
Look for the UL Recognized Component Mark on the product.

IEC 60870-5-101 Edition 2 - Balanced Controlled station (Slave)

ATTESTATION OF CONFORMITY

No. 10250861-INC 20-2735

Issued to:

GE Multilin
650 Markland Street
Markham ON, L6C 0M1
Ontario, CANADA

for the product:

G500
Advanced Substation Gateway
Type: IEC 101 Balanced Controlled station
System software version 210 revision 000
Application iec101+104dpa version 100 revision 009
Interface Type: Serial Cable

With the implemented communication protocol:

IEC 60870-5-101 Edition 2 (IS 2003)

Companion Standard for basic telecontrol tasks in standard direction and the GE Multilin IEC 60870-5-101-104 Server (DPA) for the Multifunction Controller Platform for IEC 60870-5-101 V1.00, Revision 2.

The product has not been shown to be non-conforming to the specified protocol standard, including the interface requirements.

End-to-End data element tests for the information and control points as described in manufacturer Protocol Implementation Conformance Statement (PICS) have been performed on the product's protocol implementation. Functional tests in controlled mode are performed for the following compatible Basic Application Functions:

- | | |
|---|--|
| <ul style="list-style-type: none"> • Station initialization • Cyclic data transmission • Data acquisition through read • Acquisition of events • General Interrogation | <ul style="list-style-type: none"> • Clock Synchronization • Command transmission • Transmission of Integrated Totals • Parameter Loading • Test procedure • Delay acquisition procedure |
|---|--|

The test campaign did not reveal any errors in the product's protocol implementation.

This attestation is granted on account of tests made at location of DNV GL in Arnhem, the Netherlands and performed with DNV GL UniGrid Telecontrol Simulator version 2.3.0 and UniGrid Telecontrol 101 Analyser version 1.0.3. The results, including remarks and limitations, are laid down in DNV GL Report no. 10250861-INC 20-2734.

The test has been carried out on one single specimen of the product as referred above and submitted to DNV GL by GE Multilin. The manufacturer's production process has not been assessed. This attestation does not imply that DNV GL has verified any product other than the specimen tested.

Issued to:

GE Multilin
650 Markland Street
Markham ON, L6C 0M1
Ontario, CANADA

for the product:

G500
Advanced Substation Gateway
Type: IEC 104 Controlled station
System software version 210 revision 000
Application iec101+104dpa version 100 revision 009
Interface Type: Ethernet

With the implemented communication protocol:

IEC 60870-5-104 ed.2 (IS 2006)

Network Access for IEC 60870-5-104 using standard transport profiles in Standard direction and the GE Multilin IEC 60870-5-101-104 Server (DPA) for the Multifunction Controller Platform for IEC 60870-5-104 V1.00, Revision 2.

The product has not been shown to be non-conforming to the specified protocol standard, including the interface requirements.

End-to-End data element tests for the information and control points as described in manufacturer Protocol Implementation Conformance Statement (PICS) have been performed on the product's protocol implementation. Functional tests in controlled mode are performed for the following levels:

- | | |
|---|---|
| <ul style="list-style-type: none"> • Station initialization • Redundancy • Cyclic data transmission • Data acquisition through read • Acquisition of events • General interrogation | <ul style="list-style-type: none"> • Clock synchronization • Command transmission • Transmission of Integrated Totals • Parameter Loading • Test procedure |
|---|---|

The test campaign did not reveal any errors in the product's protocol implementation.

This Attestation is granted on account of tests made at location of DNV GL in Arnhem, the Netherlands and performed with DNV GL UniGrid Telecontrol Simulator version 2.3.0 running CS104 Test Suite version 1.41 and UniGrid Telecontrol 104 Analyser version 3.2.0. The results, including remarks and limitations, are laid down in DNV GL report no. 10250861- INC 20-2744.

The tests have been carried out on one single specimen of the product, submitted by GE Multilin. The Attestation does not include an assessment of the manufacturer's production process. Conformity of his production with the specimen tested by DNV GL is not the responsibility of DNV GL.

Arnhem, October 5, 2020

G500 Substation Gateway

Appendix C: Warranty

Warranty

For products shipped as of October 1st, 2013, G500 warrants most of its GE Vernova manufactured products for 10 years. For warranty details including any limitations and disclaimers, see the GE Vernova Grid Solutions Terms and Conditions at

<https://www.gevernova.com/grid-solutions/multilin/warranty.htm>

G500 Substation Gateway

Appendix D: List of Acronyms

Acronym Definitions

This Appendix lists and defines the acronyms used in this manual.

Acronym	Definition
AC	Alternating Current
AWG	American Wire Gauge, standardized logarithmic wire gauge
CE	Conformite Europeene (European conformity)
CMOS	Complementary Metal-Oxide Semiconductor
COMe	Computer On Module express
CPU	Central Processing Unit
DC	Direct Current
DoC	Declaration of Conformity
DP	Display Port
EC	ACPI Embedded Controller
ECC	Error Correction Checking
ECCN	Export Control Classification Number
EMI	Electro-Magnetic Interference
ESD	Electro-Static Discharge
ft.	foot
FCC	Federal Communication Commission (USA)
GE	General Electric
GND	Ground, Electrical Grounding
GPIO	General Purpose I/O
GPU	Graphics Processing Unit
HSR	High Availability Seamless Redundancy
HV	High Voltage

Acronym	Definition
IRIG	Inter Range Instrumentation Group
IRIG-B	IRIG time code B (bit rate of 100 pulses-per-second with a bit time of 10 milliseconds over 1 second time frame)
I2C	two wire communication bus
I/O	Input / Output
IMR	Installation and Maintenance Requirements
IR	Interrupt Request
LAN	Local Area Network
LC	Little Connector
LED	Light Emitting Diode
LV	Low Voltage
m	meter
ms	Milliseconds
MCP	Multifunction Control Platform
MFG	Manufacturer
MLC	Multi-level cell
MMF	Multi-Mode Fiber
MST	Multi-Stream Transport
MUX	Multiplexer
M.2	a standardized module format for plug in cards, storage or interface
NVSRAM	Non-Volatile Static Random-Access Memory
OEM	Original Equipment Manufacturer
OLED	Organic Light Emitting Diode
P-state	Performance states of CPU
PCI	Peripheral Component Interconnect
PCIe	Peripheral Component Interconnect Express
POST	Power-On Self-Test
PSU	Power Supply Unit
PTP	Precision Time Protocol
PRP	Parallel Redundancy Protocol
RAM	Random Access Memory
ROM	Read Only Memory
RMA	Return Material Authorization
RoHS	Restriction of hazardous substances directive
RTC	Real-Time Clock
SATA	Serial Advanced Technology Attachment, a storage interface
SD	Secure Digital, a storage device format
SFP	Small Form Factor, a standardized plug in module for network interfaces
S/N	Serial Number
SPI	Serial Peripheral Interface
SSD	Solid State Disk
STD	Standard
UART	Universal Asynchronous Receiver Transmitter

Acronym	Definition
UEFI	Universal Extensible Firmware Interface
USB	Universal Serial Bus, a peripheral bus
VA	Volt Ampere, Power
VGA	Video Graphics Array
8P8C	Connector with eight Positions eight contacts, also known as RJ-45

G500 Substation Gateway

Revision History

Revision History

Version	Revision	Date	Change Description
1.00	0	March 25, 2019	Document created.
	1	April 02, 2019	Order Code and Redundancy wiring drawings are updated.
	2	June 11, 2019	Updated the Baud rate setting in the USB Slave section.
	3	July 17, 2019	Updated the Super Capacitor section and Wires section.
1.10	0	Feb 14, 2020	Updated document for Version 1.10.
2.00	0	May 29, 2020	Updated document for Version 2.00.
	1	June 04, 2020	Updated the Cable Assembly part number for Redundancy Wirings.
2.10	0	Dec 09, 2020	Updated the Redundancy Wiring drawings and DisplayPort™ section and Copyrights information. Updated document for Version 2.10.
	1	June 07, 2021	Updated SFP Modules information.
2.50	0	Oct 01, 2021	Updated GE logo. Updated Order Code and MCP Spares tables in Chapter 1. Updated the Peripheral compatibility with "Date of Release" column. Updated D20C compatibility Table 6. Updated the IM with RS485 Modem Control Signal Clarification. Updated D.20 Repeater/Splitter Compatibility Table 7. Added Hot-Hot Redundancy content in Chapter 3. Modified figures in Chapter 3: - Redundancy Wiring - Single RS232 Switch Panel - Redundancy Wiring - Dual RS232 Switch Panel (1 of 2) - Redundancy Wiring - Redundant RS232 Switch Panel (2 of 2) Added Status 1 and Status 2 LED Indicators table in Chapter 5.

Version	Revision	Date	Change Description
2.60	0	Dec 03, 2021	Updated Order Code table.
	1	Jan 28, 2022	Updated Redundancy wiring section in Chapter 3: - Redundancy Wiring - Single RS232 Switch Pane - Redundancy Wiring - Dual RS232 Switch Panel (1 of 2) - Redundancy Wiring - Redundant RS232 Switch Panel (1 of 2) - Redundancy Wiring - Redundant RS232 Switch Panel (2 of 2) Added a note stating G500 A and B watchdog cables are not interchangeable.
2.70	0	Feb 16, 2022	Updated Order Code and MCP Spares tables in Chapter 1. Added Software Licenses table in Chapter 1. Updated D20 port supply load from 3.5A to 2.5A in Chapter 3. Updated text "IRIG-B input watchdog signal" to "IRIG-B input invalid signal" in Chapter 5.
2.80	0	June 21, 2022	Updated Order Code table in Chapter 1. Updated Software Licenses table and MCP Spares table in Chapter 1. Updated GE Item # (517-0169) in Table 6 - Chapter 3. Mean Time Between Failure (MTBF) specifications tables are moved to a standalone document.
3.00	0	April 17, 2023	In Chapter 1 : - Updated Order Code - Added MCP Redundancy Kit (K) Switch Panel (SW PNL) table for firmware v2.80 and lower - Added MCP Redundancy Kit (N) Switch Panel (SW PNL) table for firmware v3.00 and higher In Chapter 3 : - Clarified redundancy operation - Added Redundancy wiring for v3.00 In Chapter 6 : - Updated Real Time Clock in the Product Specification section Removed Chapter 8: Restore the G500 to factory default. Note: Restore the G500 to factory default topic is described in the document TN0116 MCP Firmware Upgrade and Restore to Defaults Workflows
	1	July 18, 2023	In Chapter 3 : Updated Power-On Self-Test (POST) section
3.10	0	Aug 23, 2023	Updated Order Code.

REVISION HISTORY

Version	Revision	Date	Change Description
4.00	0	April 03, 2024	GE Vernova Logo is added on the first page. In Chapter 1: - Updated Order Code - Added sections Changes to G500 Model Number, As-Built model number digits and As-is model number - Added a table to show software digits for D2x Function - Removed D2x Legacy references from Software Licenses and MCP Spares and Accessories tables In Chapter 3: - In the Supplying power through the D.20 Link section, added 4-pin mating connector P/N for D.20 HDLC connectors - Updated connection of D.20 link for G500 B in sections - Single D.20 link with redundant G500 and Single D.20 link, redundant LAN with redundant G500 - In the G500 system redundancy section, Note is added describing the redundancy mode available for V4.0 - Added a section G500 running as D2x system redundancy In Chapter 4: - In the Alarm section, added clarification for Status 1 LED and Alarm Relay In Chapter 6: - In Communications table, updated the baud rates for Serial Communications
4.10	0	Aug 02, 2024	Updated Company name, Copyright Notice and Trademark Notice. In Chapter 1: - Updated Order Code - Remote Desktop HMI functionality and license are no longer available In Chapter 3: - Added section to specify D.20 Link Capabilities and Restrictions In Chapter 6: - In Communications table, updated the Ethernet connections and D.20 Link HDLC Communications

Version	Revision	Date	Change Description
5.00	0	Nov 11, 2024	In Chapter 1: - Updated Order Code - Update Hardware overview section to show AMD and Intel CPU modules In Chapter 3: - Updated Power-On Self-Test (POST) section - Updated connections of D.20 link for G500 (A & B) for the following: - Single D.20 link with redundant G500 layout and - Single D.20 link, redundant LAN with redundant G500 layout - Updated Table 12 and Table 13 - Removed Redundant D.20 link, redundant LAN with redundant G500 section and Table 14 In Chapter 4: - Updated sections - DisplayPort™ - M.2 SSD - OLED Display In Chapter 6: - In System table, updated the Processor, Memory and Operating system - In Communications table, updated the Video Output
5.10	0	Dec 17, 2024	In Chapter 1: - Updated Order Code In Chapter 3: - Added sections - Single Ring and Fiber Optic (FO) D.20 link with redundant G500 and Single Ring and Fiber Optic (FO) D.20 link, redundant LAN with redundant G500

REVISION HISTORY

Version	Revision	Date	Change Description
5.20	0	May 08, 2025	In Product Support, - Updated GE Vernova email addresses and phone numbers in Contact Technical Support section In Chapter 1, - Updated Order Code - Updated MCP Spares and Accessories table In Chapter 3, - In Connection Scenarios section, updated all D.20 layouts In Chapter 4, - In M.2 SSD section, added 1TB to the G500 supported storage capacity - Removed G500 SSD default password In Chapter 6, - In System table, updated the Storage with CPU Option D and clarified the minimum version In Chapter 7, - Removed G500 SSD default password
	1	June 24, 2025	In Chapter 3, - Added clarification for each D.20 layout with maximum supported peripherals - Added new layouts - Dual D.20 terminated, Ch 1 only - Dual D.20 terminated, with redundant G500
	2	Sep 16, 2025	In Chapter 4, - In G500 external accessories section, updated SFP modules supported by the G500 - In General cable requirements section, clarified the Twisted Pair Ethernet cable
5.40	0	Jan 28, 2026	In Chapter 1, - Updated Order Code - Clarified for MCP Shell Utility in As-is model number section In Chapter 3, - Updated RS-485 cable p/n in D.20 Link feature section - Updated p/n for SFP modules supported by the G500 in G500 external accessories section In Chapter 4, - Clarified MST monitor settings in DisplayPort™ section

Multilin™ G100

Substation Gateway

About this Document

Purpose

This manual provides information about installing, setting up, using and maintaining your G100 Substation Gateway. This manual does not provide any procedures for configuring the G100 software.

Intended Audience

This manual is intended for use by field technicians and maintenance personnel who are responsible for the installation, wiring and maintenance of SCADA equipment. This guide assumes that the user is experienced in:

- Electrical utility applications
- Electrical wiring and safety procedures
- Related other manufacturers' products, such as protective relays and communications equipment

Additional documentation

For further information about the G100, refer to the following documents.

- G100 Quick Start Guide (SWM0116)
- MCP Software Configuration Guide (SWM0101)
- Configuring UEFI Settings on G100 User Guide (SWM0122)
- Module layouts, as available
- MCP HMI Online Help
- DS Agile MCP Studio Online Help

How to use this document

This document describes how to install the G100.

Procedures are provided for all component options available for the G100. The components included in your G100 depend on what was ordered for your substation application. Follow only the procedures that apply to your G100 model.

To check what options are included in your G100, see [Order Code](#).

Safety words and definitions

Before attempting to install or use the device, review all safety indicators in this document to help prevent injury, equipment damage or downtime.

The following safety and equipment symbols are used in this document:

Indicates a hazardous situation which, if not avoided, will result in death or serious injury.

Indicates a hazardous situation which, if not avoided, could result in death or serious injury.

Indicates a hazardous situation which, if not avoided, could result in minor or moderate injury.

Indicates practices that are not related to personal injury.

Important information about the product, product handling which must be given attention.

Product Support

If you need help with any aspect of your G100 product, you can:

- Access the G100 Web site
- Search the GE Vernova Technical Support library
- Contact Technical Support

Also covered are:

- The GE Vernova Grid Solutions address
- Instructions on returning a G100

Access the GE Vernova Grid Solutions web site

The G100 Web site provides fast access to technical information, such as manuals, release notes and knowledge base topics.

Visit us on the Web at:

<https://www.gevernova.com/grid-solutions/>

Search GE Vernova Grid Solutions Technical Support Library

This site serves as a document repository for post-sales requests. To get access to the Technical Support Web site visit us on the Web at:

<https://www.gevernova.com/grid-solutions/events/signup.asp?sid=208>

Contact Technical Support

GE Vernova Grid Solutions Technical Support is open 24 hours a day, seven days a week for you to talk directly to a GE Vernova representative.

Region	E-mail	Telephone

Have the following information ready to give to Technical Support:

- Ship to address (the address that the product is to be returned to)
- Bill to address (the address that the invoice is to be sent to)
- Contact name
- Contact phone number
- Contact fax number
- Contact e-mail address
- Product number / serial number
- Description of problem

Technical Support will provide you with a case number for your reference.

GE Vernova Grid Solutions address

The GE Vernova Grid Solutions company address is:

GE Vernova Grid Solutions
650 Markland Street
Markham, Ontario
Canada L6C 0M1

Product returns

A Return Merchandise Authorization (RMA) number must accompany all equipment being returned for repair, servicing, or for any other reason. Before you return a product, please contact GE Vernova Grid Solutions to obtain an RMA number and instructions for return shipments.

You are sent the RMA number and RMA documents via fax or e-mail. Once you receive the RMA documents, attach them to the outside of the shipping package and ship to GE.

Product returns are not accepted unless accompanied by the Return Merchandise Authorization number.

Chapter 1 - Introduction to G100

Before you begin installing and using the G100, review the information in this chapter, including the following topics:

- [Safety precautions](#)
- [Warning symbols](#)
- [Informational symbols](#)
- [Hardware overview](#)
- [Order Code](#)
- [MCP Spares and Accessories](#)
- [G100 Redundancy Kit \(N\) - Single RS232 SWITCH PANEL \(SW PNL\) for firmware v3.00 and higher](#)

Read and thoroughly understand this guide before installing and operating the unit. Save these instructions for later use and reference.

Failure to observe the instructions in this manual may result in serious injury or death.

Disclaimer

It is the responsibility of the user to verify and validate the suitability of all GE Vernova Grid Automation products. This equipment must be used within its design limits. The proper application including the configuration and setting of this product to suit the power system assets is the responsibility of the user, who is also required to ensure that all local or regional safety guidelines are adhered to. Incorrect application of this product could risk damage to property/the environment, personal injuries or fatalities and shall be the sole responsibility of the person/entity applying and qualifying the product for use.

The content of this document has been developed to provide guidance to properly install, configure and maintain this product for its intended applications. This guidance is not intended to cover every possible contingency that may arise during commissioning, operation, service, or maintenance activities. Should you encounter any circumstances not clearly addressed in this document, please contact your local GE Vernova service site. The information contained in this document is subject to change without notice.

IT IS THE SOLE RESPONSIBILITY OF THE USER TO SECURE THEIR NETWORK AND ASSOCIATED DEVICES AGAINST CYBER SECURITY INTRUSIONS OR ATTACKS. GE VERNOVA GRID AUTOMATION AND ITS AFFILIATES ARE NOT LIABLE FOR ANY DAMAGES AND/OR LOSSES ARISING FROM OR RELATED TO SUCH SECURITY INTRUSION OR ATTACKS.

Safety precautions

Follow all safety precautions and instructions in this manual.

Only qualified personnel should install and work on the G100. Maintenance personnel should be familiar with the technology and the hazards associated with electrical equipment.

- *Never work alone.*
- **Class 1 Equipment.** This equipment must be earthed. The power plug must be connected to a properly wired earth ground socket outlet. An improperly wired socket outlet could place hazardous voltages on accessible metal parts.
- This product contains components rated as Class 1 Laser Products.
- A ground wire (18AWG) is required to be connected from the G100 chassis to protective earth.
- This product is intended to be supplied by a UL listed DC power supply or DC power source which is rated for 12/24/48Vdc, 5/2.5/1.25A minimum, Tma = 70 degree C, and the altitude of operation = 5000m.
- The device can only be used in a fixed location. Ensure that the protective earth connection is verified by qualified personnel.
- Before performing visual inspections, tests, or maintenance on this equipment, isolate or disconnect all hazardous live circuits and sources of electric power. Assume that all circuits are live until they have been completely de-energized, tested, and tagged. Pay particular attention to the design of the power system. Consider all sources of power, including the possibility of back feed.
- Turn off all power supplying the equipment in which the G100 is to be installed before installing and wiring the G100.
- Operate only from the power source specified on the installed power supply module.
- Beware of potential hazards and wear appropriate personal protective equipment, safety shoes, eye protection and gloves.
- The successful operation of this equipment depends upon proper handling, installation, and operation. Neglecting fundamental installation requirements may lead to personal injury as well as damage to electrical equipment or other property.
- All electronic components within the G100 are susceptible to damage from electrostatic discharge. To prevent damage when handling this product use approved static control procedures.
- Hazardous voltages can cause shock, burns or death. To prevent exposure to hazardous voltages, disconnect and lock out all power sources before servicing and removing components.
- If the G100 is used in a manner not specified in this manual, the protection provided by the equipment may be impaired.
- Changes or modifications made to the unit not authorized by GE Vernova could void the warranty.

Warning symbols

Table 1 explains the meaning of warning symbols that may appear on the G100 or in this manual.

Table 1: Warning symbols that may appear on the G100 and in this manual

Symbol	Description
	The relevant circuit is direct current.
	The relevant circuit is alternating current.
	Caution: Refer to the documentation for important operation and maintenance instructions. Failure to take or avoid specified actions could result in loss of data or physical damage.
	Warning: Dangerous voltage constituting risk of electric shock is present within the unit. Failure to take or avoid specified actions could result in physical harm to the user.
	Protective Ground Terminal
	Caution: Hot Surface

Informational symbols

Table 1 explains the meaning of informational symbols that may appear on the G100 or in this manual.

Table 2: Informational symbols that appear on the G100 and in this manual

Symbol	Description
	Power On
	CPU Status
	Ethernet Port
	Serial Port
	IRIG-B Time In

Symbol	Description
	Display Port
	Analog DC Input (AI)
	Binary Input (DI)
	Binary Output (DO)

Hardware overview

MCP is the Multifunction Controller Platform family of Substation Gateways by GE Vernova Grid Solutions.

G100 is the smaller member of the family, together with G500.

G100 is based on Intel® Apollo Lake SOC, with Intel Atom X5-E3930 1.3GHz Processor to provide quality performance with low power consumption and wide operating temperature. It has 8 Gigabytes of SoDIMM 204 pin DDR3L memory.

The G100 is distinguished by the noticeable lack of a hard drive and fan, employing instead the rugged and reliable Solid State Drive (SSD) mass storage and engineered heat sink.

The G100 supports various communication media types through a choice of input/output (I/O):

- Serial: 4 factory installed ports, RS-232 and RS-485 configurable, accessible via individual RJ45 connectors.
- Ethernet: 2 factory installed RJ45 Ethernet interfaces with to 2 additional SFP cages..
- D.20 Link HDLC ports: A dual channel PCIe card for communication with up to 60 – D.20 Peripherals channel, including redundant D.20 link configuration.
- IRIG-B TTL input
- Local General Purpose IO (GPIO) interface, providing:
- 8 Binary Inputs (DI), wetted internally from main unit power supply circuit using single common (positive voltage through external contacts). The binary inputs are individually isolated internally.
- 4 Binary Outputs (DO), isolated, as N.O. (Normal Open) single contact
- 4 DC Analog Input (AI) channels, +5V DC/ 20mA

The G100 device has 3 noticeable side panels for operation.

The names of each side panel as referenced in this document assume a **G100** being positioned vertically.

NOTE

Top Panel

The top panel of the G100 provides access to:

1. 1x DP display port
2. 2x TP Ethernet ports with LED indications (labelled 1, 2)
3. 2x SFP Ethernet ports (labelled 3, 4)
4. 2x USB2 ports
5. 1x USB3 port
6. 1x USB-C port (future, currently not used)
7. 4x Analog Input (AI) connections (12 pin connector)
8. 4x Binary Output (DO) connections (8 pin connector)
9. D.20 HDLC connections, with LED indications (optional, in PCIe slot)

Figure 1: G100 Top Panel

Bottom Panel

The bottom panel of the G100 provides access to:

10. 4x Serial ports (RS232/485, RJ45, labelled 1-4)
11. 8x Binary Input (DI) connections (16 pin connector)
12. Time synchronization input with IRIG-B TTL input (2 pin connector)
13. Power Supply connection (2 pin connector)
14. Protective Earth (PE) Ground connection (screw)

Figure 2: G100 Bottom Panel

Front Panel

The front panel of the G100 provides the following LED indications:

15. 8x LED for Binary Input (DI)
16. 4x LED for Binary Output (DO)
17. LED for Analog Input (AI) sampling indication
18. SFP Ethernet (3, 4) link status LED
19. 4x Serial ports status LED
20. IRIG-B Input status LED
21. Power On LED
22. CPU/HW status LED, is ON when the unit operates normally

Figure 3: G100 Front Panel

Ordering guides

The latest ordering guides are available on the GE Vernova Grid Solutions website:

<https://www.gevernova.com/grid-solutions/multilin/catalog/g100.htm>

You can select the required options from the available Product Option items. The Order Code automatically updates as each option is selected.

The following ordering guides are available:

- [Order Code](#)
- [MCP Spares and Accessories](#)
- [G100 Redundancy Kit \(N\) - Single RS232 SWITCH PANEL \(SW PNL\) for firmware v3.00 and higher](#)

The Ordering Guide information provided in this manual does not reflect the full complexity of the ordering options provided on the GE Vernova Grid Solutions Online Store; the Online Store provides the full set of G100 options and their sub-option inter-dependencies while this manual shows all sub-options, regardless of the parent option chosen.

Changes to G100 Order Code

Up to and including V3.10 the G100 Order Code is in the form of:

G100-AAL-DA-4TTUU-DUU-C1070-UU

Starting with V4.00 – the G100 Order Code is in the form of (replaced and added digits at the end):

G100-AAL-DA-4TTUU-DUU-D0070-**S-UUUUUUU**

(the bold underline digits are added to support D2x **in a future G100 release**).

Order G100 as MCP Function

S indicates MCP functionality and in this case the D2x part is "UUUUUUUU".

The new resulting G100 as MCP model number is extended with "S-UUUUUUUU" at the end, without other changes, ensuring backwards compatibility.

For e.g.:

G100-AAL-DA-4TTUU-DUU-D0070-**S-UUUUUUU**

To know the Order Code of your G100, run ***mcp*** command through the Shell access utility (see Quick Start Guide and Software Manual for more details).

As-Built model number digits

The "As-Built" model number remains always the one set from factory. This shows the initial factory built deployed modules and functions of a given MCP device.

As-Is model number

The "As-Is" model number always shows the current deployed modules and functions of a given MCP device. These can be changed from the "As-Built" stage.

An embedded MCP application runs every time when the MCP and D2x applications start and updates the "As-Is" MCP Model number to reflect what is installed and configured in the device – regardless of the functional personality.

The generation of **HW digits** is according to the G100 Order Code sheet.

G100-AAL-DA-4TTUU-DUU-D0000-S-UUUUUUU

The **Function Type (S, C, D)** is read from the set Function.

G100-AAL-DA-4TTUU-DUU-D0000-**S**-UUUUUUUU

The generation of **SW digits related to MCP function** is according to the G100 Order Code. For e.g., D0 indicates MCP version 4.00

G100-AAL-DA-4TTUU-DUU-**D0000**-S-UUUUUUUU

The generation of **SW digits related to D2x function** is always performed regardless of the function type and follows the rules below (all CAPS letters for the digits); this ensures a true representation of the absence or presence and version of the D2x environment.

G100 v4.00 has always: S-**UUUUUUUU** for the last group of 8 digits.

In the example below, after the unit was built in the factory, there were added and configured two Fiber Optic SFP (F) and a D.20 PCIe card (D) and the firmware upgraded to v4.00.

Chapter 2 - Unpacking and Inspection

This chapter covers the suggested inspection and preparation considerations and background information necessary prior to using the G100.

Unpacking, initial inspection, and first time operation of the G100 are covered.

Following the procedures given in the chapter is recommended, and they will verify proper operation before the product is integrated into your system.

Hot Surface: During operation of the G100 the surface of the heat sink, can reach a temperature of 60°C and above. Therefore, be careful and do not touch it with bare fingers.

Electro Static Discharge - ESD

The discharge of static electricity, known as Electro Static Discharge or ESD, is a major cause of electronic component failure. The Industrial Computer has been packed in a static-safe bag which protects it from ESD while it is in the bag. Before removing the Boards or any other electronic product from its static-safe bag, be prepared to handle it in a static-safe environment.

You should wear a properly-functioning anti-static strap and ensure you are fully grounded. Any surface upon which you place on the unprotected G100 should be static- safe, usually facilitated by the use of anti-static mats. From the time the board is removed from the anti-static bag until it is in the card cage and functioning properly, extreme care should be taken to avoid “zapping” the board with ESD. You should be aware that you could “zap” the board without you knowing it; a small discharge, imperceptible to the eye and touch, can often be enough to damage electronic components. Extra caution should be taken in cold and dry weather when electrostatic charge easily builds up.

Only after ensuring that both you and the surrounding area are protected from ESD, carefully remove the board or module from the shipping carton by grasping the module on its edges. Place the board, in its anti-static bag, flat down on a suitable surface. You may then remove the board from the anti-static bag by tearing the ESD warning labels.

Initial inspection

After unpacking the products, you should inspect it for visible damage that could have occurred during shipping or unpacking. If damage is observed (usually in the form of bent component leads or loose socketed components), contact GE Vernova Technical Support for additional instructions. Depending on the severity of the damage, it may be necessary to return the product to the factory for repair.

⚠ WARNING

DO NOT apply power to the product if it has visible damage!

Doing so may cause further, possibly irreparable damage, as well as introduce a fire or shock hazard.

The G100 shipment will include the following:

- G100 Substation Gateway
- Wall / Panel mounting kit
 - Wall / panel mounting bracket (quantity 2)
- DIN rail and Hardware kit
 - DIN Rail (quantity 1)
 - Screws (quantity 6)
- Analog DC Input (AI) connector (quantity 1)
- Binary Input (DI) connector (quantity 1)
- Binary Output (DO) connector (quantity 1)
- Power input connector (quantity 1)
- IRIG-B input connector (quantity 1)

Unpacking

Please read the manual carefully before unpacking the board or module or fitting the device into your system. Also adhere to the following:

- Observe all precautions for electrostatic sensitive modules.
- Do not place the board on conductive surfaces, anti-static plastic, or sponge, which can cause shocks and lead to board trace damage.
- Do not exceed the specified operational temperatures.
- Keep all original packaging material for future storage or warranty shipments of the board.

Although the products are carefully packaged to protect against the rigors of shipping, it is still possible that shipping damage can occur. Careful inspection of the shipping carton should reveal some information about how the package was handled by the shipping service. If evidence of damage or rough handling is found, you should notify the shipping service and GE Vernova Technical Support as soon as possible.

PCIe Cards and storage devices may also have temperature restrictions.

Retain all packing material in case of future need.

WARNING

Before installing or removing any board, please ensure that the system power and external supplies have been turned off!

Chapter 3 - Installing the G100

This chapter covers the installation of the G100 and initial power-on operations.

⚠ WARNING

Before you install and operate the G100, read and follow the safety guidelines and instructions in [Safety precautions](#).

Installation

The G100 device can be installed as either wall / panel mounted, or DIN Rail mounted.

The G100 shall be installed in:

- Pollution Degree II, non-hazardous and restricted access location,
- Environment where the ambient temperature does not exceed the rating of the product,
- Air flow is not restricted.

Wall / Panel Mounting instructions

Please see following instructions to mount it.

1. Mount the wall/panel mount bracket as shown below.
 - a. Locate and retrieve the wall/panel mount brackets from the G100 carton.
 - b. Locate and removed the 2x M3 screws on the left side of the chassis closest to the rear.
 - c. Position one of the wall/panel mount brackets to the chassis, aligning the mounting holes in the bracket to the chassis.
 - d. Reinstall the 2 screws removed in the step above on the left side of the chassis to secure the bracket to the chassis. The recommended torque setting for the M3 screws are 5.2 in-lb [0.59 Nm].
 - e. Repeat the above steps for the mounting the bracket to the right side of the chassis.

2. On the wall / panel, measure the exact place where you want to install the G100 and drill four holes that match the four mounting holes on both brackets.

3. Insert four anchoring bolts into the holes, or suitable panel nuts that match your mounting screws.

4. Align the G100 brackets with the four bolts / nuts you just installed on the wall / panel.

5. Drive the mounting screws into the anchoring bolts / nuts to secure the G100.

DIN Rail Mounting instructions

Please see following instructions to mount it.

1. Mount the DIN rail as shown below.
 - a. Locate and retrieve the DIN rail bracket and mounting screws from the G100 carton.
 - b. Position the DIN rail bracket to the rear of the chassis, aligning the mounting holes in the rail to the chassis.
 - c. Install the 6 screws provided with the DIN rail bracket to secure the bracket to the chassis. The recommended torque setting for the 6/32 screws are 5.2 in-lb [0.59 Nm].

NOTE

The top of the DIN rail bracket should be positioned to align with the top of the G100 chassis.

2. Position the G100 on a slight angle and slowly lower until the top of the DIN bracket on the G100 engages the DIN rail. Pull the G100 firmly downward and press flat against the wall/panel until the DIN rail bracket locks into position.

Installation of optional D.20 HDLC Card

The optional D.20 HDLC card can be ordered already installed with the unit at factory time, or can be installed later, as follows.

NOTICE

Before you open the G100 chassis to install the D.20 HDLC Card, read and follow the guidelines and instructions in [Electro Static Discharge - ESD](#).

1. To install the D.20 HDLC card, flip over the system and loosen and remove the eight screws indicated below so that the chassis cover can be removed.

2. After taking the lid off, remove the metal sheet as shown in the picture.

3. Remove the terminal block from the PCIe card before inserting it, so is possible to slide it in.

4. Place the card into the system as shown in the picture.

5. Align the notch of the module with the socket key in the slot and carefully insert the card into the slot.

6. Make sure the card slot has complete insert to these 2 metal sheets.

7. Connect the metal sheets with the system by securing the two screws.

8. Place the cover back to the system and secure it with eight screws removed in Step 1.

Grounding

It is required to connect the G100 chassis to cabinet ground, which then **MUST BE CONNECTED TO Building Protective Earth (PE) ground** using the ground connection screw located near the G100 power supply connector on the bottom side panel.

⚠ WARNING An improperly wired ground connection could place hazardous voltages on accessible metal parts.

Power Supply

The G100 is intended to be powered by a UL list DC power supply or DC power source, via one 2 Pin DC-IN connector located on the bottom side panel.

The power input is rated 12/24/48Vdc, 5/2.5/1.25A minimum, Tmax = 70 degree C, and the altitude of operation = 5000m.

The external DC power supply must be rated at minimum 60 W.

Make sure you connect the “+” and “-” wires according to the label adjacent to the connector.

Wires	The conductor size is from 16 AWG to 12 AWG and Strip Length is 7mm. After plugging cable lines into the mating connector, plug the mating connector to the product and secure the plug with the two screws.
Breaker circuit	A 20A IEC/USA/Canada breaker circuit is required as pre fuse.
Disconnect device	A readily accessible disconnect device shall be incorporated external to the unit.
Inrush current	The inrush current is typically 8A when powering up.
Reverse polarity protection	The product is equipped with built-in reverse polarity protection. If + and - are swapped the unit will not power-up and harm to neither the power supply nor the unit will occur.
Overcurrent protection	The overcurrent protection function interrupts an uncontrolled fault current or overcurrent before serious damage can occur, such as overheating of the equipment. The internal fuse is rated for 10A continuous current. If that current is exceeded by factor 10 the fuse will blow in between 1ms and 10ms. The fuse is placed in “+” connection of the power supply.

G100 System redundancy

G100 system redundancy is available starting with Firmware version 3.00.

A redundant G100 setup allows a secondary G100 to automatically take over operations from a paired G100 unit that has failed.

G100 redundancy requires two identical model and configuration G100 units and zero, one, or two RS232 switch panels when connecting to RS232 devices. RS232 switch panels are not required when connecting to RS-485 devices. For RS-485 redundant wiring approaches, refer to [RS-485 Serial Connections](#).

When using the G100 in redundant mode, and wiring the RS232 switch panel, you must ensure the switch panel cables connected to A and B units match the A and B designations in software.

The RS-232 switch panel and associated connected wiring is optional for Warm Standby, Hot Standby and Hot-Hot redundancy.

Starting with **MCP V4.00** release, **Warm-Standby** and **Hot-Standby** redundancy modes are no longer available and have been superseded by **Hot-Hot** redundancy mode. **Hot-Hot** redundancy mode has the same functionality as the superseded modes.

Using the redundancy configurations given in this section, a pair of LEDs on the RS232 switch panel marked CCU A and CCU B indicate which of the G100 unit is currently active. A toggle switch on the RS232 switch panel can be used to manually switch the G100 devices between active and standby states, if the switch panel is configured as Master.

MCP Redundancy Operation

Please refer to **SWM0101 MCP Software Configuration Guide**, section **MCP System Redundancy** for a detailed explanation of MCP redundant modes.

RS232 Switch Panel(s) may be installed for the purpose of switching serial communications to external devices from the active MCP device. The RS232 Switch Panel is either in state (position) A or B and cannot be physically in both states.

At runtime, with a correctly configured G100 redundant system: only one MCP device is in an "active" state, the other MCP device is considered to be in "standby" state. Even when configured as hot-hot redundancy - the "standby" state and designation still applies for all subsystems not running as hot-hot.

Active vs. Standby States

If RS232 Switch Panel is not installed, or if is installed and configured as Slave: the runtime active and standby states are given by mutual arbitration in software.

If RS232 Switch Panel is installed and configured as Master: the runtime active and standby states are given by the DCD signal (STATUS, BROWN wire) on the watchdog cable serial port. When DCD is positive voltage level - the device is in Active state.

There is no functional preference on which MCP device should be active; this is a function of what was the last negotiated value.

A vs B Designation

The runtime A and B designation in the MCP database is given by the configured A and B setting in the redundancy configuration regardless of RS232 Switch Panel being installed or not. This simplifies the RS232 Switch Panel connections, allows usage of the same watchdog cable for both devices A and B.

Pinout of watchdog cable 977-0568:

Note: This is the cable wiring and pinout. G100 does not provide "+12V_ISO" on pin 7.

Runtime behavior

MCP devices A and B communicate constantly with each other to confirm each one's state, using what we call a "heartbeat" signal. If this communication stops - it triggers the standby device to become active. This is why it is critical that Heart Beat Communication does not have a single point of failure in itself and is implemented using at least two separate mediums: **Serial PING** and LAN. If serial is not possible, then implement **LAN1** and **LAN2**.

Disconnecting **all** Heart Beat Communications while both MCP devices are healthy and powered on will result in either of:

1. One MCP will fail if RS232 Switch Panel is present and configured as Master.
 - In this case Human Intervention is required to restore the MCP redundancy after the Heart Beat Communications are restored.
2. Both MCP devices become active if RS232 Switch Panel is present and configured as Slave, with serial communications being questionable since the RS232 Switch Panel cannot switch and follow both units as active.
 - In this case MCP redundancy should recover itself after the Heart Beat Communications are restored, with the last active MCP before the interruption remaining active, and the RS232 Switch Panel switched towards the active MCP.
3. Both MCP devices become active if an RS232 Switch Panel is not present.
 - In this case MCP redundancy should recover itself after the Heart Beat Communications are restored, with the last active MCP before the interruption remaining active.

Notes:

After experiencing both MCP being in active state, and after correcting the Heart Beat communication defects, and if the D.20 IO is configured: it is required to power cycle both MCP devices to clear this state on the D.20 PCIe card.

In general, after recovering from any redundancy failures there should be comprehensive checks performed to ensure the active device is operating as required, D.20 IO (if configured) are online and the standby device shows online in the active device. And then same checks should be performed after a switchover, with the second device being active.

Switchover initiated in database

Switchover initiated in database is when both MCP devices operate as Active-Standby and there is a database initiated request to change the Active MCP device, e.g. using the Redundancy Manager DO point "Start Change Over".

In this case, the Active MCP sends to the Standby a request to become active, over the Heartbeat Communication channel(s).

This is followed by different actions, depending on the RS232 Switch Panel configuration - see next:

If an RS232 Switch Panel is configured as Master and installed:

The Standby MCP device asserts both TX (SET 1) and RTS (SET 2) signals on the serial port connected to the watchdog cable, for a duration of approximately 50 ms.

As a result, the RS232 Switch Panel will change positions (should occur within 25 ms and with a maximum timeout of 50 ms), resulting in a swap of the STATUS A and STATUS B signal levels. The Standby MCP device confirms this change by monitoring the DCD (STATUS) signal, de-asserts the TX (SET 1) and RTS (SET 2) signals and initiates the actions to run the applications as Active.

The RS232 Switch Panel transfers all serial field connections to the new Active MCP.

If the DCD (STATUS) signal did not change to reflect the new RS232 Switch Position even after the duration 50 ms - the Standby MCP will fail and will not become active.

If the Standby MCP confirms becoming active and communicates this to the former Active MCP which made the request - the former Active MCP will have its applications restart in standby mode or change the applications to standby mode, as a result of the agreements exchanged over the Heartbeat Communication channel(s).

The switchover is finalized.

If an RS232 Switch Panel is configured as Slave and installed:

The Standby MCP device acknowledge the request and initiates the actions to run the applications as Active, without checking the DCD (STATUS) signal.

Once the Standby MCP confirms becoming active and communicates this to the former Active MCP which made the request - the former Active MCP will have its applications restart in standby mode, as a result of the agreements exchanged over the Heartbeat Communication channel(s).

The Standby MCP device also asserts both TX (SET 1) and RTS (SET 2) signals on the serial port connected to the watchdog cable, for a duration of approximately 50 ms. As a result, the RS232 Switch Panel will change positions, resulting in a swap of the STATUS A and STATUS B signal levels. The Standby MCP device confirms this change by monitoring the DCD (STATUS) signal.

If the DCD (STATUS) signal did not change to reflect the new RS232 Switch Position even after the duration of 50 ms - the Standby MCP will log an error and continue to operate as Active now. The RS232 Switch Panel did not transfer the serial field connections to the new Active MCP.

If the Standby MCP confirms becoming active and communicates this to the former Active MCP which made the request - the former Active MCP will have its applications restart in standby mode or change the applications to standby mode, as a result of the agreements exchanged over the Heartbeat Communication channel(s).

The switchover is finalized.

If an RS232 Switch Panel is not present:

The Standby MCP device acknowledge the request and initiates the actions to run the applications as Active, without checking the DCD (STATUS) signal.

Once the Standby MCP confirms becoming active and communicates this to the former Active MCP which made the request - the former Active MCP will have its applications restart in standby mode or change the applications to standby mode, as a result of the agreements exchanged over the Heartbeat Communication channel(s).

The switchover is finalized.

Switchover initiated from RS232 Switch Panel

Switchover initiated from the button located on the RS232 Switch Panel applies only when an RS232 Switch Panel is configured as Master and installed.

In this case the DCD (STATUS) signal swaps the STATUS A and STATUS B signal levels as a result of the RS232 Switch Panel initiated action.

The Standby MCP device observes this change by monitoring the DCD (STATUS) signal and initiates the actions to run the applications as Active.

The Active MCP device observes this change by monitoring the DCD (STATUS) signal and initiates the actions to have its applications restart in Standby mode or change the applications to Standby mode.

The two MCP devices also confirm the switchover to each other over the Heartbeat Communication channel(s).

The RS232 Switch Panel transfers all serial field connections to the new Active MCP.

The switchover is finalized.

Failover event

A Failover event occurs when the Standby MCP can no longer communicate with the Active MCP. In this case, after exhausting the configured number of retries over the Heartbeat Communication channel(s) - the following actions occur, depending on the RS232 Switch Panel configuration:

If an RS232 Switch Panel is configured as Master and installed:

The Standby MCP device asserts both TX (SET 1) and RTS (SET 2) signals on the serial port connected to the watchdog cable, for a duration of approximately 50 ms.

As a result, the RS232 Switch Panel will change positions (should occur within 25 ms and with a maximum timeout of 50 ms), resulting in a swap of the STATUS A and STATUS B signal levels. The Standby MCP device confirms this change by monitoring the DCD (STATUS) signal, de-asserts the TX (SET 1) and RTS (SET 2) signals and initiates the actions to run the applications as Active.

The RS232 Switch Panel transfers all serial field connections to the new Active MCP.

If the DCD (STATUS) signal did not change to reflect the new RS232 Switch Position - the Standby MCP will fail and will not become active.

The failover is finalized.

If an RS232 Switch Panel is configured as Slave and installed:

The Standby MCP device initiates the actions to run the applications as Active, without checking the DCD (STATUS) signal.

The Standby MCP device also asserts both TX (SET 1) and RTS (SET 2) signals on the serial port connected to the watchdog cable, for a duration of approximately 50 ms. As a result, the RS232 Switch Panel will change positions, resulting in a swap of the STATUS A and STATUS B signal levels. The Standby MCP device confirms this change by monitoring the DCD (STATUS) signal.

The RS232 Switch Panel transfers all serial field connections to the new Active MCP.

If the DCD (STATUS) signal did not change to reflect the new RS232 Switch Position - the Standby MCP will log an error and continue to operate as Active now. The RS232 Switch Panel did not transfer the serial field connections to the new Active MCP.

The failover is finalized.

If an RS232 Switch Panel is not present:

The Standby MCP device initiates the actions to run the applications as Active, without checking the DCD (STATUS) signal.

The failover is finalized.

G100 Required components

To implement a redundant G100 system, you need the following components:

Component	Function	GE Vernova part number
RS232 Switch Panel	Communications switch.	517-0247
Power Supply	Power supply to power the RS232 switch panel. Input: 85 – 264 VAC or 90 – 350 VDC.	580-0046
G100 RJ45 to RS232 Serial Cable	Connects the G100 to the RS232 switch panel which is then connected to external field devices.	977-0556/LLL
Watchdog Cable Assembly	Connects G100 A to the RS232 switch panel.	977-0568/LLL
	Connects G100 B to the RS232 switch panel.	977-0568/LLL
Ping Cable Assembly	Links both G100 units to facilitate a heartbeat message that determines the status of the active unit.	977-0559/LLL
G100 A/B RS232 Switch panel Jumper (P1/P9)	Connects the isolates common of serial port to the signal used in switch panel so G100 (A or B) can make itself the active unit.	977-0562
Power Cable	Connects the RS232 switch panel to an external power supply.	970-0161
Ground Cable	Provides a ground connection for the RS232 switch panel.	970-0182

(/LLL) is length of the cable in inches, i.e., 36 inches is /036.

The serial ports on the G100 are galvanically isolated from each other, however, when the RS232 switch panel is used, the serial common of all ports are tied together. CCU A ports are tied together, CCU B ports are tied together, CCU A and CCU B remain separate.

Pins 4 on switch panel connectors J2 through J9 are tied together and to the panel's power supply. Any loading from field devices on these pins, loads the RS232 panel power supply and should be taken into consideration when sizing power supplies.

The watchdog (control) must be configured to be the same port number on both G100A and G100B.

The G100 heartbeat (ping) port is software configurable, but must be configured to the same port number on both G100A and G100B.

For serial heartbeat interconnection of 2 redundant G100, a half crossed Ethernet cable can be used, in either RS-232 or RS-485-4W modes. RS-485-2W mode is not allowed.

The assignment of G100A and G100B must be done in Settings.

To set up a redundant system:

It is recommended that you install and configure one standalone G100 unit to ensure that your configuration is valid and that device communications are operating properly. Once this is done, proceed with the installation of the redundant system as shown in [Figure 4: Redundancy Wiring - Single RS232 Switch Panel](#).

1. Mount the G100 units in a rack and connect power and ground.
2. Mount the RS232 switch panel.
3. Plug the connector of watchdog cable A (GE Vernova part number 977-0568/LLL) to the watchdog (control) serial port RJ45 connector on the first G100 (CCU A).
4. Plug the connector of watchdog cable B (GE Vernova part number 977-0568/LLL) to the watchdog (control) serial port RJ45 connector on the second G100 (CCU B). This cable must be connected to the same watchdog (control) serial port number on both G100 units.
5. Connect the bare leads of both watchdog cables to TB1 on the RS232 switch panel as shown in [Figure 4: Redundancy Wiring - Single RS232 Switch Panel](#).
6. Connect one end of the ping cable to the first G100 and the other end to the second G100. This ping cable must be connected to the same serial port number on both units.
7. Use a G100 RJ45 to RS232 Serial Cable (977-0556/LLL) to connect the G100 serial communication ports to the serial ports on the RS232 switch panel. P2 through P8 are connected to the first G100, P10 through P16 are connected to the second G100. Connections from the switch panel to both G100 units should be made in the same order. For example, if P2 is connected to port 3 on the first G100, P10 should also be connected to port 3 on the second G100.
8. Use a two RS232 DB9F SWITCH JUMPER A/B 977-0562 installed on P1 and P8 to connect the switched CCU ground for control and detection to the Currently active CCU.
9. Connect field devices to J2 through J8 on the RS232 switch panel.

RS232 switch panel

The RS232 switch panel has two sets of indicator LEDs:

- PWR A/PWR B: When lit, power and communications are received from the connected units. Normally, both LEDs are lit.
- CCU A/CCU B: Normally, one LED is lit, indicating which unit is active.

The active/standby switch on the front of the RS232 switch panel is used to:

- Restore a previously failed unit to active status once it has been repaired.
- Manually force a unit to active status so that routine maintenance can be performed on the other unit.

To manually operate the RS232 switch as Master:

1. Pull the active/standby switch straight out to release it from the locked position.
2. Switch it up to make unit A active or down to make unit B active.

The CCU A/CCU B LED indicator indicates which unit has been activated.

Redundancy wiring diagrams

The following diagrams illustrate how to wire the G100 units and RS232 switch panels to enable system redundancy:

- Redundancy Wiring - Single RS232 Switch Panel see Figure 4: Redundancy Wiring - Single RS232 Switch Panel.
- Redundancy Wiring - Redundant RS232 Switch Panel. The wiring drawing is provided in two parts: left and right.
 - o For the left side of the drawing, see Figure 5: Redundancy Wiring - Redundant RS232 Switch Panel (1 of 2).
 - o For the right side of the drawing, see Figure 6: Redundancy Wiring - Redundant RS232 Switch Panel (2 of 2).

This configuration is used to provide RS232 panel redundancy for up to 7 serial connections.

Figure 4: Redundancy Wiring - Single RS232 Switch Panel

Figure 5: Redundancy Wiring - Redundant RS232 Switch Panel (1 of 2)

Figure 6: Redundancy Wiring - Redundant RS232 Switch Panel (2 of 2)

Power-On Self-Test (POST)

Each time the G100 boots up it must pass the POST (Power-On Self-Test).

If the G100 does not pass POST, the board will fail the POST and “beep” in a specific pattern. Please contact GE Vernova Grid Solution support in this case.

To interrupt the POST process from a KVM connected directly to the **G100** and to boot from an already inserted USB drive - press F7 repeatedly immediately after power on.

To interrupt the POST process from a KVM connected directly to the **G100** and to access UEFI settings - press <TAB> or key repeatedly immediately after power on.

Is not possible to directly access the BOOT menu when using the Serial Maintenance port (i.e., equivalent to KVM and F7); use instead the UEFI options (see latest version of “TN0116 MCP Firmware Upgrade and Restore to Defaults Workflows”).

To interrupt the POST process from the Serial Maintenance port connected directly to the **G100** and to access UEFI settings – after power on wait (typically 10 seconds) for the message below:

Press <Tab> or to enter setup.

And press <TAB> or **within 4 seconds** when the message shows on the terminal console (the setup prompt timeout in UEFI/Boot is set by default to 5 seconds).

NOTICE POST messages are shown only on the Video Output (DP) port.

The message to interrupt POST is not shown on the Serial Maintenance port while a monitor is connected to the DP port.

Refer to section “[Default Serial Maintenance port \(port 4, RS232\)](#)” on page 80 for additional information on the serial maintenance port.

First time after a firmware upgrade - full completion of the POST may take up to 15 minutes. This is why is recommended to perform this process via KVM, or – if the serial maintenance port was used for the firmware upgrade – to connect a monitor to the DP port **after** the user interactive workflow to upgrade the firmware is finished.

Full completion of the POST may take up to 5 minutes after a first boot.

Super Capacitor and Real Time Clock (RTC)

The G100 does not include a battery. Instead, the G100 contains one super capacitor, powering the real-time clock (RTC). This super capacitor will power the RTC for at least 5 days with no connection to power.

After this super capacitor discharges, the **RTC** time will be reset **internally** to an invalid time (e.g. 12:00 AM, 01-10-2000), and will be later updated to the correct time after the system will be powered on again and time synchronized again.

When the system is subsequently powered up, the system time will be initialized to the RTC time if the super capacitor was not discharged. If the super capacitor was discharged, the system time will be initialized to the last time when the system was still powered on.

Chapter 4 - Interfaces and Indicators

This chapter covers the interfaces of the G100 Substation Gateway.

UEFI Settings

Please refer to the document *Configuring UEFI Settings on G100 User Guide (SWM0122)* for details.

G100 device has the following UEFI settings.

These UEFI settings are applicable only while the G100 is starting.

After the applications started, these settings are over-written by the values configured in *MCP Local Configuration Utility (mcpcfg)* or *MCP Settings GUI*.

- Default Serial Maintenance Port used as UEFI (boot) console when KVM is not available (Advanced->Serial Port Console Redirection)
 - o Console Redirection is set to Disabled for COM1-COM3, please do not change these settings.
 - o Console Redirection for COM4 should be enabled/disabled and have the “Bits per second”, to be same as in the *Serial Maintenance Port in MCP Studio* (See *MCP Software Configuration Guide SWM0101 > Serial Maintenance Port*).
- Default Serial Ports Modes (Advanced->Super IO Configuration)
 - o Please ensure are enabled/disabled as required for secure hardening purposes and set to RS-232.

General Purpose IO (GPIO)

G100 is equipped with an internal General Purpose Input/Output (GPIO) interface.

The available GPIO signal types are as follows.

Binary Inputs (DI): 8

All DI are wetted internally from main power supply circuit using single common for all 8 channels.

Each DI channel can be triggered by N.O. potential free external contacts, with the wetted positive voltage being switched through the external contacts.

The DI wetting voltage is protected internally by the main fuse.

NOTE

The DI voltage supply is the same as the G100 Power Supply: 12/24/48 VDC, with each DI channel consuming typically 5mA.

DI wiring is via a pluggable connector, pitch 3.5mm x 16 pins, located on the bottom side panel:

The small arrow on the left indicates PIN 1.

Table 5: GPIO DI connector pin assignments

PIN NO.	DESCRIPTION
1 (arrow)	DI_1
2	DI_COM (+)
3	DI_2
4	DI_COM (+)
5	DI_3
6	DI_COM (+)
7	DI_4
8	DI_COM (+)
9	DI_5
10	DI_COM (+)
11	DI_6
12	DI_COM (+)
13	DI_7
14	DI_COM (+)
15	DI_8
16	DI_COM (+)

Each DI channel is indicated as “input active” (ON) at runtime via a numbered LED located on the front side of the G100:

Binary Outputs (DO): 4

Each DO channel is isolated and independent, and provides a N.O. (Normal Open) dry relay single contact, rated at 10 – 60 VDC / 1A (Max.).

The DO channels are not fused internally.

DO wiring is via a pluggable connector, pitch 3.5mm x 8 pins, located on the top side panel:

The small arrow on the left indicates PIN 1.

Table 6: GPIO DO connector pin assignments

PIN NO.	DESCRIPTION
1 (arrow)	RELAY1_NO1
2	RELAY1_COM1
3	RELAY2_NO1
4	RELAY2_COM1
5	RELAY3_NO1
6	RELAY3_COM1
7	RELAY4_NO1
8	RELAY4_COM1

Each DO channel is indicated as “active” (ON) at runtime via a numbered LED located on the front side of the G100:

The DO operation types are PULSE, LATCH_ON and LATCH_OFF.

At runtime, commands received as CLOSE/ON are translated to LATCH_ON, and commands received as TRIP/OFF are translated to LATCH_OFF. The PULSE command types are executed as PULSE, according to their associated count and duration parameters.

Analog DC Inputs (AI): 4

Each AI channel is configurable via internal jumpers as Full Scale either +5 VDC (Default setting) or 20 mA.

The resolution is 12-bit plus sign, self-calibrating.

AI wiring is via a pluggable connector, pitch 3.5mm x 12 pins, located on the top side panel:

The small arrow on the left indicates PIN 1.

Table 7: GPIO AI connector pin assignments

PIN NO.	DESCRIPTION
1 (arrow)	A_VIN0+/IIN0 +
2	A_VIN0 -
3	AGND_ISO_CHS
4	A_VIN1+/IIN1 +
5	A_VIN1 -
6	AGND_ISO_CHS
7	A_VIN2+/IIN2 +
8	A_VIN2 -
9	AGND_ISO_CHS
10	A_VIN3+/IIN3 +
11	A_VIN3 -
12	AGND_ISO_CHS

In the pin description, “_CHS” is the shield connection for each AI channel (all CHS are common wired internally).

The jumpers for Voltage or Current input selection JAI12~JAI15 are located on the GPIO internal board and their settings are as follows:

Jumper JAI12~JAI15	
1-2 (Default)	Voltage
2-3	Current

If the G100 Unit is already equipped with D.20 HDLC card, you will need to uninstall the card temporarily before you can change the AI jumper settings and install back the card after the change is done. Refer to the chapter of "Installing the G100" for more details on the installation of optional D.20 HDLC Card.

Table 8: GPIO AI Voltage / Current selection jumper

Jumper JAI12	DESCRIPTION
1-2 (Default)	V_IN_CH_1
2-3	I_IN_CH_1

Jumper JAI13	DESCRIPTION
1-2 (Default)	V_IN_CH_2
2-3	I_IN_CH_2

Jumper JAI14	DESCRIPTION
1-2 (Default)	V_IN_CH_3
2-3	I_IN_CH_3

Jumper JAI15	DESCRIPTION
1-2 (Default)	V_IN_CH_4
2-3	I_IN_CH_4

AI sampling is indicated at runtime via one LED (for all AI channels) located on the front side of the G100:

D.20 Link Connections

G100 is able to communicate with D20 peripheral modules.

To communicate with D20 peripheral I/O modules the G100 requires the installation and configuration of the optional D.20 HDLC PCIe card.

D.20 Communications between the D.20 HDLC PCIe card and the D20 peripheral I/O modules are carried over a proprietary high-speed, high-level data link control (HDLC) protocol called the D.20 Link.

The D.20 HDLC PCIe card supports two D.20 Link communications ports. The G100 system can be ordered from the factory with the D.20 HDLC PCIe card pre-installed using the Product configurator through the Online Store or can be installed in the field by ordering the D.20 HDLC PCIe card as an accessory from the MCP Substation Gateway Spare Parts and following the [Installation of optional D.20 HDLC Card](#) on page 35.

G100 is limited by performance to communicate with up to **60** D.20 peripheral I/O modules.

Please consider the G500 product for more D20 peripheral I/O modules (up to the maximum of 120).

G100 D.20 HDLC PCIe card

The D.20 HDLC PCIe card is equipped with a Power Pass Through connector, two D.20 ports and four LEDs.

The Power Pass Through connector allows the D.20 peripheral connected to the D.20 Link to be powered through the D.20 port. The Power Pass Through requires one or two external power supplies to be connected. Refer to “Supplying power through the D.20 Link” on page 29 section for further details.

Two sets of LEDs are present on the D.20 HDLC PCIe card to indicate activity status. The first set of LEDs, on the left labeled D.20 1 Act, shows the transmit and receive activity on D.20 Channel 1 and the second set to show activity on D.20 Channel 2 on the right labeled D.20 2 Act. The receive LEDs will flash red and the transmit LEDs will flash green.

The D.20 HDLC PCIe card has two D.20 ports. Each port contains D.20 Channel 1, D.20 Channel 2, DC Supply 1, and DC Supply 2. For D.20 port A, the above signals are always available. For D.20 port B, D.20 Channel 1 and D.20 Channel 2 are configurable but DC Supply 1 and DC Supply 2 are always available. Refer to Table 9: D.20 Port A and B pin out and configuration options and Table 10: Default D.20 Relay settings. D.20 Port B settings are software controlled and are accessible through the Settings GUI on your G100. Refer to GE Vernova part number SWM0101 for further details on configuration.

Table 9: D.20 Port A and B pin out and configuration options

Pin Number	D.20 port A	D.20 Port B	
1	No Connection	No Connection	
2	D.20 Channel 1 TX/RX +	D.20 Channel 2 TX/RX +	OPEN
3	D.20 Channel 1 TX/RX -	D.20 Channel 2 TX/RX -	OPEN
4	VDC1 +	VDC1 +

8	VDC2 +	VDC2 +	
9	VDC2 -	VDC2 -	

End of link termination is required at each end of the D.20 Link and is critical for proper operation. The D.20 HDLC PCIe card has two relays which control the End of Link termination, one for each D.20 Channel. Refer to Table 10: Default D.20 Relay settings. End of Link termination settings are software controlled and are accessible through the Settings GUI on your G100. Refer to GE Vernova part number SWM0101 for further details on configuration.

Table 10: Default D.20 Relay settings

D.20 Relay setting	Default
End of Link termination on channel 1	Enabled
End of Link termination on channel 2	Enabled
D.20 channel 1 to D.20 port B connection	Disabled
D.20 channel 2 to D.20 port B connection	Disabled

Supplying power through the D.20 Link

Power is typically supplied to peripheral devices directly through the WESTERM boards or inject power into the D.20 link using the D.20 DC Interface module (520-0154). However, with the D.20 HDLC PCIe card the Power Pass Through connections can be utilized to inject power into the D.20 link to supply power to peripheral devices through the D.20 ports.

One or two independent power supplies can be connected to DC Supply 1 (VDC1) and DC Supply 2 (VDC2). DC Supply 1 (VDC1) is connected through to pins 4 and 5 on both D.20 ports (DB9 connector), respectively DC Supply 2 (VDC2) is connected to pins 8 and 9.

The DC supply load on the D.20 port by the peripheral link must not to exceed 2.5A and 20 -60 VDC

The Power Pass Through connections are protected to 2.5A

The mating connector is the 4-pin "Phoenix 1827729". This connector type is required for IP30 compliance.

D.20 Link feature

The D.20 Link has the following features:

- D.20 frame using HDLC protocol format with Manchester encoding.
- RS-485 typical cable is p/n 977-0089, half duplex at 250 kbps, 24 AWG twisted pair, for applications up to 330 meters, and maximum 32 devices in total:
 - o one single G100 counts as one device,
 - o redundant G100 count as two devices,
 - o each I/O Peripheral module counts as one device.
- Repeater/extension modules may be used to extend this limit to a maximum of 60 peripheral I/O modules, considering the RS-485 serial link limits listed above.
 - o Multi-Mode Glass Fiber (GFO), up to 2 km (each GFO counts as one device in the RS-485 serial link)
- Each set of RS-485 D.20 Link wiring must be terminated at both ends (the termination does not count as a device)

D.20 Communications Interface

Use the D.20 Communication Interface module (520-0117) when you require one-to-one communication links with peripherals.

D.20 Termination

Use the D.20 Termination (977-0049) when you need to terminate the RS-485 serial links outside of the G100.

D.20 Fiber Optic Splitter

Use the D.20 Fiber Optic Splitter (520-0118) when you require one-to-four communication links with peripherals, especially if peripherals are clustered in different areas of the substation.

GFO adapters

Glass Fiber Optic (GFO, 520-0148) adapters are used to provide glass fiber optical cable extensions to the D.20 Link. These allow interference free links to peripherals that are sited at a remote distance from the main D20 installation.

D.20 DC interface

When power requirements for multiple peripherals exceed the basic system limitations, or when necessary to power peripherals connected via GFO use the D.20 DC Interface module (520-0154).

D.20 Peripheral Types

D.20 Peripheral I/O modules are intelligent modules containing an on-board microprocessor. They are configured as slaves to the G100. In this way, specific I/O processing is distributed throughout the to the appropriate I/O module.

There are four types of I/O peripherals supported by the D.20 HDLC PCIe:

- D20A analog input
- D20S digital inputs
- D20K digital output
- D20C combination input/output

Optional high-voltage peripherals are also available.

Redundant D.20 communication channels are available on all peripherals. To utilize this function redundant D.20 LAN cards are required to be installed on the D.20 Peripheral I/O modules. D.20 A, S and K Peripheral I/O modules require 540-0207 and D.20 C requires 540-0209.

The D.20 HDLC PCIe card is only compatible with CCU BASE and PCOMMON v3.00 or higher.

Refer to Peripheral Compatibility with the D.20 HDLC PCIe card section in this manual for complete list of D.20 Peripheral I/O compatibility.

For further information on I/O peripherals, see the D20/D200 Installation and Operations Guide (refer to GE Vernova part number 994-0078); see section: Connections and Configuration.

Peripheral compatibility with the D.20 HDLC PCIe card

Use the tables in this section to check compatibility with existing D.20 Peripheral I/O modules and devices.

D.20 Connection topologies

The D.20 HDLC PCIe card supports the below D.20 topologies:

- Single D.20 terminated, single link
- Dual D.20 link terminated
- Dual D.20 terminated, Ch 1 only
- Single D.20 link, redundant LAN
- Redundant D.20 link, redundant LAN
- Single D.20 link with redundant G100
- Dual D.20 terminated, with redundant G100
- Single D.20 link, redundant LAN with redundant G100
- Single Ring and Fiber Optic (FO) D.20 link with redundant G100
- Single Ring and Fiber Optic (FO) D.20 link, redundant LAN with redundant G100

Single D.20 terminated, single link

Figure 7: Single D.20 terminated, single link - Topology

Up to 31 D.20 Peripherals in total can be present.

D.20 redundant LAN daughter card can optionally be installed with the corresponding configuration (Single Link) in DSAS.

The last D.20 peripheral must be terminated with D.20 terminator (GE Vernova part number 977-0049).

Table 16: Single D.20 terminated, Single Link - Default settings

Function	State
End of Link - D.20 Channel 1	ON
End of Link - D.20 Channel 2	ON
Port B - D.20 Channel 1 (pin 6/7)	OFF
Port B - D.20 Channel 2 (pin 2/3)	OFF

Dual D.20 link terminated

Figure 8: Dual D.20 link terminated - Topology

Up to 30 D.20 Peripherals in total can be present.

D.20 redundant LAN daughter card can optionally be installed with the corresponding configuration (Redundant Link) in DSAS.

The last D.20 peripheral must be terminated with D.20 terminator (GE Vernova part number 977-0049).

Table 17: Dual D.20 link terminated - Default settings

Function	State
End of Link - D.20 Channel 1	ON
End of Link - D.20 Channel 2	ON
Port B - D.20 Channel 1 (pin 6/7)	OFF
Port B - D.20 Channel 2 (pin 2/3)	ON

Dual D.20 terminated, Ch 1 only

Figure 9: Dual D.20 terminated, Ch 1 only - Topology

Up to 30 D.20 Peripherals in total can be present.

The last D.20 peripheral must be terminated with D.20 terminator (GE Vernova part number 977-0049).

Table 18: Dual D.20 terminated, Ch 1 only - Default settings

Function	State
End of Link - D.20 Channel 1	OFF
End of Link - D.20 Channel 2	OFF
Port B - D.20 Channel 1 (pin 6/7)	OFF
Port B - D.20 Channel 2 (pin 2/3)	ON

Single D.20 link, redundant LAN

Figure 10: Single D.20 link, redundant LAN - Topology

Up to 31 D.20 Peripherals in total can be present.

D.20 redundant LAN daughter card (GE Vernova part number 540-0209 for D.20C and GE Vernova part number 540-0207 for D.20A,S,K) must be installed with the corresponding configuration (Redundant Link) in DSAS.

The last D.20 peripheral must be terminated with D.20 terminator (GE Vernova part number 977-0049).

Table 19: Single D.20 link, redundant LAN - Default settings

Function	State
End of Link - D.20 Channel 1	ON
End of Link - D.20 Channel 2	ON
Port B - D.20 Channel 1 (pin 6/7)	OFF
Port B - D.20 Channel 2 (pin 2/3)	OFF

Redundant D.20 link, redundant LAN

Figure 11: Redundant D.20 link, redundant LAN - Topology

Up to 30 D.20 Peripherals in total can be present.

D.20 redundant LAN daughter card (GE Vernova part number 540-0209 for D.20C and GE Vernova part number 540-0207 for D.20A,S,K) must be installed.

D.20 link adapter must be installed on each D.20 peripheral (GE Vernova part number 540-0313)

The D.20 Link crossover cable must be installed from CCU D.20 Port B to peripheral link (GE Vernova part number 977-0561)

The last D.20 peripheral must be terminated with D.20 terminator (GE Vernova part number 977-0049)

Table 20: Redundant D.20 link, redundant LAN - Default settings

Function	State
End of Link - D.20 Channel 1	ON
End of Link - D.20 Channel 2	ON
Port B - D.20 Channel 1 (pin 6/7)	ON
Port B - D.20 Channel 2 (pin 2/3)	ON

Single D.20 link with redundant G100

Figure 12: Single D.20 link with redundant G100 - Topology

Up to 30 D.20 Peripherals in total can be present.

D.20 redundant LAN daughter card are not supported in Loop mode and must NOT be installed.

Table 21: Single D.20 link with redundant G100 - Default settings

Function	State MCP A	State MCP B
End of Link - D.20 Channel 1	OFF	ON
End of Link - D.20 Channel 2	OFF	ON
Port B - D.20 Channel 1 (pin 6/7)	ON	ON
Port B - D.20 Channel 2 (pin 2/3)	ON	ON

Dual D.20 terminated, with redundant G100

Figure 13: Dual D.20 terminated, with redundant G100 - Topology

Up to 30 D.20 Peripherals in total can be present.

The last D.20 peripheral must be terminated with D.20 terminator (GE Vernova part number 977-0049).

Table 22: Dual D.20 terminated, with redundant MCP – Default settings

Function	State MCP
End of Link - D.20 Channel 1	OFF
End of Link - D.20 Channel 2	OFF
Port B - D.20 Channel 1 (pin 6/7)	ON
Port B - D.20 Channel 2 (pin 2/3)	ON

Single D.20 link, redundant LAN with redundant G100

Figure 14: Single D.20 link, redundant LAN with redundant G100 - Topology

Up to 30 D.20 Peripherals in total can be present.

D.20 redundant LAN daughter card (GE Vernova part number 540-0209 for D.20C and GE Vernova part number 540-0207 for D.20A,S,K) must be installed with the corresponding configuration in DSAS.

Table 23: Single D.20 link, redundant LAN with redundant G100 - Default settings

Function	State MCP A	State MCP B
End of Link - D.20 Channel 1	OFF	ON
End of Link - D.20 Channel 2	OFF	ON
Port B - D.20 Channel 1 (pin 6/7)	ON	ON
Port B - D.20 Channel 2 (pin 2/3)	ON	ON

Single Ring and Fiber Optic (FO) D.20 link with redundant G100

Figure 15: Single Ring and Fiber Optic (FO) D.20 link with redundant G100 - Topology

Up to 30 D.20 Peripherals can be present on a single copper D.20 link, subject to total maximum of 60. This ring was tested with up to 8 D.20 Peripheral GFO drops.

Table 24: Single Ring and Fiber Optic (FO) D.20 link with redundant G100 - Default settings

Function	State MCP A	State MCP B
End of Link - D.20 Channel 1	ON	ON
End of Link - D.20 Channel 2	ON	ON
Port B - D.20 Channel 1 (pin 6/7)	OFF	OFF
Port B - D.20 Channel 2 (pin 2/3)	OFF	OFF

Single Ring and Fiber Optic (FO) D.20 link, redundant LAN with redundant G100

Figure 16: Single Ring and Fiber Optic (FO) D.20 link, redundant LAN with redundant G100 - Topology

Up to 30 D.20 Peripherals can be present on a single copper D.20 link, subject to total maximum of 60.

D.20 redundant LAN daughter card (GE Vernova part number 540-0209 for D.20C and GE Vernova part number 540-0207 for D.20A,S,K) must be installed with the corresponding configuration in DSAS.

This ring was tested with up to 8 D.20 Peripheral GFO drops.

Table 25: Single Ring and Fiber Optic (FO) D.20 link, redundant LAN with redundant G100 - Default settings

Function	State MCP A	State MCP B

End of Link - D.20 Channel 2	ON	ON
Port B - D.20 Channel 1 (pin 6/7)	OFF	OFF
Port B - D.20 Channel 2 (pin 2/3)	OFF	OFF

Serial ports (RS232/485, RJ45, labelled 1-4)

The G100 has 4 Built-in Serial ports available as RJ45 connectors on the bottom panel of the unit.

Each serial port has LED activity (Tx/Rx) indicators on the front panel:

- Tx Activity (Green)
- Rx Activity (Red)

The serial ports are isolated from the rest of the system at 1.5KV AC / 2.1KV DC.

The serial ports support the following communication modes:

- RS232
- RS485 2-Wire

For every port an Rx Termination Resistor of 120 Ohms can be enabled through the software interface.

The pin assignment of the Serial Interfaces is dependent on the operation mode selected for the interface:

Table 26: RJ45 Pin outs for Serial Port Signals

EIA568	TIA/EIA 568A	RJ45 Pin out	RS232	RS485 2-Wire
		1	Rx	D-
		2	CTS	D+
		3	Tx	-
		4	GND	GND
		5	IRIG-B OUT	IRIG-B OUT
		6	RTS	-
		7	-	-
		8	DCD	-

IRIG-B OUT is available only when an IRIG-B IN signal is connected. The G100 does not have an internal IRIG-B signal generator.

The supported levels are compliant to TTL by a load of 120 Ohm or higher. It is current limited and protected against damage by short to GND (Pin 4).

Figure 17: Modular connector 8P8C (RJ45) pins

Shielded twisted pair cables shall be used for wiring.

RS-485 Serial Connections

The G100 can be configured to communicate with RS-232 or RS-485 2-wire type devices using the 4 Built-in Serial Ports.

Each serial port can be independently configured through the Settings GUI. All port configurations persist through a power cycle and when power is lost.

In RS-485 mode End of Link Termination (120 Ohm) can be enabled through the Settings GUI.

When enabled in Settings, End of Link Termination is active only when the device is powered on and applications are running. This has no operational impact because the G100 is meant to act as a master to other devices.

The cables must be shielded and the shield of each RS-485 cable section should be grounded at one end only. This prevents circulating currents and can reduce surge-induced current on long communication lines.

Signal ground on pin4 is to be considered different then shield on cable.

When creating custom cables, it is recommended to only wire the required pins.

The following diagram illustrates how to wire the G100 units using RS485 2-wire.

Figure 18: G100 connection using RS485 2-wire

The following diagram illustrates how to wire redundant G100 units using RS485 2-wire.

Figure 19: Redundant G100 connection using RS485 2-wire

Default Serial Maintenance port (port 4, RS232)

When running the *Factory Default* configuration, G100 has one serial maintenance port enabled, which is **always allocated to Port 4**.

This maintenance port allows users to perform the following workflows:

- Intercept POST and access UEFI settings (useful when a KVM is not connected to G100)
- Access Shell for maintenance actions after the applications started

The following documents provide details for each workflow:

- Configuring UEFI Settings on G100 User Guide (SWM0122)
- G100 Substation Gateway Quick Start Guide (SWM0116)
- MCP Substation Gateway Software Configuration Guide (SWM0101)

NOTICE

While the serial maintenance port is enabled as #4, this same port cannot be used for other applications.

The serial maintenance port can be disabled as following:

- In UEFI for the POST access only. Make sure that UEFI is set to RS232.
- In Settings for Shell access and use by other runtime applications.

If the serial maintenance port is disabled, users can still access the device using either the KVM or Ethernet ports.

UEFI allocation of the serial maintenance port is intended for UEFI access in absence of KVM (during startup), and it is different than Settings serial maintenance port “shell” access (during normal operation).

NOTICE

The default settings for the maintenance port in UEFI are: 115200, 8, N, 1, VT100.

NOTICE

The serial maintenance port will not show POST messages while a monitor is connected to the DP port.

If the serial maintenance port was disabled in UEFI (i.e., Console Redirection disabled) – then UEFI access can be done only using KVM.

If the serial maintenance port was disabled in Settings (for shell access), and the IP addresses are not known or SSH access is blocked in the firewall – then access can be done only using KVM.

Ethernet ports

The top panel of the G100 provides 4 independent Ethernet ports, labelled 1 to 4.

NOTICE

The G100 Ethernet ports use separate MAC addresses.

The G100 Ethernet ports cannot be configured as Redundant Single MAC.

G100 does not support PRP (Parallel Redundancy Protocol IEC62439-3).

TP Ethernet ports and LED indications (labelled 1, 2)

Ports 1 and 2 are RJ45 Copper (RJ45 10/100/1000BASE-TX) with separate NICs (LAN1/2).

Each RJ45 port has LED indicators inside the RJ45 connector:

- Activity (Green)
- Link (Orange)

Each RJ45 port is isolated to 1.5KV AC / 2.1KV DC

SFP Ethernet ports (labelled 3, 4)

Ports 3 and 4 are SFP with separate NICs (LAN3/4).

Into each slot an SFP module can be inserted.

Each SFP port has LED indicators on the front panel:

- Activity (Green)
- Link (Orange)

Each SFP port is isolated to 1.5KV AC / 2.1KV DC

For corresponding SFP modules and order codes see following sections in this document:

Order Code

MCP Spares and Accessories

The following table presents in detail the SFP modules supported by the G100.

Table 27: SFP modules supported by the G100

Item	Description	Manufacturer	Mfg. Part number
580-3784	SFP Module 100BASE-FX LC TRANSCEIVER OPTICAL	BROADCOM (FOXCONN, AVAGO)	HFBR-57E0APZ
	SFP Module 100BASE-FX LC TRANSCEIVER OPTICAL MULTI-MODE 1300nm	AXCEN	AXFE-1314-0523
580-3785	SFP Module 1000BASE-SX LC TRANSCEIVER OPTICAL	BROADCOM (FOXCONN, AVAGO)	AFBR-5710ALZ
		Coherent (FINISAR)	FTLF8519P3BTL
580-3786	SFP Module 1000BASE-TX RJ45 TRANSCEIVER COPPER	Coherent (FINISAR)	FCLF8522P2BTL
		BROADCOM (FOXCONN, AVAGO)	ABCU-5730ARZ
		BROADCOM (FOXCONN, AVAGO)	ABCU-5731ARZ
0123-0004	SFP Module 10/100BASE-TX RJ45 TRANSCEIVER COPPER	AXCEN	AXFE-R1S4-05H3
580-3787	SFP Module 1000Base-LX LC TRANSCEIVER OPTICAL SINGLE-MODE 5km 1310nm -40 to 85C	BROADCOM (FOXCONN, AVAGO)	AFCT-5715ALZ

The cables required to make physical connections to the G100 are as follows:

Table 28: Ethernet cables required by the G100

Media	Designation	Cable	Connector
Twisted Pair Ethernet	100/1000BASE-TX	UTP (Unshielded Twisted Pair) – Cat-5 or better	RJ45
Fiber optic	100BASE-FX	Fiber optic cable multimode	LC
Fiber optic	1000BASE-SX	Fiber optic cable multimode	LC

CAUTION This product contains components rated as Class 1 Laser Products.

G100 cannot read the SFP model automatically. Each SFP Ethernet port must be configured correctly to match the installed SFP type, in the Settings utilities (**mcpcfg, Settings GUI**) – please see the *G100 Quick Start Guide* and *MCP Software Configuration Guide* documents.

The SFP Module 1000BASE-SX LC (580-3785) requires the switch port to have the speed configured for 1GB instead of Auto, and for full duplex mode.

A device reboot is required for new SFP settings to take effect.

Time synchronization IRIG-B input (2 pin connector)

The bottom panel of the unit provides one IRIG-B input connector.

Table 29: IRIG-B input connector pin assignments

PIN NO.	DESCRIPTION
1 (arrow)	SIGNAL
2	GND

This input can be used to synchronize the precision timer of the unit. The supported IRIG-B formats are B002 and B006.

Presence of an IRIG-B signal is indicated by one LED located on the front panel:

When configured as B006 the clock requires a corresponding configuration where the year and quality are included in the IRIG-B signal. If the clock is not configured to provide the year the G100 will show the year 2000.

This Port is isolated from the rest of system with an isolation voltage of 1.5kV AC / 2.1kV DC.

The supported levels are compliant to TTL or TIA232, selectable by an internal jumper:

Green PIN HEADER 1x3 Male 180° 2.0mm DIP

IRIG-B input signal selection jumper JIRIGB1 can be found on the GPIO internal board as shown below.

Table 30: IRIG-B input signal selection TTL/RS-232

Jumper JIRIGB1	DESCRIPTION
1-2	TTL
2-3	RS232

NOTICE

G100 does not support PTP IEEE1588.

NTP and SNTP are supported.

DP Display Port

The top panel of the unit provides one DisplayPort™ connector.

The interface is DisplayPort™ Version 1.2 compliant which is used mainly to enable installation personnel to connect a display for the initial configuration of the device, or a Local Runtime HMI display.

Multi Stream Transport (MST) for multiple attached displays is not supported.

The DisplayPort™ is fused internally. For normal operation don't exceed 0.5 A.

The G100 DP port requires active DP to HDMI or active DP to DVI-D adapters. Passive adapters are not supported.

G100 doesn't support Touch Screen Panel controls due to the absence of external vendor USB drivers. It's recommended to use a Windows Panel PC and the Remote HMI application instead.

USB ports

The top panel of the unit provides the following USB ports:

One USB 3.0 type A connector, mainly used to enable maintenance personnel to connect their equipment and storage devices for software updates.

The USB 3.0 A port is fused internally. For normal operation don't exceed 0.9 A per connector.

The maximum cable length for USB 3.0 cables is 3m (=118in).

Using longer cables than specified for each port might result in data loss.

Two USB 2.0 Type A connectors. Main purpose of these connectors is to enable installation personnel to connect Mouse, Keyboard and equivalent equipment for initial configuration of the device.

Each USB 2.0 A connector is fused separately. For normal operation don't exceed 0.9 A per connector. The cumulative current draw of all four ports is limited to 1A due to thermal and power budget restrictions.

The maximum cable length for USB 2.0 cables is 3m (=118in).

The USB Type C connector is for future applications, currently not used. Please do not connect external devices to it.

Internal Buzzer

The G100 has an internal buzzer, which is intended for local and close proximity general purpose usage.

NOTE

This buzzer has a very low volume and as such is not suitable for critical operators' notifications.

The Local HMI and the DO points in the database can operate the buzzer, subject to above note on low sound level.

Home Dir	Point ID	Point Reference	Point Description
SS00001	-2021	DisableAllControls	DisableAllControls
SS00001	-204	Disable Buzzer	Disable Buzzer
SS00001	-204	Buzzer Sound ON	Buzzer Sound ON

Chapter 5 - Specifications

G100 Product Specifications

System

Processor	Intel Atom X5-E3930 1.3GHz Processor
Memory	8GB SoDIMM 204 pin DDR3L (up to 1866MHz)
Storage	16GB mSATA SSD
Real Time Clock (RTC)	When powered off, the real-time clock remains active for 5 days The G100 provides an internal free running clock with no more than 0.9 second drift in 24 hours when not synchronized with an external source
Operating system	Predix Edge OS
LED indicators	Power indicator, CPU Status indicator, IRIG-B Input indicators, 2x SFP Ethernet port indicators, 2x TP Ethernet port indicators, 4X Serial port indicators, 8x DI channel indicator, 4x DO channel indicator, AI sampling indicator

Communications

Ethernet connections	2 RJ45 Ethernet ports + 2 SFP modules Supported SFP types: 10/100BASE-TX (RJ45 copper medium, Cat-5 or better) 100/1000BASE-TX (RJ45 copper medium, Cat-5 or better) 100BASE-FX 1300nm (LC fiber multimode) 1000BASE-SX 850nm (LC fiber multimode) 1000BASE-LX 1310nm (LC fiber single-mode)
Serial communications	4x serial interfaces accessible via individual RJ45 connectors Serial interfaces use 16550 compatible UART. Support baud rates 200, 300, 600, 1200, 2400, 4800, 9600, 19.2k, 38.4k, 57.6k, 115.2k. Software controlled mode of operation between RS232 or RS485 2-wire. Software controlled termination resistor (120 ohm) for RS485 mode (termination is not active while powered off). All software selection persist when power cycled. IRIG-B available on all serial interfaces.
D.20 Link HDLC Communications	A dual channel card is available to communicate D.20 Link protocol to up to 60 D20 Peripherals per channel. Each channel communicates at 250kbps. Channels are isolated from each and from other internal circuits.
Time synchronization	IRIG-B (TTL) Input Connector available as 2 positions removable Phoenix terminal block on bottom panel

Video Output	DisplayPort (DP) version 1.2 available on top panel
USB Ports	1x USB 3.0 Type A (male) on top panel 2x USB 2.0 Type A (male) on top panel 1x USB 2.0 Type C (male) on top panel (Future use)

Electrical

G100 rated input	Nominal 12/24/48 VDC $\pm 10\%$, 5A/2.5A/1.25A Minimum/Maximum DC voltage: 10 VDC to 60 VDC	
GPIO (DI/DO/AI)	Isolation rating: 820V _{RMS} /1150V _{DC}	
GPIO AI	Full Scale	Configurable, either 0-5V or 0-20mA
	Accuracy	$\pm 0.1\%$ FS (Voltage) / $\pm 0.2\%$ FS (Current)
	Input Impedance (A)	250 OHM $\pm 10\%$
	Conversion range (A)	0 to 20 mA
	Conversion range (V)	0 to 5 V
	Overall conversion update time:	0.25sec (max.)
G100 maximum power consumption	21W Measured under full CPU load, without DI/DO/AI, without PCIe card, at 25°C 50%RH.	

G100 Environmental Specifications

Temperature and Humidity

Storage	-40°C to 85°C
Operating Conditions	-40°C to 70°C
Humidity	5%~90% relative humidity, non-condensing

Ingress Protection (IEC 60529)

IP40 Protected from tools and small wires greater than 1 millimeter. Not protected from liquids.

Mechanical Specifications

Weight

Part	Weight in kg
G100	2.47
D.20 Link HDLC PCIe Card	0.18
Packaging + accessories	2.15

Dimensions

All dimensions are in mm

200 (L) x 90(W) x 195(H) mm

Storage recommendations

Storage conditions

Always store the G100 in an environment compatible with operating conditions. Recommended environmental conditions for storage are:

- Temperature: -40°C to +85°C
- Relative humidity: 5% to 95%, non-condensing

Exposure to excessive temperature or other extreme environmental conditions might cause damage and/or unreliable operation.

To avoid deterioration and early failure of electrolytic capacitors, power up units that are stored in a de-energized state once every 12 months, for one hour continuously.

Chapter 6 - Removing the G100 from Service

Before you begin installing and using the G100, review the information in this chapter, including the following topics:

When the G100 is to be removed from service, it is necessary to:

- Remove the configuration data and sensitive information from:
 - o The G100
 - o The PC used to remotely configure the G100
- Dispose of the equipment.

Remove configuration data and sensitive information from the G100

In the event that it is necessary to remove the configuration data and sensitive information from the G100 (for example, the G100 is being disposed of or being returned for maintenance [i.e., RMA]), this chapter provides the data removal procedure.

For additional information, please refer to “SWM0123 G100 Secure Deployment User Guide”.

To remove configuration data and sensitive information from the G100:

1. For an RMA: GE Vernova recommends restoring the unit to factory default state using the procedure in Section 3 of TN0116 MCP Firmware Upgrade and Restore to Defaults Workflows.
2. For hardware decommissioning and disposal: GE Vernova recommends that you destroy the device as per NIST* recommendations.

* Publication 800-88 Revision 1. Guidelines for Media Sanitization, Recommendations of the National Institute of Standards and Technology:

<http://nvlpubs.nist.gov/nistpubs/SpecialPublications/NIST.SP.800-88r1.pdf>

Removing configuration data on a PC

When a PC application is used to configure the G100, configuration data resides on the data storage media (e.g., hard drives, memory cards, etc.) of the PC running the configuration application.

The G100 configuration data can be removed from the PC by either:

- Recommended: Physically removing and destroying the data storage media, or
- Using a program to securely wipe (that is, completely erase) the data storage media (that is, not just reformat or remove the names of the files from the file allocation table).

Appendix A – Standards & Compliance

Compliance Standards

The G100 complies with the tests listed below.

Standard	Description	Test Level / Class	Pass Criteria
IEEE 1613	IEEE Standard Environmental and Testing Requirements for Communications Networking Devices Installed in Electric Power Substations	Per standard	
IEC 61850-3	Communication Networks and systems for power Utility Automation-Part 3	Per standard	
IEC 62368-1	Audio/Video, Information And Communication Technology Equipment - Part 1: Safety Requirements	Per standard	
IEC 60068-2-1	Cold	-40°C for 16hours	A
	Cold start	1hour soak, 3 power ups every 10 mins	A
IEC 60068-2-2	Dry Heat	+70°C for 16hours	A
	Hot start	1hour soak, 3 power ups every 10 mins	A
IEC 60068-2-78	Damp Heat, steady-state	+40°C, 95%RH, non-condensing, 96hours	A
IEC 60068-2-6	Vibration (sinusoidal)	0.5g, 1 sweep, 3 axes, with EUT energized	A
IEC 60255-21-1		1g, 10 sweep, 3 axes, with EUT non-energized	
IEC 60068-2-27	Shock Response	5g, 3 +/- shocks, 3 axes, with EUT energized.	A
	Shock Withstand	15g, 3 +/- shocks, 3 axes, with EUT non-energized.	
IEC 60068-2-27	Bump (Non-operating test)	10g, 1k bumps, 6 axes, with EUT non-energized.	No damage, functions
IEC 60068-2-31	Drop & Topple	100mm non-energized	No damage, functions
IEC 60255-21-3	Seismic	1-35Hz; X axis: 7.5mm, 2g; Y axis: 3.5mm, 1g	A
EN 60255-27	Product safety requirements: information technology equipment	Impulse: 1/5kV _{PEAK}	No damage, breakdown or flashover
		Dielectric: 820V _{RMS} /1150V _{DC}	
		Insulation Resistance: >100MΩ	
CISPR22	Radiated RF Emission	Radiated Emissions: 30 MHz to 6 GHz	Class A

Standard	Description	Test Level / Class	Pass Criteria
	Conducted Emission	NA	
IEC 61000-4-2	Immunity to Electrostatic Discharge	8kV - Contact/15kV – Air	A
IEEE C37.90.3			
IEC 61000-4-3	Immunity to Radiated RF	80 MHz- 3 GHz @ 10V/m (35V/m)	A
IEEE C37.90.2			
IEC 61000-4-4	Immunity to Fast Transient Burst	4kV/5kHz	A/B
IEEE C37.90.1			
IEC 61000-4-5	Immunity to Surge	Power and Signal ports: 4/2/1/0.5kV	A/B
IEEE 1613			
IEC 61000-4-6	Immunity to Conducted RF	10Vrms/150kHz-80MHz	A
IEC 61000-4-18	Immunity to Damped Oscillatory	2.5kV/1MHz	A/B
IEEE C37.90.1			
IEC 61000-4-8	Immunity to Power Magnetic Field	100A/m @ 180s	A
		1000A/m @ 3s	
IEC 61000-4-11	Immunity to Voltage Dip and Interrupt	100% @ 5, 10-200msec (10msec increments)	A
IEC 61000-4-16	Immunity to Conducted CM Disturbances (DC-150kHz)	30Vrms & 300Vrms	A/B
IEC 61000-4-17	Ripple on DC power supply	10% AC ripple on DC Power Port	A
IEC 61000-4-29	Dip and Interrupt on DC power supply	Voltage Dips: 40%/70% for 0.01 sec	A
		Interruptions: 0% for 0.01 sec	
		Variations: 85% to 120% for 10 sec	

Appendix B – Warranty

Warranty

For products shipped as of October 1st, 2013, G100 warrants most of its GE Vernova manufactured products for 10 years. For warranty details including any limitations and disclaimers, see the GE Vernova Grid Solutions Terms and Conditions at:

<https://www.gevernova.com/grid-solutions/multilin/warranty.htm>

Appendix C – Glossary of terms used in this document

D

DP: Display Port

G

GPIO: General Purpose I/O

GUI: Graphical User Interface (also called Human Machine Interface – HMI)

GW / GTW: Gateway (in Substation Automation context)

H

HMI: Human Machine Interface (also called Graphical User Interface – GUI)

HMI Client: Client-side functionality that resides in the user's browser

HMI Server: Server-side functionality that resides on the G100 and provides services to the client-side browsers

HTTP: HyperText Transfer Protocol

HTTPS: Designated the use of HTTP but with a different default port and an additional encryption/authentication layer between HTTP and TCP

I

IED: Intelligent Electronic Device

IP: Internet Protocol

IRIG-B: Inter Range Instrumentation Group (IRIG) - an American standardized network time code format

L

LAN: Local Area Network

M

MAC: Media Access Control

MCP: Multifunction Controller Platform

N

NIC: Network Interface Card

NTP: Network Time Protocol

NVRAM: Non-Volatile Random Access Memory

P

P: Power

PRP: Parallel Redundancy Protocol

PTP: Precision Time Protocol

R

RTC: Real-time clock

S

SCADA: Supervisory Control And Data Acquisition

SNTP: Simple Network Time Protocol

SSH: Secure Shell

T

TCP: Transmission Control Protocol

U

UR: Universal Relay

URL: Universal Resource Locator

Modification Record

Version	Revision	Date	Change Description
1.00	0	25 th May, 2021	Initial release.
	1	5 th July, 2021	Updated GPIO DO types and Compliance standards.
	2	6 th January, 2022	Updated to reflect that UEFI settings are retained even after super cap discharges.
	3	19 th September, 2022	In Chapter 3, - Updated the steps for Installation of optional D.20 HDLC Card In Chapter 4, - Added Table 13, GE Item # (517-0169) In Chapter 5, - Added Real Time Clock (RTC), clock free running accuracy content in System table
3.00	0	17 th April, 2023	In Chapter 1, - Added Disclaimer - Updated Order Code and added MCP Redundancy Kit Switch Panel (SW PNL) table In Chapter 3, - Added redundancy operation for v3.0 - Added Redundancy wiring for v3.0 - Updated Power-On Self-Test (POST) section
	1	18 th July, 2023	In Chapter 3, - Updated Power-On Self-Test (POST) section In Chapter 4, - Updated DP Display Port section, added content for Display port and adapters required for G100
	2	18 th August, 2023	Corrected G500 reference to G100 in Ordering guides section.

Version	Revision	Date	Change Description
3.10	0	23 rd August, 2023	In Chapter 1 , Updated Order Code
4.00	0	28 th March, 2024	GE Vernova Logo is added on the first page. In Chapter 1, - Updated Order Code - Added sections - Changes to G100 Model Number, As-Built model number digits and As-is model number In Chapter 3, Note is added describing the redundancy mode available for v4.0 in G100 System redundancy section In Chapter 4, - In Supplying power through the D.20 Link section, corrected D.20 power supply rating - Added 4-pin mating connector P/N for D.20 HDLC connectors - Added new sections under D.20 Connection topologies: - Single D.20 link with redundant G100 - Single D.20 link, redundant LAN with redundant G100 - Redundant D.20 link, redundant LAN with redundant G100 In Chapter 5, - In the Communications table, updated the baud rates for Serial Communications
4.10	0	20 th August, 2024	Updated Company name, Copyright Notice and Trademark Notice. In Chapter 1, Updated Order Code

Version	Revision	Date	Change Description
			- Remote Desktop HMI functionality and license are no longer available In Chapter 4, - Added section to specify D.20 Link Capabilities and Restrictions In Chapter 5, - In the Communications table, updated the Ethernet connections
5.00	0	01 st November, 2024	In Chapter 1, - Updated Order Code In Chapter 4, - Updated connections of D.20 link for G100 (A & B) for the following: - Single D.20 link with redundant G100 layout - Single D.20 link, redundant LAN with redundant G100 layout - Updated Table 20 and Table 21 - Removed section Redundant D.20 link, redundant LAN with redundant G100 and Table 22
5.10	0	17 th December, 2024	In Chapter 1, - Updated Order Code In Chapter 4, - Added new sections under D.20 Connection topologies: - Single Ring and Fiber Optic (FO) D.20 link with redundant G100 - Single Ring and Fiber Optic (FO) D.20 link, redundant LAN with redundant G100
5.20	0	08 th May, 2025	In Product Support, Updated GE Vernova email addresses and phone numbers in Contact Technical Support section

Version	Revision	Date	Change Description
			In Chapter 1 , - Updated Order Code - Updated MCP Spares and Accessories table In Chapter 4 , - In the D.20 Connection topologies section, updated all D.20 layouts
	1	24 th June, 2025	In Chapter 4 , - Added clarification for each D.20 layout with maximum supported peripherals - Added new layouts - Dual D.20 terminated, Ch 1 only - Dual D.20 terminated, with redundant G100
	2	03 rd October, 2025	In Chapter 1 , - Updated Order Code with DC Analog Inputs A,V In Chapter 4 , - In Analog DC Inputs (AI) section, added a note and supported illustration showing: - Analog Input selection jumpers (JAI12~JAI15) - IRIG-B Input selection jumper (JIRIGB1) - Updated SFP modules supported by the G100 table In Chapter 5 , - In the Electrical table, added maximum power consumption for G100
5.40	0	09 th February, 2026	In Chapter 1 , - Updated Order Code In Chapter 4 , - Clarified D.20 cable p/n in D.20 Link feature section - Updated SFP modules supported by the G100 table

Version	Revision	Date	Change Description
			In Chapter 5, • In the Electrical table, added GPIO AI – Full Scale, Accuracy, Impedance, Conversion range (A & V) and Conversion time

The software included in this product contains copyrighted software that is licensed under the GPL and other open source licenses.

A copy of each of these licenses is included in this document. You may obtain the complete corresponding source code from us for a period of three years after our last shipment of this product, by contacting the GE Vernova Customer Service Center.

In the U.S. and Canada, call toll-free: 1 877 547 8629

International customers, please call: +1 905 927 7070

Or send an e-mail to: multilin.tech@gevernova.com

This offer is valid to anyone in receipt of this information.

NOTICE

This document applies to the MCP family (G100/G500) unless otherwise indicated.

The document lists the open-source software licenses of the additional third-party packages (i.e., third-party packages not addressed by the next two paragraphs) used in the MCP Version 5.4 firmware and the open-source software licenses of the third-party Java Archive (JAR) files used in DS Agile Studio v5.4 and MCP Runtime HMI v5.4.

The MCP also includes GE Vernova's Predix Edge OS (PEOS), standard distributions of Ubuntu, the JRE from OpenJDK and various Node modules. The list of packages inherited from these distributions are captured in their respective folders from the MCP Product DVD [PEOS (G100), PEOS (G500), Ubuntu, OpenJDK and Node].

The MCP also uses a standard distribution of Arch Linux with the MCP Utilities Package. The list of packages inherited from the Arch Linux distribution is captured on a USB flash drive created by DS Agile Studio in the file "pkglist.x86_64.txt" under the folder "fwupgutil". The licenses for the packages are captured in the folder "/usr/share/" in the squash file archive found on the same USB flash drive in the file "airootfs.sfs", under the folder "fwupgutil/x86_64".

Artistic License

- Perl modules (Apache2::AuthCookie v3.09 , Archive::Zip v1.17_02, Date::Manip v5.44 and String::CRC::Cksum v0.03) are licensed *under the Artistic License* category.

The "Artistic License"

Preamble

The intent of this document is to state the conditions under which a Package may be copied, such that the Copyright Holder maintains some semblance of artistic control over the development of the package, while giving the users of the package the right to use and distribute the Package in a more-or-less customary fashion, plus the right to make reasonable modifications.

Definitions:

"Package" refers to the collection of files distributed by the Copyright Holder, and derivatives of that collection of files created through textual modification.

"Standard Version" refers to such a Package if it has not been modified, or has been modified in accordance with the wishes of the Copyright Holder as specified below.

"Copyright Holder" is whoever is named in the copyright or copyrights for the package.

"You" is you, if you're thinking about copying or distributing this Package.

"Reasonable copying fee" is whatever you can justify on the basis of media cost, duplication charges, time of people involved, and so on. (You will not be required to justify it to the Copyright Holder, but only to the computing community at large as a market that must bear the fee.)

"Freely Available" means that no fee is charged for the item itself, though there may be fees involved in handling the item. It also means that recipients of the item may redistribute it under the same conditions they received it.

1. You may make and give away verbatim copies of the source form of the Standard Version of this Package without restriction, provided that you duplicate all of the original copyright notices and associated disclaimers.
2. You may apply bug fixes, portability fixes and other modifications derived from the Public Domain or from the Copyright Holder. A Package modified in such a way shall still be considered the Standard Version.
3. You may otherwise modify your copy of this Package in any way, provided that you insert a prominent notice in each changed file stating how and when you changed that file, and provided that you do at least ONE of the following:
 - a) place your modifications in the Public Domain or otherwise make them Freely Available, such as by posting said modifications to Usenet or an equivalent medium, or placing the modifications on a major archive site such as uunet.uu.net, or by allowing the Copyright Holder to include your modifications in the Standard Version of the Package.
 - b) use the modified Package only within your corporation or organization.
 - c) rename any non-standard executables so the names do not conflict with standard executables, which must also be provided, and provide a separate manual page for each non-standard executable that clearly documents how it differs from the Standard Version.
 - d) make other distribution arrangements with the Copyright Holder.

4. You may distribute the programs of this Package in object code or executable form, provided that you do at least ONE of the following:

- a) distribute a Standard Version of the executables and library files, together with instructions (in the manual page or equivalent) on where to get the Standard Version.
- b) accompany the distribution with the machine-readable source of the Package with your modifications.
- c) give non-standard executables non-standard names, and clearly document the differences in manual pages (or equivalent), together with instructions on where to get the Standard Version.
- d) make other distribution arrangements with the Copyright Holder.

5. You may charge a reasonable copying fee for any distribution of this Package. You may charge any fee you choose for support of this Package. You may not charge a fee for this Package itself. However, you may distribute this Package in aggregate with other (possibly commercial) programs as part of a larger (possibly commercial) software distribution provided that you do not advertise this Package as a product of your own. You may embed this Package's interpreter within an executable of yours (by linking); this shall be construed as a mere form of aggregation, provided that the complete Standard Version of the interpreter is so embedded.

6. The scripts and library files supplied as input to or produced as output from the programs of this Package do not automatically fall under the copyright of this Package, but belong to whoever generated them, and may be sold commercially, and may be aggregated with this Package. If such scripts or library files are aggregated with this Package via the so-called "undump" or "unexec" methods of producing a binary executable image, then distribution of such an image shall neither be construed as a distribution of this Package nor shall it

fall under the restrictions of Paragraphs 3 and 4, provided that you do not represent such an executable image as a Standard Version of this Package.

7. C subroutines (or comparably compiled subroutines in other languages) supplied by you and linked into this Package in order to emulate subroutines and variables of the language defined by this Package shall not be considered part of this Package, but are the equivalent of input as in Paragraph 6, provided these subroutines do not change the language in any way that would cause it to fail the regression tests for the language.

8. Aggregation of this Package with a commercial distribution is always permitted provided that the use of this Package is embedded; that is, when no overt attempt is made to make this Package's interfaces visible to the end user of the commercial distribution. Such use shall not be construed as a distribution of this Package.

9. The name of the Copyright Holder may not be used to endorse or promote products derived from this software without specific prior written permission.

10. THIS PACKAGE IS PROVIDED "AS IS" AND WITHOUT ANY EXPRESS OR IMPLIED WARRANTIES, INCLUDING, WITHOUT LIMITATION, THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE.

TERMS AND CONDITIONS FOR USE, REPRODUCTION, AND DISTRIBUTION

1. Definitions.

"License" shall mean the terms and conditions for use, reproduction, and distribution as defined by Sections 1 through 9 of this document.

"Licensor" shall mean the copyright owner or entity authorized by the copyright owner that is granting the License.

"Legal Entity" shall mean the union of the acting entity and all other entities that control, are controlled by, or are under common control with that entity. For the purposes of this definition, "control" means (i) the power, direct or indirect, to cause the direction or management of such entity, whether by contract or otherwise, or (ii) ownership of fifty percent (50%) or more of the outstanding shares, or (iii) beneficial ownership of such entity.

"You" (or "Your") shall mean an individual or Legal Entity exercising permissions granted by this License.

"Source" form shall mean the preferred form for making modifications, including but not limited to software source code, documentation source, and configuration files.

"Object" form shall mean any form resulting from mechanical transformation or translation of a Source form, including but not limited to compiled object code, generated documentation and conversions to other media types.

"Work" shall mean the work of authorship, whether in Source or Object form, made available under the License, as indicated by a copyright notice that is included in or attached to the work (an example is provided in the Appendix below).

"Derivative Works" shall mean any work, whether in Source or Object form, that is based on (or derived from) the Work and for which the editorial revisions, annotations, elaborations, or other modifications represent, as a whole, an original work of authorship. For the purposes of this License, Derivative Works shall not include works that remain separable from, or merely link (or bind by name) to the interfaces of, the Work and Derivative Works thereof.

"Contribution" shall mean any work of authorship, including the original version of the Work and any modifications or additions to that Work or Derivative Works thereof, that is intentionally submitted to Licensor for inclusion in the Work by the copyright owner or by an individual or Legal Entity authorized to submit on behalf of the copyright owner. For the purposes of this definition, "submitted" means any form of electronic, verbal, or written communication sent to the Licensor or its representatives, including but not limited to communication on electronic mailing lists, source code control systems, and issue tracking systems that are managed by, or on behalf of, the Licensor for the purpose of discussing and improving the Work, but excluding communication that is conspicuously marked or otherwise designated in writing by the copyright owner as "Not a Contribution."

"Contributor" shall mean Licensor and any individual or Legal Entity on behalf of whom a Contribution has been received by Licensor and subsequently incorporated within the Work.

2. **Grant of Copyright License.** Subject to the terms and conditions of this License, each Contributor hereby grants to You a perpetual, worldwide, non-exclusive, no-charge, royalty-free, irrevocable copyright license to reproduce, prepare Derivative Works of, publicly display, publicly perform, sublicense, and distribute the Work and such Derivative Works in Source or Object form.
3. **Grant of Patent License.** Subject to the terms and conditions of this License, each Contributor hereby grants to You a perpetual, worldwide, non-exclusive, no-charge, royalty-free, irrevocable (except as stated in this section) patent license to make, have made, use, offer to sell, sell, import, and otherwise transfer the Work, where such license applies only to those patent claims licensable by such Contributor that are necessarily infringed by their Contribution(s) alone or by combination of their Contribution(s) with the Work to which such Contribution(s) was submitted. If You institute patent litigation against any entity (including a cross-claim or counterclaim in a lawsuit) alleging that the Work or a Contribution incorporated within the Work constitutes direct or contributory patent infringement, then any patent licenses granted to You under this License for that Work shall terminate as of the date such litigation is filed.
4. **Redistribution.** You may reproduce and distribute copies of the Work or Derivative Works thereof in any medium, with or without modifications, and in Source or Object form, provided that You meet the following conditions:
 - a) You must give any other recipients of the Work or Derivative Works a copy of this License; and
 - b) You must cause any modified files to carry prominent notices stating that You changed the files; and
 - c) You must retain, in the Source form of any Derivative Works that You distribute, all copyright, patent, trademark, and attribution notices from the Source form of the Work, excluding those notices that do not pertain to any part of the Derivative Works; and
 - d) If the Work includes a "NOTICE" text file as part of its distribution, then any Derivative Works that You distribute must include a readable copy of the attribution notices contained within such NOTICE file, excluding those notices that do not pertain to any part of the Derivative Works, in at least one of the following places: within a NOTICE text file distributed as part of the Derivative Works; within the Source form or documentation, if provided along with the Derivative Works; or, within a display generated by the Derivative Works, if and wherever such third-party notices normally appear. The contents of the NOTICE file are for informational purposes only and do not modify the License. You may add Your own attribution notices within Derivative Works that You distribute, alongside or as an addendum to the NOTICE text from the Work, provided that such additional attribution notices cannot be construed as modifying the License.

You may add Your own copyright statement to Your modifications and may provide additional or different license terms and conditions for use, reproduction, or distribution of Your modifications, or for any such Derivative Works as a whole, provided Your use, reproduction, and distribution of the Work otherwise complies with the conditions stated in this License.
5. **Submission of Contributions.** Unless You explicitly state otherwise, any Contribution intentionally submitted for inclusion in the Work by You to the Licensor shall be under the terms and conditions of this License, without any additional terms or conditions. Notwithstanding the above, nothing herein shall supersede or modify the terms of any separate license agreement you may have executed with Licensor regarding such Contributions.
6. **Trademarks.** This License does not grant permission to use the trade names, trademarks, service marks, or product names of the Licensor, except as required for reasonable and customary use in describing the origin of the Work and reproducing the content of the NOTICE file.
7. **Disclaimer of Warranty.** Unless required by applicable law or agreed to in writing, Licensor provides the Work (and each Contributor provides its Contributions) on an "AS IS" BASIS, WITHOUT WARRANTIES OR CONDITIONS OF ANY KIND, either express or implied, including, without limitation, any warranties or conditions of TITLE, NON-INFRINGEMENT, MERCHANTABILITY, or FITNESS FOR A PARTICULAR PURPOSE. You are solely responsible for determining the appropriateness of using or redistributing the Work and assume any risks associated with Your exercise of permissions under this License.

8. **Limitation of Liability.** In no event and under no legal theory, whether in tort (including negligence), contract, or otherwise, unless required by applicable law (such as deliberate and grossly negligent acts) or agreed to in writing, shall any Contributor be liable to You for damages, including any direct, indirect, special, incidental, or consequential damages of any character arising as a result of this License or out of the use or inability to use the Work (including but not limited to damages for loss of goodwill, work stoppage, computer failure or malfunction, or any and all other commercial damages or losses), even if such Contributor has been advised of the possibility of such damages.
9. **Accepting Warranty or Additional Liability.** While redistributing the Work or Derivative Works thereof, You may choose to offer, and charge a fee for, acceptance of support, warranty, indemnity, or other liability obligations and/or rights consistent with this License. However, in accepting such obligations, You may act only on Your own behalf and on Your sole responsibility, not on behalf of any other Contributor, and only if You agree to indemnify, defend, and hold each Contributor harmless for any liability incurred by, or claims asserted against, such Contributor by reason of your accepting any such warranty or additional liability.

END OF TERMS AND CONDITIONS

APPENDIX: How to apply the Apache License to your work.

To apply the Apache License to your work, attach the following boilerplate notice, with the fields enclosed by brackets "[]" replaced with your own identifying information. (Don't include the brackets!) The text should be enclosed in the appropriate comment syntax for the file format. We also recommend that a file or class name and description of purpose be included on the same "printed page" as the copyright notice for easier identification within third-party archives.

Copyright [yyyy] [name of copyright owner]

Licensed under the Apache License, Version 2.0 (the "License"); you may not use this file except in compliance with the License. You may obtain a copy of the License at <http://www.apache.org/licenses/LICENSE-2.0>

Unless required by applicable law or agreed to in writing, software distributed under the License is distributed on an "AS IS" BASIS, WITHOUT WARRANTIES OR CONDITIONS OF ANY KIND, either express or implied. See the License for the specific language governing permissions and limitations under the License.

Eclipse Public License - v 1.0

- paho-mqtt-cpp v1.2.0 is licensed under the Eclipse Public License v 1.0 Category.

Eclipse Public License - v 1.0

THE ACCOMPANYING PROGRAM IS PROVIDED UNDER THE TERMS OF THIS ECLIPSE PUBLIC LICENSE ("AGREEMENT"). ANY USE, REPRODUCTION OR DISTRIBUTION OF THE PROGRAM CONSTITUTES RECIPIENT'S ACCEPTANCE OF THIS AGREEMENT.

1. DEFINITIONS

"Contribution" means:

- a) in the case of the initial Contributor, the initial code and documentation distributed under this Agreement, and
- b) in the case of each subsequent Contributor:
 - i) changes to the Program, and

ii) additions to the Program;

where such changes and/or additions to the Program originate from and are distributed by that particular Contributor. A Contribution 'originates' from a Contributor if it was added to the Program by such Contributor itself or anyone acting on such Contributor's behalf. Contributions do not include additions to the Program which: (i) are separate modules of software distributed in conjunction with the Program under their own license agreement, and (ii) are not derivative works of the Program.

"Contributor" means any person or entity that distributes the Program.

"Licensed Patents" mean patent claims licensable by a Contributor which are necessarily infringed by the use or sale of its Contribution alone or when combined with the Program.

"Program" means the Contributions distributed in accordance with this Agreement.

"Recipient" means anyone who receives the Program under this Agreement, including all Contributors.

2. GRANT OF RIGHTS

a) Subject to the terms of this Agreement, each Contributor hereby grants Recipient a non-exclusive, worldwide, royalty-free copyright license to reproduce, prepare derivative works of, publicly display, publicly perform, distribute and sublicense the Contribution of such Contributor, if any, and such derivative works, in source code and object code form.

b) Subject to the terms of this Agreement, each Contributor hereby grants Recipient a non-exclusive, worldwide, royalty-free patent license under Licensed Patents to make, use, sell, offer to sell, import and otherwise transfer the Contribution of such Contributor, if any, in source code and object code form. This patent license shall apply to the combination of the Contribution and the Program if, at the time the Contribution is added by the Contributor, such addition of the Contribution causes such combination to be covered by the Licensed Patents. The patent license shall not apply to any other combinations which include the Contribution. No hardware per se is licensed hereunder.

c) Recipient understands that although each Contributor grants the licenses to its Contributions set forth herein, no assurances are provided by any Contributor that the Program does not infringe the patent or other intellectual property rights of any other entity. Each Contributor disclaims any liability to Recipient for claims brought by any other entity based on infringement of intellectual property rights or otherwise. As a condition to exercising the rights and licenses granted hereunder, each Recipient hereby assumes sole responsibility to secure any other intellectual property rights needed, if any. For example, if a third party patent license is required to allow Recipient to distribute the Program, it is Recipient's responsibility to acquire that license before distributing the Program.

d) Each Contributor represents that to its knowledge it has sufficient copyright rights in its Contribution, if any, to grant the copyright license set forth in this Agreement.

3. REQUIREMENTS

A Contributor may choose to distribute the Program in object code form under its own license agreement, provided that:

a) it complies with the terms and conditions of this Agreement; and

b) its license agreement:

i) effectively disclaims on behalf of all Contributors all warranties and conditions, express and implied, including warranties or conditions of title and non-infringement, and implied warranties or conditions of merchantability and fitness for a particular purpose;

ii) effectively excludes on behalf of all Contributors all liability for damages, including direct, indirect, special, incidental and consequential damages, such as lost profits;

iii) states that any provisions which differ from this Agreement are offered by that Contributor alone and not by any other party; and

iv) states that source code for the Program is available from such Contributor, and informs licensees how to obtain it in a reasonable manner on or through a medium customarily used for software exchange.

When the Program is made available in source code form:

a) it must be made available under this Agreement; and

b) a copy of this Agreement must be included with each copy of the Program.

Contributors may not remove or alter any copyright notices contained within the Program.

Each Contributor must identify itself as the originator of its Contribution, if any, in a manner that reasonably allows subsequent Recipients to identify the originator of the Contribution.

4. COMMERCIAL DISTRIBUTION

Commercial distributors of software may accept certain responsibilities with respect to end users, business partners and the like. While this license is intended to facilitate the commercial use of the Program, the Contributor who includes the Program in a commercial product offering should do so in a manner which does not create potential liability for other Contributors. Therefore, if a Contributor includes the Program in a commercial product offering, such Contributor ("Commercial Contributor") hereby agrees to defend and indemnify every other Contributor ("Indemnified Contributor") against any losses, damages and costs (collectively "Losses") arising from claims, lawsuits and other legal actions brought by a third party against the Indemnified Contributor to the extent caused by the acts or omissions of such Commercial Contributor in connection with its distribution of the Program in a commercial product offering. The obligations in this section do not apply to any claims or Losses relating to any actual or alleged intellectual property infringement. In order to qualify, an Indemnified Contributor must: a) promptly notify the Commercial Contributor in writing of such claim, and b) allow the Commercial Contributor to control, and cooperate with the Commercial Contributor in, the defense and any related settlement negotiations. The Indemnified Contributor may participate in any such claim at its own expense.

For example, a Contributor might include the Program in a commercial product offering, Product X. That Contributor is then a Commercial Contributor. If that Commercial Contributor then makes performance claims, or offers warranties related to Product X, those performance claims and warranties are such Commercial Contributor's responsibility alone. Under this section, the Commercial Contributor would have to defend claims against the other Contributors related to those performance claims and warranties, and if a court requires any other Contributor to pay any damages as a result, the Commercial Contributor must pay those damages.

5. NO WARRANTY

EXCEPT AS EXPRESSLY SET FORTH IN THIS AGREEMENT, THE PROGRAM IS PROVIDED ON AN "AS IS" BASIS, WITHOUT WARRANTIES OR CONDITIONS OF ANY KIND, EITHER EXPRESS OR IMPLIED INCLUDING, WITHOUT LIMITATION, ANY WARRANTIES OR CONDITIONS OF TITLE, NON-INFRINGEMENT, MERCHANTABILITY OR

FITNESS FOR A PARTICULAR PURPOSE. Each Recipient is solely responsible for determining the appropriateness of using and distributing the Program and assumes all risks associated with its exercise of rights under this Agreement, including but not limited to the risks and costs of program errors, compliance with applicable laws, damage to or loss of data, programs or equipment, and unavailability or interruption of operations.

6. DISCLAIMER OF LIABILITY

EXCEPT AS EXPRESSLY SET FORTH IN THIS AGREEMENT, NEITHER RECIPIENT NOR ANY CONTRIBUTORS SHALL HAVE ANY LIABILITY FOR ANY DIRECT, INDIRECT, INCIDENTAL, SPECIAL, EXEMPLARY, OR CONSEQUENTIAL DAMAGES (INCLUDING WITHOUT LIMITATION LOST PROFITS), HOWEVER CAUSED AND ON ANY THEORY OF LIABILITY, WHETHER IN CONTRACT, STRICT LIABILITY, OR TORT (INCLUDING NEGLIGENCE OR OTHERWISE) ARISING IN ANY WAY OUT OF THE USE OR DISTRIBUTION OF THE PROGRAM OR THE EXERCISE OF ANY RIGHTS GRANTED HEREUNDER, EVEN IF ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

7. GENERAL

If any provision of this Agreement is invalid or unenforceable under applicable law, it shall not affect the validity or enforceability of the remainder of the terms of this Agreement, and without further action by the parties hereto, such provision shall be reformed to the minimum extent necessary to make such provision valid and enforceable.

If Recipient institutes patent litigation against any entity (including a cross-claim or counterclaim in a lawsuit) alleging that the Program itself (excluding combinations of the Program with other software or hardware) infringes such Recipient's patent(s), then such Recipient's rights granted under Section 2(b) shall terminate as of the date such litigation is filed.

All Recipient's rights under this Agreement shall terminate if it fails to comply with any of the material terms or conditions of this Agreement and does not cure such failure in a reasonable period of time after becoming aware of such noncompliance. If all Recipient's rights under this Agreement terminate, Recipient agrees to cease use and distribution of the Program as soon as reasonably practicable. However, Recipient's obligations under this Agreement and any licenses granted by Recipient relating to the Program shall continue and survive.

Everyone is permitted to copy and distribute copies of this Agreement, but in order to avoid inconsistency the Agreement is copyrighted and may only be modified in the following manner. The Agreement Steward reserves the right to publish new versions (including revisions) of this Agreement from time to time. No one other than the Agreement Steward has the right to modify this Agreement. The Eclipse Foundation is the initial Agreement Steward. The Eclipse Foundation may assign the responsibility to serve as the Agreement Steward to a suitable separate entity. Each new version of the Agreement will be given a distinguishing version number. The Program (including Contributions) may always be distributed subject to the version of the Agreement under which it was received. In addition, after a new version of the Agreement is published, Contributor may elect to distribute the Program (including its Contributions) under the new version. Except as expressly stated in Sections 2(a) and 2(b) above, Recipient receives no rights or licenses to the intellectual property of any Contributor under this Agreement, whether expressly, by implication, estoppel or otherwise. All rights in the Program not expressly granted under this Agreement are reserved.

This Agreement is governed by the laws of the State of New York and the intellectual property laws of the United States of America. No party to this Agreement will bring a legal action under this Agreement more than one year after the cause of action arose. Each party waives its rights to a jury trial in any resulting litigation.

Eclipse Public License – v2.0

- aspectjrt-1.9.22.1.jar is licensed under the Eclipse Public License v 2.0 Category

Eclipse Public License - v 2.0

THE ACCOMPANYING PROGRAM IS PROVIDED UNDER THE TERMS OF THIS ECLIPSE PUBLIC LICENSE ("AGREEMENT"). ANY USE, REPRODUCTION OR DISTRIBUTION OF THE PROGRAM CONSTITUTES RECIPIENT'S ACCEPTANCE OF THIS AGREEMENT.

1. DEFINITIONS

"Contribution" means:

- a) in the case of the initial Contributor, the initial content Distributed under this Agreement, and
- b) in the case of each subsequent Contributor:
 - i) changes to the Program, and
 - ii) additions to the Program;where such changes and/or additions to the Program originate from and are Distributed by that particular Contributor. A Contribution "originates" from a Contributor if it was added to the Program by such Contributor itself or anyone acting on such Contributor's behalf. Contributions do not include changes or additions to the Program that are not Modified Works.

"Contributor" means any person or entity that Distributes the Program.

"Licensed Patents" mean patent claims licensable by a Contributor which are necessarily infringed by the use or sale of its Contribution alone or when combined with the Program.

"Program" means the Contributions Distributed in accordance with this Agreement.

"Recipient" means anyone who receives the Program under this Agreement or any Secondary License (as applicable), including Contributors.

"Derivative Works" shall mean any work, whether in Source Code or other form, that is based on (or derived from) the Program and for which the editorial revisions, annotations, elaborations, or other modifications represent, as a whole, an original work of authorship.

"Modified Works" shall mean any work in Source Code or other form that results from an addition to, deletion from, or modification of the contents of the Program, including, for purposes of clarity any new file in Source Code form that contains any contents of the Program. Modified Works shall not include works that contain only declarations, interfaces, types, classes, structures, or files of the Program solely in each case in order to link to, bind by name, or subclass the Program or Modified Works thereof.

"Distribute" means the acts of a) distributing or b) making available in any manner that enables the transfer of a copy.

"Source Code" means the form of a Program preferred for making modifications, including but not limited to software source code, documentation source, and configuration files.

"Secondary License" means either the GNU General Public License, Version 2.0, or any later versions of that license, including any exceptions or additional permissions as identified by the initial Contributor.

2. GRANT OF RIGHTS

a) Subject to the terms of this Agreement, each Contributor hereby grants Recipient a non-exclusive, worldwide, royalty-free copyright license to reproduce, prepare Derivative Works of, publicly display, publicly perform, Distribute and sublicense the Contribution of such Contributor, if any, and such Derivative Works.

b) Subject to the terms of this Agreement, each Contributor hereby grants Recipient a non-exclusive, worldwide, royalty-free patent license under Licensed Patents to make, use, sell, offer to sell, import and otherwise transfer the Contribution of such Contributor, if any, in Source Code or other form. This patent license shall apply to the combination of the Contribution and the Program if, at the time the Contribution is added by the Contributor, such addition of the Contribution causes such combination to be covered by the Licensed Patents. The patent license shall not apply to any other combinations which include the Contribution. No hardware per se is licensed hereunder.

c) Recipient understands that although each Contributor grants the licenses to its Contributions set forth herein, no assurances are provided by any Contributor that the Program does not infringe the patent or other intellectual property rights of any other entity. Each Contributor disclaims any liability to Recipient for claims brought by any other entity based on infringement of intellectual property rights or otherwise. As a condition to exercising the rights and licenses granted hereunder, each Recipient hereby assumes sole responsibility to secure any other intellectual property rights needed, if any. For example, if a third party patent license is required to allow Recipient to Distribute the Program, it is Recipient's responsibility to acquire that license before distributing the Program.

d) Each Contributor represents that to its knowledge it has sufficient copyright rights in its Contribution, if any, to grant the copyright license set forth in this Agreement.

e) Notwithstanding the terms of any Secondary License, no Contributor makes additional grants to any Recipient (other than those set forth in this Agreement) as a result of such Recipient's

receipt of the Program under the terms of a Secondary License (if permitted under the terms of Section 3).

3. REQUIREMENTS

3.1 If a Contributor Distributes the Program in any form, then:

- a) the Program must also be made available as Source Code, in accordance with section 3.2, and the Contributor must accompany the Program with a statement that the Source Code for the Program is available under this Agreement, and informs Recipients how to obtain it in a reasonable manner on or through a medium customarily used for software exchange; and
- b) the Contributor may Distribute the Program under a license different than this Agreement, provided that such license:
 - i) effectively disclaims on behalf of all other Contributors all warranties and conditions, express and implied, including warranties or conditions of title and non-infringement, and implied warranties or conditions of merchantability and fitness for a particular purpose;
 - ii) effectively excludes on behalf of all other Contributors all liability for damages, including direct, indirect, special, incidental and consequential damages, such as lost profits;
 - iii) does not attempt to limit or alter the recipients' rights in the Source Code under section 3.2; and
 - iv) requires any subsequent distribution of the Program by any party to be under a license that satisfies the requirements of this section 3.

3.2 When the Program is Distributed as Source Code:

- a) it must be made available under this Agreement, or if the Program (i) is combined with other material in a separate file or files made available under a Secondary License, and (ii) the initial Contributor attached to the Source Code the notice described in Exhibit A of this Agreement, then the Program may be made available under the terms of such Secondary Licenses, and
- b) a copy of this Agreement must be included with each copy of the Program.

3.3 Contributors may not remove or alter any copyright, patent, trademark, attribution notices, disclaimers of warranty, or limitations of liability ("notices") contained within the Program from any copy of the Program which they Distribute, provided that Contributors may add their own appropriate notices.

4. COMMERCIAL DISTRIBUTION

Commercial distributors of software may accept certain responsibilities with respect to end users, business partners and the like. While this license is intended to facilitate the commercial use of the Program, the Contributor who includes the Program in a commercial product offering should do so in a manner which does not create potential liability for other Contributors. Therefore, if a Contributor includes the Program in a commercial product offering, such Contributor ("Commercial Contributor") hereby agrees to defend and indemnify every other Contributor ("Indemnified Contributor") against any losses, damages and costs (collectively "Losses") arising from claims, lawsuits and other legal actions brought by a third party against the Indemnified Contributor to the extent caused by the acts or omissions of such Commercial Contributor in connection with its distribution of the Program in a commercial product offering. The obligations in this section do not apply to any claims or Losses relating to any actual or alleged intellectual property infringement. In order to qualify, an Indemnified Contributor must: a) promptly notify the Commercial Contributor in writing of such claim, and b) allow the Commercial Contributor to control, and cooperate with the Commercial Contributor in, the defense and any related settlement negotiations. The Indemnified Contributor may participate in any such claim at its own expense.

For example, a Contributor might include the Program in a commercial product offering, Product X. That Contributor is then a Commercial Contributor. If that Commercial Contributor then makes performance claims, or offers warranties related to Product X, those performance claims and warranties are such Commercial Contributor's responsibility alone. Under this section, the Commercial Contributor would have to defend claims against the other Contributors related to those performance claims and warranties, and if a court requires any other Contributor to pay any damages as a result, the Commercial Contributor must pay those damages.

5. NO WARRANTY

EXCEPT AS EXPRESSLY SET FORTH IN THIS AGREEMENT, AND TO THE EXTENT PERMITTED BY APPLICABLE LAW, THE PROGRAM IS PROVIDED ON AN "AS IS" BASIS, WITHOUT WARRANTIES OR CONDITIONS OF ANY KIND, EITHER EXPRESS OR IMPLIED INCLUDING, WITHOUT LIMITATION, ANY WARRANTIES OR CONDITIONS OF TITLE, NON-INFRINGEMENT, MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE. Each Recipient is solely responsible for determining the appropriateness of using and distributing the Program and assumes all risks associated with its exercise of rights under this Agreement, including but not limited to the risks and costs of program errors, compliance with applicable laws, damage to or loss of data, programs or equipment, and unavailability or interruption of operations.

6. DISCLAIMER OF LIABILITY

EXCEPT AS EXPRESSLY SET FORTH IN THIS AGREEMENT, AND TO THE EXTENT PERMITTED BY APPLICABLE LAW, NEITHER RECIPIENT NOR ANY CONTRIBUTORS SHALL HAVE ANY LIABILITY FOR ANY DIRECT, INDIRECT, INCIDENTAL, SPECIAL, EXEMPLARY, OR CONSEQUENTIAL DAMAGES (INCLUDING WITHOUT LIMITATION LOST PROFITS), HOWEVER CAUSED AND ON ANY THEORY OF LIABILITY, WHETHER IN CONTRACT, STRICT LIABILITY, OR TORT (INCLUDING NEGLIGENCE OR OTHERWISE) ARISING IN ANY WAY OUT OF THE USE OR DISTRIBUTION OF THE PROGRAM OR THE EXERCISE OF ANY RIGHTS GRANTED HEREUNDER, EVEN IF ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

7. GENERAL

If any provision of this Agreement is invalid or unenforceable under applicable law, it shall not affect the validity or enforceability of the remainder of the terms of this Agreement, and without further action by the parties hereto, such provision shall be reformed to the minimum extent necessary to make such provision valid and enforceable.

If Recipient institutes patent litigation against any entity (including a cross-claim or counterclaim in a lawsuit) alleging that the Program itself (excluding combinations of the Program with other software or hardware) infringes such Recipient's patent(s), then such Recipient's rights granted under Section 2(b) shall terminate as of the date such litigation is filed.

All Recipient's rights under this Agreement shall terminate if it fails to comply with any of the material terms or conditions of this Agreement and does not cure such failure in a reasonable period of time after becoming aware of such noncompliance. If all Recipient's rights under this Agreement terminate, Recipient agrees to cease use and distribution of the Program as soon as reasonably practicable. However, Recipient's obligations under this Agreement and any licenses granted by Recipient relating to the Program shall continue and survive.

Everyone is permitted to copy and distribute copies of this Agreement, but in order to avoid inconsistency the Agreement is copyrighted and may only be modified in the following manner. The Agreement Steward reserves the right to publish new versions (including revisions) of this Agreement from time to time. No one other than the Agreement Steward has the right to modify this Agreement. The Eclipse Foundation is the initial Agreement Steward. The Eclipse Foundation may assign the responsibility to serve as the Agreement Steward to a suitable separate entity. Each new version of the Agreement will be given a distinguishing version number. The Program (including Contributions) may always be Distributed subject to the version of the Agreement under which it was received. In addition, after a new version of the Agreement is published, Contributor may elect to Distribute the Program (including its Contributions) under the new version.

Except as expressly stated in Sections 2(a) and 2(b) above, Recipient receives no rights or licenses to the intellectual property of any Contributor under this Agreement, whether expressly, by implication, estoppel or otherwise. All rights in the Program not expressly granted under this Agreement are reserved. Nothing in this Agreement is intended to be enforceable by any entity that is not a Contributor or Recipient. No third-party beneficiary rights are created under this Agreement.

Exhibit A - Form of Secondary Licenses Notice

"This Source Code may also be made available under the following Secondary Licenses when the conditions for such availability set forth in the Eclipse Public License, v. 2.0 are satisfied: {name license(s), version(s), and exceptions or additional permissions here}."

Simply including a copy of this Agreement, including this Exhibit A is not sufficient to license the Source Code under Secondary Licenses.

If it is not possible or desirable to put the notice in a particular file, then You may include the notice in a location (such as a LICENSE file in a relevant directory) where a recipient would be likely to look for such a notice.

You may add additional accurate notices of copyright ownership.

Mozilla Public License Version 2.0

- httpclient-4.5.14.jar is licensed under the Mozilla Public License Version 2.0 category.

Mozilla Public License Version 2.0

=====

1. Definitions

1.1. "Contributor" means each individual or legal entity that creates, contributes to the creation of, or owns Covered Software.

1.2. "Contributor Version" means the combination of the Contributions of others (if any) used by a Contributor and that particular Contributor's Contribution.

1.3. "Contribution" means Covered Software of a particular Contributor.

1.4. "Covered Software" means Source Code Form to which the initial Contributor has attached the notice in Exhibit A, the Executable Form of such Source Code Form, and Modifications of such Source Code Form, in each case including portions thereof.

1.5. "Incompatible With Secondary Licenses" means

(a) that the initial Contributor has attached the notice described in Exhibit B to the Covered Software; or

(b) that the Covered Software was made available under the terms of version 1.1 or earlier of the License, but not also under the terms of a Secondary License.

1.6. "Executable Form" means any form of the work other than Source Code Form.

1.7. "Larger Work" means a work that combines Covered Software with other material, in a separate file or files, that is not Covered Software.

1.8. "License" means this document.

1.9. "Licensable" means having the right to grant, to the maximum extent possible, whether at the time of the initial grant or subsequently, any and all of the rights conveyed by this License.

1.10. "Modifications" means any of the following:

(a) any file in Source Code Form that results from an addition to, deletion from, or modification of the contents of Covered Software; or

(b) any new file in Source Code Form that contains any Covered Software.

1.11. "Patent Claims" of a Contributor means any patent claim(s), including without limitation, method, process, and apparatus claims, in any patent Licensable by such Contributor that would be infringed, but for the grant of the License, by the making, using, selling, offering for sale, having made, import, or transfer of either its Contributions or its Contributor Version.

1.12. "Secondary License" means either the GNU General Public License, Version 2.0, the GNU Lesser General Public License, Version 2.1, the GNU Affero General Public License, Version 3.0, or any later versions of those licenses.

1.13. "Source Code Form" means the form of the work preferred for making modifications.

1.14. "You" (or "Your") means an individual or a legal entity exercising rights under this License. For legal entities, "You" includes any entity that controls, is controlled by, or is under common control with You. For purposes of this definition, "control" means (a) the power, direct or indirect, to cause the direction or management of such entity, whether by contract or otherwise, or (b) ownership of more than fifty percent (50%) of the outstanding shares or beneficial ownership of such entity.

2. License Grants and Conditions

2.1. Grants

Each Contributor hereby grants You a world-wide, royalty-free, non-exclusive license:

- (a) under intellectual property rights (other than patent or trademark) Licensable by such Contributor to use, reproduce, make available, modify, display, perform, distribute, and otherwise exploit its Contributions, either on an unmodified basis, with Modifications, or as part of a Larger Work; and
- (b) under Patent Claims of such Contributor to make, use, sell, offer for sale, have made, import, and otherwise transfer either its Contributions or its Contributor Version.

2.2. Effective Date

The licenses granted in Section 2.1 with respect to any Contribution become effective for each Contribution on the date the Contributor first distributes such Contribution.

2.3. Limitations on Grant Scope

The licenses granted in this Section 2 are the only rights granted under this License. No additional rights or licenses will be implied from the distribution or licensing of Covered Software under this License. Notwithstanding Section 2.1(b) above, no patent license is granted by a Contributor:

- (a) for any code that a Contributor has removed from Covered Software; or
 - (b) for infringements caused by: (i) Your and any other third party's modifications of Covered Software, or (ii) the combination of its Contributions with other software (except as part of its Contributor Version); or
 - (c) under Patent Claims infringed by Covered Software in the absence of its Contributions.
- This License does not grant any rights in the trademarks, service marks, or logos of any Contributor (except as may be necessary to comply with the notice requirements in Section 3.4).

2.4. Subsequent Licenses

No Contributor makes additional grants as a result of Your choice to distribute the Covered Software under a subsequent version of this License (see Section 10.2) or under the terms of a Secondary License (if permitted under the terms of Section 3.3).

2.5. Representation

Each Contributor represents that the Contributor believes its Contributions are its original creation(s) or it has sufficient rights to grant the rights to its Contributions conveyed by this License.

2.6. Fair Use

This License is not intended to limit any rights You have under applicable copyright doctrines of fair use, fair dealing, or other equivalents.

2.7. Conditions

Sections 3.1, 3.2, 3.3, and 3.4 are conditions of the licenses granted in Section 2.1.

3. Responsibilities

3.1. Distribution of Source Form

All distribution of Covered Software in Source Code Form, including any Modifications that You create or to which You contribute, must be under the terms of this License. You must inform recipients that the Source Code Form of the Covered Software is governed by the terms of this License, and how they can obtain a copy of this License. You may not attempt to alter or restrict the recipients' rights in the Source Code Form.

3.2. Distribution of Executable Form

If You distribute Covered Software in Executable Form then:

- (a) such Covered Software must also be made available in Source Code Form, as described in Section 3.1, and You must inform recipients of the Executable Form how they can obtain a copy of such Source Code Form by reasonable means in a timely manner, at a charge no more than the cost of distribution to the recipient; and
- (b) You may distribute such Executable Form under the terms of this License, or sublicense it under different terms, provided that the license for the Executable Form does not attempt to limit or alter the recipients' rights in the Source Code Form under this License.

3.3. Distribution of a Larger Work

You may create and distribute a Larger Work under terms of Your choice, provided that You also comply with the requirements of this License for the Covered Software. If the Larger Work is a combination of Covered Software with a work governed by one or more Secondary Licenses, and the Covered Software is not Incompatible With Secondary Licenses, this License permits You to additionally distribute such Covered Software under the terms of such Secondary License(s), so that the recipient of the Larger Work may, at their option, further distribute the Covered Software under the terms of either this License or such Secondary License(s).

3.4. Notices

You may not remove or alter the substance of any license notices (including copyright notices, patent notices, disclaimers of warranty, or limitations of liability) contained within the Source Code Form of the Covered Software, except that You may alter any license notices to the extent required to remedy known factual inaccuracies.

3.5. Application of Additional Terms

You may choose to offer, and to charge a fee for, warranty, support, indemnity or liability obligations to one or more recipients of Covered Software. However, You may do so only on Your own behalf, and not on behalf of any Contributor. You must make it absolutely clear that any such warranty, support, indemnity, or liability obligation is offered by You alone, and You hereby agree to indemnify every Contributor for any liability incurred by such Contributor as a result of warranty, support, indemnity or liability terms You offer. You may include additional disclaimers of warranty and limitations of liability specific to any jurisdiction.

4. Inability to Comply Due to Statute or Regulation

If it is impossible for You to comply with any of the terms of this License with respect to some or all of the Covered Software due to statute, judicial order, or regulation then You must: (a) comply with the terms of this License to the maximum extent possible; and (b) describe the limitations and the code they affect. Such description must be placed in a text file included with all distributions of the Covered Software under this License. Except to the extent prohibited by statute or regulation, such description must be sufficiently detailed for a recipient of ordinary skill to be able to understand it.

5. Termination

5.1. The rights granted under this License will terminate automatically if You fail to comply with any of its terms. However, if You become compliant, then the rights granted under this License from a particular Contributor are reinstated (a) provisionally, unless and until such Contributor explicitly and finally terminates Your grants, and (b) on an ongoing basis, if such Contributor fails to notify You of the non-compliance by some reasonable means prior to 60 days after You have come back into compliance. Moreover, Your grants from a particular Contributor are reinstated on an ongoing basis if such Contributor notifies You of the non-compliance by some reasonable means, this is the first time You have received notice of non-compliance with this License from such Contributor, and You become compliant prior to 30 days after Your receipt of the notice.

5.2. If You initiate litigation against any entity by asserting a patent infringement claim (excluding declaratory judgment actions, counter-claims, and cross-claims) alleging that a Contributor Version directly or indirectly infringes any patent, then the rights granted to You by any and all Contributors for the Covered Software under Section 2.1 of this License shall terminate.

5.3. In the event of termination under Sections 5.1 or 5.2 above, all end user license agreements (excluding distributors and resellers) which have been validly granted by You or Your distributors under this License prior to termination shall survive termination.

6. Disclaimer of Warranty

* ----- *

Covered Software is provided under this License on an "as is" basis, without warranty of any kind, either expressed, implied, or statutory, including, without limitation, warranties that the Covered Software is free of defects, merchantable, fit for a particular purpose or non-infringing. The entire risk as to the quality and performance of the Covered Software is with You. Should any Covered Software prove defective in any respect, You (not any Contributor) assume the cost of any necessary servicing, repair, or correction. This disclaimer of warranty constitutes an essential part of this License. No use of any Covered Software is authorized under this License except under this disclaimer.

7. Limitation of Liability

* ----- *

Under no circumstances and under no legal theory, whether tort (including negligence), contract, or otherwise, shall any Contributor, or anyone who distributes Covered Software as permitted above, be liable to You for any direct, indirect, special, incidental, or consequential damages of any character including, without limitation, damages for lost profits, loss of goodwill, work stoppage, computer failure or malfunction, or any and all other commercial damages or losses, even if such party shall have been informed of the possibility of such damages. This limitation of liability shall not apply to liability for death or personal injury resulting from such party's negligence to the extent applicable law prohibits such limitation. Some jurisdictions do not allow the exclusion or limitation of incidental or consequential damages, so this exclusion and limitation may not apply to You.

8. Litigation

Any litigation relating to this License may be brought only in the courts of a jurisdiction where the defendant maintains its principal place of business and such litigation shall be governed by laws of that jurisdiction, without reference to its conflict-of-law provisions. Nothing in this Section shall prevent a party's ability to bring cross-claims or counter-claims.

9. Miscellaneous

This License represents the complete agreement concerning the subject matter hereof. If any provision of this License is held to be unenforceable, such provision shall be reformed only to the extent necessary to make it enforceable. Any law or regulation which provides that the language of a contract shall be construed against the drafter shall not be used to construe this License against a Contributor.

10. Versions of the License

10.1. New Versions

Mozilla Foundation is the license steward. Except as provided in Section 10.3, no one other than the license steward has the right to modify or publish new versions of this License. Each version will be given a distinguishing version number.

10.2. Effect of New Versions

You may distribute the Covered Software under the terms of the version of the License under which You originally received the Covered Software, or under the terms of any subsequent version published by the license steward.

10.3. Modified Versions

If you create software not governed by this License, and you want to create a new license for such software, you may create and use a modified version of this License if you rename the license and remove any references to the name of the license steward (except to note that such modified license differs from this License).

10.4. Distributing Source Code Form that is Incompatible With Secondary Licenses

If You choose to distribute Source Code Form that is Incompatible With Secondary Licenses under the terms of this version of the License, the notice described in Exhibit B of this License must be attached.

Exhibit A - Source Code Form License Notice

This Source Code Form is subject to the terms of the Mozilla Public License, v. 2.0. If a copy of the MPL was not distributed with this file, You can obtain one at <http://mozilla.org/MPL/2.0/>.

If it is not possible or desirable to put the notice in a particular file, then You may include the notice in a location (such as a LICENSE file in a relevant directory) where a recipient would be likely to look for such a notice.

You may add additional accurate notices of copyright ownership.

Exhibit B - "Incompatible With Secondary Licenses" Notice

This Source Code Form is "Incompatible With Secondary Licenses", as defined by the Mozilla Public License, v. 2.0.

Public Domain License

- json-20240303.jar is licensed under the Public Domain license category.

Public Domain

Generic License – CGIC

- cgic version 205 is licensed CGIC *License category*.

CGIC License Terms

----- Basic License -----

CGIC, copyright 1996-2011 by Thomas Boutell and Boutell.Com, Inc. Permission is granted to use CGIC in any application, commercial or noncommercial, at no cost. HOWEVER, this copyright paragraph must appear on a "credits" page accessible in the public online and offline documentation of the program. Modified versions of the CGIC library should not be distributed without the attachment of a clear statement regarding the author of the modifications, and this notice may in no case be removed. Modifications may also be submitted to the author for inclusion in the main CGIC distribution.

IF YOU WOULD PREFER NOT TO ATTACH THE ABOVE NOTICE to the public documentation of your application, consult the information which follows regarding the availability of a nonexclusive commercial license for CGIC.

Commercial License -----

The price of a nonexclusive commercial license is \$200 U.S.

To purchase the license, visit our online store here:

<https://www.boutell.com/>

Signed originals are available on request after purchase.

Commercial licensees are entitled to ongoing email support and update notifications.

* * *

CGIC Nonexclusive Commercial License

The party purchasing this license is granted the right to utilize CGIC, major version 1 or 2, any minor version thereof, in CGI applications without the need for a credit notice of any kind. CGI applications developed by the holder of this license may be distributed freely in source code or binary form without additional fees or royalties. This license does not grant the right to use CGIC to create a development tool which passes on substantially all of the capabilities of the CGIC library to the user of the tool, unless that tool is to be used internally by the license holder only in order to develop CGI applications. This license may not be resold, but applications developed in accordance with the terms of the license may be distributed freely subject to the limitations described above.

Future minor (2.x) versions of CGIC will be covered by this license free of charge. If significant defects of workmanship are discovered in version 2.x, minor releases to correct them will be made available before or at the same time that those defects are addressed in any future major version.

Future "major" (3.x) versions will be available to licensees at an upgrade price of \$50.

If, for any reason, any portion of this license is found to be invalid, that portion of the license only is invalidated, and the remainder of the agreement remains in effect.

Generic License – Zlib

- zlib version 1.2.13 is licensed Zlib License category.

System Status Manager – Text Points.....	950
D.20 Peripheral Link Client Pseudo Points	950
D.20 Peripheral Link Client: Per – Peripheral Pseudo Points.....	950
D.20 Peripheral Link Client – Global Pseudo points	951
GPIO Client Pseudo Points	952
GPIO Client: Pseudo Points.....	952
Chapter 9 - EdgeManager and PETC	953
Downloading and Running Predix Edge Technician Console.....	955
Device Status	955
Configuring the Network and Proxy Settings.....	955
Appendix A - Secure Terminal Emulator.....	956
Connect to MCP Secure Terminal Emulator through SSH	956
Connect to MCP Secure Terminal Emulator through Serial Port	958
Appendix B - Secure File Browser	959
Appendix C - GenASCII Client - Time Sequence Diagrams & Sample Configuration for FEP Devices ..	961
Time Sequence of Message Transactions	961
Time Sequence of Message Transaction with Support for delayed message processing as False	962
Time Sequence of Message Transaction with Support for delayed message processing as True	963

Delayed Response received within Device Response Timeout	963
Delayed Response not received within Device Response Timeout	964
Sample Configuration where response is expected within definite period	965
Appendix D - Configuring a Linux-based Enterprise Server	967
SSH Server	967
Rsync utility	967
Installation Steps	967
Appendix E - Running Cron Jobs on the MCP	968
Scheduling background jobs in MCP using Cron utility	968
Appendix F - Shell commands	970
mcpcsb	970
mcpsi	971
Version info from Firmware container	972
get_version from HAMA container	972
musb: USB Mount command	973
Good USB	973
Corrupted USB	973
No USB	973
musb unmount: USB unmount command	973
Appendix G - Security Certificates Creation for MCP	974
Overview	974
Setting up a Certification Authority	974
Setting up the XCA Certification Authority	974
Certificate Generation	976
Creating a CA-Signed Server Certificate	976
Installing Certificates	978
Installing Server Certificate and Private Key on the MCP	978
Installing CA Certificate for use by the MCP Runtime HMI Viewer	979
Appendix H - List of Factory Default Open Ports (TCP and UDP)	983
Overview	983
Appendix I – Modbus Protocol Support	985
Read Coils Status (Function Code 1)	985
Read Input Status (Function Code 2)	985
Read Holding Registers (Function Code 3)	985
Read Input Registers (Function Code 4)	985
Write Single Coil (Function Code 5)	986

Write Single Register (Function Code 6)	986
Data Representation for Write Single Register	987
Appendix J - List of supported qualities in MCP applications	988
Appendix K - List of MCP Logs in Runtime HMI	995
Overview.....	995
Control Log.....	995
Diagnostic Log.....	997
System Event Log	999
User Activity Log	1000
Analog Report Log	1001
VPN Server Log	1002
List of Applications Numbers & Names.....	1003
Glossary	1005
Modification Record	1007

About this Document

Purpose

This guide provides detailed information on how to configure the software of the Multilin™ MCP Substation Gateway. Although this document describes all the configurable software applications in the MCP, only the applications you purchased for your MCP are available to you.

NOTICE

This document applies to the entire MCP family (G100/G500) unless otherwise indicated.

Screen captures may show G100 or G500 in some areas, however the workflow applies to products in the MCP family (G100/G500), unless otherwise indicated.

This document reflects functions available in the following product versions:

- G100 V5.40
- G500 V5.40

Please refer to previous versions of this document for previous MCP releases.

Intended Audience

This document is a helpful resource for utility personnel and system engineers who are implementing the MCP in an overall substation automation system, and protection engineers who are controlling network devices. It is intended for readers who have knowledge of substation automation equipment and applications.

Additional Documentation

For further information about the MCP, refer to the following documents:

- *G100 Substation Gateway Instruction Manual (994-0155)*
- *G500 Substation Gateway Instruction Manual (994-0152)*
- *IEC 61850 Server User Guide (SWM0124)*
- *MCP HMI Online Help*
- *DS Agile MCP Studio (DSAS) Online Help*
- *G100 Quick Start Guide (SWM0116)*
- *G500 Quick Start Guide (SWM0106)*
- *Configuring UEFI Settings on G100 User Guide (SWM0122)*
- *Configuring UEFI Settings on G500 User Guide (SWM0110)*
- *Configuring UEFI Settings on G500 with Intel Hardware User Guide (SWM0125)*

How to Use this Guide

This guide describes how to configure the MCP. The MCP employs sophisticated applications that contain many advanced features and capabilities. To successfully configure and operate the MCP for your substation environment, it is highly recommended that you work through this entire guide.

Where appropriate, a detailed Table of Contents is provided at the beginning of a chapter.

If you need assistance, contact GE Vernova Grid Solutions Technical Support.

In configuration tables, “N/A” in the “Default” column indicates there is no default setting provided, and “X” indicates the number is automatically incremented.

Safety words and definitions

Before attempting to install or use the device, review all safety indicators in this document to help prevent injury, equipment damage or downtime.

The following safety and equipment symbols are used in this document:

Indicates a hazardous situation which, if not avoided, will result in death or serious injury.

Indicates a hazardous situation which, if not avoided, could result in death or serious injury.

Indicates a hazardous situation which, if not avoided, could result in minor or moderate injury.

Indicates practices that are not related to personal injury.

Important information about the product, product handling which must be given attention.

Product Support

If you need help with any aspect of your GE Vernova Grid Solutions product, you can:

- Access the GE Vernova Grid Solutions Web Site
- Search the GE Vernova Technical Support Library
- Contact Technical Support

GE Vernova Grid Solutions Web Site

The GE Vernova Grid Solutions Web site provides fast access to technical information, such as manuals, release notes and knowledge base topics.

Visit us on the Web at: <https://www.gevernova.com/grid-solutions/>

GE Vernova Technical Support Library

This site serves as a document repository for post-sales requests. To get access to the Technical Support Web site, go to: <https://www.gevernova.com/grid-solutions/events/signup.asp?sid=208>

Contact Technical Support

For help with any aspect of your GE Vernova Grid Solutions product, contact our support team, 24/7, as follows:

Chapter 1 - MCP Basics

MCP Multi-function Controller Platform

GE Vernova's advanced Multi-function Controller Platform (MCP) offers a high-capacity, secure, substation hardened set of modular and expandable hardware and software components designed to simplify deployment, operation, and maintenance of automation systems for a variety of applications including:

- Transmission & Primary distribution centralized automation,
- Secure substation automation systems

The MCP family is currently composed of the following Substation Gateway models:

- G100 - refer to *G100 Substation Gateway Instruction Manual (994-0155)*
- G500 - refer to *G500 Substation Gateway Instruction Manual (994-0152)*

The MCP implementation makes it possible for a single device to host multiple functions and applications such as Supervisory Control and Data Acquisition (SCADA) Concentrator, Remote terminal Unit (RTU), Human Machine Interface, Ethernet Switch functions, Data Storage among others. Consolidation of functions reduces the cost of deployment and operation while increasing system reliability through a reduced number of devices in the system.

MCP Substation Gateway

GE Vernova's MCP Substation Gateway is a secure, hardened, advanced substation gateway that collects metering, status, event, and fault report data from serial or LAN based intelligent substation devices. The MCP summarizes data from the substation devices and makes it available locally /remotely through a stand-alone HTTPS based HMI. It supports serial and/or LAN connections to SCADA masters such as EMS, DMS or other enterprise applications.

With its modern and robust cyber security features, the MCP is designed for smooth integration into NERC CIP and Cyber Security environments while consolidating functions such as Ethernet communications, time synchronization, HMI and SCADA applications.

Key Benefits

- Standardize Substation Architectures with a cost-effective IEC 61850-3 compliant platform capable of handling small to large systems.
- Simplify Engineering and operations through consolidation of functions.
- Reduce equipment cost by eliminating dedicated HMI computers, external Ethernet.
- Optimize Cyber Security management with hardened Linux based operating system and container technologies enabling modular updates instead of single image updates.
- Improve time synchronization performance internal IRIG-B Signal Generation.

Figure 1-1: G500 System Overview

Figure 1-2: G100 System Overview

G500 as D2x RTU

In this context **D2x RTU** means:

- Single CPU D20 RTU, or
- Single CPU D200 RTU, or
- Single Partition D20MX RTU.

Starting with G500 version 4.00 is possible to run legacy D2x applications in the embedded device, either combined or distinct – subject to a separate set of licenses and depending on the G500 device model.

NOTICE “Combined MCP and D2x” (Function C) runs two separate environments and databases which are not automatically interconnected in V4.00. Users will treat these as two separate devices and – if desired – configure data exchanges between them according to the application requirements and using an internal LAN (see LAN-I in [Chapter 7 – D2x Configuration and Operation](#)). In the project space – these are part of same instantiated DSAS Device.

The configuration workflows are similar to legacy D2x RTU Applications.

The list of available D2x applications is updated separately from the MCP (G500) releases.

See [Chapter 7 – D2x Configuration and Operation](#) for all details and workflows related to the use of D2x function within the G500.

See [Chapter 7 – D2x Configuration and Operation](#) for important [G500 as D2x Limitations](#).

Unless otherwise and specifically indicated - all other Chapters in this document refer to the MCP core features, not to D2x.

MCP and D2x Order Code

In order to accommodate the added D2x functionality in MCP V4.00 - the MCP Order Code and Model Number for G100 and G500 has been updated as below.

This section indicates only changes starting with MCP v4.00. For details about the signification of each digit in the MCP Order Code please refer to the Order Code section in the Instruction Manuals of G100 and G500.

Changes to G100 Order Code

Up to and including V3.10 the G100 Order Code is in the form of:

G100-AAL-DA-4TTUU-DUU-C1070-UU

Starting with V4.00 – the G100 Order Code is in the form of (replaced and added digits at the end):

G100-AAL-DA-4TTUU-DUU-D0070-**S-UUUUUUU**

(the bold underline digits are added to support D2x in a future G100 release).

Order G100 as MCP Function

S indicates MCP functionality and in this case the D2x part is "UUUUUUU".

The new resulting G100 as MCP model number is extended with "S-UUUUUUU" at the end, without other changes, ensuring backwards compatibility.

For e.g.:

G100-AAL-DA-4TTUU-DUU-D0070-**S-UUUUUUU**

Order G100 as D2x Function

This is not available in V4.00

Changes to G500 Order Code

G500 Order Code always had the functional designation "S" and the last digits present and set to UUUUUUU.

Starting with V4.00 – the G500 Order Code makes use of the last group of digits for the purpose of tracking the D2x function attributes as described below:

G500-BHU8-TTUUUU-BUUU-UUD-UUU-**S**-CAD0094-**NNVVVLL**

Order G500 as MCP Only Function

S indicates MCP functionality and in this case NNVVVLL == "UUUUUUU" (i.e., D2x part is not used).

This is identical to previous G500 model number structure, ensuring backwards compatibility.

For e.g.:

G500-BHU8-TTUUUU-BUUU-UUD-UUU-**S**-CAD0094-**UUUUUUU**

Order G500 as D2x Only Function

D indicates D2x functionality, and in this case:

- **NN** denotes the **NAME** of the D2x SMX firmware (equivalent to SAN0001 in D20MX). First public release is A0.
- **VVV** denotes the **VERSION** of the SMX firmware (equivalent to 210 in D20MX). First public release is 400.
- **LL** denotes the two digit number associated with **D2x Licenses**.

For e.g.:

G500-BHL8-TTUUUU-BUUU-UUD-UUU-**D**-CAD0000-**A040003**

Order G500 as MCP/D2x Combined Function

This is available only on G500 with 4-cores CPU.

C indicates both MCP and D2x (**C**ombined) functionality, and in this case:

- **NN** denotes the NAME of the D2x SMX firmware (equivalent to SAN0001 in D20MX). First public release is A0.
- **VVV** denotes the VERSION of the SMX firmware (equivalent to 210 in D20MX). First public release is 400.
- **LL** denotes the two digit number associated with D2x licenses.

For e.g.:

G500-BHU8-TTUUUU-BUUU-UUD-UUU-**C**-CAD0095-**A040003**

As-Built model number digits

The “As-Built” model number remains always the one set from factory. This shows the initial factory built deployed modules and functions of a given MCP device.

As-Is model number

The “As-Is” model number always shows the current deployed modules and functions of a given MCP device. These can be changed from the “As-Built” stage.

An embedded MCP application runs every time when the MCP and D2x applications start and updates the “As is” MCP Model number to reflect what is installed and configured in the device – regardless of the function.

The generation of **HW digits** is according to the Instruction Manual.

G100-AAL-DA-4TTUU-DUU-D0000-S-UUUUUUU

G500-BHU8-TUUUUF-BUUU-UUD-UUU-S-CAD0000-UUUUUUU

The **Function Type (S, C, D)** is read from the set Function.

G100-AAL-DA-4TTUU-DUU-D0000-**S**-UUUUUUUU

G500-BHU8-TUUUUF-BUUU-UUD-UUU-**S**-CAD0000-UUUUUUU

The generation of **SW digits related to MCP function** is according to the Instruction Manual. For e.g., D0 indicates MCP version 4.00.

G100-AAL-DA-4TTUU-DUU-D0000-S-UUUUUUUU

G500-BHU8-TUUUUF-BUUU-UUD-UUU-S-CAD0000-UUUUUUUU

The generation of **SW digits related to D2x function** is always performed regardless of the function type and follows the rules below (all CAPS letters for the digits); this ensures a true representation of the absence or presence and version of the D2x environment.

G100 v4.00 has always: S-UUUUUUUU for the last group of 8 digits.

G500 v4.00 has the following possible combinations for the last group of 7 digits:

G500-BHU8-TUUUUF-BUUU-UUD-UUU-S-CAD0000-UUUUUUUU

Description	SW Digits for D2x						
Function Type = S , no present D2x Container Environment, no present D2x Firmware in /mnt/data log/D2x	U	U	U	U	U		
Function Type = C or D , no present D2x Container Environment, no present D2x Firmware in /mnt/data log/D2x	X	X	X	X	X		
Any Function Type (S, C, D), Valid D2x Container Environment and valid D2x FW in /mnt/data log/D2x, NN is SMX Name, VVV is the SMX Version	N	N	V	V	V		
Any Function Type (S, C, D), Valid D2x Container Environment, invalid D2x FW (i.e., not following SMX pattern) in /mnt/data log/D2x	?	?	?	?	?		
Any Function Type (S, C, D), D2x License file is NOT present						U	U
Any Function Type (S, C, D), D2x License file is present, valid - but it doesn't have at least Core active						X	X
Any Function Type (S, C, D), D2x License file is present but is invalid (no match on HW ID, corrupted, etc.)						?	?
Any Function Type (S, C, D), D2x License file is present, valid - and it has at least Core active (LL is the D2x License code sum)						L	L

UEFI Settings

The G100 and G500 have different UEFI settings, described in the documents below, for each product model:

- Configuring UEFI Settings on G100 User Guide (SWM0122)
- Configuring UEFI Settings on G500 User Guide (SWM0110)
- Configuring UEFI Settings on G500 with Intel Hardware User Guide (SWM0125)

NOTICE These UEFI settings are applicable only while the G100 is starting.

After the applications started, these settings are over-written by the values configured in [MCP Local Configuration Utility \(mcpcfg\)](#) and [MCP Settings GUI](#).

- Default Serial Maintenance Port used as UEFI (boot) console when KVM is not available (Advanced-> Serial Port Console Redirection)
 - o Console Redirection is set to Disabled for COM1-COM3, please do not change these settings.
 - o Console Redirection for COM4 should be enabled/disabled and have the “Bits per second”, to be same as in *the Serial Maintenance Port in MCP Studio* (see Serial Maintenance Port on page 541).
- Default Serial Ports Modes (Advanced → Super IO Configuration)
 - o Ensure are enabled/disabled as required for secure hardening purposes and set to RS-232.

MCP Time Synchronization

Time Synchronization Configuration

Time synchronization configuration workflows use:

- Online MCP Local Configuration Utility (*mcpcfg*) or MCP **Settings GUI** for configuring time synchronization for PTP/IRIG-B/NTP
- DS Agile MCP Studio configuration tool for configuring SCADA based time synchronization

Time Synchronization Input

G100 accepts the following methods for time synchronization input sources (IN):

- IRIG-B TTL – should be in UTC for correct operation of configured Time Zone
 - o B002 without YEAR information
 - o B006 with YEAR information
- NTP – always in UTC
- SCADA (DNP3 Server, IEC 101 Server when “Set Main”)

G500 accepts the following methods for time synchronization input sources (IN):

- PTP (Precision Time Protocol - IEEE 1588) – always in UTC
- IRIG-B TTL – should be in UTC for correct operation of configured Time Zone
 - o B002 without YEAR information
 - o B006 with YEAR information
- NTP – always in UTC

- SCADA (DNP3 Server, IEC 101 Server when “Set Main”)

Note: If IRIG-B IN signal is in Local time zone: the MCP Time Zone must be configured as UTC in all areas (mcpcfg, Settings GUI, HMI, Protocols). In this case the internal time tagging will be done only as Local time zone and time zone shifting based on protocol or Remote HMI will not work correctly.

Time Synchronization Output

G100 provides the following time synchronization output signals (OUT):

- IRIG-B TTL – only repeater of IRIG-B IN – same time zone as IRIG-B IN
- NTP – always in UTC
- SCADA – time zone depends on protocol setting

G500 provides the following time synchronization output signals (OUT):

- PTP (Precision Time Protocol - IEEE 1588) – always in UTC
- IRIG-B TTL (B002 without YEAR information) – same time zone as IRIG-B IN
- NTP – always in UTC
- SCADA – time zone depends on protocol setting

SCADA Time Synchronization Applications

MCP accepts time synchronization over the following SCADA communication protocols:

- DNP3 Master (Server) (IN)
- IEC 60870-101/104 Master (Server) (IN)

MCP provides time synchronization over the following SCADA communication protocols:

- DNP3 Client as Time Signal to IEDs (OUT)
- IEC 60870-101/104 Client as Time Signal to IEDs (OUT)

Table 1-1: Available Time Sync Combinations

IN \ OUT	PTP OUT	IRIG-B TTL OUT	NTP OUT	SCADA OUT (to IEDs)
PTP IN	✓ G500	* Not Available	✓ MCP	✓ MCP
IRIG-B TTL IN	* Not Available	✓ MCP ^{Note 2}	✓ MCP	✓ MCP
NTP IN	* Not Available	* Not Available	✓ MCP	✓ MCP
SCADA IN (from Masters)	* Not Available	* Not Available	✓ MCP	✓ MCP
NONE IN	* Not Available	* Not Available	✓ MCP ^{Note 1}	✓ MCP ^{Note 1}

MCP indicates is applicable to both G100 and G500.

NTP/ SCADA are being driven from the software.

Note 1 In absence of any valid time source input, the MCP CPU is free running. Refer to the G100 and G500 Instruction Manuals and Data Sheets for free running clock accuracy data (ppm deviation).

G500:

- PTP/IRIG-B OUT in G500 are being driven from an internal high accuracy FPGA.
- When PTP/IRIG-B Input is enabled and a valid PTP/IRIG-B Signal is present, G500 FPGA synchronizes the time to the CPU and an internal Real Time Clock (RTC), and the CPU in turn provides time as a source to NTP OUT or SCADA OUT (i.e., to IEDs via supported SCADA protocols).
- The internal RTC is powered by a super capacitor, and its value is used at startup if the super capacitor was not discharged. If the super capacitor was discharged the system will use the last valid time when was last powered on. Refer to the G500 Instruction Manual and Data Sheet for the super capacitor time availability when the unit is powered off.
- When NTP/SCADA are used as time synchronization input sources, the internal CPU does not act as a time source of synchronization to the G500 FPGA and the G500 PTP/IRIG-B outputs are disabled.

G100:

- **Note 2** IRIG-B OUT in G100 is repeated from the IRIG-B IN signal, there is no internal FPGA to generate the signal.
- When IRIG-B Input is enabled and a valid IRIG-B Signal is present, G100 software-based decoding synchronizes the time to the CPU, which in turn provides time as a source to an internal Real Time Clock (RTC), NTP OUT or SCADA OUT (i.e., to IEDs via supported SCADA protocols).
- The internal RTC is powered by a super capacitor, and its value is used at startup if the super capacitor was not discharged. If the super capacitor was discharged the system will use the last valid time when was last powered on. Refer to the G100 Instruction Manual and Data Sheet for the super capacitor time availability when the unit is powered off.
- When NTP/SCADA are used as time synchronization input sources, the G100 does not provide an IRIG-B OUT time signal.

NOTICE

A system's Time-Sync accuracy cannot be guaranteed if you enable multiple time-sync inputs, and "time jumps" may be observed.

In the Gateway Configuration Utility (mcpcfg, Settings GUI), it is not allowed to configure more than one time source input from PTP / IRIG-B / NTP. Prior to MCP V3.00, if one of these time sources is configured, make sure the time synchronization in SCADA applications are all disabled to avoid conflicts.

Or, if the time synchronization from one of the SCADA Master applications is configured, all the PTP/IRIG-B/NTP time sources should be disabled to avoid conflicts.

Starting with G100 V3.00 and G500 V3.00: DNP3 and IEC101 (when "Set Main") Master time synchronization can be configured in addition to one of PTP/IRIG-B/NTP – in which case the DNP3 / IEC101 time will be used as backup only while the PTP/IRIG-B/NTP input signal is invalid. Note that enabling time synchronization in more than one SCADA Master application could result in conflicts.

MCP Settings

This part of the configuration is associated with the MCP hardware, UEFI, Serial port settings, LAN configuration, Time settings, Administrators User management etc.

These configuration settings are performed online using either MCP Local Configuration Utility (mcpcfg) or MCP Settings GUI, or a browser-based utility called Predix Edge Technician Console (PETC) or the MCP Runtime HMI.

MCP Firmware Version Information

» To check firmware release information:

1. Go to the MCP command line interface using [Secure Terminal Emulator](#).
2. Type **cat /home/ MCP_APPS/version_banner**.
3. Press **Enter**.

Local Configuration Utility (mcpcfg) or MCP Settings GUI

MCP supports Local configuration utility (mcpcfg) or MCP Settings GUI to manage the MCP real time/hardware/system settings.

Serial Ports Settings

All the MCP supported serial port modes (RS232/485) are configured using online [MCP Local Configuration Utility \(mcpcfg\)](#) or [MCP Settings GUI](#).

Ethernet Settings

All the MCP network interfaces are configured using online MCP Local Configuration Utility (mcpcfg) or MCP Settings GUI. In addition to the Gateway connectivity, a browser-based utility called Predix Edge Technician Console (PETC) is used to configure the Maintenance Port for Edge connectivity.

Refer to the [Chapter 9 - EdgeManager and PETC](#) for port availability and additional information.

The remaining Ethernet Ports are used for SCADA/Gateway connections and Edge Connectivity which can be enabled on one designated port. User can configure them using “single” mode of configuration using mcpcfg.

Administrators User Setup

MCP comes from the factory has a default administrator user “defadmin”. Only minimal configuration options (i.e., Adding a New/Nominated administrator user, Configuring IP Addresses, Rebooting the unit and Restoring MCP Snapshots) are available using default administrator user.

The default administrator (defadmin) user will be deleted automatically once the default administrator (defadmin) is logged out and logs in successfully with the newly added administrator user.

MCP Configuration

This section provides an overview of each DS Agile MCP studio and the basic steps to configuring the MCP.

G100 devices can be converted to G500 devices.

G500 devices can be converted to G100 devices, with the user required to resolve and re-allocate the less available ports in G100 (Serial, Net).

This part of the configuration is associated with the configuring Gateway/SCADA specific configuration using DS Agile MCP Studio's offline and online configuration tools. This configuration includes configuring IEDs/master stations/automation applications/HMI settings/security settings or system configurations etc. The user would like to customize the following aspects of the MCP configuration management through offline and online editors using DS Agile MCP studio:

- Communication connections
- Device data collection
- Master Station data presentation
- Alarm annunciation

- Data calculation
- Data logging
- Operational (One-Line) diagrams
- User management
- HMI preferences
- E-mail notification
- Open VPN and Secure SCADA
- Passthrough and Terminal server
- Device Redundancy

System/PC Requirements

Minimum Windows 7 x64, 10 x64 and 8GB Memory required for DS Agile MCP Studio and MCP Runtime HMI.

The MCP Runtime HMI runs as a standalone application, so the installation of the Java/JRE on the Windows PC is not required.

DS Agile MCP Studio Software Version Information

Refer to the [Chapter 6 - MCP Configuration](#) for the supported DS Agile MCP Version details.

Offline Editor

The Offline Editor is used to create, edit and update the software configuration of the MCP. The Offline Configuration Tool is a component of the DS Agile MCP Studio.

Offline Editor (DS Agile MCP Studio) is used to:

- Set up MCP communications to devices and masters (serial or network connections)
- Select and/or create point maps (for devices and masters)
- Configure alarms
- Create custom data calculations
- Set system preferences
- Create one-line diagrams
- Create Secure SCADA and Open VPN server configurations

All these configurations changes will not take effect until “Sync To” operation is performed through DS Agile MCP studio.

One-Line designer

The One-Line Designer is a specialized drawing tool for creating substation one-line diagrams and forms, such as a Digital Event Manager panel. The One-Line Designer is accessed from within the DS Agile MCP Studio Offline Editor/Configuration Tool.

You must have either Administrator or Supervisor privileges to access the offline configuration tool. It is suggested that either one Administrator or Supervisor user at a time can be logged in to perform configuration functions.

This manual provides detailed information on the configurable settings in the MCP, and how to configure the MCP to work with various aspects of the substation system.

For more information about using the MCP offline Configuration Tool, functions and screens refer to the MCP online Help in DS Agile MCP Studio.

Online Editor

The Online Editor monitor the status of your substation network, view data, execute control commands and change the system set-up by connecting to the MCP. In addition to this, Online Editor can also be used to configure MCP SCADA and Gateway configuration including One-Line Diagrams. The Online Editor includes the following components:

- Online Editor is used to view and control the operation of the MCP.
- Online Editor includes optional One-Line Viewer for viewing one-line diagrams.
- Power Bar buttons also give access to MCP display screens and utilities.
- SCADA/Gateway configuration including One-Line Designer in the Connected Mode to MCP.

The Online Editor is not available if the MCP device Function is “D” (only D2x).

IEC 61850 Loader (optional)

The IEC 61850 Loader (referred to as the Loader) is specifically designed to configure the MCP to communicate to IEC 61850 compliant server devices using the MCP's IEC 61850 client application. The Loader makes use of the self-description capabilities of the IEC 61850 protocol and device information files provided by most devices to simplify and speed up configuration of the IEC 61850 client application.

The IEC 61850 Loader within DS Agile MCP studio is used to configure and upload the IEC 61850 client application to the MCP.

For more information on using the IEC 61850 Loader, see the Loader Help in DS Agile MCP studio.

LogicLinx (optional)

LogicLinx is a tool that enables the user to create automation applications that have traditionally been too costly or difficult to implement - all without hard wiring. Using any or all the IEC 61131-3 programming languages, the user can create automation routines that run on the MCP.

LogicLinx automation routines are created using the LogicLinx editor. The LogicLinx Wizard within DS Agile MCP Studio is then used to configure and upload the LogicLinx application to your MCP.

For more information on using LogicLinx, refer to the LogicLinx on a MCP *Quick Start Guide* (GE Vernova Ref Number- SWM0107).

Snapshots

“Snapshot” is an archived image of the device configuration taken (that is, *saved*) at a given time, in the form of a special compressed file. It can be saved using DS Agile MCP Studio, which includes all settings required to completely recover a MCP device.

- Multiple snapshots can be saved for the same device configuration, at different times, using different names with different storage paths.
- A snapshot can be restored to the same device or to a different device.
- The MCP Gateway device must be configured for SSH and SFTP services, for this feature to be used.
- The Snapshots greatly reduce time when replacing hardware (MCP) and copying a reference configuration to multiple devices, eliminating the need for additional manual configuration.

Snapshot restoration updates the new MCP (i.e., target MCP) with the following hardware and software settings as were defined in the original MCP (i.e., source MCP), at the time of the snapshot was taken, if the respective options were selected to be saved:

- User Authentication
- Network Settings

- Network Interfaces
- Secure Access
- Firewall settings
- Host Names
- Time settings and time synchronization
- Local HMI settings – except number of displays and displays resolution which are specific to the MCP being restored
- Synch Manager
- Redundancy (except paired keys when the MCP target is already paired as redundant)
- Emulation of D20 IEC101 DPA Unbalanced Mode and quality event suppression at startup
- Serial port modes (RS232/485, 2/4 wires)
- Configuration implemented in MCP Studio:
 - o Connections
 - o Client and Server Map files
 - o System Point Manager
 - o Alarms
 - o Calculator
 - o Data Logger (storage may need to be re-adjusted if the target MCP has different storage sizes)
 - o Load Shed
 - o Systemwide (storage may need to be re-adjusted if the target MCP has different storage sizes)
 - o Access (Local users, Automatic HMI login settings, VPN Client List)
 - o ARRM
 - o AI Text Enumeration
 - o One-line Screens
 - o Analog Reports (not available after and including MCP V2.60)
 - o IEC61850 Client
 - o LogicLinx

Cyber security related Certificates are not included in the Snapshot, and therefore cannot be restored. To comply with cyber security requirements, all certificates must be imported again to the target MCP, after the snapshot is restored. All secure connections using certificates must be re-associated with the new imported certificates (e.g., Secure Connection Relay, VPN Server, etc.).

Snapshot restoration results in a MCP configured into Local Authentication mode, even though snapshot contains the Remote Authentication (this is to avoid possible lockout scenarios). However, all the Remote Authentication configuration settings will get restored as part of snapshot. You need to re-install the certificates and reconfigure the Remote Authentication using the restored configurations.

The keys associated with Sync Manager (rsync/SSH, SFTP), Modbus TCP/SSH secure tunnel and ARRM SFTP are not restored with snapshot due to cyber security requirements, and these sessions shall have to be re-paired again by user.

License file (key) is not restored with the snapshot because this is hardware ID specific.

MCP enrollment in EdgeManager Cloud and associated settings are not restored with the snapshot. For more details, refer to Predix Edge Technician Console - see [Chapter 9 - EdgeManager and PETC](#).

Snapshot Compatibility

The following table shows the Snapshot Compatibilities between DSAS and GE Vernova's Gateway devices:

FULL "Clone" Snapshot compatibility Configuration + Settings (using DSAS 2.1 or later)		Restore snapshot (Configuration and Settings) to <u>target</u> device:				Restore snapshot (Only Configuration part) to <u>offline</u> device:			
Save snapshot from device:		D400	MCP (G500/G100 within same type)			D400	MCP (G500/G100 within same type)		
		Any version	1.00	1.10	2.00 or later	Any version	1.00	1.10	2.00 or later
D400	<= 5.20	YES ONLY same D400 and same version	N/A	N/A	N/A	YES Direct same version	N/A	N/A	N/A
	5.30 or later	YES ONLY same D400 and same version	N/A	N/A	N/A	YES Direct same version	Indirect Via Create MCP	Indirect Via Create MCP	Indirect Via Create MCP
MCP	1.00	N/A	YES ONLY same MCP	N/A	YES ANY MCP	N/A	YES Direct	Indirect Via Offline Upgrade	Indirect Via Offline Upgrade
	1.10	N/A	N/A	YES ANY MCP	YES ANY MCP	N/A	N/A	YES Direct	Indirect Via Offline Upgrade
	2.00 or later	N/A	N/A	N/A	YES ANY MCP	N/A	N/A	N/A	YES Direct same version

Note: The above table also shows the snapshot compatibility of DSAS with D400® Substation Gateway.

Snapshot Management

Using DS Agile MCP Studio:

- Snapshots can be saved from the MCP using only administrator user credentials.
- Snapshots can be restored to the MCP using the “**defadmin**” default credentials or any other configured administrator user credentials.

Types of Snapshots

There are two types of snapshots:

1. Standard Snapshot

- Standard Snapshot is used between one MCP to any MCP of same firmware version.
- Standard snapshot may contain user credentials, internal saved secrets, Network settings and Logs – if the user selects the option to include them.
- The name of the Standard Snapshot ends with the extension - ***.MCPSnapshot.DS7zip**
 - o e.g., ***MCP_V100.MCPSnapshot.DS7zip***, while saving the Standard Snapshot (the *italic* text is entered as *name* by the user)

2. MCP Clone Snapshot

- MCP Clone snapshots contain all information associated with a running MCP (configurations, settings, users, internal configured “secrets” for IED access, etc. – except certificates).
- MCP Clone Snapshots are the primary instrument used as source image in “disaster recovery” workflows.
- MCP Clone Snapshots may be used with the same firmware version or across different firmware versions from one version to a newer one.
- The name of the MCP Clone Snapshot contains the extension - ***.MCPCloneSnapshot.DS7zip**
 - o e.g., ***Test5_1_dot_0.MCPCloneSnapshot.DS7zip***, while saving the MCP Clone Snapshot (the *italic* text is entered as *name* by the user)

Refer to the Application Note (*GE Vernova Part Number AN0015*) *MCP Snapshot and Configuration Workflows* for a full understanding of the included data types in snapshots of both types and their associated save / restore options in workflows.

Saving a Standard Snapshot

1. Select the device for which Standard snapshot to be saved. The device appears within a green box with anchor points, as shown below:

2. Various methods to save Standard Snapshot are given below with detailed steps. Standard snapshot can be saved by any of the below methods:
- Right click on the device,
Archive → Save → Save Snapshot.

- From the top ribbon,
Save → Save Snapshot.

- Sync from Device → Save Snapshot (for this method, skip step '3' and proceed to step '4').

- d. File menu,
 - i. Archive → Snapshot section → Save.

- 3. Then (except for step '2(c)'), specify the IP address of the source MCP and type of snapshot as 'Standard', as shown below:

Then, a window “Device Snapshot Details” pops up, as shown below.

4. Specify the below details:

Archive (snapshot) File Name

- o Type in the file name and path (or)
- o Click the [...] button to navigate to the storage location.
- View the **Device Name**. This read-only field shows the DS Agile Studio device name.
 - o Type a **Description** into this free-form text field.

Choose what data is to be saved in the device **Snapshot contents** by selecting the required checkboxes:

Configuration data and network settings	:	All snapshots contain configuration data and network settings; this checkbox is always selected by default.
Log files	:	Log files are created by the MCP Gateway device.
Hardware, license and diagnostic information	:	This information is used by the GE Vernova Grid Solutions Technical Support team.
Information required to clone the device (password required)	:	This additional information allows you to clone an existing configuration.

5. Type in an **Optional password (for integrity checking)** and make sure it meets password strength requirements.
6. If the device contains internal configuration “secrets” (e.g., IED or ARRM passwords used for Machine-to-Machine connections) – a password is mandatory to protect the snapshot. Alternatively, the user has a choice to remove the “secrets”.

Important: This password is used only to protect the snapshot that will be created. This is separate from any passwords used for user credentials or other “secrets” configured in the device. Ensure that this snapshot password is available if restoration is required later. There is no alternative method through GE Vernova Grid Solutions to obtain the correct password.

When you begin typing characters in the password field, additional information is presented, guiding you to meet password strength requirements.

The screenshot shows a dialog box titled "Optional password (for integrity-checking, cloning devices and including/extracting log files)". It features a password input field with a cursor. Below the field, the text "If used, must meet the following requirements:" is displayed. A list of four requirements follows, each with an unchecked checkbox: "At least 8 characters", "At least one uppercase and one lower case letter", "At least one number", and "At least one non-alphanumeric character (e.g., @, %, &, *)". At the bottom of the dialog are three buttons: "OK", "Cancel", and "Help".

The tracking and checking of snapshot (archive) file integrity and non-tampering may be disabled from the Global System Preferences window:

- i. For all **Snapshot contents** options except Information required to clone the device, the snapshot file may be optionally secured by specifying a password.
- ii. If the device contains internal configuration “secrets”, a password is mandatory to protect the snapshot. Alternatively, the user has a choice to remove the “secrets”.
- iii. If a password is provided, DS Agile Studio can check the snapshot (archive) file for **integrity and non-tampering** at restoration time.
- iv. If a password is not provided, the snapshot (archive) file is valid, but does not contain information used for integrity and tamper-proof checking at restoration time.
- v. When a password is provided, the snapshot file content – except (Information required to clone the device) – is not encrypted, allowing users who forgot the password to restore the snapshot data, but without the integrity check.
- vi. For the **Snapshot contents: Information required to clone the device** option, sensitive data and information is included in the snapshot file; consequently, a password must be provided.
 - Sensitive data and information contain configured local user accounts, internal secrets like credentials used for IED access (e.g., SEL Binary access), ARRM secured file transfers parameters, and Dial-in and Email configuration.
 - If the **Snapshot contents: Information required to clone the device** option was chosen and a password is not typed in, the snapshot process does not continue, and you are prompted again to:
 - De-select the Information required to clone the device option (or)
 - Provide a password

7. Upon clicking **OK**, a window pops up to re-enter and confirm the password, as shown below. Type in the password again and proceed.

8. Then, device login window pops up, as shown below. Authenticate as a valid administrator user, by providing the **User Name** and **Password** for the physical MCP Gateway device.

9. After successful login, the configuration files are downloaded from the MCP device and get saved in the specified location.

Restoring Standard Snapshot to a Device

1. Select the device for which Standard snapshot to be restored. The device appears within a green box with anchor points, as shown below:

2. Various methods to restore Standard Snapshot to a Device are given below with detailed steps.
Standard snapshot can be restored by any of the below methods:
- Right-click on the device,
 - Archive → Restore → Restore Snapshot.

- From the top ribbon,
 - Restore → Restore Snapshot.

- Sync To Device → Restore Snapshot to Device.

- c. File menu,
 - i. Archive → Snapshot section → Restore.

- 3. If prompted, enter the IP address of the target MCP device:

Note: if the workflow was started in the context of a device in the project, the IP address configured for that device will be used automatically.

Then, a window “Device Snapshot Details” appears, as shown below:

4. Specify the below details:

- Archive (snapshot) File Name
 - o Type in the file name and path (or)
 - o Click the [...] button to navigate to the snapshot file location.
 - o By default, standard snapshots are filtered:

- o View the **Archived Device Name**. This read-only field shows the name of the archived device.
- o View the **Description** in this read-only text field; this is the description entered when the snapshot was saved.
- o Select which type of data is to be restored:

- | | | |
|--|---|--|
| Restore Configuration data | : | This option is selected by default as a minimum to be restored |
| Restore network settings | : | This option is selected to restore the network settings |
| Restore information required to clone a device | : | This option is not available, if the snapshot file does not contain cloning information. To proceed with this type of data restoration, the correct password must be provided. |

Hint:

Selecting this option will restore all saved users and their credentials and will overwrite existing users and credentials in the target MCP.

This is useful for deploying snapshots into MCP devices using the defadmin user account. In some other cases it may be desired to restore the configuration and network settings, but not the previous saved users credentials, because they were lost, and restoring them would conduct to a MCP device that cannot be accessed. In this case, do not select this option.

- Type in an Optional password (for integrity checking).
 - o If the correct password (i.e., the same password entered when the snapshot was saved) is provided at this time, DS Agile Studio will check the snapshot (archive) file for **integrity and non-tampering** and proceed to restoration of chosen data.
 - o If a password is not provided at this time, the snapshot (archive) file is restored – except the cloning data – but cannot be checked for integrity and tamper proof.
 - o If a password is not provided for a snapshot file that was created with encrypted cloning sensitive information – then the restoration continues without the sensitive data information being recovered. In this case, all sensitive data will have to be re-entered again using the corresponding configuration fields.
 - o Information can only be restored for cloning when the correct password is provided.
5. Click **OK** and then the “Device Snapshot Details” window closes, and a Restoration confirmation window appears, as shown below:

6. Click **Accept**, and then a login window appears, as shown below:

7. Authenticate as a valid administrator user and login to the device, by providing the **User Name** and **Password** for the physical MCP Gateway device.

8. DS Agile Studio uploads the data file (Standard Snapshot) to the MCP Gateway device.

When restoring a snapshot image, the following data is not restored on the target device, even if was included in the snapshot file:

- o Log files
- o Hardware, license and diagnostic information

Saving an MCP Clone Snapshot

1. Select the device for which MCP Clone snapshot to be saved. The device appears within a green box with anchor points, as shown below:

2. Various methods to save MCP Clone Snapshot are given below with detailed steps. MCP Clone snapshot can be saved by any of the below methods:
 - a. Right click on the device,
Archive → Save → Save Snapshot.

- b. From the top ribbon,
Save → Save Snapshot.

- c. Sync from Device → Save Snapshot (for this method, skip step '3' and proceed to step '4')

- d. File menu,
Archive → Snapshot section → Save.

3. Then (except for step '2(c)'), specify the IP address of the source MCP and type of snapshot as 'MCP Clone', as shown below:

The 'Save Snapshot' dialog box has a title bar with a green icon and a close button. It contains an 'IP Address' section with a text field showing '192 . 168 . 168 . 81'. Below this is a checked checkbox labeled 'Create device in the current project and page:'. There are two radio buttons: 'Standard snapshot' (unselected) and 'MCP clone snapshot' (selected). At the bottom are 'OK', 'Cancel', and 'Help' buttons.

Then, a window "Device Snapshot Details" pops up, as shown below.

The 'Device Snapshot Details' dialog box has a title bar. It contains three main sections:

- Archive File Name:** A text field with a dropdown arrow and a '...' button.
- Device Name:** A text field.
- Description:** A large text area with a scrollbar.

 Below these is a section titled 'Snapshot contents' with four checkboxes:

- ☒ Configuration data and network settings
- ☐ Hardware, license and diagnostic information
- ☐ Log files (password required)
- ☒ Information required to clone this device (password required)

 The next section is 'Mandatory password (for integrity-checking, cloning devices and including/extracting log files)' with a password text field. Below it, it says 'If used, must meet the following requirements:' followed by four checkboxes:

- ☐ At least 8 characters
- ☐ At least one uppercase and one lower case letter
- ☐ At least one number
- ☐ At least one non-alphanumeric character (e.g., @, %, &, *)

 At the bottom are 'OK', 'Cancel', and 'Help' buttons.

4. Specify the below details:
 - a. **Archive (snapshot) File Name**
 - o Type in the file name and path (or)
 - o Click the [...] button to navigate to the storage location.
 - b. View the **Device Name**. This read-only field shows the DS Agile Studio device name.
 - c. Type a **Description** into this free-form text field.

Choose what data is to be saved in the device **Snapshot contents** by selecting the required checkboxes:

Configuration data and network settings	:	All snapshots contain configuration data and network settings; this checkbox is always selected by default.
Log files	:	Log files are created by the MCP Gateway device.
Hardware, license and diagnostic information	:	This information is used by the GE Vernova Grid Solutions Technical Support team.
Information required to clone the device (password required)	:	This information allows you to clone an existing configuration; this checkbox is always selected by default when saving MCP Clone snapshots.

5. Type in the **Mandatory password** and make sure it meets password strength requirements.

Important: This password is used only to protect the snapshot that will be created. This is separate from any passwords used for user credentials or other “secrets” configured in the device. Ensure that this snapshot password is available if restoration is required later. There is no alternative method through GE Vernova Grid Solutions to obtain the correct password.

When you begin typing characters in the password field, additional information is presented, guiding you to meet password strength requirements.

6. Upon clicking **OK**, a window pops up to confirm the password, as shown below. Type in the password again and proceed.

7. Then, device login window pops up, as shown below. Authenticate as a valid administrator user, by providing the **User Name** and **Password** for the physical MCP Gateway device.

The image shows a 'Login' dialog box with a dark header. It contains two input fields: 'User Name' and 'Password'. Below the fields are two buttons: 'Login' and 'Cancel'.

8. After successful login, the configuration files are downloaded from the MCP device and get saved in the specified location.

Restoring MCP Clone Snapshot to a Device (using DSAS)

1. Select the device for which the clone snapshot is to be restored. The device appears within a green box with anchor points, as shown below:

2. Various methods to restore Standard Snapshot to a Device are given below with detailed steps. Clone snapshot can be restored by any of the below methods:
 - a. Right click on the device,
 - Archive → Restore → Restore Snapshot.

- b. From the top ribbon,
- Restore → Restore Snapshot

- Sync To Device → Restore Snapshot to Device

- c. File menu,
- Archive → Snapshot section → Restore.

3. If prompted, enter the IP address of the target MCP device:

The "Restore Snapshot" dialog box has a title bar with a close button. It contains an "IP Address" label above a text input field with the value "0.0.0.0". Below the input field is a checkbox labeled "Create device in the current project and page". At the bottom are three buttons: "OK", "Cancel", and "Help".

Note: if the workflow was started in the context of a device in the project, the IP address configured for that device will be used automatically.

Then, a window "Device Snapshot Details" appears, as shown below:

The "Restore Snapshot Details" dialog box has a title bar. It contains several fields: "Archive File Name:" with a text input and a browse button (...), "Archived Device Name:" with a text input, and "Description:" with a large text area. Below these are two checkboxes: "Restore configuration data" (checked) and "Restore network settings" (unchecked). At the bottom is a section titled "Optional password (for integrity-checking)" with a text input. At the very bottom are three buttons: "OK", "Cancel", and "Help".

4. Specify the below details:
- Archive (snapshot) File Name**
 - Type in the file name and path (or)
 - Click the [...] button to navigate to the snapshot file location.
 - Select the snapshot filter to MCP Clone:

A file selection dialog box showing a list of files. The file "MCP Clone snapshot files (*.MCP)" is selected and highlighted with a red rectangle. Below the list are two buttons: "Open" and "Cancel".

- b. Enter the password for the selected MCP Clone snapshot:

- c. Wait for the Processing message to end (it may take few minutes).
The window will now change as following:

- d. View the **Archived Device Name**. This read-only field shows the name of the archived device.
e. View the **Description** in this read-only text field; this is the description entered when the snapshot was saved.
f. For MCP Clone snapshots all data types are selected to be restored and cannot be changed.
g. At this step, if the selected MCP snapshot contains internal configuration “secrets”, an option will be available to reset (erase) all.

5. Click **OK** and then a login window appears, as shown below:

6. Authenticate as a valid administrator user and login to the device, by providing the **User Name** and **Password** for the physical MCP Gateway device.

7. DS Agile Studio uploads the data file (Clone Snapshot) to the MCP Gateway device.

When restoring a clone snapshot image, the following data is not restored on the target device, even if it was included in the snapshot file:

- o Log files
- o Hardware, license and diagnostic information

Upgrading MCP Clone Snapshot

1. Open the file menu to upgrade the firmware version of the saved snapshot, as shown below:
File → Archive → Snapshot → Upgrade Firmware Version

2. Upon clicking 'Upgrade Firmware Version', a window 'Upgrade MCP Clone Snapshot details' pops up, as shown below:

The dialog box titled 'Upgrade MCP Clone Snapshot Details' contains the following fields and controls:

- 'Archive File Name:' with a text input field and a dropdown arrow.
- 'Archived Device Name:' with a text input field.
- 'Description:' with a large text area and a dropdown arrow.
- At the bottom are three buttons: 'OK', 'Cancel', and 'Help'.

3. Specify and check the below details:
 - a. **Archive (snapshot) File Name.**
 - Type in the file name and path (or)
 - Click the [...] button to navigate to the storage location.
 - b. Select desired MCP Clone snapshot.
 - c. Enter the password for the selected clone snapshot:

- d. View the Archived Device Name. This read-only field shows the name of the archived device.
 - e. View the Description in this read-only text field; this is the description entered when the snapshot was saved.
4. Click OK. The following message will be displayed:

5. This completes the upgrade procedure of the Clone snapshot and will be saved in the specified location as {ArchiveFilename}_v220.MCPCloneSnapshot.DS7zip.

Restoring MCP Clone Snapshot using USB

An MCP Clone Snapshot can be restored to MCP in online (mcpcfg and settings GUI) and offline (USB) modes.

Online Clone Snapshot Restore (Using mcpcfg)

- Place the MCP Clone snapshot(s) on a USB formatted FAT32, e.g., using Windows File Explorer.
- Insert the USB in the target MCP.
- Connect to MCP using Secure Terminal and with valid administrator user credentials.

- Launch mcpcfg -> Gateway Settings menu and select the option 'Restore Clone Snapshot' from the menu, as shown below:

```

=====
Gateway (G500) Settings Menu
=====

0.  Back
1.  Configure Authentication
2.  Configure Network Settings
3.  Configure Network Interfaces
4.  Configure Secure Access
5.  Configure Firewall
6.  Configure Host Names
7.  Configure Time & Time Sync
8.  Reset System Logs
9.  Reset Database Tables
10. Reset File Persistence Data
11. Local HMI
12. Configure Sync Manager
13. Redundancy
14. ARRM
15. Suppress Forced Qualities To Masters
16. Configure Serial Ports
17. Configure D.20 Port Settings
18. EdgeOS Host
19. Clear Chassis Intrusion State
20. Restore Clone Snapshot
21. Restore Factory Default
22. Reboot Device

Enter Your Choice : ( Between 0 and 22 ) : █

```

- Confirm and acknowledge the Snapshot restoration (followed by a reboot) by pressing 'Y', as shown below:

```

=====
Gateway Settings Menu
Restore Clone Snapshot
=====

WARNING!!! This action needs REBOOT of the device.

Do you want to Restore Clone Snapshot[Y/N]: Y █

```

- Then, list of clone snapshots available in the USB will be displayed on the screen, as shown below.

```

-----
List of Snapshots present in the USB.
-----

0.  Back
1.  RAMU.MCPCloneSnapshot.DS7zip
2.  TANTIMESYNC.MCPCloneSnapshot.DS7zip

Enter Your Choice : ( Between 0 and 2 ) : 1 █

```

- Select the required snapshot to be restored and enter corresponding password.
- Follow the instructions displayed on the screen to copy the clone snapshot from USB to MCP.
- After the automatic reboot, clone snapshot will be restored into the MCP.

Online Clone Snapshot Restore (Using Settings GUI)

- Place the MCP Clone snapshot(s) on a USB formatted FAT32, e.g., using Windows File Explorer.
- Insert the USB in the target MCP.
- Launch settings GUI and login to the device with valid user credentials.
- Select 'Restore Clone Snapshot' option from the settings menu, as shown below:

- Confirm and acknowledge the Snapshot restoration (followed by a reboot) by clicking 'Yes', as shown below:

- Then, list of clone snapshots available in the USB will be displayed on the screen, as shown below.

- Select the required snapshot to restore and enter corresponding password
- Follow the instructions displayed on the screen
- After the automatic reboot, clone snapshot will be restored into the MCP

Offline Upgrade (Using Firmware Upgrade)

- o Follow the procedure described in the TN-0116.

When restoring a snapshot image, the following data is not restored on the target device, even if was included in the snapshot file:

- o Log files
- o Hardware, license, and diagnostic information

Redundancy - Snapshots

This is not supported in MCP.

In case of Redundant configuration of MCPs, below steps can be followed for saving the snapshots (Standard/MCP Clone Snapshot) from a pair of Redundant MCP's and restore them into ANY pair of Redundant MCP's.

Applicable for Both Standard/MCP Clone Snapshots

Setup the Redundancy in Source MCP's

1. Login both the MCP's with their respective IP address through mpcfg or Settings GUI.
2. Configure Redundancy in both the MCP's, refer Configure the MCP for Redundancy.
3. Reboot both the MCP's.
4. Using DSAS (Online/Offline Editors) configure the first MCP device or MCP-A
5. Apply "**Sync To**" or do the "Commit" changes from DSAS to upload the configuration into the first MCP device or MCP-A.
6. Go to the **Runtime HMI** → **Point Details** → **Redundancy Manager** and apply DO command on "**Sync Config**" DO pseudo point.
7. After this command, the configuration from the first MCP device or MCP-A will be synced to second MCP or MCP-B and both the MCP's will be configured into the redundancy mode.

Save the Snapshots from Source MCP's

Snapshots (Standard or MCP Clone Snapshots) need to be saved separately from both the redundant source MCP's (say MCP-A and MCP-B). Refer [Saving a Standard Snapshot](#) procedure detailed in the earlier section to save the Standard Snapshot, for each MCP (i.e., MCP-A and MCP-B).

Similarly, in case of saving MCP Clone snapshot, refer to the procedure explained in [Saving an MCP Clone Snapshot](#) section, for each MCP (i.e., MCP-A and MCP-B).

Upgrade the Snapshots from Source MCP's

In case of MCP Clone Snapshot, the snapshot needs to be upgraded. This can be done by following the procedure detailed in [Upgrading MCP Clone Snapshot](#) section, for snapshot from each MCP.

Restore the Snapshots to Target MCP's

For Snapshot restoration, the saved (and upgraded snapshot, in case of MCP Clone Snapshot) snapshot need to be restored for both the redundant target MCP's (i.e., MCP-A and MCP-B) individually. Refer [Restoring Standard Snapshot](#) procedure detailed in the earlier section to restore the Standard Snapshot, for each MCP (i.e., MCP-A and MCP-B). Similarly, in case of restoring MCP Clone snapshot, refer to the procedure explained in [Restoring MCP Clone Snapshot](#), for each MCP (i.e., MCP-A and MCP-B).

NOTE: While restoring MCPA snapshot, MCPB must be powered OFF and vice versa.

NOTE: Power ON both the MCP's once the snapshots are restored successfully.

Setup the Redundancy in the Target MCP's

1. Login MCP with the IP address in the Snapshot or the Target MCP through mcpcfg or Settings GUI.
2. Select the option '13. Redundancy' → '8. Setup Public Key Authentication with PEER Gateway'.
3. Enter Password of Peer administrator user configured in each Redundancy configuration.
4. Reboot both the MCP's.
5. After reboot, go to the active's MCP runtime HMI and then navigate to Redundancy Manager Point details page and apply DO command on "**Sync Config**" DO pseudo point.
6. Go to Redundancy Manager Analog inputs Point details page and verify peer MCP enters standby state.
7. Now, reboot the standby MCP to synch the settings files.

NOTE: Both the MCP's must have same time while performing **Keytransfer** and **Sync Config**, if not, select **Time Source** option in both the devices and **Enable Time Sync with Standby** option from mcpcfg/Settings GUI -> Redundancy.

Project and Archive Management

DS Agile MCP Studio has the option to archive an entire project and restore it to same or different machines in which DS Agile MCP Studio has installed. Project can contain many devices. DS Agile MCP Studio can save/restore all the devices available in the project page.

Individual devices can also be archived or restored.

The following sections explain the procedure to archive and restore a project with MCP devices using DS Agile MCP Studio.

Save a Project Archive

1. Go to the File menu on the top left corner of the DS Agile MCP Studio and archive the project (as shown below): File → Archive → Project → Save.

2. A window pops up with list of projects, as shown below:

3. Select the desired Project to be archived and click 'OK'.
4. Alternatively, right click on the project name in the tree on the left area and select **Archive Project**

5. The Archive Project details window shows:

The screenshot shows the 'Archive Project Details' dialog box. It has a title bar with the text 'Archive Project Details'. Inside the dialog, there are three main input areas: 'Archive File Name' with a text box and a browse button (...), 'Project Name' with a text box containing 'TST500', and 'Description' with a large text area. Below these is a checkbox labeled 'Include application definitions'. A section titled 'Optional password (for integrity-checking)' contains a password field. At the bottom of the dialog are three buttons: 'OK', 'Cancel', and 'Help'.

6. Specify the below details:

- **Archive File Name**
 - o Type in the file name and path (or)
 - o Click the [...] button to navigate to the storage location.
- Type in the **Description (optional)**.
- Type in an **Optional password (for integrity checking)**, if the Project needs to be saved with.

7. Click **OK**.

8. Project will be saved now at the specified file location with **name. project.DS7zip**. It can be used to restore in the same machine or in a different machine, as per user need.

9. If the project contains MCP devices with internal “secrets”, the following dialog will be displayed at step 5 above:

The dialog box is titled "Archive Project Details". It contains the following fields and options:

- Archive File Name:** A text input field with a dropdown arrow and a browse button (...).
- Project Name:** A text input field containing the text "SAVE_RESTORE".
- Description:** A large text area with scrollbars.
- ☐ Include application definitions

Below these fields is a section titled "Mandatory password (for encryption)". It contains:

- A password input field.
- ☐ Exclude IED and email passwords from archive

At the bottom of the dialog are three buttons: "OK", "Cancel", and "Help".

10. In this case the password is mandatory, to protect the secrets in the archive. Alternatively, the secrets can be removed by checking the box **Exclude IED and email passwords from archive**, in which case a password is no longer mandated.

The dialog box is titled "DS Agile Studio™" and features a yellow warning triangle icon. The text inside reads:

Are you sure you want to exclude passwords from the archive? You will not be able to connect to any IEDs referenced in the device configuration(s) that require passwords.
Do you wish to continue?

At the bottom are two buttons: "Yes" and "No".

Note: once excluded, they cannot be recovered, and will have to be entered manually.

Restore a Project Archive

1. Go to the File menu on the top left corner of the DS Agile MCP Studio and restore the project (as shown below): File → Archive → Project → Restore.

2. Upon clicking 'Restore', a window 'Restore Project Details' pops up, as shown below, in which details of archived project to be entered:

3. Specify the below details:
 - **Archive File Name**, which needs to be restored.
 - o Type in the file name and path (or)
 - o Click the [...] button to navigate to the storage location.
 - Type in the **password (for integrity checking)**, if the Project was saved with a Password.
4. Click **OK**.
5. Project will get restored now.
6. If the project contains encrypted "secrets", the dialog at step 2 will prompt to enter the mandatory archive password:

7. Alternatively, the secrets can be removed from all restored devices inside the project by checking the box **Reset IED and email passwords in restored device(s)**, in which case a confirmation will be required:

Note: once reset, they cannot be recovered, and will have to be entered manually.

The following sections explain the procedure to save and restore the MCP's device as an archive using DS Agile MCP Studio.

Save a MCP Device Archive

1. Select the device to save as an archive. The device appears within a green box with anchor points, as shown below:

2. Then, click on the **Save** option, as shown below:

3. Alternatively, right click on the MCP device and select Archive → Save → Save option:

4. The Archive Device details window is shown:

The 'Archive Device Details' window contains the following fields:

- Archive File Name:** A text field with a dropdown arrow and a browse button (...).
- Device Name:** A text field containing 'DUTG500'.
- Description:** A large text area.
- Optional password (for integrity-checking):** A text field.

At the bottom are buttons for **OK**, **Cancel**, and **Help**.

5. Specify the below details:

- **Archive File Name**
 - o Type in the File name and path (or)
 - o Click the [...] button to navigate to the storage location.
- Type a **Description** of the device (Not Mandatory)
- Type in an **Optional password** (for integrity checking)

When you begin typing characters in the password field, additional information is presented, guiding you to meet password strength requirements.

This window shows the password field with two dots (••) indicating masked input. Below the field, it states: 'If used, must meet the following requirements:'

- ☐ At least 8 characters
- ☐ At least one uppercase and one lower case letter
- ☐ At least one number
- ☐ At least one non-alphanumeric character (e.g., @, %, &, *)

6. Re-enter the password and confirm the same, as shown below:

The 'Confirm Password' window shows a single text field for re-entering the password. Below the field are **OK** and **Cancel** buttons. In the background, the password field from the previous window is visible with masked characters (••••••••).

7. Device will be saved now at the specified file location as **name.device.DS7zip**. It can be used to restore, as needed.
8. If the device contains encrypted “secrets”, the dialog at step 4 will prompt to enter the mandatory snapshot password:

A dialog box titled "Mandatory password (for encryption)". It features a text input field for a password and a checkbox labeled "Exclude IED and email passwords from archive". At the bottom, there are three buttons: "OK", "Cancel", and "Help".

9. Alternatively, the secrets can be removed from all restored devices inside the project by checking the box **Exclude IED and email passwords from archive**, in which case a confirmation will be required:

A confirmation dialog box from "DS Agile Studio™". It contains a yellow warning icon and the text: "Are you sure you want to reset the passwords in restored device(s)? The devices will not be able to connect to any IEDs referenced in the device configuration(s) that require passwords. Do you wish to continue?". At the bottom, there are "Yes" and "No" buttons.

Note: once excluded, they cannot be recovered, and will have to be entered manually.

Restore a MCP Device Archive

1. From ribbon, inside an open project, click on 'Restore' option, as shown below: Restore → Restore Device Archive.

2. Alternatively, right click on the project empty canvas and select Archive → Restore → Restore Device Archive.

3. Upon clicking 'Restore Device Archive', a window 'Restore Device Details' appears, as shown below, in which details of archived device to be entered.

 A screenshot of a dialog box titled 'Restore Device Details'. It contains several input fields: 'Archive File Name' with a dropdown and a browse button (...), 'Archived Device Name' with a text box, 'Description' with a large text area, and 'Restore Device Name' with a text box. Below these fields is a section titled 'Optional password (for integrity-checking)' with a password input field. At the bottom are three buttons: 'OK', 'Cancel', and 'Help'.

4. Specify the below details:
- **Archive File Name**
 - o Type in the file name and path (or)
 - o Click the [...] button to navigate to the storage location.
 - Type in the **password (for integrity checking)** if the archive file was saved with a password.
5. Click **OK** and then verify that you trust the source of the archive/package and click **Accept**; the archive file is restored to the device, as shown below:

6. Then, DS Agile Studio popup will be displayed, indicating that the device has been restored.
7. If the device archive contains encrypted “secrets”, the dialog at step 3 will prompt to enter the mandatory archive password:

8. Alternatively, the secrets can be removed from all restored devices inside the project by checking the box **Reset IED and email passwords in restored device(s)**, in which case a confirmation will be required:

Note: once reset, they cannot be recovered, and will have to be entered manually.

MCP Runtime HMI

The MCP Runtime Human machine interface (HMI) is your window into the MCP. Through the HMI you can monitor the status of your substation network, view data, execute control commands and change the system set-up.

The MCP Runtime HMI:

- Is used to view and control the operation of the power network.
- Includes the optional One Line Viewer for viewing one-line diagrams.
- Provides access from the Power bar buttons to view the MCP display screens and utilities.

The MCP Runtime HMI is available in three forms:

- Local HMI using device's KVM (Keyboard, Video monitor, Mouse).
- Remote HMI (running in a Windows PC, this is the preferred remote HMI method).
- Only in MCP versions 3.00 and 3.10 which were shipped before June 1, 2024: Local HMI via Remote Desktop connection from a Windows PC (this is targeted for temporary maintenance activities and requires a Remote Desktop MCP license and the Remote Desktop Application installed).

Multiple users can use the MCP Runtime HMI simultaneously, using any of the above implementations concurrently.

Local HMI shares computing resources (CPU, Memory) with all other MCP Gateway runtime applications; due to this, extremely large volumes of data in custom screens may cause sluggish interactions at runtime when using the Local HMI. In such cases is recommended to use Remote HMI instead so the HMI processing occurs in the Windows PC.

NOTE

Local HMI does not support touch screen functions. If touch screen operation is required then use the Remote HMI instead, with the Touch Screen connected to the Windows PC running the Remote HMI.

NOTE

The MCP Runtime HMI is not available if the MCP device Function is "D" (only D2x). If attempted - a connection will be initiated, but a non availability message will be displayed to the user and the connection will be closed. The reason for this behavior is the Runtime HMI client must first connect to the target device in order to identify the MCP Function of the target device.

NOTE

Starting with MCP v4.10 – the Runtime HMI implements a check of connection availability using an internal fast heartbeat. In Systemwide → GUI: users can configure the heartbeat period (default is 2 seconds) and the number of retries (default are 2) to monitor the connection; after expiry the Runtime HMI user is logged out. The Local HMI and the Remote HMI have separate settings, to accommodate possible different applications, for e.g., Local HMI is fast detection on a local LAN, while Remote HMI could require an increased heartbeat period and more retries due to a WAN connection. This functionality is implemented to prevent as soon as possible users to see stale data due to runtime HMI loss of connection.

A Local HMI is available for accessing the MCP through a local substation computer setup (via the display port / KVM). The Local HMI provides the same operator functions for local display and control as the remote HMI with few exceptions. For more information, refer to Local HMI.

The MCP HMI access is protected by a Login screen that requires a username and password to access the HMI. Your user access level determines the screens and functions available to you.

Local HMI using KVM

The Local HMI provides access to the MCP through a local substation computer setup (via the display port / KVM).

MCP supports Local HMI by connecting the monitors using the display ports.

G100 supports 1 monitor and G500 supports up to 2 monitors.

Note: In some cases, when using monitors which support MST, the G500 may not wake up the connected monitor after the screen saver went on. If this occurs - change the MST setting in the Display Monitor Menu from OFF to SECONDARY.

Taskbar Functions

The Taskbar shown in the Local HMI on the bottom of the screen provides the following functions:

1. Access to **Start** applications.
2. Minimize all windows and Show Desktop.
3. Switch between active windows and workspaces (up to 4 workspaces are supported).

Same as from **Start**:

4. Launch a Terminal session to the MCP shell.

Same as from **Start**:

5. Launch MCP System Settings GUI (should have only one instance across all workspaces).

Same as from **Start**:

6. Launch MCP Emergency access (should have only one instance across all workspaces).

Same as from **Start**:

7. Launch Local Runtime HMI (supports only one instance across all workspaces).

Same as from **Start**:

If launching more than one Runtime HMI instance there will be a prompt to close existing session:

8. Network Interface 0 statistics (additional information is shown when hovering the mouse).
9. Memory statistics (additional information is shown when hovering the mouse).
10. CPU statistics (additional information is shown when hovering the mouse).
11. Local time clock (additional information is shown when hovering the mouse).

The Color theme can be changed using **Start** → **Settings** → **Themes**:

The Local HMI and all applications running can be restarted using **Start → Logout**:

A confirmation window is shown:

Configure Screen Layout

Screen Layout and resolutions may be configured using Screen Layout utility. This utility can be launched from Local HMI start menu using **Start → System → Screen Layout**:

The minimum resolution supported in Local HMI is 1280x1024 and the recommended resolution is FHD (1920x1024) or higher.

Configuring Monitor Layout

Multiple monitors can be connected to MCP via display ports (G500 only).

When a single monitor is connected, the connected monitor becomes the Primary (G100 and G500).

When two monitors are connected to the G500, by default, the monitor connected to display port (labelled as DP 1, at the rear side of the device) becomes Primary. And the monitor connected to display port (labelled DP 2 at the rear side of the device) becomes extended monitor as shown below.

Note: In the Intel CPU units Monitor A/DP 1 and Monitor B/DP 2 are swapped; all other functions are same.

1. Monitor A - connected to DP 1 (shown as Display Port 1 on Screen Layout).
2. Monitor B - connected to DP 2 (shown as Display Port 0 on Screen Layout).

Figure 1-3: Monitor A becomes Primary and Monitor B is extended

The user can reconfigure the layout without changing the backend connections by dragging & dropping the monitors and placing at the required position on Screen Layout canvas as described below.

e.g., When user configures connections such that Monitor A is connected to DP 2 and Monitor B is connected to DP1 however chooses Monitor A as Primary and Monitor B as extended.

In this case by default Monitor B becomes Primary and Monitor A will move in extended mode. Now, open the Screen Layout utility and drag the Monitor B (shown as Display port 1/DP1) to the right and Monitor A (Display Port 0/DP 2) to the left.

Right click on Monitor A (Display Port 0/DP 2) and select it as Primary. Now click **Apply** button and close the utility. These layout changes described above are shown below.

Figure 1-4: Monitor A (connected to Display Port0/DP2) becomes Primary & Monitor B (connected to Display Port1/DP1) becomes Extended

The configured layout will always be persisted once the Screen Layout utility is closed. And whenever the HMI is relaunched, it will open as per the last configured layout.

Virtual Keyboard

A virtual keyboard may be displayed on the screen using **Start → System → OnBoard**:

Clicking on the top right X will close the virtual keyboard.

Login to Local HMI

Local HMI will be started automatically once MCP is powered on and a monitor is connected to a display port.

If Local HMI is configured with Auto Login, then Local HMI will be launched automatically, and MCP Home Page comes with the configured user privileges. For more details, refer to Local HMI Auto Log in.

If Local HMI is not configured with Auto Login, then user would need to connect to Local HMI as described below.

>> To log into the HMI:

1. Type in your Username and Password. MCP doesn't have default HMI user and it is required to create a nominated administrator user to access HMI and create other HMI users.

Figure 1-5: Login HMI screen

2. Click **Login**.

Result: If your login is successful, the configured Login Security Banner is shown:

After which the configured MCP Home page appears.

Figure 1-6: MCP Home Page

The User Login level/role determines which MCP HMI features and functions the user can have access to/support.

The MCP Local HMI contains a lock out feature which prevents you from logging in after several failed attempts for a set period.

Logout from Local HMI

It is suggested to logout from the MCP Local HMI once work is finished with MCP Local HMI to secure the system. Logging out terminates the respective user session with the MCP and closes all MCP Local HMI displays and windows.

» To Logout from the MCP Local HMI:

- Click the **Logout** button on the Power bar.

Result: The MCP Local HMI closes and the MCP **Login to Local HMI** screen appears.

Figure 1-7: MCP Logout Screen

Connecting to MCP Command Prompt

MCP Local HMI supports connection to MCP Command prompt using built-in shell. User can connect to the MCP command prompt using either default administrator credentials or nominated administrator credentials.

» To Connect to MCP Command Prompt:

Click on the icon  available on task bar to connect to the command line prompt from the Local HMI. Once the shell or window is launched then provide the administrator-level user credentials (Default Administrator or Nominated Administrator) to connect to the MCP from the command line.

Standby HMI Redirects to Active

If MCP redundancy is enabled, the current redundancy state of the MCP can also be seen in the Local HMI Power Bar. If the Standby MCP HMI redirects to the Active MCP when redundancy is enabled, both the Local HMI monitors connected to each MCP unit points to Active MCP only. The Local HMI Power Bar on each MCP Utility indicates whether the Local HMI is showing information for its(this) MCP or the redundant (PEER) MCP.

Remote Runtime HMI

The Remote Runtime HMI provides access to the MCP from a remote computer setup.

The Remote Runtime HMI has the same functionality for G500 and G100, and it will be referred to as “MCP” herein, with screen captures in this document taken from G500.

Up to and including V4.10 there is a specific installation file and application associated with each MCP version, common for G100 and G500.

Starting with V5.00 there is a single installation file and application associated with any MCP version, common for G100 and G500.

Install MCP Remote Runtime HMI (up to and including V4.10)

The MCP Remote Runtime HMI requires Windows x64 bit OS. This is available via GE Vernova support channels and consists of a single installation file named “SetupMCPHMI_x64_vabc.exe” and “abc” represents the version (this must match the MCP firmware version on first two digits).

For example:

SetupMCPHMI_x64_v4.0.92.exe

To access the MCP Runtime HMI, for both G100 and G500, go to Start Menu > MCP Runtime HMI group folder.

Installation of Java/JRE on the Windows PC is not required.

To install the MCP Remote Runtime HMI:

1. Run the **SetupMCPHMI_x64_vabc.exe** install file.
2. Select **OK** at the Windows security prompt.
3. Select **Next** in the installation wizard.
4. Select **Finish** to complete the install.
5. Launch the MCP Runtime HMI from the Start Menu.

Install MCP Dynamic Remote HMI (all versions)

The MCP Dynamic Remote HMI requires Windows x64 bit OS. This is available via GE Vernova support channels and consists of a single installation file named “**SetupMCPDynamicRemoteHMI.exe**” and is compatible with all MCP Versions.

The concept is to install the MCP Dynamic Remote HMI only once and then import only required “MCPDynamicRemoteHMI” signed packages, if and as needed (no additional installation needed).

For up to and including MCP version 4.00 – a manual import of the corresponding version “MCPDynamicRemoteHMI” signed package is required, only once for each Windows PC running the MCP Dynamic Remote HMI.

For MCP version 4.10 and later – the MCP Dynamic Remote HMI can automatically obtain and import the signed package from the connected MCP device. A manual import of the corresponding version “MCPDynamicRemoteHMI” signed package is possible but is not required.

The “MCPDynamicRemoteHMI” signed packages can be obtained via GE Vernova Support channels, and follow the following file name patterns:

- For versions up to and including V2.80: Gx00_abc.MCPDynamicRemoteHMI.DS7zip – where x is either 1 or 5, and abc is the version, for example:
 - o G100_230.MCPDynamicRemoteHMI.DS7zip
 - o G500_110.MCPDynamicRemoteHMI.DS7zip
- For versions 3.00 and later: MCP_abc.MCPDynamicRemoteHMI.DS7zip – where abc is the version, for example:
 - o MCP_300.MCPDynamicRemoteHMI.DS7zip

To access the MCP Dynamic Remote HMI, for both G100 and G500, go to Start Menu > MCP Dynamic Remote HMI group folder.

Installation of Java/JRE on the Windows PC is not required.

To install the MCP Dynamic Remote HMI:

1. Run the **SetupMCPDynamicRemoteHMI.exe** install file.
2. Select **OK** at the Windows security prompt.
3. Select **Next** in the installation wizard.
4. Select **Finish** to complete the install.
5. Launch the MCP Dynamic Remote HMI from the Start Menu.

Log in to Remote Runtime HMI (up to and including V4.10)

» To log in to the HMI:

1. Launch the installed MCP Remote Runtime HMI.

Result: The below screen appears.

Figure 1-8: Remote HMI Login

Note: The login mode is always secure HTTPS and the default port number is 443. If you need to use a different TCP port, due to routing rules existing between the PC and MCP, you may enter it in the form of IP: TCP, for e.g., **10.10.11.50:30500**

2. Apply **Connect** after entering the Host IP.

Result: The below screen appears.

Figure 1-9: Username and Password window

3. Type in your Username and Password.

4. Click **Login**.

Result: If your login is successful, the configured Login Security Banner is shown:

After which the configured Home Page appears.

Figure 1-10: MCP Home page

After successful login - the remote runtime HMI shows either G100 or G500 automatically, by detecting the connected device type.

The User Login level/role determines which MCP HMI features and functions the user can have access to/support.

The MCP contains a lock out feature which prevents you from logging in after several failed attempts for a set period.

Log in to MCP Dynamic Remote HMI (all versions)

» To log in to the HMI:

1. Launch the installed MCP Dynamic Remote HMI.

Result: The below screen appears.

Figure 1-11: MCP Dynamic Remote HMI Login

Note: The login mode is always secure HTTPS and the default port number is 443. If you need to use a different TCP port, due to routing rules existing between the PC and MCP, you may enter it in the form of IP: TCP, for e.g., **10.10.11.50:30500**

2. Enter the **Host IP, User Name, Password** – and click **Launch**.
3. If the MCP device is of version up to and including v4.00 and if this is the first time you connect to this MCP version from this Windows PC – you will be prompted with below message (in this example is v4.00):

In this case import (only once) the required version of the “MCPDynamicRemoteHMI” signed package (in this example: “MCP_400.MCPDynamicRemoteHMI.DS7zip”) using button “**Import Package**”. Wait for the success message:

Launch again.

4. If the MCP device is of version 4.10 and later and if this is the first time you connect to this MCP version from this Windows PC – the “MCPDynamicRemoteHMI” signed package is read and imported automatically (only once) from the connected MCP device.
5. If your login is successful, the configured Login Security Banner is shown:

After which the configured Home Page appears.

Figure 1-12: MCP Home page

After successful login - the remote runtime HMI shows either G100 or G500 automatically, by detecting the connected device type.

The User Login level/role determines which MCP HMI features and functions the user can have access to/support.

The MCP contains a lock out feature which prevents you from logging in after several failed attempts for a set period.

Logout from Remote HMI

It is suggested to logout from the MCP HMI once work is finished with MCP HMI to secure the system. Logging out terminates the respective user session with the MCP and closes all MCP HMI displays and windows.

» To Logout from the MCP Runtime HMI:

- Click the **Logout** button on the Power bar.

Result: The MCP Runtime HMI closes and the MCP **Log in to Remote Runtime HMI** screen appears.

Figure 1-13: Logout from the MCP Runtime HMI

Accessing Remote HMI Using Shortcuts (up to and including V4.10)

You can create your own MCP Runtime HMI shortcuts based on the initial one created during installation, following Windows standard methods, each shortcut with a desired name.

By customizing a MCP Runtime HMI shortcut the user can predefine the login User, IP Address, or Remote Port.

1. Locate the MCP Runtime HMI shortcut.
2. Copy the shortcut to the desktop, or a desired location, or pin it to Taskbar or Start Menu.
3. Right click on the shortcut and select “Properties”.
4. Add the below parameters to the shortcut at the location “Target” as seen in the below table:

Target Parameters	Shortcut Target content
IP Address (-host)	C:\Program Files\MCP Runtime HMI\4.0\MCPHMI_x64_v4.0.exe -host 192.168.168.81
IP Address & Port (-port) (e.g., for local port re-direct)	C:\Program Files\MCP Runtime HMI\4.0\MCPHMI_x64_v4.0.exe -host 127.0.0.1 -port 30500
Only User Name (-username)	C:\Program Files\MCP Runtime HMI\4.0\MCPHMI_x64_v4.0.exe -username admin1
Shortcut with All Parameters	C:\Program Files\MCP Runtime HMI\4.0\MCPHMI_x64_v4.0.exe -host 192.168.168.81 -port 30500 -username admin1

Shortcut properties display updated “Target” data launches the HMI with the IP and pre-defined username.

5. Double clicking the newly created shortcut will launch the MCP Runtime HMI using the parameters configured in the Target.

Accessing MCP Dynamic Remote HMI Using Shortcuts (all versions)

You can create your own MCP Dynamic Remote HMI shortcuts based on the initial one created during installation, following Windows standard methods, each shortcut with a desired name.

By customizing a MCP Dynamic Remote HMI shortcut the user can predefine the login User, IP Address, Remote Port or Autologin option.

1. Locate the MCP Dynamic Remote HMI shortcut.
2. Copy the shortcut to the desktop, or a desired location, or pin it to Taskbar or Start Menu.
3. Right click on the shortcut and select "Properties".

4. Add the below parameters to the shortcut at the location “Target” as seen in the below table:

Target Parameters	Shortcut Target content
IP Address (-host)	C:\Program Files\MCP Dynamic Remote HMI\MCPDynamicRemoteHMI.exe -host 192.168.168.81
IP Address & Port (-port) (e.g., for local port re-direct)	C:\Program Files\MCP Dynamic Remote HMI\MCPDynamicRemoteHMI.exe -host 127.0.0.1 -port 30500
Only User Name (-username)	C:\Program Files\MCP Dynamic Remote HMI\MCPDynamicRemoteHMI.exe -username admin1
Only autologin (-autologin) <i>When present it will attempt autologin, assuming is enabled in the MCP Device. “username” is not applicable when autologin is enabled.</i>	C:\Program Files\MCP Dynamic Remote HMI\MCPDynamicRemoteHMI.exe -autologin
Shortcut with All Parameters	C:\Program Files\MCP Dynamic Remote HMI\MCPDynamicRemoteHMI.exe -host 192.168.168.81 -port 30500 -username admin1

Double clicking the newly created shortcut will launch the MCP Dynamic Remote HMI using the parameters configured in the Target.

Remote HMI Auto Login

If the MCP device has Remote HMI auto login enabled, you can create a shortcut with the target *IP:Port* (and *autologin* for the MCP Dynamic Remote HMI), which when launched – will result into a session with an automatically logged on configured user after the configured Login Wait Time.

Auto login is configured in the Runtime HMI, under Settings > [Automatic Login](#)

 User Management  Authentication  Automatic Login	
Name	
Local UI Automatic Login	false
Local UI Automatic Login Wait Time	60
Local Automatic Login Privilege Level	Observer
Local Automatic Login User	
Remote UI Automatic Login	true
Remote UI Automatic Login Wait Time	60
Remote Automatic Login Privilege Level	Observer
Remote Automatic Login User	auto_observer

Remote Desktop (RD) Access (V3.00 and V3.10)

In MCP v3.00 and v3.10 is possible to connect to a separate instance of the Local HMI using Remote Desktop (herein named “RD”), from a Windows PC (minimum Windows 10).

Remote Desktop access should be used only for temporary activities performed from Windows computers when the Remote Runtime HMI is not available and should not be a permanent replacement for the Remote Runtime HMI.

Remote Desktop access and licenses are not available after June 1, 2024, for any MCP version.

RD Architecture

The MCP Remote Desktop (RD) functionality is provided by a separate application (Docker container), herein called “RD HMI application”, dedicated to RD. This design eliminates all possible interactions and cross-talk/cross-actions between the KVM Local HMI and RD sessions.

Users can operate independently the KVM Local HMI and the RD Local HMI Sessions.

For security reasons, all RD sessions are handled inside an RD SSH tunnel.

All users accessing the RD SSH tunnel must be configured in an “Rdtunnel” user group.

RD sessions use the Windows *Remote Desktop Connection* application. Except the screen, mouse and keyboard – there are no additional resources shared over Windows Remote Desktop, (i.e., no copy-paste clipboard, no sound, no printers, no shared folders, etc.).

Only one RD session is allowed at a time, to eliminate potential cross-talk/cross-actions between different concurrent RD sessions. If the RD session is terminated abruptly there is a delay of about 60 seconds for the next session request to be processed.

While inside an active RD session: menus, layout, taskbar, runtime HMI auto login, user actions and results are same as the user would be in front of the MCP device’s KVM Local HMI, with the following exceptions:

- The applications Terminal, System Settings and Emergency Access, and their associated icons and menu items are removed from the Remote Desktop taskbar. This prevents inadvertent access to these in the event that these services are blocked in the firewall. It also prevents remote access to emergency access configuration, which would violate the KVM local-only rule for this service.
- When starting an RD session – the MCP runtime HMI application is not automatically launched or running inside the RD session, this is to prevent security bypass for the runtime HMI users.
- When the RD session is closed - if the MCP runtime HMI application was active inside the RD session, it will be closed as well for next RD session, so new RD users cannot “inherit” another runtime HMI user’s session.

Please keep in mind the RD session with HMI application runs in the target device (not in the Windows PC like Remote Runtime HMI), therefore the user experience relative to performance depends on the target device resources and loading.

RD Application Deployment

The RD HMI application is not included in firmware images of MCP 3.0 (G100 and G500), unless was factory ordered.

The RD HMI application can be obtained as a signed Docker Container file from GE Vernova repositories, or using *DSAS Updates* workflow, and has the file name “mcprdhmi”, followed by the compatible firmware version, for e.g., *mcprdhmi-300.2515-0.0*.

Ensure the main version matches the MCP Firmware version and build (e.g., 300).

The “mcprdhmi” application is installed in the MCP device using a PETC based workflow described below.

For details about PETC connectivity please refer to [Chapter 9 - EdgeManager and PETC](#) in this document.

1. Open a web browser (Chrome recommended) and navigate to `https://<Edge Manager IP Address>`.

Since, the web browser used a self-signed certificate, the browser warns that the connection is not private. You can proceed. For example, on Chrome, click **Advanced**, then **Proceed to** (unsafe).

2. Enter your username and password to login. If this is your first time logging into the PETC, use the default credentials – “admin / admin” and you will be prompted to change your password.

The image shows the login interface for the Predix Edge Technician Console. At the top is the 'PREDEX' logo in blue. Below it is the title 'Edge Technician Console'. There are two input fields: 'USERNAME' and 'PASSWORD'. Below these fields is a 'Sign In' button. At the bottom, there is a copyright notice: 'Copyright © 2019 General Electric Company. All rights reserved.'

3. When you sign into PETC, the **Device Status** page is displayed. Move to the left and click **Application Manager** to navigate to Application Manager page.

- Click **Upload App** from **Actions** drop-down list on **Available Packages** section, you will be prompted with a file selection dialog.

- You can either **Drag and Drop** the signed application package here or click **Choose File** to browse the file system and select the signed RD application package obtained from GE Vernova.

Note: Ensure the chosen application package is compatible with the MCP firmware version, there is no automated check for this.

- Enter the NAME as **mcprdhmi** (do NOT change this).

Upload Application

NAME

mcprdhmi

↑ Drag and drop Application package here.

Choose File No file selected

Cancel Upload

- When the application package file is selected, click **Upload** to upload the signed application package to target device and wait for the upload to complete.
- When the upload is completed, it will appear in the **Available Packages** list and a message will be shown in lower right corner.

- Select the RD application from the list and then click **Deploy** from the **Actions** drop-down list, the dialog below appears, click **Deploy** button again. Wait for the deployment process to complete.

This action will take some time, the status can be seen in the "Deployed Instances" screen:

▼ AVAILABLE PACKAGES (1)			Actions ▼
NAME	SIZE	STATUS	
☒ mcprdhmi	511.7 MB	Uploaded	
Rows per page 10 ▼			1 - 1 of 1 ← 1 →
Available Staging Space: 2.5 GB			

▼ DEPLOYED INSTANCES (13)			Actions ▼
TYPE	APPLICATION ID	STATUS	
☐	mcprdhmi	Deploying	

10. When the deployment is completed successfully, RD application will appear in the **Deployed Instances** list as Application ID "mcprdhmi" (the state will show either stopped or running, depending on the RD configuration being enabled and RD license being present):

▼ DEPLOYED INSTANCES (13)			Actions ▼
TYPE	APPLICATION ID	STATUS	
☐	mcprdhmi	Stopped	

11. Final step is to delete the *mcprdhmi* staging package to free up the available staging space; select the *mcprdhmi* package **checkbox** and then select **Delete** in Actions:

Application List

Updated a few seconds ago Refresh

▼ AVAILABLE PACKAGES (1)

NAME	SIZE	STATUS	Actions ▼
☒ mcprdhmi	511.7 MB	Uploaded	1 2 Upload App Deploy Delete

Rows per page 10 ▼

1 - 1 of 1 ← 1 →

Available Staging Space: 2.5 GB

RD Application Version

The version of the RD HMI application can be checked in PETC > **Application Manager** > **Deployed Instances**.

Click on the “mcprdhmi” application (in blue below):

▼ DEPLOYED INSTANCES (13)	
TYPE	APPLICATION ID
☐	mcprdhmi

In the resulting **Details** window the version will be displayed:

Details

Containers

NAME	IMAGE
mcprdhmi_mcprdhmi.1	mcprdhmi:300.2515-0.0

If the application never ran there is nothing displayed in **Details**. In this case select **Start** from **Actions**, and a log will be created with the associated application name and version.

Make sure that mcprdhmi main version matches the MCP firmware release main version (e.g., 300 above).

If they do not match perform the steps below in PETC > **Application Manager** > **Deployed Instances**:

1. **Select** the mcprdhmi application and choose **Delete** action.

▼ DEPLOYED INSTANCES (13)

TYPE	APPLICATION ID	STATUS
☒	mcprdhmi	Running
☐	predix-edge-broker	Running

Actions ▼

- Delete
- Start
- Stop
- Apply Config

Delete Application

Do you really want to delete the mcprdhmi application?

Cancel Delete

- Wait for the confirmation message in upper right corner:

- Reboot the MCP device.
- Re-deploy the correct version following steps above.

RD Licensing

The RD HMI application runs subject to a deployed RD HMI activation license, unique for each device (based on the HW identifier), which is a similar workflow to license other MCP features (e.g., IEC 61850 client, ARRM, Tejas V Server, etc.).

DSAS MCP Studio is not checking for RD HMI License being present, to allow compatibility with current and past implementations, as well as to grow with more docker applications to arrive in future, some of them potentially managed outside of DSAS MCP Studio.

The RD HMI Application checks for a valid RD HMI license at startup and logs a message in the system event log if the RD license is present / or not present. If a valid RD license is not present, the RD HMI Application will shut down after logging the message in the system event log.

When reading the license information, users see below data as shown in the format:

Application ID number: Description of the feature | License status

License Report Utility v01.000

License Information

RD Configuration and Settings

Applies to MCP versions 3.00, 3.10.

For the RD SSH Tunnels a new Device Role (LDAP)/Privilege Level (Local) has been added: **Rdtunnel**. Only users declared here will be able to initiate the RD SSH Tunnel session.

RD users are maintained in same way as Observers, Operators, Pass Through users (via Runtime HMI).

The RD functionality is enabled/disabled and has a configurable RD inactivity timeout (default 15 minutes, range 10–60 minutes) in **Systemwide > Access Manager**:

The Remote Desktop functionality setting is used to automatically “add” (when RD enabled) or “remove” (when RD disabled) a firewall rule called **Remote_Desktop_Inbound**, which defaults to the Internal Zone.

- This rule can later be edited by administrators.
- This rule can be used to Disable access, as an “RD stop switch”.

Adding and removing RD firewall rules is independent of an RD license or RD HMI application being deployed or not.

Configuring RD in Systemwide > Access Manager is independent of an RD license or RD HMI application being deployed or not.

Configuring users in “Rdtunnel” role is independent of an RD license or RD HMI application being deployed or not.

Transferring MCP configurations (synch from/to, snapshots save/restore) and archive operations are independent of an RD license or RD HMI application being deployed or not.

The PETC interface could be used to manage the RD HMI application, e.g., for updates, or checking the “mcprdhmi” container status – but is not required.

After changing the RD inactivity timeout in Access Manager – the “mcprdhmi” application must be restarted for the new inactivity timeout to take effect. This can be achieved by one of:

- Toggle the RD disabled/enabled setting in the Online Editor under Access Manager, or
- Reboot the entire device, or
- Use PETC access to stop and run again the “mcprdhmi” application:

PREDIX Edge Technician Console

Device Status

DEPLOYED INSTANCES (13)

	TYPE	APPLICATION ID	STATUS
☒		mcprdhmi	Stopped

The screenshot shows the MCP Software Configuration interface. At the top, there is a table with columns: TYPE, APPLICATION ID, and STATUS. The first row shows a checked checkbox, a lock icon, and the application ID 'mcprdhmi' with status 'Stopped'. An 'Actions' dropdown menu is open for this row, showing options: Delete, Start (highlighted with a red box), Stop, and Apply Config. Below the table, a success message is displayed: 'Success! Application ID "mcprdhmi" was started.' Below the message, there is a section titled 'DEPLOYED INSTANCES (13)' with a table showing the updated state. The first row shows 'mcprdhmi' with status 'Starting', and the second row shows 'mcprdhmi' with status 'Running'.

RD Runtime Behavior

The RD SSH tunnel server is automatically started or stopped based on the Remote Desktop functionality setting.

The RD HMI Application is automatically started or stopped based on the Remote Desktop functionality setting, on the RD HMI license validation and on *mcprdhmi* application being installed.

RD HMI License	<i>mcprdhmi</i> application	RD Enabled in Configuration	RD HMI runtime behavior	RD SSH Tunnel Server
Present (unlocked)	Deployed	Enabled	Runs, see RD State 1	Available
(don't care)	(don't care)	Disabled	Stopped, see RD State 2	Not running
Absent	Not deployed	Enabled	Stopped, see RD State 3	Available
Absent	Deployed	Enabled	Stopped, see RD State 4	Available
Present (unlocked)	Not deployed	Enabled	Stopped, see RD State 5	Available

- 1) RD State 1
RD runs, System Event Log shows:

Application	Message Class	Description	Misc
mcprdhmi	INFO	Container Application Start Succeeded	Remote Desktop enable succeeded.
mcprdhmi	INFO	Valid application license	mcprdhmi license is verified.

2) RD State 2

RD does not run, System Event Log may show (if anything on mcprdhmi):

Application	Message Class	Description	Misc
mcprdhmi	INFO	Container Application Stop Succeeded	Remote Desktop is stopped.

3) RD State 3

RD does not run, System Event Log shows:

Application	Message Class	Description	Misc
mcprdhmi	ERROR	Container Application Start Failed	Remote Desktop failed to enable.

4) RD State 4

RD does not run, System Event Log shows:

Application	Message Class	Description	Misc
mcprdhmi	INFO	Application license not found	mcprdhmi license is not present.
mcprdhmi	INFO	Container Application Start Succeeded	Remote Desktop enable succeeded.

5) RD State 5

RD does not run, System Event Log shows:

Application	Message Class	Description	Misc
mcprdhmi	ERROR	Container Application Start Failed	Remote Desktop failed to enable.

Initiating an RD session:

After confirming all RD prerequisites have been configured:

1. **Step 1:** open the SSH tunnel for RD. For this use the Windows CMD line:

```
ssh -N -p 53389 -L 33389:127.0.0.1:3389 <rdtunnel_user>@<mcp_ip>
```

For e.g.:

```
ssh -N -p 53389 -L 33389:127.0.0.1:3389 rduser1@192.168.168.81
```

UNAUTHORIZED ACCESS TO THIS DEVICE IS PROHIBITED

You must have explicit permission to access or configure this device. All activities may be logged. Violations of policy governing this device may result in disciplinary action and may be reported to law enforcement. There is no right to privacy in accessing this device.

rduser1@192.168.168.81's password:

```

Command Prompt - ssh -N -p 53389 -L 33389:127.0.0.1:3389 rduser1@192.168.168.81
C:\>ssh -N -p 53389 -L 33389:127.0.0.1:3389 rduser1@192.168.168.81
UNAUTHORIZED ACCESS TO THIS DEVICE IS PROHIBITED

You must have explicit permission to access or configure this device. All activities
may be logged. Violations of policy governing this device may result in disciplinary
action and may be reported to law enforcement. There is no right to privacy in access
ing this device.
rduser1@192.168.168.81's password:

```

When the RD SSH tunnel has been opened the cursor moves to a new line, there is no additional confirmation message.

Leave this window open to allow RD sessions.

In case you receive a message that the SSH key cannot be accepted – please open in a text editor (e.g., Notepad) the file:

C:\Users\{current_user}\.ssh\known_hosts

Delete the entry associated with the IP address you use, save the file and launch again the RD SSH tunnel creation. You should get prompted to accept the key, for e.g.: (xx are replaced by specific messages):

The authenticity of host '[192.168.168.81]:53389

([192.168.168.81]:53389)' can't be established.

EDxxxxx key fingerprint is SHA256:xxxxxxxxxxxxxxxxxxxxxxxx.

Are you sure you want to continue connecting (yes/no/[fingerprint])? yes

Warning: Permanently added '[192.168.168.81]:53389' (EDxxxxx) to the list of known hosts.

An alternate method to create the RD SSH tunnel is using PuTTY configured as following:

The RD SSH Tunnel does not time out and may be used across multiple consecutive RD Client sessions.

The RD SSH tunnel should be closed when RD is not required anymore.

Opening more than one RD SSH Tunnel in same Windows PC to the same target MCP will not cause adverse effects, however only the first opened RD SSH Tunnel is bound to the Windows RD application.

The RD SSH tunnel connection will be rejected in any of the following cases:

- i. RD is disabled.
 - ii. RD SSH tunnel **user name** and credentials do not match configured user(s) in Rdtunnel group.
 - iii. Firewall rule Remote_Desktop_Inbound prevents access.
2. **Step 2:** after RD SSH tunnel is open – launch the Remote Desktop client in the initiating Windows computer, with the settings below:
- a. Do **not** select “Always ask for credentials”.
 - b. If prompted – user is always *hmi* and password is *hmi*.
 - c. It is recommended to use high resolutions.

3. The Remote Desktop Connection client will time out if RD is enabled and correctly configured but RD HMI Application is stopped, for e.g., if there is no installed associated RD HMI license.

4. If an RD session is active and another new RD session is attempted – the new session is rejected.

5. Upon closing the RD Client the RD session is made available to a new future request (wait at least 60 seconds).
6. Upon expiration of the configured RD inactivity timeout, the RD session will be closed, to avoid being monopolized by a single user.
7. As long as the SSH tunnel window remains open – RD Client sessions can be re-opened directly.

After the RD session is opened – there are no active applications, below is an example of an initial RD session window:

To launch the MCP runtime HMI application – click on the icon in the taskbar, and login to the runtime HMI.

If Local HMI Auto Login is enabled – it will be active in the RD HMI session as well.

Users may logout gracefully from an RD session using Logout menu option (this will not require the 60 seconds cleanup time for another new RD session):

MCP Applications

MCP and MCP-D2x System Redundancy

NOTICE

Starting with **MCP V4.00** release, **Warm-Standby** and **Hot-Standby** redundancy modes are no longer available and have been superseded by **Hot-Hot** redundancy mode. **Hot-Hot** redundancy mode has the same functionality as the superseded modes.

The MCP redundancy solution uses two MCPs connected through serial and/or network links - one in active mode and one in standby mode. If the active unit fails, the standby unit becomes active and takes over system operation.

MCP System Redundancy is configured using MCP System Utilities (mcpcfg) or MCP Settings GUI.

The redundancy modes which are available on the MCP are:

MCP Warm Standby redundancy (superseded by Hot-Hot in V4.00 and later)	Two MCP units are connected using network and/or serial communication links. Only one MCP unit is active at a time. Connection to an RS232 switch panel is optional. Data synchronization from active to standby unit is minimal, restricted to field Accumulator points, local command quality, and configurations.
MCP Hot Standby redundancy (superseded by Hot-Hot in V4.00 and later)	Two MCP units are connected using network (mandatory) and optional backup serial communication links. Only one MCP unit is active at a time. Connection to an RS232 switch panel is optional. The two MCP units are kept in constant data synchronization with respect to their real-time databases. DNP3 (only) communications to master(s) offer a seamless transition during redundancy switch-over.
MCP Hot-Hot redundancy (MCP functions "S" and "C" in V4.00 and later)	Two MCP units are connected using network (mandatory) and optional backup serial communication links. Only one MCP unit is active at a time. Connection to an RS232 switch panel is optional. The two MCP units are kept in constant data synchronization with respect to their real time databases. Depending on configured parameters at communication protocol and port level – either each MCP unit communicates independently and simultaneously with the IEDs (assuming IEDs allow this), or one MCP unit (active) communicates with the IEDs and then synchronizes its data constantly to the other MCP unit. DNP3 (only) communications to master(s) offer a seamless transition during redundancy switch-over.
D2x Warm Standby redundancy (MCP function "D" in V4.00 and later)	Two MCP-D units (running as "D" function i.e. D2x only) are connected using D2x method (serial PING on configurable COM port in D2x application Redundant Monitor B034-0S) . Only one MCP-D unit is active at a time. Connection to an RS232 switch panel is MANDATORY using COM8 (RS232 mode). Data synchronization from active to standby unit is minimal, restricted to D20 Accumulator points. This setup operates same as D20MX redundancy.

No redundancy / Standalone (Default)	If No Redundancy is configured, then all configured applications in MCP run independently on each MCP.
--------------------------------------	--

Note: In Warm-Standby and Hot-Hot Redundancy modes, if D.20 is configured then there will be a default D.20 Heart-beat link available in addition to the configured Redundancy Heart Beat communications. This option is not available in Hot-Standby Redundancy mode.

Types of MCP Applications - Functionality

The MCP is an advanced substation SCADA gateway device that encompasses the functionality of several typical substation devices in one. It can carry out a variety of functions, including:

- Data Collection : Collect data from Intelligent Electronic Devices (IEDs) installed in the substation.
- Data Presentation : Present collected data to a Supervisory Control and Data Acquisition (SCADA) system.
- Data Translation : Manipulate the data comes to Data Collection applications and Provides to Data Presentation Applications. Also, Monitor devices for alarm conditions and issue alarms to the operator for action.
- Substation HMI : Visually present the substation in one-line diagrams and display communications data to a system operator to monitor, control and operate the substation locally, or remotely over a network.
- Terminal server : Provide transparent access (also known as pass-through) to connected devices using vendor-supplied PC programs.

Types of MCP Applications - Architecture

The MCP makes use of three types of embedded software applications to collect, present and manipulate data. These are called client, server and automation applications respectively. The input and output data of these applications is stored in a real-time database, commonly referred to as the System Point Database.

Client applications

This type of application typically interfaces with a substation device over a communications channel and collects data points from it. The client application writes input point values to the real-time database and may process control requests. Known previously within GE Vernova embedded devices as a Data Collection Application (DCA).

Server applications

This type of application typically allows the MCP to communicate with a master station or host computer over a communications channel. The server application reads input point values from the real-time database and sends control requests to it. Known previously within GE Vernova embedded devices as a Data Presentation Application (DPA).

Automation applications

This type of application manipulates data within the real-time database. The automation application can examine the status and values of input points in the real-time database and accept control requests from server applications or other automation applications. The automation application can process this data and then update the values of the input points owned by the automation application or output points belonging to another application. Known previously within GE Vernova embedded devices as a Data Translation Application (DTA).

System Point Database

Information collected by the MCP is stored in a central database on the MCP called the System Point Database. This data base includes all types of system information, including communication statistics, present values, peak values and event records. The real-time database is dynamically updated for all the MCP system inputs/outputs as substation events take place and information is exchanged between applications.

Figure 1-14 illustrates a simplified relationship between the three application types and the system point database within the MCP.

Figure 1-14: Data applications within the MCP

Types of MCP Applications - Automation Features

This manual describes the standard and optional MCP automation features available in MCP. The applications available depend on MCP Order Code and License.

Feature	Standard	Optional
Accumulator Freeze	✓	
Analog Report Generation (not available after and including MCP V2.60)	✓	
Automated Record Retrieval Manager (ARRM)		✓
Calculator	✓	
Data Logger	✓	
Digital Event Manager (Alarm)	✓	
Firewall	✓	
Hybrid Model for MCP Redundancy	✓	
Input Point Suppression	✓	

Feature	Standard	Optional
Internationalization	✓	
Load Shed and Curtailment	✓	
LogicLinx Executor		✓
One Line Viewer	✓	
Secure Enterprise Connectivity	✓	
System Point Manager	✓	
System Status Manager	✓	
Terminal Services	✓	

MCP License Types

MCP has below License Options and their respective value of each Option.

License Options	Value
Remote Desktop HMI (not available after June 1, 2024)	001
Automatic Record Retrieval Manager (ARRM)	002
IEC61850 Client	004
IEC61850 Server	008
IEC 61131-3 Logic Engine (LogicLinx)	016
Tejas V Server	064

The total applied license value is the sum of each individual license, for e.g., if MCP includes License Options for ARRM, IEC61850 Client and LogicLinx then the combined License value is $002 + 004 + 016 = 022$.

MCP v3.00 adds support for future Docker Container Applications licenses, which begin with letter C followed by 3 numerical digits (e.g., C001) and are maintained and reported separately from above.

D2x License Types

Starting with MCP v4.00 is possible to run D2x applications inside the G500 device, subject to a separate set of licenses.

The D2x applications have below License Options and their respective value of each Option.

License Options	Value
D2X Applications	01
Advanced Automation Applications	02

The total applied license value is the sum of each individual license, for e.g., if D2x includes License Options for D2X Applications and Advanced Automation Applications then the combined License value is $01 + 02 = 03$.

Types of MCP Applications - Configuration

This section lists the configurable applications that may be available for MCP. The applications available depend on MCP Order Code and License.

Below table lists the MCP applications that are available with the:

- Standalone mode
- Warm Standby redundancy mode
- Hot Standby redundancy mode
- Hot-Hot redundancy mode

NOTICE

Not all protocols are supported in the various Redundancy modes. Carefully review product documentation and configure Redundancy accordingly.

In *Hot-Hot column*: □H-H indicates that MCP A and B can be each configured as active for the respective communication protocol, if desired for simultaneous hot-hot IED communications, separately from MCP A and MCP B; requires IED support. Otherwise only the Active MCP connects to the IEDs. See also [Table 3-20: IED Communication Summary](#).

Table 1-2: MCP Applications - Redundancy

Application Name	Standalone	Redundancy			License required
		Warm Standby	Hot Standby	Hot-Hot	
DNP3 Client	✓	✓	✓	✓H-H	
IEC 61850 Client	✓	✓	✓	✓H-H	Yes (IEC61850 Client)
MODBUS Multi-Drop® Client	✓	✓	✓	✓H-H	
MODBUS TCP ® Client	✓	✓	✓	✓H-H	
MODBUS TCP/SSH® Client	✓	✓	✓	✓	
D.20 Client	✓	✓	✗ Not Available	✓	
SEL Binary Client	✓	✓	✗ Not Available	✓	
Generic ASCII Client	✓	✓	✗ Not Available	✓	
IEC 60870-5-101+104 Client	✓	✓	✗ Not Available	✓	
IEC 60870-5-103 Client	✓	✓	✗ Not Available	✓	
SNMP Client	✓	✓	✗ Not Available	✓

User Management	✓	✓	✓	✓	
One-Line Designer & Viewer	✓	✓	✓	✓	
Secure Enterprise Connectivity	✓	✓	✓	✓	
VPN Server	✓	✓	✓	✓	
HAMA (Hardware Asset Manager Application)	✓	✓	✗ Not Available	✓	

User Roles

Default Users

The MCP unit that comes from the factory has two types of default users.

defadmin : The MCP default administrator **defadmin** is used to connect to MCP from Secure Terminal Emulator client from the command line interface of Local HMI. The default password of default administrator user is **defadmin**. When user logins using **defadmin**, below set of operations only can be performed.

- To change or configure IP Address
- To add a nominated administrator-level user(s).
- To restore MCP Snapshots
- To reboot the MCP.

The default administrator (**defadmin**) user will be deleted automatically once the default administrator (**defadmin**) is logged out and logs in successfully with the newly added administrator user.

root : The MCP default root user is available from serial maintenance port. The default password for the root user is **geroot**.

- Restricted to local access only

It is strongly suggested to change the password of the **root** user by using MCP Local Configuration Utility (**mcpcfg**) or MCP Settings GUI. Also, the User is responsible for the new root password. And in case root password is lost then there is no back door and Return Materials Authorization (RMA) is required to recover. For more details, refer to the [User Management](#) section.

HMI User Access Levels

Users are assigned one of the below four levels of access to the MCP Runtime HMI:

- Observer** : View only privileges for all runtime screens.
- Operator** : Same as Observer, adds substation operation privileges to operate controls, force points and do maintenance tagging.
- Supervisor** : Same as Operator, adds privileges to access and modify configuration, runtime HMI Users.
- Administrator** : Same as Supervisor, adds full privileges to access and modify all configuration and settings, perform runtime debugging, add system administration users. Also, OpenVPN and its related configuration can be created or modified with administrator privileges only.

User assigned access level appears in the top right corner of the title bar of the MCP HMI screen when you log in. Except Administrator - user access levels are configured in the User Management tab in the Settings > Access page in Runtime HMI. Administrator role is configured using MCP Configuration Utility or MCP Settings.

The privilege level **SSHPassThrough** is not available to access the MCP HMI. Users configured under this privilege level or role are only allowed access for SSH Secure Tunnel to Pass-through and Terminal Server Connections.

The privilege level **Rdtunnel** is not available to access the MCP HMI. Users configured under this privilege level or role are only allowed access for SSH Secure Tunnel to Remote Desktop Connections.

User Level Permissions

Administrator-level users have Supervisor-level access to all configuration, runtime, operation, and system screens in the MCP Online/Runtime HMI.

Only Administrator-level users have access to run commands at the MCP command line interface when the sudo command is used. OpenVPN configuration and Runtime viewers are only available from Runtime HMI using administrator-level users only.

The following table indicates the system privileges for each access level.

HMI Function	Administrator	Supervisor	Operator	Observer
Access built-in TELNET/SSH client	Y (see note)	Y (see note)	Y (see note)	N
Acknowledge Alarms	Y	Y	Y	N
Clear Logs	Y	N	N	N
Enable/Disable Device	Y	Y	Y	N
Add/Delete Operator Notes	Y	Y	Y	N
Execute Digital/Analog Controls	Y	Y	Y	N
Place/Remove Alarm Inhibit	Y	Y	Y	N
Place/Remove Control Inhibit	Y	Y	Y	N
Place/Remove Local force	Y	Y	Y	N
Place/Remove Scan Inhibit	Y	Y	Y	N
Place/Remove Tags	Y	Y	Y	N
Enable/Disable Unsolicited Responses	Y	Y	Y	N
View Alarms	Y	Y	Y	Y
View Events	Y	Y	Y	Y
View I/O Traffic	Y	Y	Y	Y
View Logs (Except OpenVPN Log)	Y	Y	Y	Y
View Operator Notes	Y	Y	Y	Y
View One-Line Diagrams	Y	Y	Y	Y
View Point Summary & Detail Pages	Y	Y	Y	Y
View Communication Statistics	Y	Y	Y	Y
View OpenVPN Log	Y	N	N	N
View System Status	Y	Y	Y	Y

By default, access to the SSH clients and other command-line tools is limited to Administrator level and Passthrough-level users only. This setting is available through the mcpcfg tool.

See [mcpcfg - Gateway Configuration Utility](#) for more information.

User Authentication

When user log in to the MCP, user account is authenticated by the system. The following items are verified:

- Username exists
- User entered password corresponds to the configured password
- User assigned permission levels
- Total number of simultaneous users permitted for user security permission level is not exceeded
- Record of log in

If user have a problem logging into the system, check the above items for a conflict.

Authentication Modes

MCP supports both Local and Remote Authentication Modes and the Local Authentication Mode is enabled by default.

Authentication Rules

Authentication rules for different user types and services are provided in the following table:

Service	User Type						SSHPass Through	rdtunnel	Additional Security Notes
	Admin User Types		HMI User Types						
	root	Administrator	Supervisor	Operator	Observer				
Local HMI	Not Allowed	Allowed	Allowed	Allowed	Allowed	Not Allowed	Not Allowed	The Local HMI session is automatically started with Operator privileges without prompting for user credentials, if the Systemwide configuration > Access Manager > Local UI Automatic Login parameter is set to true.	
Maintenance Network Port	Allowed (Command Prompt)	Allowed (Command Prompt)	Not Allowed	Not Allowed	Not Allowed	Not Allowed	Not Allowed		
Remote HMI	Not Allowed	Allowed	Allowed	Allowed	Allowed	Not Allowed	Not Allowed		
Settings GUI	Allowed	Allowed	Not Allowed	Not Allowed	Not Allowed	Not Allowed	Not Allowed		
SSH (Secure Remote Login)	Not Allowed	Allowed (Command Prompt)	Not Allowed	Not Allowed	Not Allowed	Not Allowed	Not Allowed		
SFTP (Secure File Transfer)	Not Allowed	Allowed (Command Prompt)	Not Allowed	Not Allowed	Not Allowed	Not Allowed	Not Allowed		
DSAS Sync To/From Operations	Not Allowed	Allowed	Allowed	Not Allowed	Not Allowed	Not Allowed	Not Allowed		
DSAS Snapshot Operations	Not Allowed	Allowed	Not Allowed	Not Allowed	Not Allowed	Not Allowed	Not Allowed		
Pass-through Connection (Telnet & TLS)	Not Allowed	Allowed	Allowed	Not Allowed	Not Allowed	Not Allowed	Not Allowed	Pass-through for remote TCP clients is enabled using Pass Through Access in Security parameters under Configuration > Systemwide and select Secure Type under Configuration > Connection to Telnet or TLS. Pass-through is allowed without Login/Password if its Pass-through password Authentication is disabled in MCP Config Tool (mcpcfg) or MCP Settings GUI > Configure Authentication.	

Service	User Type						Additional Security Notes	
	Admin User Types		HMI User Types			SSHPass Through		rdtunnel
	root	Administrator	Supervisor	Operator	Observer			
Terminal Server Connection (Telnet & TLS)	Not Allowed	Allowed	Allowed	Allowed	Not Allowed	Not Allowed	Not Allowed	Terminal Server is allowed without Login/Password, if its application parameter Password Authentication is set to No. Terminal Server for remote TCP clients is enabled by selecting "Secure Type" under Configuration > Connection to Telnet or TLS. Terminal Server application parameter Minimum Privilege Level specifies if Operator user is allowed or not.
Pass-through Connection (SSH Secure Tunnel)	Not Allowed	Allowed	Not Allowed	Not Allowed	Not Allowed	Allowed	Not Allowed	Pass-through for remote SSH clients is enabled using Pass Through Access in Security parameters under Configuration > Systemwide and select Secure Type under Configuration > Connection to SSH Secure Tunnel. Pass-through for SSH Secure Tunnel is always allowed with Login/Password,
Terminal Server Connection (SSH Secure Tunnel)	Not Allowed	Allowed	Not Allowed	Not Allowed	Not Allowed	Allowed	Not Allowed	Terminal Server for remote TCP clients is enabled by selecting Secure Type under Configuration > Connection to SSH Secure Tunnel. Terminal Server for SSH Secure Tunnel is always allowed with Login/Password. The parameter Minimum Privilege Level for SSH Secure Tunnel is always SSHPassThrough only.
Remote Desktop (SSH Secure Tunnel)	Not Allowed	Not Allowed	Not Allowed	Not Allowed	Not Allowed	Not Allowed	Allowed	Remote Desktop is enabled under Systemwide > Access Manager. Applies to MCP versions 3.00, 3.10.

Chapter 2 - Introducing MCP Features

Substation Gateway Features

GE Vernova's MCP Substation Gateway supports the following key features:

Security Features

The MCP supports the following security features:

- NERC compliant passwords, with strong complexity rules and one-way encryption
- Full auditing including Syslog integration to enterprise systems
- SFTP for secure network-based firmware upgrades and configuration file transfers
- SSH for secure network access to the maintenance facility
- SSH for secure programming and connection to the IEC 61131 programming facility
- Integration with LDAP/AD centralized RBAC

Advanced Gateway

The MCP collects data from substation protection, control, monitoring, RTU, and intelligent devices, pre-processes the data and moves it up to EMS and DMS SCADA systems providing centralized substation management.

Gateway features include:

- Data collection, concentration, and visualization
- Includes embedded General Purpose IO module (G100 only)
- IEC 61850 Gateway
- Device Redundancy
- Built in Media Conversion
- Files Retrieval capabilities
- Built-in HMI

Advanced Automation

The MCP provides the computing platform necessary to automate substation procedures, such that intricate processes are carried out safely and efficiently by creating advanced custom automation programs using IEC 61131 compliant tools and perform basic math functions on data points using the built-in calculator tool.

Automation features include:

- HMI & One Line Viewer
- Mathematical Control Logic using Calculator
- Programmable Logic using LogicLinx
- Accumulator Freeze
- Analog Value Selection

- Control Lockout
- Double Point Association
- Input Point Suppression
- Redundant I/O
- SOE & Alarm Management
- Analog Averaging
- Mail Box Functionality
- Parallel Redundancy Protocol
- Precision Time Protocol (PTP IEEE 1588)
- Hardware Asset Management Application
- System Status Manager
- Load Shedding and Curtailment

Fault Recording/Datalogging

Using pass-through connections, users can extract valuable non-operational data such as digital fault recording (DFR) records, event, and oscillography files. The user can also access the historical log files and upload the archived data for trending and analysis.

Fault recording features include:

- Automatic Record Retrieval Manager (ARRM)
- ARRM Runtime Viewer

Datalogging features include:

- Data Logger
- Trend Viewer
- Data Base Exporter
- Online & Offline Tabular Reports (Analog Reports not available after and including MCP V2.60)

Secure Remote Access

The MCP allows maintenance and relay engineers to securely access substation devices, locally or remotely, through advanced visualization and communication tools, increasing productivity.

Secure remote access features include:

- Build-in Firewall
- Access to Operational and Non-operational Data (rsync/SFTP/TLS/HTTPS)
- Pass-through/Terminal Server (SSH/TLS)
- Role Based Access Control
- Local Authentication, Authorization and Auditing(syslog)
- Virtual Serial Ports
- Electronic Access Point (EAP) - OpenVPN

Edge Connectivity

The MCP allows built in support for the Edge Manager Connectivity for the fleet level and local device management.

Edge Connectivity feature includes:

- Secure and Hardened Linux Based Predix Edge OS
- Predix Edge Technician Console Support for Local Device Management
- EdgeManager Connectivity through WAN to support Fleet Level Device Management.

Local HMI

The MCP supports built-in Local HMI for accessing the MCP through the display port(s). The Local HMI provides the same functions for local display and control as the remote HMI with few exceptions/additions.

Local HMI feature includes:

- Supports monitor (G100 supports 1 monitor and G500 supports 2 monitors) using Display Port (DP)
- Configurable Screen Resolutions and Screen Layouts
- Audio Buzzer for Alarm Management
- File Explorer Functionality

Chapter 3 - MCP HMI Runtime

This chapter contains the following sections which provide the details about the MCP Runtime HMI.

Runtime HMI Navigation

- Main Display Area
- Power Bar
- Change Displayed Information
- Internationalization

Manage Alarms

- Digital Event Management
- Alarm Types
- Alarm Groups
- Double Point Alarms
- Active Alarms
- Historical Alarms

View Data

- View Data
- Real-Time Database
- Data types
- Data Quality Status
- Point Summary
- View Point Details
- View Events
- Connections
- Logs
- Trends

Execute Commands

- Issue a Command
- Acknowledge an Alarm (One-Line Viewer)
- Acknowledge an Alarm Group (One-Line Viewer)
- Analog Output Interface
- Analog Set-point Interface
- Digital Control Interface
- Digital Output Interface
- Navigate to Active Alarm Page (One-Line Viewer)
- Point Forcing Interface
- DataSource Types
- Raise/Lower Control Interface
- Tag/Inhibit Interface
- Global Controls Disable

Operator Notes

Runtime HMI Navigation

Main Display Area

The main display area is where most MCP data display pages are presented for viewing or entering information. The **Power bar** is located across the top of the screen and contains buttons to navigate to the MCP display pages and functions. To go to a display, click a Power bar button.

Figure 3-1: Main Display

To view the Help topic for the MCP HMI screen you are currently viewing, click the **Help**  button on the Power bar.

Popup Windows

Popup windows appear for certain functions so that you can edit information or perform an action, for example, **I/O Traffic Viewer**. Most popup windows include a **Help** button. Click **OK** or the **Close** button on the title bar to close the popup window.

Tree views

Many display pages present a tree view (shown below in the left pane) for finding and selecting relevant data. The tree view lists MCP system elements in a hierarchy, typically: Devices > device type > device name > point group > point type > point names.

Figure 3-2: Tree view

Collapse and expand parts of the list by clicking the + or - at each level. When you find what you are looking for, click to select the item. A check appears in the checkbox next to the item to indicate it is selected. When you select or de-select items in the tree view, the adjacent data display typically updates for the selected information.

Power Bar

The Power bar is located across the top of the main display area and contains buttons to navigate to the MCP display pages and functions.

Figure 3-3: Typical Power Bar

Standard Power bar buttons include:

- [User Screens](#)
- [Trends](#)
- [Reports](#) (not available after and including MCP V2.60)
- [Operator Notes](#)
- [Connections](#)
- [ARRM Status](#)
- [Point Details](#)
- [Logs](#)
- [History Events](#)
- [SOE](#)
- [Active Alarms](#)

- [System Status](#)

- [File Explorer](#)

- [Settings](#)
- [User](#)
- [Help](#)

The MCP HMI Power Bar buttons can NOT be customized. If navigation across multiple screens is required within One-line Diagrams, the required screen navigation buttons must be custom-configured within the One-line diagrams workspace.

To go to a specific display, click the Power bar button.

A tooltip indicates the function of the Power bar button when you hover over the button with the pointer.

If MCP redundancy is enabled, the Power Bar in Local HMI will display an indication to reflect the current redundancy state of the MCP.

If Standby HMI redirects to Active MCP feature is enabled, the Power Bar in Local HMI will display an indication to reflect the HMI pointing to self or PEER MCP. For details see the Local HMI section of the G500 Instruction Manual (*GE Vernova Part Number 994-0152*) or G100 Instruction Manual (*GE Vernova Part Number 994-0155*).

User Screens

The User Defined Screens (also referred to as the Single Line Diagram - SLD) Viewer displays:

- The main drawing (main.dra) by default.
- Simplified schematic diagrams during runtime that represent the interconnections in a substation, including devices and the real-time values and/or state of selected ports and points.

These custom-built diagrams are built using the following two types of objects from the MCP HMI library:

- Static objects that do not change during runtime. Examples of static objects are buttons, labels, lines and other shapes used to lay out the drawing.
- Dynamic objects that represent a data source and are updated continually as new information becomes available. Examples of dynamic objects are circuit breakers, switches and value boxes. The source of the data can be the real-time database, the Active Alarms (Digital Event Manager) application or other MCP resources.

The **User Defined Screens** are designed and configured using the [One-Line Designer](#).

Starting with MCP v3.0 – users can open multiple screens with a single mouse action, by clicking on the little black arrow beside the button and choose “Multiple User Screens”:

This option is available only when the Runtime HMI is configured for “Floating” mode:

The list of screens to open is configured under Settings > **Open Multiple Screens List**.

Up to 8 entries can be added to the list.

“Screen Type” column is a dropdown list with options associated with every screen type.

Depending on the selected "Screen Type" - the "Screen Parameter" may be grayed out, or will show an applicable parameter as following:

- When selecting “User Defined Screens” – the parameter is a dropdown list with the name of all drawings identified in the target MCP device.
- When selecting “Active Alarms” – the parameter is a dropdown list with the name of all alarm groups identified in the target MCP device.

The “Display Screen Menu” is a checkbox and applies only to the User Screens selection, and is intended to show or not the top of the screen when the screen was opened:

The restriction when adding entries to the list is to not have duplicates of same rows. This means that except User Defined Screens, there can be no duplicates of other “Screen Types” in first column.

The combination of “User Defined Screens – Parameter” must be unique (checked when click Save).

Users can enter rows in any order.

This list applies to all MCP runtime HMI users and is saved on the local storage medium of the device where the runtime HMI runs (is not part of the MCP configuration). This means that Local Runtime HMI can have a list, and each Remote Runtime HMI can have different lists.

When connecting to different target MCP devices from the same Remote Runtime HMI machine, the lists are different and associated with each target MCP device.

If a user defined screen declared in the saved list is deleted - then later when the list is brought up – that entry will be deleted from the list.

If an Active Alarm Group declared in the saved list is deleted - then later when the list is brought up – that entry will be deleted from the list.

The Trending also known as Data Logger application allows you to graphically monitor and record data from devices connected to the MCP. You can also save and review historical reports created by the

application. For more details, see **Trends**  section.

Reports

The Reports screen also known as Analog Report View allows you to view online and offline analog reports.

NOTICE

Analog Reports are available in MCP versions below:

- G100 up to and including v2.30
- G500 up to and including v2.50

Newer versions of MCP do not include Analog Reports functionality.

Periodic logging of the analog parameter information is required for records, periodic maintenance and preventive maintenance of the substation equipment. The Analog Report application allows you to record the Analog Data of various devices connected to the MCP. It allows you to configure the MCP to capture the configured Analog Input values with [Quality Attributes](#) at regular intervals of time and format.

The Analog Report application allows you to choose existing record templates or create and import new templates to log reports. It also allows you to back up the generated reports. The reports can be stored in html, pdf, or xls format.

Operator Notes

The **Operator Notes** page lists operator notes that have been entered by users and stored in the MCP database.

Note records

Each note record displays the following information:

Table 3-1: Note Records

Button	Description
Note Number	Automatically assigned number to identify the note.
Sequence Number	Sequence Number to identify the original note or comments added to the note. Sequence Number 0 indicates the original note and greater than 0 indicates the comment(s) added to the original note.
Operator Name	MCP HMI username of the note author (original or commented).
Date Created	Date and time that the note or comment was created.
Notes	Free-form text entered by the note author.

The following related actions can be performed from the GUI:

[Add a Note](#)

[Edit a Note](#)

[Operator Notes Log](#)

[Sort Records](#)

Connections

The connections also known as **Communications Summary** page lists the most recent communication statistics between the MCP and configured device or master station connections.

The following related actions can be performed:

[View Device Communications](#)

[View Master Station Communications](#)

[View Pseudo points – Detailed Communication Statistics](#)

[Enable/Disable Device Communications](#)

ARRM Status

The Automated Record Retrieval Manager retrieves and stores record files from devices connected to your MCP. The [ARRM Viewer](#) can be used to view the status of this application and to initiate manual transfers. You can also retrieve downloaded records from the MCP using any FTP/SCP/SFTP client as needed or on a scheduled basis.

You can also configure the MCP to automatically upload files to a remote location using the Sync Manager utility. For more information refer to [Configure Sync Manager](#) section.

Point Details

The **Point Details also known as Point Summary** page lists system elements (and identifying information) for which points have been configured, categorized by:

- IED Point Summary
- Master Station Point Summary
- Application Point Summary
- Point Groups Summary

The following related actions can be performed:

- [View I/O \(IED and Master Station only\)](#)
- [View Point Details](#)

Logs

The **Logs** also known as System logs page provides a report utility to display a list of system activities maintained by the MCP and stored in the [real-time database](#). The logs are useful for troubleshooting and tracking purposes. The following reports are available:

- [Control Log](#)
- [Diagnostic Log](#)
- [System Event Log](#)
- [User Activity Log](#)
- [Analog Report Log](#)
- [VPN Server Log](#) (Available only to Administrator class/role users)

CAUTION

SYSLOG-based event logging (i.e., System Event Log, Diagnostic Log, Control Log and User Activity Log) should not be used for real time and Mission Critical purposes. Data presented in the SYSLOG may not be updated in real time to correctly indicate the status of monitored and controlled equipment.

For example, a power line could be listed as inactive in a system log, while in fact the power line is active and its status in the system log may be updated significantly later in terms of real time applications.

Only use SYSLOG-based event logging for system management, security auditing, general informational and debugging messages.

The following related actions can be performed:

[View a Log](#)

[Clear a log](#)

History Events

A historical alarm is an alarm that has been archived from the **Active Alarms** list. The History Events also known as **Historical Alarms** page provides a search utility to filter, sort and display historical alarm records stored in the [real-time database](#).

To be archived to the **Historical Alarms** page, an alarm must meet the following conditions:

- "Deviation" alarm is acknowledged and has returned to normal state
- "On update" alarm is acknowledged

"Double Point" alarm is acknowledged and the pair of source points have moved into a non-alarmable state.

SOE

The **SOE** page provides a search utility to filter, sort and display Sequence of Event (SOE) items stored in the MCP.

Active Alarms

The **Active Alarms** page lists all active alarm events on every alarm-enabled point in the MCP database. The display automatically updates whenever the MCP generates a new alarm, or when the status of an existing alarm changes. The total number of active alarms in the system database is shown in the bottom left corner of the window.

The **Active Alarms** button on the Power bar visually indicates the status of active alarms in the MCP:

Blinking red when unacknowledged active alarms exist

Steady green when no active alarms are present

Steady yellow when acknowledged active alarms are present

The Alarm application must be configured to view the Active Alarms button and page. The icons shown above are system defaults and can be modified on the **Alarms** tab of the **Configuration** tool.

The MCP does not raise alarms on points that are offline.

System Status

The System Status page lists running status and startup time for all active applications. The display automatically updates whenever the status of an application changes.

Home Dir	Application Name	Status	Time Started (sec)
AR00000	Atmfd Rcd Rtrvl Mngr	Started	127

Max Startup Time Configured value corresponds to the value that is configured in **Max Startup Sync** from online/offline Editor's Systemwide -> RTDB setting:

Name	Value
AI Persistence	RAM
AO Persistence	RAM
DI Persistence	RAM
DO Persistence	RAM
ACC Persistence	RAM
Text Persistence	RAM
Output Command Time to Live	5
Max Startup Sync	180
Event Queue Full Action	DoNotLoseEvents
Event Distribution Priority	High
Global Control Disable Home Directory	SS00001
Global Control Disable Point ID	-2021
Default Value of Global Control Disable Point	Enabled
Reject Control Request on Offline Points	Yes
Report Offline Points if Comm Lost	Yes
Use Legacy IED Physical Device Name in IEC 61850 model	Yes

Startup Timer runtime value is the maximum startup time value among all the active applications listed here.

The following application running status are available:

1. Wait

This is a transit state indicating the application is waiting to be started.

2. In Progress

This is a transit state indicating the starting of the application is in progress.

3. Started

The application is started completely, and the startup time is within the configured Max Startup Sync value.

Home Dir	Application Name	Status	Time Started (sec)
AR00000	Alarm Rcd Rtrvl Mnar	In Progress	
CA00000	Calculator	In Progress	
RT00000	ctrlLockoutMnar	Started	34
PL00001	ID_20C Bent_PClm_3	Wait	
DL00000	Data Logger	In Progress	
5000010	Demo 1 I CUBE 2 I N60 141 I DCA MULTI I EC 61850	Wait	
5000014	Demo 1 I CUBE 2 I T501 SEL421 142 I DCA MULTI I EC 61850	Wait	
DM00000	Distal Event Manager	In Progress	
0000059	DNP MASTER 1 I SerialMaster I DNP	In Progress	
Event	rtos	Started	35
HAMALOC	HAMA LOCAL	Wait	
SC00001	IEC 61850 Client	Wait	
0000014	Line 1 I Bay 1 I IED MODBUS 1 I DCA MULTI I Modbus	Wait	
0000037	Line 1 I Bay 2 I IED SEL 1 I DCA SINGLE I Setbin	Wait	
0000040	Line 2 I Bay 1 I IED DNP 3 I DCA MULTI I DNP	Wait	
0000041	Line 2 I Bay 1 I IED DNP 3 I DCA MULTI I DNP	In Progress	

4. Excess Started

The application is started completely, however the startup time it takes is beyond the configured Max Startup Sync value. In the following example, the status for applications with startup time more than the configured Max Startup Time – 126s is shown as Excess Started.

Max Startup Time Configured value: 126 Startup Timer runtime value: 126			
Home Dir	Application Name	Status	Time Started (sec)
AR00000	Alarm Rcd Rtrvl Mnar	Excess Started	127
CA00000	Calculator	Excess Started	127
RT00000	ctrlLockoutMnar	Started	34
PL00001	ID_20C Bent_PClm_3	Excess Started	128
DL00000	Data Logger	Excess Started	127
5000010	Demo 1 I CUBE 2 I N60 141 I DCA MULTI I EC 61850	Excess Started	127
5000014	Demo 1 I CUBE 2 I T501 SEL421 142 I DCA MULTI I EC 61850	Excess Started	127
DM00000	Distal Event Manager	Excess Started	127
0000059	DNP MASTER 1 I SerialMaster I DNP	Excess Started	127
Event	rtos	Started	35
HAMALOC	HAMA LOCAL	Excess Started	127
SC00001	IEC 61850 Client	Excess Started	127

5. Failed

The application is failed to start for some reasons.

Max Startup Time Configured value: 143 Startup Timer runtime value: 143			
Home Dir	Application Name	Status	Time Started (sec)
AR00000	Alarm Rcd Rtrvl Mnar	Failed	126
CA00000	Calculator	Failed	0
RT00000	ctrlLockoutMnar	Started	34
PL00001	ID_20C Bent_PClm_3	Started	128
DL00000	Data Logger	Started	126
5000010	Demo 1 I CUBE 2 I N60 141 I DCA MULTI I EC 61850	Started	126
5000014	Demo 1 I CUBE 2 I T501 SEL421 142 I DCA MULTI I EC 61850	Started	126
DM00000	Distal Event Manager	Started	126
0000059	DNP MASTER 1 I SerialMaster I DNP	Started	126
Event	rtos	Started	35
HAMALOC	HAMA LOCAL	Started	126

Columns can be sorted by clicking on the headers.

Notes:

In case of the occurrence of Excess Started, the value of Max Startup Sync setting needs to be increased to allow more time for the application to be started.

In cases that the applications are not fully started, System Status would be the default page when the user logs in Runtime HMI.

File Explorer

With a USB key connected to one of the MCP USB ports you can:

- Browse user accessible files in the following folders and their sub-folders:
 - o HMI Logs
 - o D2x
 - o System Logs
 - o ARRM
- File names are shown with their modified date and file size.
- Copy selected folders and files from the above user folder(s) to the USB key, using mouse right click action.

NOTICE

In MCP versions up to and including v5.10: do not back up your user folder using the Copy function, since some sensitive files are hidden and cannot be copied due to security reasons; for example, User Certificates, MCP Password and Shadow files etc.

Starting with MCP v5.20 only non-sensitive and non-hidden user files are available for bulk copy.

File Explorer Viewer is only available in the Local HMI mode.

The USB must be formatted with **FAT32** and must have a partition table.

» To mount the USB key:

1. Connect USB keys to the MCP USB ports.
2. Click the **Mount USB** button below the file tree.

Result: The mounted USB keys appear on the file tree as **usb1** and **usb2**.

Once a USB key is mounted, you can copy and save files.

USB key is mounted under the /mnt/usb/ location.

» To select a file or multiple files:

- For a single file, left click the file.
- For multiple files, left-click the first file and [Ctrl]+left-click the additional files.

» To copy selected file(s) and/or folders to the USB key:

1. Select a file, multiple files, a folder name on the left or a sub-folder on the right.
2. Right-click the file(s).
Result: A popup menu appears.
3. Select **Copy to USB Key** command.
Result: A Save To dialog window appears.
4. Navigate to the destination.
5. Click **Save**.

» To unmount the USB key:

- Click the **Unmount USB** button below the file tree.

Settings

The Settings page has Access and Utilities to provides access to software tools installed on your MCP device.

Access

All available options under Access page are listed along with a description of the functionality they provide.

User Management

The User Management tab on the Access page allows the user to set up accounts for MCP users, including usernames, passwords and access level.

Add a User

» To add a user:

1. Click Add to create a new user account.
2. Enter the user information.
3. Click OK.

Result: The User Management table is saved.

Change a User Account

» To change a user account:

1. Click on the user record from the list in the User Management table.
2. Change the user information as required.
3. Click OK.

Result: The User Management table is saved.

Delete a User

» To delete a user:

1. Click on a user record from the list in the User Management table.
2. Click Delete.
3. Click Yes to confirm the deletion.

Result: The Update User window appears.

Result: The Delete confirmation popup appears.

Configure User Home Page

» To configure the User Homepage:

1. Click on the user record from the list in the User Management table.
2. Update the user information as required.
3. Select the user Home Page from the dropdown list.
4. Click OK.

Result: The User Management table is saved.

Authentication

The Authentication tab on the Access page allows the user to configure either:

- Local Mode** : Local authentication makes use of files stored locally to control user authentication, as opposed to connecting to a remote server to obtain username and password information.
- Remote Mode** : Remote authentication makes use of user account information stored on remote server. The MCP supports two remote authentication modes:
- Cisco® TACACS+
 - LDAP

Note: Starting with MCP V520, Cisco® TACACS+ is no longer available.

Automatic Login

The Automatic Login on the Access page allows the user to setup Local and Remote HMI auto login accounts.

- Local UI Automatic Login** : Select to skip the Local HMI log in when a user logs into the MCP through the local substation computer setup and go directly to the Local HMI main page (home page). Default is False.
- SECURITY NOTICE:** If Local UI Auto Login is set to true, the Local HMI will perform an automatic login using the selected user privilege level and name, without additional human authentication required. It is up to the system's Engineer / Operations to assess the effect and application of this behavior at runtime.
- Local UI Automatic Login Wait Time** : This parameter can only be configured if "Local UI Automatic Login" is set to true. The Local UI Automatic Login Wait Time parameter represents the wait time (in seconds) that is available for the user to interrupt the system from entering the Local Graphical UI's Main Page from the Command Line Interface.
- Local Automatic Login Privilege Level** : This parameter can only be configured if the Local UI Automatic Login parameter is set to true. The Local Automatic Login Privilege Level parameter provides the user with the option to configure the Default Privilege Level when navigating to the Local Graphical UI.
- Local Automatic Login User** : This parameter can only be configured if the Local UI Automatic Login parameter is set to true. The Local Automatic Login User parameter allows the user to choose the default user from the list of users configured under each Privilege Level (Operator/Observer).
- Remote UI Automatic Login** : Select to skip the Remote HMI log in when a user logs into the MCP through the Remote substation computer and go directly to the Remote HMI main page (home page). Default is False.
- SECURITY NOTICE:** If Remote UI Auto Login is set to true, the Remote HMI will perform an automatic login using the selected user privilege level and name, without additional human authentication required. It is up to the system's Engineer / Operations to assess the effect and application of this behavior at runtime.
- Remote UI Automatic Login Wait Time** : This parameter can only be configured if "Remote UI Automatic Login" is set to true.
- : The Remote UI Automatic Login Wait Time parameter represents the wait time (in seconds) that is available for the user to interrupt the system from entering the Remote UI's Main Page from the Command Line Interface.

Remote Automatic Login Privilege Level : This parameter can only be configured if the Remote UI Automatic Login parameter is set to true.

The Remote Automatic Login Privilege Level parameter provides the user with the option to configure the Default Privilege Level when navigating to the Remote Graphical UI.

Remote Automatic Login User : This parameter can only be configured if the Remote UI Automatic Login parameter is set to true.

The Remote Automatic Login User parameter allows the user to choose the default user from the list of users configured under each Privilege Level (Operator/Observer).

VPN Client

The VPN Client on the Access page allows the User to create VPN Client settings including Routing and White list options.

Table 3-2: VPN Client settings

Settings	Description	Range	Default
Client Name	The client names. This name must match the Common Name of the client certificate.	Text string 32 characters are allowed	Client1
Enabled	Selected if the Client is enabled. Not selected if the Client is disabled	Enabled Disabled	Enabled
Routing List and White List	Click Configure to access the Configure Routing List and the White List.		

Table 3-3: Routing List and White List

Settings	Description	Range	Default
Routing List	Drop-down list of Route IP Address & Subnet Mask in CIDR notation. Note: The Routing List contains a list of configured networks (including VLANs & PRP) in the MCP. This list can't be edited by the User.	Valid IP4 Address/Net mask	172.12.232.0/16
White List	The MCP VPN Server will provide configuration option for "IP/Port/Protocol Whitelist" for each VPN client to allow the incoming connections based on the combination of destination IP Address, protocol and Port number through VPN tunnel. The MCP VPN Server provides a configuration option for "IPAddress/Port/Protocol Whitelist" for each VPN client to allow the incoming connections based on the combination of destination IP Address, protocol and Port number through VPN tunnel. The MCP device needs to be restarted after changing the White List.	IP Address: Valid IP4 Address Port No: Valid TCP/UDP Port Number Protocol: From the below drop-down list: - TCP - UDP - TCP+UDP - Any ICMP - Useful ICMP - Useful ICMP+ Ping The ICMP Type/Code allowed combinations are described in the ICMP White List Options table.	IP Address: 172.12.232.106 Port: 22 Protocol: TCP

NOTE: Port Number is available for TCP, UDP and TCP+UDP protocols only in White List configuration.

Table 3-4: ICMP White List options

ICMP White List options	Type	Code
Any ICMP	All	All
Useful ICMP and Useful ICMP + Ping	3 (Destination Unreachable)	All
	0 (Echo reply)	0
	11 (Time Exceeded)	0 (TTL expired in transit)
	11 (Time Exceeded)	1 (Fragment reassembly time expired)
Useful ICMP + Ping	8 (Echo request)	0

Utilities

All available utilities are listed along with a description of the functionality they provide. The following related actions can be performed:

- Utilities Log In** : This Utility is used for an SSH (Secure Shell) terminal session to the MCP. This option is available from local HMI and Remote HMI. This option is only available to Administrator-level users.
- To login to SSH Shell user must have Administrator access and your username and password.
- Certificate Import** : This utility allows to import certificates and Certificate Revocation Lists (CRLs) from an externally mounted filesystem or the local import directories. This option is available only from local HMI and for Administrator-level users. For more details, refer to [Appendix G - Security Certificates Creation for MCP](#).
- Certificate Management** : This utility allows to manage Local Certificates, Issuer Certificates, and Certificate Revocation Lists. Available only from local HMI and for Administrator-level users. For more details, refer to [Appendix G - Security Certificates Creation for MCP](#).
- Export Trending/SOE Database** : This utility allows to Export/Backup Local Database. This option is available from local HMI and Remote HMI. This option is available to all user levels except Observer-level users.
- Generate Gateway Key Pair** : Generate Public/Private key pairs in the Gateway/MCP for the SSH terminal session or SFTP. This option is available from local HMI and Remote HMI. This option is available to all user levels except Observer-level users.
- This utility provides an option to:
- Save the generated Public key to the host computer.
 - Delete the existing keys.
- Exporting VPN Client Configuration File** : Export VPN Client Configuration File into a PC/Shared Location/USB. The VPN Client File is used to configure the VPN Client to establish VPN Connection. This option is available only from local HMI and for Administrator-level users.
- Upload SSL Server Certificate / Server Key** : This MCP HMI utility provides an option to:
- Upload P12 file (PKCS#12) with SSL Server Certificate and Server Key to the device.
- This utility allows to enable secured communication between HMI client and MCP device.
- This option is available only from local HMI and for Administrator-level users.

The following table lists the available access to different features across the different HMI tools.

Table 3-5: Access to various features of HMI Tools

	Online Config	Local Runtime Viewer	Remote Runtime Viewer
SSH Terminal	Enabled for admin	Enabled for admin	NA
Certificate Import	Enabled for admin	Enabled for admin	NA
Certificate Management	Enabled for admin	Enabled for admin	NA
Export Database ()	NA	Enabled for operator, supervisor and admin	Enabled for operator, supervisor and admin
Generate Gateway Key Pair	Enabled for supervisor and admin	Generate Key Pair - Enabled for supervisor and admin Save Public Key – Enabled for Operator, supervisor and admin Delete Keys - Enabled for supervisor and admin	Save Public Key – Enabled for Operator, supervisor and admin
Export VPN Client	Enabled for admin user only	Enabled for admin	NA
Upload SSL Server Certificate/Key	Enabled for admin user only	Enabled for admin	NA

User

This User setting provide options to configure the appearance of the windows.

- Look & Feel** - This option allows MCP user to change the look & feel of the windows launched. MCP HMI support multiple themes. Default is GADX.

Themes supported:

1. GADX (Default)
2. Acryl
3. Noire

MCP saves the last configured theme and re-opens the windows with the same theme after re-login.

- Window** - This option allows to configure the mode in which the main windows and sub windows launch. Default is Docked.

Modes supported:

1. Docked: In this mode, all windows when launched, attach to the main window.
2. Floating: In this mode, all windows when launched, open as an independent window.
3. Single: In this mode, all windows when launched, open as an independent window.

Whenever any window is opened, its position is persisted so that after re-login, MCP opens all the last opened windows in the same state at the same position.

In addition to mode configuration, it also provides option to launch Debugging window for troubleshooting.

User can opt to re-arrange the opened windows in different style.

- Tiled
- Horizontal
- Vertical
- Cascade

User can click “Close All” to close all the opened windows.

Reset Persistency

- This option allows MCP to clear all the persisted state of windows.

The Persistency is a default feature both in Remote and Local HMI and will be used to for the below purposes.

- a. Persistence of sorting order of the columns, column filters, column width in all the tabular screens or windows.
- b. Vertical and horizontal re-sizing of all layout boundaries between screen areas of same screen.
- c. Size and position of all windows in floating mode, except location of child pop up dialogs.
- d. Persistency is transferrable from one machine to another user (Use case: allow a given user to have the same layout settings across different machines).
- e. Persistency is transferrable from one user to another (Use case: allow a given user to give her/his layout settings to another user in the same Windows OS machine, or across machines).
- f. Persistency information can be transferred using USB storage, email attachments, Cloud storage from a Windows OS machine.

The Runtime Remote HMI persistency information is generally stored in the Windows OS Machine in the below path:

C:\Users\<User Login Name or User
LoginID>\AppData\Local\MCP\RUNTIME_VIEWER

The Reset Persistency is used for the below purposes.

- a. User change the resolution of the desktop: changed and current opened window is too big.
- b. User wants to reset the current persistency of the size of the connection window.
- c. User wants to reset the current sorting persistency of the connection window.
- d. User wants to reset the order and column width of point details window.
- e. User wants to reset the current column order and width of the Logs window (Control Log/System Event Log/Diagnostic Log/User Activity Log etc.).

This option also has an option to reset the persistency of current user or all users.

If user selects the option to reset the persistency of current user, then all the persistency related information of the HMI user that applied this setting will be cleared.

And, if user selects the option to reset the persistency of all users then all the persistency related information of all the HMI users will be cleared.

Only supervisor and administrator can reset all users, individual operators and observers can only reset his own persistency files.

- Logout - When you are finished working with the MCP HMI, you should log out to secure the system. Logging out terminates your user session with the MCP and closes all MCP HMI displays and windows.

» To exit from the MCP HMI:

- Click the Logout button on the Power bar.

The MCP HMI closes, and the MCP Login screen appears.

Help

When you click the **Help -> Content** button on the Power bar, the MCP Substation Gateway Online Help opens and displays the topic associated with the MCP page you are currently viewing. The MCP online Help guides you through the displays and functionality of the MCP HMI. The online Help is supplied by the MCP Web server and is not stored on your PC.

There are a few different ways to find information within the MCP Online Help system.

» **To find a topic in Help, use one of the following navigation tools:**

- Click the **Contents** button to browse through topics by category.
- Click the **Search** tab to search for specific words or phrases contained in Help topics - enter text and select topics from the displayed list.
- Click the **Index** tab to see a list of keywords - either type the word you're looking for or scroll through the list.

» **To view Help topics, use one or more of the following techniques:**

- On the MCP HMI page you are currently viewing, click the **Help**  button on the Power bar to view the Help topic associated with that page.
- In the Help window, use the **Contents**, **Search** and **Index** buttons to find specific topics.
- In a Help topic, click underlined links to jump to the associated topic.

» **To print a Help topic**

1. Right-click while hovering anywhere on the MCP HMI Online Help window.
2. Select the Print command.

Change Displayed Information

Sort Records

Sorting changes the order in which data appears on the screen.

On many display pages, you can change the order in which records appear by choosing a different field to sort by and by choosing to sort records in ascending or descending order.

On most MCP HMI displays, you can change how information appears on the screen.

» **To change the sort order of records:**

1. Click a field column heading: for example, **Active Alarms** page > **Alarm Date** column heading.
Result: The records are sorted according to that column heading and an arrow appears in the heading to indicate that the records are sorted in ascending  order.

- Click the field column heading again to change the order from ascending  to descending .

The records are sorted either:

- Chronologically for date/time information, or
- Alphanumerically for all other data types

Result: The records appear in the new sort order.

When you sort data, only the display on your screen changes, the data is not refreshed from the system database.

Tip: Many pages support customization of columns. Right-click the column heading to add or remove columns from the data grid. You can also drag-and-drop column headings to re-order them horizontally.

Move a Table Column

» To move a column:

- Select a field heading and drag to a new column location.

Result: The records appear in the new field order.

The data is not refreshed when you change the column order.

Resize a Table Column

» To resize a column:

- Position the cursor over the left or right border of a column heading until a double-headed arrow display. Drag left or right to change the column width.

Result: Columns to the right of the changed column resize to accommodate the changed column width.

Filter Events

Filtering presents all, or a subset of available data from the database.

On some displays, you can filter data by selecting the desired criteria for the records to be retrieved from the database. The following pages can be configured to display different sets of data:

- Active Alarms (configured)
- Historical Alarms (user selectable)
- SOE List (user selectable)
- System Event Log (user selectable)
- Point Details (configured)

Configured filtering is preset in the DS Agile MCP Studio Configuration tool. User-selectable filtering is set by the user on the HMI Runtime screens.

Internationalization

The MCP HMI is:

- Internationalized to adapt to different languages and regional settings.
- Ready to be localized to reflect regional languages, number formats, and date/time formats.

Externalization

The text and labels in the MCP HMI are externalized to resource bundle files so that they may be localized without the involvement of an engineering team.

The following items are not internationalized:

- MCP Configuration Command-line utilities.
- Any text or data coming from external devices (for example, auto-discovered names from a SEL relay).
- File Names, Login Screens, Usernames and passwords.
- All graphics and icons.
- GE Vernova corporate identities, logos and indicia.

Localization

Localization is the process of adapting an internationalized HMI for a specific region or language by adding locale-specific components and translating text.

For the MCP HMI, localization involves:

1. Translating resource bundle files into specific language.
2. Installing resource bundle files to MCP.
3. Configuring Locale settings.

Localization for a region should be performed by personnel trained in localization for that region. Please contact GE Vernova Grid Solutions Technical Support for procedure to create and install resource bundle files to the MCP.

Local Settings

The following local settings can be configured in the MCP HMI:

- HMI language
- Number format
- Data/time formats
- Decimal separator
- Grouping separator

» To reconfigure the local settings:

1. Access the MCP HMI.
2. Click the **Configuration** Power bar button.
3. Click the **Systemwide** tab.
4. In the left pane, click **System > Security** and change the security settings, if desired.

Configuration Parameters Supporting Unicode Strings

The below table provides a list of key parameters that can be configured as Unicode UTF-8 strings.

Table 3-6: Configuration Parameters

Configuration Screen	Parameter / Field
Connection	Line ID
	Device ID
	Bay ID
Client Maps	Point Description
	On State (For DI and DO points)
	Off State (For DI and DO points)
System Point Manager	Double Point: Point Description, State
	Point Description for points associated with groups of Accumulator Freeze, Analog Value Selection, Control Lockout, Input Point Suppression, Redundant I/O and Control in progress features.
Alarm	Alarm Description
	Text State 0, Text State 1
	Alarm Groups: Point Description for points associated with groups.
Calculator	Expression: Name, Expression Notes
	Expression: Result Point Description
Load Shed	Feeders: Feeder Description
	Zones: Zone Description
ARRM	Applications → File Set: Point Description for points associated with File Set.
AI Text Enumeration	Text
	Invalid Value Text
One Line Designer	All Elements: Name, Caption
	Alarm Element: Offline – Text Neutral – Text Ack'd Alarm – Text Alarm, No Ack – Text Reset, No Ack - Text
	DataSource → Digital Control DataSource: On State Control Text Off State Control Text State 00/01/10/11 Text
	DataSource → Digital Status DataSource: State 00/01/10/11 Text
Analog Report (not available after and including MCP V2.60)	Reports → Parameter Map: Value Note: Unicode is supported for parameter's value, if exporting or viewing online/offline in PDF format.

Language Locale IDs

The following table lists the allocated language Locale IDs. This is not an indication that localized resources are available in these languages; please contact GE Vernova Grid Automation Technical Support for currently available language packs.

Table 3-7: Languages - Locale ID's

Manage Alarms

This chapter contains the following sections and sub-sections:

Digital Event Management

Alarm Types

Alarm Groups

Double Point Alarms

Active Alarms

[View Active Alarms](#)

[Acknowledge an Alarm](#)

[Enable or Mute an Audible Alarm](#)

[Enable or Mute an Alarm Buzzer](#)

Historical Alarms

[View Historical](#)

Digital Event Management (Alarms)

The Digital Event Management (Alarms) functionality applies to the MCP HMI, as well as at database level in form of pseudo points that can be mapped to other applications.

In the substation-monitoring environment, alarms are used to indicate the occurrence of an event that requires attention, for example, the opening of a breaker due to an over-current condition.

The MCP monitors a given set of digital input points for alarm conditions. Each configured alarm by default has no associated pseudo points. However, if the “individual digital input indications” parameter is set in an alarm group, then a single digital input pseudo point is created for each alarm in the group.

Digital Event Management (DEM) allows mapping of individual binary points from the RTDB (“source points”) into Alarm Groups, resulting in alarm grouping and alarm reduction.

Abnormal source point conditions (such as, offline) are automatically translated into configurable alarm events, without the need of additional logic.

Additional alarm events occurring in a group already in alarm, causes the “re-flash” (pulsing) of a dedicated associated point associated with each group without additional logic being required.

The time stamp of the alarm group output and re-flash points follow the time stamp event of the source point that caused the group change.

In addition to the Alarm Grouping and re-flash functionality in the RTDB, DEM also provides the HMI Active Alarm page and provides support for Alarm Annunciator functions – created and enabled automatically when configuring DEM.

Upon detecting an alarm condition on a source point or a group of points, the MCP creates a record in the database and presents the alarm to the operator on the MCP Active Alarms page for further action. Once an alarm is acknowledged it is archived by moving it from the **Active Alarms** page to the **Historical Alarms** page.

You can:

- [View Active Alarms](#)
- [View Historical Events](#)

- [Acknowledge an Alarm](#)
- [Configure Alarms](#), including double-point alarms, alarm points and alarm settings
- [Enable or Mute an Audible Alarm](#)

Alarm Types

The following alarm types are configurable:

- Deviation Alarms (2-state) : Generates an active alarm when the point state changes from normal to alarmable and archives the alarm only when the point state returns to normal and the alarm is acknowledged.
- On Update Alarms (2-state) : Generates an active alarm when the alarm state changes from one state to another and archives the alarm when the alarm is acknowledged. In effect, two alarms are created: the first alarm is generated when the source point changes from ON to OFF, and a second alarm is generated when the source point changes from OFF to ON.
- Double Point Alarms (4-state) : Two alarm types are generated – an On Update Alarm and a Deviation Alarm.

You can only select pre-configured double points for this type of alarm.

- An **On Update Alarm** is generated when the double point is in the transit state (both points = 0) or in the invalid state (both points = 1) and the state persists longer than the configured invalid period of time. The On Update alarm is archived when it is acknowledged.
- A **Deviation Alarm** is generated when the double point is in the open state (open point = 1, close point = 0) and is put in the reset state when the double point returns to the close state (open point = 0, close point = 1). The Deviation alarm is archived when the alarm state is reset, *and* it is acknowledged.

The Digital Event Manager does not support the “,” (comma) character in the Point, Point State, Alarm and Alarm State field descriptions. If the user has used commas in these field descriptions during configuration, the commas are automatically replaced with spaces during runtime processing.

The MCP does not raise alarms on points that are offline.

Alarm Groups

Digital Event Management supports alarm groups named Group1, Group2, Group3, and so on, plus a System alarm group. Based on your alarm group settings, individual alarms within an alarm group are displayed with the configured foreground color, background color, blinking rate and sound for the current alarm state.

You can think of an alarm group as a summary - if a given alarm group is in the normal state, then all alarms belonging to the group are normal. Alarm group indications are further grouped into a System alarm to indicate if any input point in the group is in an alarm condition.

Alarm Groups can be configured as non-visible at runtime. The intent for these is to allow creation of alarms to be used only at RTDB level for Automation and reporting to SCADA.

When the MCP HMI is used to display alarms - it is the end user's responsibility to ensure that OPERATIONAL ALARMS are always assigned to VISIBLE Alarm Groups.

Double Point Alarms

The **Double Point** feature of the System Point Manager allows you to associate two digital input points to form a double point indication.

Active Alarms

The **Active Alarms** page lists all active alarm events on every alarm-enabled point in the MCP database. The display automatically updates whenever the MCP generates a new alarm, or when the status of an existing alarm changes. The total number of active alarms in the system database is shown in the bottom left corner of the window.

If All Alarm Groups are configured to be visible at runtime – then the **Active Alarms** button on the Power bar visually indicates the status of active alarms in the MCP:

Blinking red when unacknowledged active alarms exist

Steady green when no active alarms are present

Steady yellow when acknowledged active alarms are present

If there are Alarm Groups configured as non-visible at runtime – then the **Active Alarms** button on the Power bar is always GREY color:

Static GREY color

The MCP does not raise alarms on points that are offline.

View Active Alarms

The **Active Alarms** page lists all active alarm events on every alarm-enabled point in the MCP database. Active alarms are in one of the following states:

- Normal (Deviation)
- In Alarm (On Update)

By default, the alarms are listed with the most recent alarms appearing at the top of the list.

Alarms assigned **only** to Groups set as non-visible at runtime will not show in the Active Alarms Page.

Alarm records

The following details are available for each alarm record.

Table 3-8: Alarm Records

Setting	Description
Acknowledged Date	Date and time (to millisecond) when the alarm was acknowledged.
Acknowledge (Button) – Active Alarms Only	Click to manually acknowledge the alarm
Acknowledged (Acknowledge Indicator)	A checkmark appears if the active alarm has already been acknowledged (manually or automatically).

Setting	Description
State Description	Describes the point state when the associated alarm value is in the Alarm state. Typically, the point is in the: • ON if the alarm value is in alarm the state and • OFF if the alarm value is in the Normal state. In case of Double Point Alarms, the alarm state description can be one of the below: • Open • Close • In transit • Invalid
Alarm Date	Date and time (to millisecond) when the alarm was created.
Alarm ID (Alarm Identifier)	A unique ID of an alarm.
Reference	Describes the alarm point. It defaults to the name of the alarm point.
Type	Indicates the type of alarm: "On Update" or "Absolute".
Value	Indicates the alarm state: 0, typically the Normal state or 1, typically the Alarm state. In case of Double Point Alarms, the alarm state value indicates one of the below: • State 2 = Open • State 3 = Close • State 4 = In transit • State 5 = Invalid
Device ID	Identifies the device associated with this alarm point.
Groups (Active Alarms Only)	Alarm group to which the point's alarm is associated.
Line ID	Identifies the electrical transmission line associated with the device of this alarm point.
Originator	The source of the control command. See Originators for more information.
Reset Date	Date and time (to millisecond) when the alarm was reset.
Reset (Reset Indicator)	When a checkmark is displayed, it indicates that alarm has returned to Normal state.
Sequence ID	Sequence ID of the alarm record.
Archived (Historical Alarms Only)	When a checkmark is displayed, it indicates that alarm has been archived.
Archived Date (Historical Alarms Only)	Date and time (to millisecond) when the alarm was archived.
Username	Identifies the Username that acknowledged the alarm
Description	Describes the alarm point. It defaults to the source point.
Home Directory	Home directory of the source producer / application
Bay ID	Bay ID description of the Home directory
Device Type	Device Type of the Home directory

The fields which appear on the Active Alarms page are configurable.

The fields which appear on the Historical Alarms page are user selectable.

NOTES:

- **Critical Alarms** are shown in a separate tab in the lower half of the window. All other alarm groups can be accessed by clicking the tabs in the top half of the window.

- If one or more digital input points have the force, alarm inhibit, or scan inhibit quality flags set, a message saying "Alarms have been suppressed" is shown at the bottom of the screen.
- The MCP does not raise alarms on points that are offline.
- Active Alarm Viewer retains the last saved sorting criteria/filters for the fields when navigating away and back.

» **To view alarms:**

1. Click the **Active Alarms** button on the Power bar.
2. Select a **Group** tab or **All Alarms** (includes System alarms) tab to view the current active alarms. You can filter by **Line ID**, **Device ID**, and/or **Bay ID**.

Each tab lists active alarm records generated by the MCP. Alarms that need to be acknowledged are visually indicated by color and flashing as configured in the alarm settings.

Tip: Right-click any column heading to customize the columns shown. You can also drag-and-drop column headings to re-order them horizontally.

» **To create an alarm group tab:**

1. Click the **Add Alarm Group** button.
Result: A popup window appears.
2. Select the desired alarm group.
3. Click **OK**.

» **To delete an alarm group tab:**

- Click the red **x** on the right side of the tab.

Acknowledge an Alarm

Alarms are acknowledged on the **Active Alarms** page. You can manually acknowledge an individual alarm, selected alarms or a group of alarms. "On Update" alarms are acknowledged automatically only if the **Ack Method** is set to Automatic.

» **To acknowledge an alarm:**

1. Select one or more alarms on the **Active Alarms** page.
2. Click Acknowledge Alarm(s).

» **To acknowledge all alarms in an alarm group:**

- On an alarm group tab on the **Active Alarms** page, click **Acknowledge Group**.

When you acknowledge an alarm or alarm group:

- "Acknowledge Indicator" field is checked
- Acknowledged alarm record changes in foreground color, background color and blink rate as configured in alarm settings
- Acknowledged alarm record is moved from the Active Alarms page to the Historical Alarms page

NOTES:

- Deviation alarms that are acknowledged continue to appear on the Active Alarms page until they return to a normal (non-alarmable) state.
- You cannot remove an acknowledgement once an alarm has been acknowledged.
- Dynamic alarm objects can be acknowledged directly on a one-line diagram

Enable or Mute an Audible Alarm

You can activate a sound to be played when a new alarm is received.

» To enable/mute an audible alarm:

- On the **Active Alarms** page, click **Enable Alarm Sound** or **Disable Alarm Sound** to toggle the audible alarm on or off.

To hear audible alarms in the MCP HMI, the volume must not be muted in Windows. Check the Volume control  on the Windows taskbar. Click the control to change the volume setting.

Enable or Mute an Alarm Buzzer

The buzzer will be activated based on the configuration values. This buzzer can be activated or deactivated when a new alarm is received.

» To enable/mute buzzer

- On the **Active Alarms** page, click **Enable Buzzer** or **Disable Buzzer** to toggle the buzzer on or off.

If there are Alarm Groups configured as non-visible at runtime – then Audible Alarms and Buzzer cannot be enabled.

Historical Events

A historical event is an alarm that has been archived from the **Active Alarms** list. The **Historical Events** page provides a search utility to filter, sort and display historical alarm records stored in the [real-time database](#).

To be archived to the **Historical Events** page, an alarm must meet the following conditions:

- "Deviation" alarm is acknowledged *and* has returned to normal state
- "On update" alarm is acknowledged
- "Double Point" alarm is acknowledged and the pair of source points have moved into a non-alarmable state

View Historical Events

The **Historical Events** page provides a search utility to filter, sort and display historical alarm records stored in the MCP.

» To view historical events:

- Click the **Historical Events** button on the Power bar. A new window opens.
- All the available historical alarm records are shown. You can filter by **Line ID**, **Device ID**, and/or **Bay ID**, and you can choose the number of records to show on each page.
- You can save the records in CSV format by clicking the **Export Data** button. This exports all available data, even across multiple pages. Records that are filtered out are not included.

Tip: Right-click any column heading to customize the columns shown. You can also drag-and-drop column headings to re-order them horizontally.

Real-Time Database

The MCP communicates with devices connected to the electric power network. These devices monitor and record several types of information, which can be generally classified as:

- Present values (PVal) that reflect the state of the power system at an instance in time.
- Peak demand values that reflect the minimum and maximum power flow conditions encountered.
- Demand values.
- Disturbance or fault records - time-stamped record of a disturbance, fault or other similar event within the power system, considered to be a serious alarm condition.

The real-time database (RTDB) is a core component of the MCP. It resides within the MCP and acts as a central container for all data that is collected and may need to be exchanged between MCP applications. The real-time database stores the value of all input/output data collected by the MCP in the form of point data, as well as the occurrence of events that take place (for example, disturbance or fault records). The MCP can manipulate the data from devices to produce additional local/pseudo data points. The real-time database is commonly referred to as the system point database.

The following general types of information are stored:

- Point data and values
- Analog set point status
- Digital control status
- Tagging/Inhibit status
- Force value status
- Statistics

Data is organized and presented to the User in the following formats:

Table 3-9: Data Formats

Format	Description
Record	Single set of data pieces, for example, an alarm record or SOE record.
Field	Single piece of information or data that is of the same type across all records, for example, Device ID.
Sort key	Field information that is used to select the type of information to display from the database.
Filter criteria	Specific parameters used to isolate and select appropriate records from the database.

The following related actions can be performed:

[View Active Alarms](#)

[View Historical Alarms](#)

Data Types

The [real-time database](#) (RTDB) stores the following data types:

Table 3-10: Data Types

Format	Abbreviation	Data Type	Description
Digital Input (also Binary Input)	DI (BI)	One-bit Integer	Typically represents the On/Off state of a physical device. May also indicate any single bit value that is derived from other data or used to indicate that a condition exists or that a process is in a state. If not representing the state of a physical device, it is referred to as a pseudo point.
Digital Output (also Binary Output)	DO (BO)	One-bit Integer	Used as a means to control the On/Off state of a physical device, or in the case of a pseudo output, to initiate the function or operation associated with the output.
Analog Input	AI	64 bits Real	Typically represents the value of a physical device that is capable of sensing and reporting a range of discrete values. May also be used as a pseudo point to represent the output of a process or any other derived value that cannot be represented as a single bit.
Analog Output	AO	64 bits Real	Used to control the value provided to an external device or process.
Accumulator	ACC	64 bits Integer	Typically represents the accumulated value of a counting operation. This count could be the number of times a digital input changed state, or the amount of energy carried by a conductor over a certain period. May also be used as a pseudo point to represent the number of times an operation took place or how often a function was executed.
Text	TXT	132 bytes Character 255 bytes characters only for 61850 Client applications	Typically used to represent the description of an event such as a protective fault report.

Data Quality Status

Quality details are provided for each configured point or object to inform the operator of the status of the data shown. The quality status and quality attribute (also referred to as the quality flags) are stored in the MCP database along with the point/object and are updated as the status or value of the point or object changes. The current quality status and quality attribute are presented on the **Point Details** page and **One-Line Viewer**.

Quality status

The current quality status is presented for each point and object and indicates the general nature of the data stored for the point. Quality status can be one of:

- Normal - The data is considered correct and there are no actions or exceptions marked on the point
- Invalid - The data is not accurate or up-to-date due to the status of the device
- Questionable - The data is likely to be inaccurate or out-of-date due to the status of the device

The foreground and background colors for **Point Value** and **Quality Status** (based on configured display settings) change to alert the user regarding the current quality state. The default color settings to indicate quality status are:

Table 3-11: Quality Status

Quality Status	Foreground Color	Background Color (default)
Normal	Black	Green
Invalid	Pink	Grey
Questionable	Black	Grey
Zombie	Maroon	Grey
Engaged Quality	Black	Spring green

Quality Attributes

The MCP provides the following quality attributes for each point:

Table 3-12: Quality Attributes

Indicator	Bit	Quality Attribute (legacy)	Quality Attribute (61850)	Available in One Line Diagram (OLD) symbols	Description
O	0	Offline	Failure		Offline indicates that the MCP is not communicating with the device
R~	1	Restart			Device restart
CX	2	Comm Lost			The MCP is unable to communicate with the device or application reporting the point.
R	3	Remote force	Substituted	Yes	The device is reporting that the point has been forced to a static value remotely. The point is no longer being updated with actual data.
CK	4	Reference Check	Bad Reference		Reference Check indicates that the device is reporting that one or more of the references used to determine the value of the field point are outside allowable tolerances

Indicator	Bit	Quality Attribute (legacy)	Quality Attribute (61850)	Available in One Line Diagram (OLD) symbols	Description
XX	5	Chatter	Oscillatory		This attribute means Chatter for Digital Inputs and Over-Range for Analog Inputs. Chatter indicates that the device is reporting that the point is experiencing an excessive number of state changes and that a chatter filter may be engaged. Over-Range indicates that the device is reporting that the point value has exceeded its maximum measurement range.
OR	5	Over Range	Out of Range		Over-Range indicates that the device is reporting that the point value has exceeded its maximum measurement range
OD	6	Old Data	Old Data		Old Data indicates that the value has not been updated within a configured time interval. Old Data can be set under various conditions: 1) Scan Inhibit is applied and new data is available. 2) Data is reported directly by a 61850-capable device. 3) Communication congestion is preventing the device from being scanned as required by the user configuration settings.
TS	7	Test	Test	Yes	Test Indicates the MCP firmware application sets the IED into the Test mode. This parameter is applicable only for IEC 61850 client application only.
T-	8	No Time Sync	Clock Not Synchronized (same as Clock Failure / Time Invalid)		Reported by IED as no time synchronization or clock failed / invalid

Indicator	Bit	Quality Attribute (legacy)	Quality Attribute (61850)	Available in One Line Diagram (OLD) symbols	Description
?	9	Questionable		Yes	Functions as a summary flag for the Communication Lost and Old Data flags, where: - Communication Lost indicates that the MCP has lost communication with the reporting device, or that the device itself has lost communication with the source of the point data - Old Data indicates that the value has not been updated within a configured time interval. Old Data can be set under various conditions: 1) Scan Inhibit is applied and new data is available. 2) Data is reported directly by a 61850-capable device. 3) Communication congestion is preventing the device from being scanned as required by the user configuration settings. When quality is "Questionable", the data reported by the MCP may not be an accurate representation of the actual data source.
X	10	Invalid		Yes	Functions as a summary flag for: - Offline - Chatter - Over Range - Overflow - Reference Check When quality is "Invalid", the data reported by the MCP may not be an accurate representation of the actual data source.
SR	11	Remote Scan Inhibit			Remote Scan Inhibit indicates quality attribute coming from the remote IED is scan inhibited.
OF	12	Overflow	Overflow		Overflow indicates that the device is reporting that the point value has exceeded its maximum reporting range. For accumulators, this means that the value has rolled over.
!	13		Inconsistent		IEC61850 Inconsistent data.
<>	14		Inaccurate		IEC61850 Inaccurate data.

Indicator	Bit	Quality Attribute (legacy)	Quality Attribute (61850)	Available in One Line Diagram (OLD) symbols	Description
TR	15	No Remote Timestamp			Applicable to communication protocols that support time stamp (e.g., DNP3, IEC 61850). Indicates that a remote time stamp was not received and a local MCP one was applied.
C	16	Control inhibited (also called Output inhibited)		Yes	An operator has blocked output requests on this point. All output requests directed to this point are rejected.
A	17	Alarm inhibited		Yes	An operator has blocked alarms on this point. All alarms derived from this point cannot be raised.
S	18	Scan inhibited		Yes	An operator has blocked scanning of the point. The point is no longer being updated with actual data.
T	19	Tagged		Yes	The point has been tagged with additional information, such as a note.
M	20	Manual (Local) force		Yes	An operator has forced the point value and/or quality to static values at the point of origin. The point is no longer being updated with actual data
2	21	Secondary Source		Yes	The data of this point is being reported from a Secondary source. Refer to Redundant I/O for more information.
2x	22	Secondary Source Invalid (Offline)		Yes	The Secondary source of this point is invalid. This flag is applied regardless of whether the Primary source is being reported as itself or as the Secondary source. Refer to Redundant I/O for more information.
2F	23	Secondary Source Inhibit (Forced)			The Secondary source of this point is being inhibited (see above for inhibit types). This flag is applied regardless of whether the Primary source is being reported as itself or as the Secondary source. Refer to Redundant I/O for more information.
LC	24	Local Control Active		Yes	This point belongs to a local control group that is currently active. Refer

Indicator	Bit	Quality Attribute (legacy)	Quality Attribute (61850)	Available in One Line Diagram (OLD) symbols	Description
					to Control Lockout for more information on this feature.
RC	25	Remote Control Active		Yes	This point belongs to a remote-control group that is currently active. Refer to Control Lockout for more information on this feature.
P	26	Suppressed		Yes	Suppression is active on this point. Refer to Input Point Suppression for more information on this feature.
Z	27	Zombie			Zombie indicates when a MCP firmware application becomes non-functional after restart attempts.
Op	28		Operator Blocked		IEC61850 Operator Blocked

In some places, quality attributes (flags) are presented as a numeric value instead of a list of discrete flags.

Each discrete flag is represented as a bit encoded value.

To determine which quality flags are set you need to convert the decimal numeric value to binary and, starting from the right side, first bit is Bit 0, then immediately followed to the left by Bit 1, etc.

Please note that, depending on the tool you use to convert to binary - the leading zero bits (i.e., most left ones which are only 0) may not be shown.

For example, the numeric value is 262720.

Using for example the Calculator application within Windows 10, set to Programmer mode:

1. Make sure you are in Decimal mode (click on DEC).
2. Enter the decimal value.
3. Look at the BIN field value, it shows the binary bit encoded representation.

4. In this calculator application you may also click on the binary toggle button (4), and see a detailed bit wise representation, as following:

In the above example, the set (=1) bits are 6, 9, and 18.

Based on the encoded table this means:

- Old Data
- Questionable
- Scan inhibited

» **To view data quality:**

The User can view quality information for individual data points and objects from the following pages and screens:

- Point Details
- One-Line Viewer
- Local force interface
- Tag/inhibit interface
- Analog output interface
- Digital output interface

The quality attributes (except Zombie Quality) are presented in abbreviated format (see **Indicator** in table above) on the Point Detail pages and One-Line Viewer.

You can force quality attributes from the [One-Line Viewer](#) or [Point Details](#) pages if the user have Operator or Supervisor permission levels.

Forcing data quality and values

If the user has an operator or supervisor privilege level, then they can force the system to stop responses for data quality attributes in the following ways:

- Alarm inhibit (the associated data point does not cause an alarm)
- Control inhibit (the associated data point does not cause a control to activate)
- Scan inhibit (the associated data point does not update the database)

In addition, if the user has an operator or supervisor privilege level, then they can force a data value on a data point.

Forcing quality can be performed locally or remotely.

Point Details

The **Point Details** page lists system elements (and identifying information) for which points have been configured, categorized by:

- [IED](#)
- [Master Station](#)
- [Application](#)
- [Point Groups](#)

The following related actions can be performed:

[View I/O](#) (IED and Master Station only)

[View point details](#)

IED Point Summary

The **IED Point Summary** page lists the configured devices in the system. The following information is provided for each device:

Table 3-13: IED Point Summary

Point Name	Description
Home Dir	System location of the device/application.
Line ID	Electrical transmission line associated with the device.
Device ID	Description of the device.
Bay ID	The name of the bay containing the device.
Device Type	Name of the client map file used with the specific device.
Details	Protocol address of the device (i.e., DNP device address, IP Address, or serial port number, etc.).
Source	This option is available if the system level redundancy is Hot-Hot. This can have 3 enumerated values. ACTIVE MCP – The source of the data comes from the IED to the ACTIVE MCP only and source of data is ACTIVE MCP both in Active and Standby MCP devices. ACTIVE MCP HH – The source of the data comes from the IED to the Active MCP, and source of data is ACTIVE MCP HH in Active MCP STANDBY MCP HH – The source of the data comes from the IED to the Standby MCP and the source is STANDBY MCP HH in Standby MCP.

The user can display the recorded sequence of event (SOE) and protective relay fault (PRF) events for a selected device.

» To view SOE/PRF events:

- Click the **SOE/PRF** button for a selected device on the **IED Point Summary** page.
Result: The **SOE/PRF List** window opens showing the stored SOE and PRF event records for the selected device.

SOE List

Table 3-14: SOE List

Event Record	Description
Event Date Time	Date and time (to millisecond) when the event was created.
Point Description	Description of the point in the map file.
State	Value of the state (1 = ON, 0 = OFF)
State Descriptor	Description of the state.

PRF List

Table 3-15: PRF List

Event Record	Description
Event Date Time	Date and time (to millisecond) when the event was created.
Fault Distance	Description of the point in the map file.
Trip Description	Description of the state.

The following related actions can be performed:

[View I/O](#)

[View point details](#)

[Enable/disable IED communications](#)

Protective Relay Faults (PRF)

With PRF the supported DCAs/Client applications detect new faults from supported relays, extract the fault information from the relay and prepares it for presentation within 15 seconds of occurrence of the fault event.

Supported DCA Applications

Currently only below DCA/Client applications in MCP support PRF information from the Protective Relays/IEDs.

1. Modbus DCA (Serial, TCP & TCP/SSH) - supports PRF processing of below GE Vernova devices:
 - GE Multilin Universal Relay
 - GE Multilin SR 750
 - GE Multilin SR 760
 - GE Multilin SR 745
 - GE Multilin SR 369
 - GE Multilin SR 469
 - GE Multilin SR 485
 - GE Multilin SR 489
2. SEL Binary DCA – SEL Binary DCA supports PRF processing for the SEL relays that support PRF through SEL Binary protocol.
3. Generic ASCII DCA – Generic ASCII DCA supports PRF processing for the SEL relays (1xx/2xx series) that support PRF through SEL ASCII protocol.

PRF Fault Pseudo Points

The PRF able DCA creates, maintains, and updates Pseudo Points in the System Points Database to represent Fault information. The below table describes the required pseudo points that shall be supported by DCAs that interface with Protective Relays.

Table 3-16: Protective Relay Fault (PRF) Pseudo Points

Pseudo Points Name	Date Type	Description
LF_Year	Analog Input	Year of the Last Fault Report
LF_Month	Analog Input	Month of the Last Fault Report

Pseudo Points Name	Date Type	Description
LF_Day	Analog Input	Day of the Last Fault Report
LF_Hour	Analog Input	Hour of the Last Fault Report
LF_Min	Analog Input	Minute of the Last Fault Report
LF_Sec	Analog Input	Second of the Last Fault Report
LF_Msec	Analog Input	Millisecond of the Last Fault Report
DIGLF_A	1 Bit Digital Input	Phase A was involved in the Last Fault Reported
DIGLF_B	1 Bit Digital Input	Phase B was involved in the Last Fault Reported
DIGLF_C	1 Bit Digital Input	Phase C was involved in the Last Fault Reported
DIGLF_G	1 Bit Digital Input	Ground was involved in the Last Fault Reported
LF_Distance	Analog Input	Fault Distance reported in the Latest Fault Report
LF_Current	Analog Input	Fault Current reported in the Latest Fault Report
LF_Duration	Analog Input	Fault Duration reported in the Latest Fault Report
LF_Frequency	Analog Input	Fault Frequency reported in the Latest Fault Report

The update policy of these pseudo points is driven by 2 configuration parameters:

- **Fault Reset Time:** This is the time for which Fault Pseudo Points shall hold the values obtained from the last legal fault report. This parameter ensures that the fault information is present in the MCP long enough for the SCADA master to interrogate and correctly process it. The MCP shall hold the values from the last legal fault report for the duration specified as the Fault Reset Time.
- **Restrike Interval:** This is the minimum duration that shall exist between 2 fault reports for the 2nd fault report to be considered legal. This parameter ensures that vital quantities such as Fault Distance and Fault Current are adequately captured, and reported to the SCADA master station. These quantities are prone to be invalid if there is a Fault Restrike, or a Reclose into Fault situation. After a legal fault report is received, the MCP shall treat subsequent faults occurring in the Restrike Interval as invalid.

PRF Text Pseudo Point

Apart from the above pseudo points, the PRF able DCA creates a TEXT pseudo point. This data point is used to create PRF reports. This pseudo point is used for archival of PRF reports collected from the system. The DCA updates PRF only with new protective relay fault report collected from the IED/relay. The PRF report contains:

- Home Directory of the IED reporting the fault.
- Date and Time of the PRF report
- Trip type description
- A numeric fault code
- Distance to Fault (-1 if N/A)
- A description of other parameters in the PRF reported from the IED

Master Station Point Summary

The **Master Station Point Summary** page lists the configured master stations in the system. The following information is provided for each master station:

Table 3-17: Master Station Point Summary

Field	Description
Home Dir	System location of the device/application.
Map File	Name of the server map file used with the specific master.
Name	Description of the master station.
Details	Protocol address of the device (i.e., DNP device address, IP Address, or serial port number, etc.).
Mode	This option indicates the mode of operation of the Server while communicating with the Master Station. This option is available only if the system level redundancy is Hot-Hot. This option is available if the system level redundancy is Hot-Hot. This can have 3 enumerated values. ACTIVE MCP – Only Active Server communicates to the Master whereas Standby Server will not communicate to the Master. This value is ACTIVE MCP both in Active and Standby MCP devices if the Server does not support Hot-Hot mode. This value is not applicable in Standalone/Warm Standby/Hot Standby system level redundancy. ACTIVE MCP HH – Active Server communicates to the Master in the case Server supports Hot-Hot mode. Standby MCP HH – Standby Server communicates to the Master in the case Server supports Hot-Hot mode.

The following related actions can be performed:

[View I/O](#)

[View point details](#)

Application Point Summary

The **Application Point Summary** page lists the configured applications in the system. The following information is provided for each application:

Table 3-18: Application Point Summary

Field	Description
Home Dir	System location of the device/application.
Application Name	Description of the application.
Application Address	A unique identifier for the application, usually used to identify pseudo points.

The following related actions can be performed:

[View I/O](#)

[View point details](#)

Point Groups Summary

The **Point Groups Summary** page lists the configured point groups in the system. The available information is provided for each point group:

- [Tree view](#) of selectable point groups for **Present Value**, **Peak Demand** and **Demand** data
- Tabbed panes for each data type: **Accumulator**, **Analog Input**, **Analog Output**, **Digital Input** and **Digital Output**, **All** showing point details

The following related action can be performed:

[View point details](#)

I/O Traffic Viewer

The **I/O Traffic Viewer** lists real-time communication messages between the MCP and a selected device or master station. The display automatically scrolls and refreshes as new messages are exchanged.

» To view I/O:

- Click the View button on the IED/Master Station Communications Summary page or the Monitor button on the Point Summary page or Detailed Statistics window.

The **I/O Traffic Viewer** window opens. Each message includes the following information:

- Direction of message flow (incoming or outgoing)
- Date and time of message
- Message content in ASCII or HEX text (as configured)
- Message type

On this screen, user can:

- Show/Hide Info Messages
- Pause/Resume the display of messages
- Clear all messages from the buffer
- Change the buffer size

When I/O communication messages exceed the buffer size, the oldest message is removed to make room for the new message. The default buffer size for the screen text area is 32 KB.

» To change the buffer size:

1. In the I/O Traffic Viewer window, click Buffer Size.
2. Enter a value and click **OK**.

The buffer size is changed as the user specified.

Tip: User can copy and paste text from the message window using the browser's copy and paste functions (e.g., **Ctrl-C** to copy and **Ctrl-V** to paste).

View Point Details

» To view point details:

1. On the **Point Summary** page, click the **Details** button for a selected connection (IED, Master Station, Application, Point Group). The **Point Details** page displays.
2. Select a point type tab, for example **Analog Input**. All the configured points and point details appear.
3. Use the page navigation buttons to select and scroll pages quickly.
4. Click **Close** when you are done.

Multiple Point Details windows may be open; they must be closed manually. Up to 8 windows may be open.

Tip: If more than 20 points exist for the selected type, the point display is broken up across multiple pages. Use the navigation buttons shown at the bottom of the window to move through the points list.

Maintenance Mode

A checkbox at the top of the point details window allows you to toggle **Maintenance Mode** on and off. This allows the user to view actual point details on system points that are affected by system features like [input point suppression](#) and [redundant I/O](#). Enabling maintenance mode adds the **Last Reported Value**, **Last Reported Quality**, and **Last Reported Time** fields to the data grid.

The following related actions can be performed:

[Sort records](#)

[Issue a command](#)

Point Details

The **Point Details** page lists all configured points and real-time point values in the real-time database. The **Point Details** page displays one tabbed pane per point type:

- [Accumulator](#)
- [Analog Input](#)
- [Analog Output](#)
- [Digital Input](#)
- [Digital Output](#)
- [Text](#)
- [All Points](#)

Point values update at a configured interval to display the most current values.

Tips

- If more than 20 points exist for the selected type, the point display is broken up across multiple pages. 20 points are shown per page with page numbers and navigation buttons shown at the bottom of the window.
- Pseudo points and values are available from the **IED/Master Station Communications Summary** pages.

The following related actions can be performed:

[View point details](#)

[Issue a command](#)

Accumulator tab

Accumulators typically represent the accumulated value of a counting operation. This count could be the number of times a digital input changed state, or the amount of energy carried by a conductor over a certain period. May also be used as a pseudo point to represent the number of times an operation took place or how often a function was executed.

The following point information is provided for each accumulator point on the **Point Details** page:

- Point ID
- Point reference
- Point description

- IEC 61850 reference (visible when IEC 61850 Server is enabled). Refer to the IEC 61850 Server User Guide (*GE Vernova Part Number SWM0124*)
- Running value - current value
- Quality attributes
- Updated time
- Frozen value
- Freeze date and time
- Clear date and time

The quality status of Running value and Quality Attributes are visually indicated according to configured color settings for Invalid, Questionable or Normal.

Point values update at a configured interval to display the most current values.

If more than 30 points exist for the selected type, the point display is broken up across multiple pages. Use the navigation buttons shown at the bottom of the window to move through the points list.

The following related actions can be performed:

[View point details](#)

[Issue a command](#)

Analog Input tab

Analog inputs typically represent the value of a physical device that is capable of sensing and reporting a range of discrete values. An analog input may also be used as a pseudo point to represent the output of a process or any other derived value that cannot be represented as a single bit.

The following point information is provided for each analog input point on the **Point Details** page:

- Point ID
- Point reference
- Point description
- IEC 61850 reference (visible when IEC 61850 Server is enabled). Refer to the IEC 61850 Server User Guide (*GE Vernova Part Number SWM0124*)
- Point value - scaled value and Enumeration
- [Quality Attributes](#)
- Updated time

The quality status of Point value and Quality attributes are visually indicated according to configured color settings for Invalid, Questionable or Normal.

Point values update at a configured interval to display the most current values.

If more than 30 points exist for the selected type, the point display is broken up across multiple pages. Use the navigation buttons shown at the bottom of the window to move through the points list.

The following related actions can be performed:

[View point details](#)

[Issue a command](#)

Analog Output tab

Analog outputs are typically used to control the value provided to an external device or process.

The following point information is provided for each analog output point on the **Point Details** page:

- Point ID
- Point reference
- Point description
- IEC 61850 reference (visible when IEC 61850 Server is enabled). Refer to the IEC 61850 Server User Guide (*GE Vernova Part Number SWM0124*)
- Point value - scaled value
- [Quality Attributes](#)
- Updated time

The quality status of Point value and Quality attributes are visually indicated according to configured color settings for Invalid, Questionable or Normal.

NOTE

TIP

Point values update at a configured interval to display the most current values.

If more than 30 points exist for the selected type, the point display is broken up across multiple pages. Use the navigation buttons shown at the bottom of the window to move through the points list.

The following related actions can be performed:

[View point details](#)

[Issue a command](#)

All Points tab

The **All** tab on the **Point Details** page lists all configured data points in the system point database.

The following point information is provided for each point on the **Point Details** page:

- Point ID
- Point reference
- Point description
- IEC 61850 reference (visible when IEC 61850 Server is enabled). Refer to the IEC 61850 Server User Guide (*GE Vernova Part Number SWM0124*)
- Point value - current present value
- [Quality Attributes](#)
- Updated time
- [Data type](#)

The quality status of Point value and Quality attributes are visually indicated according to configured color settings for Invalid, Questionable or Normal.

NOTE

TIP

Point values update at a configured interval to display the most current values.

If more than 30 points exist for the selected type, the point display is broken up across multiple pages.

Use the navigation buttons shown at the bottom of the window to move through the points list.

The following related actions can be performed:

[View point details](#)

[Issue a command](#)

Digital Input tab

Digital inputs (also referred to as binary inputs) typically represent the On/Off state of a physical device. A digital input may also indicate any single bit value that is derived from other data or used to indicate that a condition exists or that a process is in a state. If not representing the state of a physical device, it is referred to as a pseudo point.

The following point information is provided for each digital input point on the **Point Details** page:

- Point ID
- Point reference
- Point description
- IEC 61850 reference (visible when IEC 61850 Server is enabled). Refer to the IEC 61850 Server User Guide (*GE Vernova Part Number SWM0124*)
- Point value - current present value
- [Quality Attributes](#)
- Updated time
- State description

The quality status of Point value and Quality attributes are visually indicated according to configured color settings for Invalid, Questionable or Normal.

Point values update at a configured interval to display the most current values.

If more than 30 points exist for the selected type, the point display is broken up across multiple pages. Use the navigation buttons shown at the bottom of the window to move through the points list.

The following related actions can be performed:

[View point details](#)

[Issue a command](#)

Digital Output tab

Digital outputs (also referred to as binary outputs or control outputs) are used to control the On/Off state of a physical device, or in the case of a pseudo output, to initiate the function or operation associated with the output.

The following point information is provided for each digital output point on the **Point Details** page:

- Point ID
- Point reference
- Point description
- IEC 61850 reference (visible when IEC 61850 Server is enabled). Refer to the IEC 61850 Server User Guide (*GE Vernova Part Number SWM0124*)
- Point value - current present value
- [Quality Attributes](#)
- Updated time
- State description

The quality status of Point value and Quality attributes are visually indicated according to configured color settings for Invalid, Questionable or Normal.

Point values update at a configured interval to display the most current values.

If more than 30 points exist for the selected type, the point display is broken up across multiple pages. Use the navigation buttons shown at the bottom of the window to move through the points list.

The following related actions can be performed:

[View point details](#)

[Issue a command](#)

Text tab

Text points are typically used to represent the description of an event such as a protective fault report. They may also be used as a pseudo point to represent the output of a process or any other derived value that cannot be represented as a single bit or analog value.

The following point information is provided for each text point on the **Point Details** page:

- Point ID
- Point reference
- Point description
- IEC61850 reference (optional - depends on configuration). Refer to the IEC 61850 Server User Guide (*GE Vernova Part Number SWM0124*)
- Point value - current present value
- [Quality Attributes](#)
- Updated time

The quality status of Point value and Quality attributes are visually indicated according to configured color settings for Invalid, Questionable or Normal.

Point values update at a configured interval to display the most current values.

[Issue a Command](#)

View Events

The **SOE/PRF** page provides a search utility to filter, sort and display sequence of events (SOEs) and protective relay faults (PRFs) records stored in the MCP.

» To view events:

1. Click the **SOE/PRF** button on the Power bar. A new window opens.
2. Select the **SOE** tab for sequence of events records. Select the **PRF** tab for protective relay fault records.
3. The records are shown in the data table. You can filter by **Line ID**, **Device ID**, and/or **Bay ID**, and you can choose the number of records to show on each page.
4. User can save the records in CSV format by clicking the **Export Data** button. This exports all available data, even across multiple pages. Records that are filtered out are not included.

Right-click any column heading to customize the columns shown. You can also drag-and-drop column headings to re-order them horizontally.

Event Records

The following details are available for each event record (depending on the record type):

Table 3-19: Event Records

Field	Event Type		Description
	SOE	PRF	
Record ID	✓		A unique number to identify the event record.
Event ID		✓	
Trip Description		✓	An alphanumeric value indicating the type of failure recorded.
Fault Code		✓	A numeric value indicating the type of failure recorded.
Fault Distance		✓	A numeric value indicating where the fault is located. The protective relay calculates this value and provides it to the MCP device in the fault message.
Source Point ID	✓		The identification number of the point.
Source Point Reference	✓		A short, ASCII text identifier for the source point.
Source Point Description	✓		A user-defined, localized, description of the source point.
Point Type	✓		The type of point associated with the event (single or double point).
Event Value	✓		Value of the state (1 = ON, 0 = OFF) For the Single Point, the Value of the state is 1 or 0, where 1 = ON, 0 = OFF. For the Double Point, the Value of the state is 2 to 5, where • State 2 = Open • State 3 = Close • State 4 = In transit • State 5 = Invalid
Event Date	✓	✓	Date and time of the event as reported by the device or application.
Archived Date	✓		The date and time when the event was recorded in the system database.
Originator	✓		The source of the control command. See Originators for more information.
Quality	✓		The quality flag associated with the record.
State Description	✓		Text description of the state (ON = 1, OFF = 0)
Home Directory	✓	✓	System location of the device/application.
Line ID	✓	✓	Electrical transmission line associated with the device of this event.
Device ID	✓	✓	Device associated with this event.
Bay ID	✓	✓	Name of the bay associated with this event.
Device Type	✓	✓	Name of the client map file used with the specific device.

Connections

Communications Summary

The **Communications Summary** page lists the most recent communication statistics between the MCP and configured device or master station connections.

The following related actions can be performed:

[View device communications](#)

[View master station communications](#)

[View pseudo points \(detailed communication statistics\)](#)

[Enable/Disable Device Communications](#)

IED Communications Summary

The **IED Communications Summary** displays the status of configured devices in the system. The display includes:

Table 3-20: IED Communication Summary

Point Name	Description
Home Dir	System location of the device/application.
Line ID	Electrical transmission line associated with the device.
Device ID	Description of the device.
Bay ID	Description of the substation bay.
Device Type	Name of the client map file used with the specific device.
IED Details	Protocol address of the device (i.e., DNP device address, IP Address, or serial port number, etc.).
Total Transactions	Total number of failed and successful transactions
Total Transaction Failures	Total number of failed transactions
Percentage efficiency	Communications efficiency of the data link calculated from $\{1 - (\text{Total Transaction Failures} / \text{Total Transactions})\} \times 100\%$  Total Transactions and Total Transaction Failures information is refreshed each second. NOTE
Disable/Enable	This option disables or enables the IED or IED(s). Note: This option is disabled for D.20 peripherals.
Rotate Key	This option is available only for Modbus TCP/SSH IEDs to rotate the public keys into the IED. This option is disabled for all others.
Pair Device	This option is available only for Modbus TCP/SSH IEDs to pair the MCP with the IED. This option is disabled for others.

Point Name	Description
Source	This option is available if the system level redundancy is Hot-Hot. This can have 3 enumerated values. ACTIVE MCP – The source of the data comes from the IED to the ACTIVE MCP only and source of data is ACTIVE MCP both in Active and Standby MCP devices. ACTIVE MCP HH – The source of the data comes from the IED to the Active MCP, and source of data is ACTIVE MCP HH in Active MCP. STANDBY MCP HH – The source of the data comes from the IED to the Standby MCP and the source is STANDBY MCP HH in Standby MCP.

The following related actions can be performed:

[View I/O](#)

[View pseudo points \(detailed communication statistics\)](#)

[Enable/disable device communications](#)

Master Station Communications Summary

The **Master Station Communications Summary** displays the status of configured master stations in the system. The display includes:

Table 3-21: Master Station Communication Summary

Field	Description
Home Dir	System location of the device/application.
Map File	Name of the server map file used with the specific master.
Master Station Name	Description of the master station.
Details	Protocol address of the device (i.e., DNP device address, IP Address, or serial port number).
Total Transactions	Total number of failed and successful transactions
Total Transaction Failures	Total number of failed transactions
Percentage efficiency	Communications efficiency of the data link calculated from $\{1 - (\text{Total Transaction Failures} / \text{Total Transactions})\} \times 100\%$ Note: Total Transactions and Total Transaction Failures information is refreshed each second.
Mode	This option indicates the mode of operation of Server while communicating with the Master Station. This option is available only if the system level redundancy is Hot-Hot. This option is available if the system level redundancy is Hot-Hot. This can have 3 enumerated values. ACTIVE MCP – Only Active Server communicates to the Master whereas Standby Server will not communicate to the Master. This value is ACTIVE MCP both in Active and Standby MCP devices if the Server does not support Hot-Hot mode.

Field	Description
	This value is not applicable in Standalone/Warm Standby/Hot Standby system level redundancy.
	ACTIVE MCP HH – Active Server communicates to the Master in the case Server supports Hot-Hot mode.
	Standby MCP HH – Standby Server communicates to the Master in the case Server supports Hot-Hot mode.

The following related actions can be performed:

[View I/O](#)

[View pseudo points \(detailed communication statistics\)](#)

Detailed Communication Statistics - IED

Device communications statistics and other device specific information are supplied as pseudo point values in the real-time database.

» To view pseudo points:

- Click the Display button on the IED Communications Summary page.

The **IED Detailed Statistics** window opens. The pseudo points vary according to the type of device and protocol configured.

NOTE

Communications statistics update at a configured interval to display the most current values.

Detailed communication statistics – Master Station

Host communications statistics and other host specific information are supplied as pseudo point values in the real-time database.

» To view pseudo points:

- Click the Display button on the Master Communications Summary page.

The **Master Station Detailed Statistics** window opens. The pseudo points vary according to the type of host and protocol configured.

NOTE

Communications statistics update at a configured interval to display the most current values.

Enable/Disable Device Communications

On the **IED Communication Summary** display, click **Enable/Disable** to resume/suspend communications between the MCP and a selected device for scheduled polling and control operations.

NOTE

You must have Operator or Supervisor privileges to use the Enable/Disable communications function.

I/O Traffic Viewer

The **I/O Traffic Viewer** lists real-time communication messages between the MCP and a selected device or master station. The display automatically scrolls and refreshes as new messages are exchanged.

» To view I/O:

- Click the View button on the IED/Master Station Communications Summary page or the Monitor button on the Point Summary page or Detailed Statistics window.

The **I/O Traffic Viewer** window opens. Each message includes the following information:

- Direction of message flow (incoming or outgoing)
- Date and time of message
- Message content in ASCII or HEX text (as configured)
- Message type

On this screen, you can:

- Show/Hide Info Messages
- Pause/Resume the display of messages
- Clear all messages from the buffer
- Change the buffer size

When I/O communication messages exceed the buffer size, the oldest message is removed to make room for the new message. The default buffer size for the screen text area is 32 KB.

» **To change the buffer size:**

1. In the I/O Traffic Viewer window, click Buffer Size.
2. Enter a value and click **OK**.

Result: The buffer size is changed as you specified.

Tip: You can copy and paste text from the message window using your browser's copy and paste functions (e.g., **Ctrl-C** to copy and **Ctrl-V** to paste).

Logs

The **Logs** also known as **System Logs** page provides a report utility to display a list of system activities maintained by the MCP and stored in the [real-time database](#). The logs are useful for troubleshooting and tracking purposes. The following reports are available:

- [Control Log](#)
- [Diagnostic Log](#)
- [System Event Log](#)
- [User Activity Log](#)
- [Analog Report Log](#)
- [VPN Server Log](#) (Available only to Administrator class users/roles)

CAUTION

SYSLOG-based event logging (i.e., System Event Log, Diagnostic Log, Control Log and User Activity Log) should not be used for real time and Mission Critical purposes. Data presented in the SYSLOG may not be updated in real time to correctly indicate the status of monitored and controlled equipment.

For example, a power line could be listed as inactive in a system log, while in fact the power line is active and its status in the system log may be updated significantly later in terms of real time applications.

Only use SYSLOG-based event logging for system management, security auditing, general informational and debugging messages.

The following related actions can be performed:

- [View a log](#)
- [Clear a log](#)

Control Log

The **Control Log** lists command requests initiated by the master station or MCP and MCP responses. The following types of command events are logged:

- Analog set points
- Digital controls
- Forcing of data values (from HMI or master station)
- Forcing of data quality flags (from HMI or master station)
- Addition/removal of information tag

The log can support 8192 records.

The following related actions can be performed:

- [Sort records](#)
- [Clear records](#) (Supervisor only)

Diagnostic Log

The **Diagnostic Log** lists application specific error messages. The following types of events are logged:

- Switching between Primary and Backup serial channels
- Communication errors
- Internal errors (for example, unable to connect, read/write errors)
- Data errors originating in device (for example, invalid date from protective relay)

The log can support 16384 records.

The following related actions can be performed:

- [Sort records](#)
- [Clear records](#) (Supervisor only)

System Event Log

The **System Event Log** lists time-stamped system events. The following types of system events are logged:

- Application restarts
- Application failure to start errors
- Watchdog timer-based application restarts
- Buffer overflows
- Failure to log to SOE (sequence of event)
- Failure to log alarms
- Forcing of data values (from HMI or master station)
- Forcing of data quality flags (from HMI or master station)
- Addition/removal of information tag
- Loss of events
- Corrupt configuration

The log can support 32768 log records.

The following related actions can be performed:

- [Sort records](#)
- [Clear a log](#)

User Activity Log

The **User Activity Log** contains event records relating to user interaction with the MCP. The following pieces of information may be included in each log entry:

- Application Type
- Date/Time
- User Name
- Source IP Address
- Source Subnet Address
- Privilege Level
- User Text

You may see entries like the following in the user log: *(pam_unix) session opened for user root by (uid=0)*
(pam_unix) session closed for user root

These entries, denoted by the *pam_unix* prefix, are caused by the internal operation of the MCP security system and can be disregarded. They do not indicate that someone has logged into the MCP using the root account.

The following related actions can be performed:

- [Sort records](#)
- [Clear records](#) (Supervisor only)

Analog Report Log

Not available after and including MCP V2.60.

The **Analog Report Log** lists time-stamped analog report events. The following types of analog report events are logged:

- New report is generated
- Report is automatically deleted by the Analog Report application
- Report has been manually deleted by a user
- Reports(s) has been downloaded by a user
- Downloading report failed
- Deleting report failed

The following related actions can be performed:

- [Sort records](#)
- [Clear a log](#)

VPN Server Log

The MCP HMI provides support for the VPN Server Log; this log is only available to Administrator Users. This Log is accessed through the System Logs button and can be used for diagnostic purposes.

This log is also available to Administrator or Root Users through the MCP command prompt using command:

```
sudo tail -f /mnt/datalog/Logs/openvpn.log
```

View a Log

The **System Logs** page provides a search utility to filter, sort and display [system logs records](#).

» **To view a log:**

1. Click the **System Logs** button on the Power Bar.

2. Click the tab for the log to be viewed.
3. Sort the logs using the drop-down menus at the top of the screen (e.g., **Home directory**).
4. Click the **Refresh Filters** button to include entries created since the window has been opened.

You can copy and paste text from the report window using your browser's copy and paste functions (e.g., Ctrl-C to copy and Ctrl-V to paste) or **export the data in a *.csv format**.

In Local HMI, the logs (.csv files) must be exported to **/home/hmi/logs** or into the USB mounted on the MCP.

The following related actions can be performed:

- [Sort records](#)
- [Clear a log](#)

Clear a log

You may need to clear a log if the buffer has reached the maximum number of records. Login with Administrator credentials via `sudo mcpcfg` or MCP settings and clear the system logs.

» To clear a log:

1. Select a log from the **System Logs** page.
2. Click **Clear Log** and click **OK** to confirm deletion.

All log entries are deleted from the system database.

System Log Records

Control Log

Table 3-22: Control Log

Field	Description												
Message ID	Message ID is a unique identifier for the Control Log messages. <table> <tr> <th>Message ID</th><th>Message description</th></tr> <tr> <td>1</td><td>Set point operation</td></tr> <tr> <td>2</td><td>Control operation</td></tr> <tr> <td>3</td><td>Counter operation</td></tr> <tr> <td>4</td><td>Local command operation</td></tr> <tr> <td>5</td><td>Invalid command</td></tr> </table>	Message ID	Message description	1	Set point operation	2	Control operation	3	Counter operation	4	Local command operation	5	Invalid command
Message ID	Message description												
1	Set point operation												
2	Control operation												
3	Counter operation												
4	Local command operation												
5	Invalid command												
Date	Date and time (to millisecond) when the command was created.												

Field	Description
Command Type	Consists of one of the following Command Types: • Set Point • Control • Counter • Local Command - Consists of one of the following types. ▪ Force Value ▪ Force Quality ▪ Force Value and Quality ▪ Unforce ▪ Scan Inhibit ▪ Resume Scan ▪ Output Inhibit ▪ Permit Output ▪ Alarm Inhibit ▪ Permit Alarm ▪ Apply Tag ▪ Remove Tag ▪ Invalid • Invalid
Operation Type	Each Command Type (except Local Command) consists of one of the following Operation types: • Select • Operate • Select Before Operate • Direct Operate • Direct Operate No Ack • Freeze • Clear • Freeze and Clear • No Operation • Invalid
Control Type	Control Type (Digital Control only) consists of one of the following types: • Trip • Close • Pulse On • Pulse Off • Latch On • Latch Off • Invalid
Set Point Value (Analog Output Commands only)	Requested Value in the AO command.
On Time	On Time period (in milliseconds) for the Digital Controls.

Field	Description
Off Time	Off Time period (in milliseconds) for the Digital Controls.
Count	Repeat Count value for the Digital Controls.
Input Direction	Direction of the Command which consists of: • Consumer writes the command to RTDB. • Producer reads command from RTDB. • Producer sends the command response to RTDB.
Status	Status of the command.
Global ID	A unique identifier generated by the RTDB for each command except for the command with the operation type "Operate". In the case of "Operate", the identifier is the previous command identifier used for "Select".
Home Directory	Home Directory of the device/application.
Point ID	A 32-bit signed integer for the point that is unique within a home directory.
Point Reference	User defined point reference (ASCII string) of the point.
Originator	The source of the command. If the command originates from the remote HMI, this is the ID of the Secession.
User Description	An optional ASCII text field into which the user has entered additional information.

System Event Log

Table 3-23: System Event Log

Field	Description		
Message ID	Message ID is a unique identifier for the System Event Log messages.		
	Message ID	Enumeration	Description
	1	APPL_STARTS	MsgText_Application_Starts
	2	APPL_RESTARTS	MsgText_Application_Restarts
	3	CHILD_STARTS	MsgText_Child_Starts
	4	CHILD_RESTARTS	MsgText_Child_Restarts
	5	CHILD_TERMINATES	MsgText_Child_Terminates
	6	WATCHDOG_TIMER_APPL_RESTARTS	MsgText_WatchDog_Timer_Appl_Restarts
	7	APPL_FAILUE_TO_START_ERROR	MsgText_Application_Failed_to_Start_Error
	8	BUFFER_OVERFLOW	MsgText_Buffer_Overflows_DPA_Or_DTA
	9	FAIL_TO_LOG_SOE	MsgText_Failure_to_Log_SOE
	10	FAIL_TO_LOG_ALARMS	MsgText_Failure_to_Log_Alarms
	11	FORCING_DATA_VALUES	MsgText_Forcing_of_Data_Values_HMI_Or_Master_Station
	12	FORCING_DATA_FLAGS	MsgText_Forcing_Data_Quality_Flags
13	APPLY_INFORMATION_TAG	MsgText_Apply_Information_on_Tag	

Field	Description		
	14	REMOVE_INFORMATION_TAG	MsgText_Removal_Information_on_Tag
	15	LOSS_OF_TIMESYNC	MsgText_Loss_of_Time_Sync
	16	RECOVERY_OF_TIMESYNC	MsgText_Recovery_of_Time_Sync
	17	DST_MISMATCH	DST_Flag_Mismatch_Between_Time_Recieve d_From_IED_and_Zoneinfo_File
	18	LOSS_OF_EVENTS	MsgText_Loss_of_Events_DCA_Or_DTA
	19	INCORRECT_CONFIGURATION	MsgText_Incorrect_Configuration
	20	XML_PARSE_ERROR	MsgText_XML_Parse_Error
	21	MCP_START_ACTIVE_MODE	Msg_Text_Gateway_Started_in_Active_Mode
	22	MCP_SWITCH_TO_STANDBY_MODE	Msg_Text_Gateway_switching_to_Standby_M ode
	23	MCP_CONFIG_SYNC_SUCCESS	Msg_Text_Gateway_configuration_sync_to_St andby_Success
	24	MCP_CONFIG_SYNC_FAILED	Msg_Text_Gateway_configuration_sync_to_St andby_Failed
	25	MCP_RX_HB_FROM_STANDBY	Msg_Text_Received_HB_from_Standby
	26	MCP_SENT_RESTART_ALL_APPS	Msg_Text_Sent_message_to_SWWatchdog_t o_restart_all_Apps
	27	MCP_SENT_STOP_ALL_APPS	Msg_Text_Sent_message_to_SWWatchdog_t o_stop_all_Apps
	28	DAEMONIZE_FAILED	Msg_Text_Daemonize_call_failed
	29	MCP_FAIL	Msg_Text_Failing_Gateway
	30	MCP_START_NONREDUNDANT_MODE	Msg_Text_Gateway_started_in_Non_Redunda nt_Mode
	31	MCP_START_STANDBY_MODE	Msg_Text_Gateway_started_in_Standby_Mode
	32	MCP_SWITCH_TO_ACTIVE_MODE	Msg_Text_Gateway_Switching_to_Active_Mode
	33	MCP_RTDB_CONSUMER_DELAY_START	Msg_Text_Consumer_started_late_may_miss_ events
	34	MCP_RTDB_CONSUMER_DELAY_START	Msg_Text_Consumer_started_late_may_miss_ events
	35	RECEIVED_RESTART	MsgText_Received_Restart_IIN
	36	RECEIVED_NEED_CONFIG	MsgText_Received_Need_Config_IIN
	37	MCP_FAILED	MsgText_Gateway_Failed
	38	MCP_RESTART_ALL_APPS	MsgText_Gateway_restart_all_applications
	39	CRITICAL_APPL_FAILED	MsgText_Critical_Application_Failed
	40	MCP_KILL_APPL	MsgText_Kill_Application
	41	PERCENTAGE_APPL_FAILED	MsgText_Percentage_applications_Failed

Field	Description		
	42	EMERGENCY_ACCESS_CODE_CLEARED	MsgText_Emergency_Access_Code_has_been_cleared
	43	EMERGENCY_ACCESS_CODE_CLEAR_FAIL	MsgText_Emergency_Access_Code_failed_to_be_clear
	44	EMERGENCY_ACCESS_CODE_GEN	MsgText_Emergency_Access_Code_has_been_generated
	45	EMERGENCY_ACCESS_CODE_GEN_FAIL	MsgText_Emergency_Access_Code_failed_to_be_generate
	46	EMERGENCY_ACCESS_CODE_AUTHENTICATED	MsgText_Emergency_Access_Code_has_been_authenticated
	47	EMERGENCY_ACCESS_CODE_AUTH_FAIL	MsgText_Emergency_Access_Code_has_failed_authentication
	48	EMERGENCY_ACCESS_CODE_EXPIRED	MsgText_Emergency_Access_Code_has_expired
	49	RECEIVED_SIGNAL	MsgText_Received_signal
	50	MAX_RESTARTS	MsgText_Max_restarts_for_terminal_server
	51	MISSED_MAX_HEART_BEATS	MsgText_Missed_max_heartbeats_for_terminal_server
	52	RESTART_MAIN_CONTROLLER	MsgText_Restarting_main_controller_Too_many_broken_threads
	53	NO_SERVERS_FOUND	MsgText_No_servers_found
	54	DATALOG_INFO_MSG	MsgText_DataLogger_Info_Message
	55	DATALOG_ERR_MSG	MsgText_DataLogger_Error_Message
	56	CONNECT_TCP_MSG	MsgText_TCP_Connect_Message
	57	DISCONNECT_TCP_MSG	MsgText_TCP_Disconnect_Message
	58	RESET_TCP_SERVER_MSG	MsgText_Resetting_TCP_Server_Message
	59	TCP_SERVER_ERR_MSG	MsgText_TCP_Server_Unknown_Error_Message
	60	PAM_START_ERR_MSG	MsgText_Failed_to_fork_authentication_child_process_Message
	61	VALID_APP_LICENCE_MSG	MsgText_Valid_application_license_Message
	62	INVALID_APP_LICENCE_MSG	MsgText_Invalid_application_license_Message
	63	LICENCE_NOT_FOUND_MSG	MsgText_Application_license_not_found
	64	APP_LICENCE_ADDED_MSG	MsgText_Application_license_added
	65	APP_LICENCE_ADD_FAIL_MSG	MsgText_Couldnot_add_new_application_ID
	66	APPL_LICENCE_NOT_FOUND_MSG	MsgText_Application_license_not_found_in_license_file
	67	TRIAL_LICENCE_NOT_ENABLED_MSG	MsgText_Trial_License_not_enabled
	68	TRIAL_LICENCE_ENABLED_MSG	MsgText_Trial_license_already_enabled

Field	Description		
	69	TRIAL_LICENCE_EXPIRED_MSG	MsgText_Trial_license_already_expired
	70	NO_APPL_LICENCE_MSG	MsgText_Application_License_does_not_exist
	71	UNABLE_TO_CONNECT_TO_A_MPLSOLVER_MSG	MsgText_Unable_to_connect_to_amplsolver
	72	RESTORE_CLONE_SNAPSHOT_SUCCESSFUL	MsgText_Restore_Clone_Snapshot_Successful
	73	RESTORE_CLONE_SNAPSHOT_FAIL	MsgText_Restore_Clone_Snapshot_Failed
	74	RESTORE_STANDARD_SNAPSHOT_SUCCESSFUL	MsgText_Restore_Standard_Snapshot_Successful
	75	RESTORE_STANDARD_SNAPSHOT_FAIL	MsgText_Restore_Standard_Snapshot_Failed
	76	FIRMWARE_UPGRADE_SUCCESSFUL	MsgText_Firmware_Upgrade_Successful
	77	FIRMWARE_UPGRADE_FAIL	MsgText_Firmware_Upgrade_Failed
	78	UPGRADE_RUNTIME_DATA_SUCCESSFUL	MsgText_Upgrade_Runtime_Data_Successful
	79	UPGRADE_RUNTIME_DATA_FAIL	MsgText_Upgrade_Runtime_Data_Failed
	80	SCHEMA_VERSION_CHECK_SUCCESSFUL	MsgText_Schema_Version_Check_Successful
	81	SCHEMA_VERSION_CHECK_FAIL	MsgText_Schema_Version_Check_Failed
	82	FIRMWARE_VERSION_CHECK_SUCCESSFUL	
	83	FIRMWARE_VERSION_CHECK_FAIL	MsgText_Firmware_Version_Check_Failed
	84	INVALID_SYSLOG_MESSAGE_ID	MsgText_Invalid_SysLog_Message_ID
Event Date	Date and time (to millisecond) when the event was created.		
Message Class	Type of message.		
Description	Brief description of the event. Some of the most commonly used messages are: CHILD Started CHILD Re-started Application Started Application Re-started etc.		
Application	Unique identification number for the application.		
Connection Type	Connection or Communication type of the application instance.		

Field	Description
Home Directory	Home directory of the device/application.
Instance	The execution instance of the application starting with the number one.
Misc	This is an optional ASCII text of size 512 bytes for the user to log additional information.

Diagnostic Log

Table 3-24: Diagnostic Log

Field	Description
Message ID	System assigned number to identify the message.
Message Class	Type of the message.
Date	Date and time (to millisecond) when the event was created.
Description	Brief description of the event.
Application	Unique Identification number of the application.
Application Interface	The execution instance of the application.
Home Directory	Home Directory of the device/application.
User Action	This is optional text for additional user-logged information.

User Activity Log

Table 3-25: User Activity Log

Field	Description
Application Type	Application Description
Date	Date and time (to millisecond) when the event was created.
Username	ASCII name of the user who issued the command.
IP Address	IP Address of the remote user.
Subnet IP	Subnet IP of the remote user.
Description	Brief description of the event.
Privilege Level	Privilege level of the user.

Analog Report Log

Table 3-26: Analog Report Log

Field	Description
Message ID	System assigned number to identify the message.
Date	Date and time (to millisecond) when the event was created.
Message Class	Type of message.
Description	Brief description of the event.
File	Name of the file to be created or deleted.
Username	Optional text to be added for user-logged information.
User Action	Optional text to be added for user-logged information.

The following related actions can be performed:

[Sort records](#)

[View a log](#)

Trends

The Trending also known as Data Logger application allows you to graphically monitor and record data from devices connected to the MCP. You can also save and review historical reports created by the application.

Using the Trends

When the Trends is opened, click the **Select Points** button to choose the points to be graphed. Up to 10 points can appear at one time.

Screen Areas

The Trends window is comprised of several areas.

Screen Area	Description
1. Summary Area	The summary area shows the entire timeframe of all selected points. You can use the left and right sliding markers to zoom a portion of this timeframe within the viewing area. Click and drag the area between the markers to re-position the timeframe.
2. Viewing Area	The viewing area is a larger graph detailing the selected portion of the summary area. When you click the graph, crosshairs are shown pinpointing the date and value. The closest points are highlighted, and their attributes are shown in the point detail pane. Click and drag to highlight a portion of the viewing area to launch a popup detail window showing the selected area.
3. Point Detail Pane	The point detail pane shows detailed attributes for the points selected in the viewing area.

Options

Y-Scale Auto-zoom

When selected, the Y-axis scale of the Viewing Area automatically expands and contracts to fit the largest visible deviation. This setting does not affect the scale of the Summary Area.

Auto-trend

When selected, the viewing area always shifts to show the latest information received. For this option to be available, enable **No End Date** in the **Select Points** window.

Execute Commands

This chapter contains the following sections:

Issue a Command

Acknowledge an Alarm (One-Line Viewer)

Acknowledge an Alarm Group (One-Line Viewer)

Analog Output Interface

Analog Set-point Interface

Digital Control Interface

Digital Output Interface

Navigate to Active Alarm Page (One-Line Viewer)

Point Forcing Interface

Dress Device State Interface

DataSource Types

Raise/Lower Control Interface

Tag/Inhibit Interface

Global Controls Disable

Control Lockout Feature

Issue a Command

The MCP supports the following control operations:

- Repeated control operations in quick succession (window remains open until cancelled)
- Separate Select and Operate commands
- For IEDs that do not support Trip/Close commands to the same point, the Trip command can be sent to one digital output point and the Close command can be sent to another digital output point.
- Specification of control command attributes at runtime

You can execute a command on a data point from the **Point Details** page or the **One-Line Viewer**.

» To issue a command:

1. Select an item.

In One-Line Viewer, the Digital Output interface can be opened on any of the following three ways:

- Double click
- Left click and then select Digital Output Interface
- Right click and then select Digital Output Interface

In Point Details, the Digital Output interface can be opened in either of the following ways:

- Double click and then select the Digital Output Interface
- Right click and then select Digital Output Interface

2. Select a command option.

3. In the command interface window, enter the desired command settings:

NOTE

This command is only applicable to the command interface window on the viewpoint details page.

Set up one control command as follows:

- a. Select Function Code.

One of: Direct Operate, Direct Operate with No ACK, Select, Operate, Select Before Operate

- b. Select Control Code.

One of Pulse On, Pulse Off, Latch On, Latch Off, Trip, Close

- c. Enter a Pulse On time.

Trip/Close and Pulse On/Off controls only

- d. Enter a Pulse Off time.

Trip/Close and Pulse On/Off controls only

The above options do not show at run time when using objects within the one-line screens.

4. Click **Execute** or **OK** to send the command request.

A message confirms whether the command was successful.

NOTE

In a distributed system, the only reliable way to determine the success of a control operation is through a hardwired digital input or analog input point providing the feedback of the process state being controlled. The popup window that indicates when a control has been sent only indicates that the MCP has sent the control to a downstream device.

NOTE

If you do not complete an action within a pre-defined period, the operation is cancelled and the window closes.

Acknowledge an Alarm (One-Line Viewer)

If an alarm panel has been configured in a one-line diagram, you can manually acknowledge alarms directly in the **One-Line Viewer**. Alarm panel is configured using the **One-Line Designer**.

» To acknowledge an alarm object:

1. Go to the **One-Line Viewer** and open the alarm panel drawing.
2. Select the object that is in alarm and click. The Acknowledge Alarm window opens.

NOTE: Alarm panel objects can be configured for acknowledgement using a single or double-click.

3. Click **OK** to confirm the acknowledgement.
4. Click **OK** to confirm the completion of the command.

When you acknowledge an alarm object:

- "Acknowledge Indicator" field is checked on the Active Alarms page.
- Acknowledged alarm object changes in foreground color, background color and blink rate as configured in alarm settings.

NOTE: You cannot remove an acknowledgement once an alarm has been acknowledged

Acknowledge an Alarm Group (One-Line Viewer)

If an alarm panel has been configured on an Alarm group in a one-line diagram, you can manually acknowledge the alarm Group (all the alarms at once within the configured Alarm group) directly in the **One-Line Viewer**. Alarm panel is configured using the **One-Line Designer**.

» To acknowledge an alarm object configured on Alarm Group

1. Go to the **One-Line Viewer** and open the alarm panel drawing.
2. Select the object that is in alarm (the alarm object is in alarm mode when any point in the group is in alarm state) and click. The Acknowledge Alarm window opens.

NOTE: Alarm panel objects can be configured for acknowledgement using a single or double-click.

3. Click **OK** to confirm the acknowledgement.
4. Click **OK** to confirm the completion of the command.

When you acknowledge an alarm object:

- "Acknowledge Indicator" field is checked on the Active Alarms page.
- Acknowledged alarm object changes in foreground color, background color and blink rate as configured in alarm settings.

NOTE: You cannot remove an acknowledgement once an alarm has been acknowledged.

Analog Output Interface

The **Analog Output Interface** allows you to execute a set point command on an analog output point.

» To open the Analog Output Interface:

- Right-click an analog output data object on the **One-Line Viewer** or an analog output point on the **Point Details** page and select **Analog Output Interface**.

The **Analog Output Interface** displays the following information:

- Line ID/Device ID
- Point description
- Point value

- [Quality Attributes](#)

The quality status is visually indicated according to configured color settings.

» **To execute a set point:**

1. Right-click an analog output data object on the **One-Line Viewer** or analog output point on the **Point Detail** page and select **Analog Output Interface**.
2. Enter a Set Point Value.
3. Select the Function Code.
4. Click **Execute** to send the request.

Result: A message confirms whether the command was successful.

If you do not complete an action within a pre-defined period of time, the operation is cancelled and the window closes

Analog Set-point Interface

The **Analog Set Point Interface** allows you to view point status and execute a set point command on an analog set point object's output point.

» **To open the Analog Set Point Interface:**

- Right-click an analog set point data object on the **One-Line Viewer** and select **Analog Set Point Interface**.

The **Analog Set Point Interface** displays the following information:

- IED/Point descriptor
- [Quality Attributes](#)
- Feedback point value (engineering units)

The quality status of the feedback point value and Quality attribute are visually indicated according to configured color settings.

» **To execute a set point command:**

1. Right-click an analog output data object on the **One-Line Viewer** and select **Analog Set Point Interface**.
2. Enter a **Set Point Value** within the shown configured range of values.
3. Click **Execute** to send the request.

Result: A message confirms whether the command was successful.

If you do not complete an action within a pre-defined period, the operation is cancelled and the window closes.

Digital Control Interface

The **Digital Control Interface** supports multiple datasources. Each datasource allows you to viewpoint status and execute a control command on a digital control object's output point. Two-state and four-state feedback controls are supported.

» **To open the Digital Control Interface:**

- Right-click a digital control data object on the **One-Line Viewer** and select **Digital Control Interface**

The **Digital Control Interface** displays the following information:

- IED/Point descriptor (Secondary output point as well, if configured)
- [Quality Attributes](#)

- Present state: **Open** or **Closed** for 2-state feedback controls *or* **Open**, **Closed**, **In Transit** or **Invalid** for 4-state feedback controls

The quality status of the state and Quality attribute are visually indicated according to configured color settings.

» **To execute a control command:**

1. Right-click a digital control data object on the **One-Line Viewer** and select **Digital Control Interface**.

Result: The Digital Control Interface window appears.

2. Select a datasource.
3. Verify the point status.
4. Click the **On** or **Off** control state button.

Result: The selected state button displays in green.

5. Click **Execute** to send the request.

Result: A message confirms whether the command was successful.

If you do not complete an action within a pre-defined period, the operation is cancelled and the window closes.

Digital Output Interface

The **Digital Output Interface** allows you to issue control requests on digital output points.

» **To open the Digital Output Interface:**

- Right-click a digital output data object on the **One-Line Viewer** *or* a digital output point on the **Point Details** page and select **Digital Output Interface**.

Result: The **Digital Output Interface** displays the following information:

- Line ID/Device ID
- Point description
- [Quality Attributes](#)
- Digital output state

The quality status of the Point value and Quality attribute are visually indicated according to configured color settings.

» **To execute a control command on a digital output point:**

1. Right-click a digital output data object on the **One-Line Viewer** *or* a digital output point on the **Point Details** page and select **Digital Output Interface**.
2. Verify the point status.
3. Set up one control command as follows:
 - Select **Function Code**. One of Direct Operate, Direct Operate with No ACK, Select, Operate, Select Before Operate
 - Select **Control Code**. One of Pulse On, Pulse Off, Latch On, Latch Off, Trip, Close
 - Enter a **Pulse On** time (Trip/Close and Pulse On/Off controls only)
 - Enter a **Pulse Off** time (Trip/Close and Pulse On/Off controls only)

4. Click **Execute** to send the request.

Result: A message confirms whether the command was successful.

In a distributed system, the only reliable way to determine the success of a control operation is through a hardwired digital input or analog input point providing the feedback for the process state being controlled. The popup window that indicates when a control has been sent only indicates that the MCP has sent the control to a downstream device.

If you do not complete an action within a pre-defined period, the operation is cancelled and the window closes.

How parameters to the Digital Output Interface are Used by DCAs

Parameters to the Digital Output Interface of the MCP HMI and One-Line Viewer (OLV) are utilized by the following DCA applications:

Table 3-27: DCA Applications - Digital Output Interface Parameters

DCA Applications	Function Code	Control Code	Pulse On Duration	Pulse Off Duration	Number of Pulses	Notes
IEC 61850 DCA	Don't Care	Any	Send as a part of control object	Send as a part of control object	Send as a part of control object	The function provided by the user is not considered. The function code depends on the control model of the point configured at the Server.
Modbus DCA	Don't Care	Trip Pulse Off Latch Off	Don't Care	Don't Care	Don't Care	Modbus DCA sends an OFF command to the IED. Modbus protocol doesn't support control code, Pulse on/off duration and number of pulses.
	Don't Care	Close Pulse On Latch On	Don't Care	Don't Care	Don't Care	Modbus DCA sends an OFF command to the IED. Modbus protocol doesn't support control code, Pulse on/off duration and number of pulses.
DNP DCA	Don't Care	Any	Send as a part of control object	Send as a part of control object	Send as a part of control object	The function code and control specifications specified by the user are considered.
	Direct Operate		Send as a part of control object	Send as a part of control object	Send as a part of control object	The function code specified by the user is overridden by the "Direct Operate" and sent to the IED. Control specification parameters specified by the user are considered.
	Direct Operate with No Ack	Any	Send as a part of control object	Send as a part of control object	Send as a part of control object	The function code specified by the user is over-written by the "Direct Operate No Ack" and sent to the IED. Control specification parameters specified by the user are considered.
	SBO	Any	Send as a part of control object	Send as a part of control object	Send as a part of control object	The function code specified by the user is over-written by the "SBO" and sent to the IED. Control specification parameters specified by the user are considered.

DCA Applications	Function Code	Control Code	Pulse On Duration	Pulse Off Duration	Number of Pulses	Notes
IEC 101/104 DCA	Direct Operate		Send as a part of control object	Send as a part of control object	Send as a part of control object	The function code specified by the user is over-written by the "Direct Operate" and sent to the IED. Navigate to Active Alarm Page (One-Line Viewer)

If an alarm panel has been configured in a one-line diagram, you can navigate to Active Alarms page directly from the **One-Line Viewer**. Alarm panel is configured using the **One-Line Designer**.

1. Go to the **One-Line Viewer** and open the alarm panel drawing.
2. Select the alarm object and click. It navigates to the Active Alarm page.
NOTE: Alarm panel objects can be configured for navigation using a single or double-click.
3. If navigation is invoked on alarm object configured on group of points, it navigates to the active alarm page with the respective group tab selected.
4. If navigation is invoked on alarm object configured on a point, it navigates to the active alarm page.

Point Forcing Interface

The **Point Forcing Interface** allows you to view the point status and manually enter (force) the value of any type of data point.

» To open the Point Forcing Interface:

1. Click a data object on the **One-Line Viewer** or a point on the **Point Details** page.
2. Select **Point Forcing Interface**.

Result: The following options may appear:

- Feedback
- Control

The **Point Forcing Interface > Feedback** window shows the following information:

- DataSource
- Status
- Value(s)
- Tag(s)
- DataSource Status/Control for the [Quality Attributes](#)

The **Point Forcing Interface > Control** window shows the following information:

- Line ID/Device ID
- [Data type](#)
- Point name
- Point value
- [Quality Attributes](#)

NOTES:

- Values are in engineering units for Analog Input and Analog Output points.
- The quality status of the Point value and Quality attribute are visually indicated according to configured color settings.

Below screen shot shows the Point Forcing interface for Digital Input in MCP from the Runtime HMI Point details page.

Beh ENS: on

» **To force a value on the One-Line Viewer page:**

1. Click an object on the One-Line Viewer drawing.
2. Select **Point Forcing Interface**
3. Select **Feedback** or **Control**.

Result: The DataSource Feedback Force or the DataSource Control Feedback Force window appears.

» **To force a value on the Point Details page:**

1. Right-click a point on the **Point Details** page.
2. Select **Point Forcing Interface**.
Result: The Point Status window appears.
3. Verify the point quality status in the **Point Status Control** pane.
4. Click a Point Status button to force a value. Click the button again to toggle the state.
Result: A message confirms whether the force action was successful or not.
5. Click **Close**.
Result: The Point Status window closes.

Dress Device State Interface

The **Dress Device State** action is available in the One-Line Viewer starting with MCP V530.

This allows you to manually enter (force) the value of Digital Input (feedback) and/or Digital Output (control) states in a simple to use quick action.

» **To perform Dress Device State:**

1. Click a binary data object on the **One-Line Viewer**.
2. Select **Dress Device State**.
3. In the submenu select the checkbox(es) for the desired state(s).
Result: The value of the binary object changes to the selected dress state(s) and the M flag is set.

» **To remove Dress Device State:**

1. Click a binary data object on the **One-Line Viewer**.
2. Select **Dress Device State**.
3. In the submenu select **Remove**.
Result: The value of the binary object is no longer forced and the M flag is reset (unless other forced flags are still applied, see [Point Forcing Interface](#)).

DataSource Types

The following table summarizes the functionality associated with each DataSource type.

Table 3-28: DataSource Types

DS type	Control 1	Control 2	Feedback	Feedback Value	Control
Accumulator Status			1ACC	Any integer>=0	NA
Alarm				Alarm Group – NA Individual Alarm - NA	NA

DS type	Control 1	Control 2	Feedback	Feedback Value	Control
Analog Set Point	1AO		1AI	Feedback AI: any float value	AO - between min and max
Analog Status			1AI	Feedback AI: any float value	NA
Digital Control	1DO	1DO	2DI	Set 2/4 state depending on the Primary feedback Secondary feedback DI Point: State 00/01/10/11 Text	Primary/Secondary DO State (defined for open/close state desc): 0 or 1
Digital Status			2DI	Set 2/4 state depending on the Primary & Secondary DI Point: State 00/01/10/11 Text	NA
Raise/Lower Control	1DO	1DO	1AI	AI Feedback: any float value	Primary/Secondary DO Point State (defined for open/close state desc : 0 or 1
TEXT			1TXT	NA	NA

DataSource Feedback Force – Window Elements

Force Feedback is only applicable to Analog Output and Digital Output points which are configured as feedback points in the DataSource. A typical use case: Force Feedback can change a 2 Feedback State (00/01) point or a 4 Feedback State (00/01/10/11) point in one operation by changing multiple feedback points' values in one command.

The table below describes the fields and controls on the window for the following datasource types used in Point Forcing Interface > Feedback:

- Digital Control
- Analog Status
- Raise/Lower Control
- Analog Set Point
- Digital Status
- Accumulator Status

Table 3-29: Window Elements - DataSource Feedback

Element	Description
Datasource	The Datasource assigned to the Data Source Value in the One-Line Designer.
Status	Indicates the Data Quality Status .
Value	Indicates the current value for the Datasource. The Force Value button can be used to force the value to one of the following, depending on the Datasource type: • Digital Control: Force 2 States depending on the Primary IED point value. The valid states and the corresponding text are: - o When the point feedback value is 00, the text appears as Off (default) - o When the point feedback value is 01, the text appears as On (default) Force 4 States depending on the Primary and Secondary IED point states. The valid states and the corresponding text are: - o When the point feedback value is 00, the text appears as Opened (default)

Element	Description
	- o When the point feedback value is 01, the text appears as In Transit (default) - o When the point feedback value is 10, the text appears as Closed (default) - o When the point feedback value is 11, the text appears as Invalid (default) • Analog Status: Force the Analog Input point value. Enter a floating-point number. • Raise/Lower Control: Force the Analog Input point value. Enter a floating-point number. • Analog Set Point: Force the Analog Input point value. Enter a floating-point number. • Digital Status: Force 2 States depending on the Primary Feedback Point 00/01(default text is Off and On); Force 4 States depending on the Primary and Secondary Digital Input Feedback point: state. Valid states are: 00/01/10/11 (default text strings are In Transit, Open, Closed and Invalid) • Digital Status: Force 2 States depending on the Primary IED point value. The valid states and the corresponding text are: - o When the point feedback value is 00, the text appears as Off (default) - o When the point feedback value is 01, the text appears as On (default) Force 4 States depending on the Primary and Secondary IED point states. The valid states and the corresponding text are: - o When the point feedback value is 00, the text appears as Opened (default) - o When the point feedback value is 01, the text appears as In Transit (default) - o When the point feedback value is 10, the text appears as Closed (default) - o When the point feedback value is 11, the text appears as Invalid (default) • Accumulator Status: Force the Accumulator point value to the entered positive number
Tag(s)	Indicates the current Tag status. See for Tag/inhibit interface further information.
Datasource Status/Control	Indicates the status of the Quality Attributes , including the state of any current control actions.

DataSource Control Force – Window Elements

Force Control is only applicable to Analog Output and Digital Output points which are configured as Primary point and Secondary points in the DataSource. The point values can be changed by manual force, depending upon the datasource type.

The table below describes the fields and controls on the window for the following datasource types used in Point Forcing Interface > Control:

- Digital Control
- Raise/Lower Control
- Analog Set Point

Table 3-30: Window Elements - DataSource Control

Element	Description
Datasource	The Datasource assigned to the Data Source Value in the One-Line Designer.
Status	Indicates the Data Quality Status .
Primary Point	Indicates the Primary point name which is providing the Datasource.

Element	Description
Primary Point Value	Indicates the current value for the Datasource. The Force Value button can be used to force the value to one of the following, depending on the Datasource type: - Digital Control: Force Primary or Secondary Digital Input point state. Select 0 or 1. - Raise/Lower Control: Force the Primary or Secondary Digital Output point state. Select 0 or 1. - Analog Set Point: Force the Analog Output point value. The valid range is determined by the min to max values specified in the Analog Set Point Datasource.
Secondary Point	Indicates the Secondary point name which is providing the Datasource.
Secondary Point Value	See the description for the Primary Point Value.
Tag(s)	Indicates the current Tag status. See for Tag/inhibit interface further information.
Datasource Status/Control	Indicates the status of the Quality Attributes , including the state of any current control actions.

Raise/Lower Control Interface

The **Raise Lower Control Interface** allows you to viewpoint status and execute a raise or lower command on a raise/lower control object's output point. Raise/Lower control is available on configured buttons and transformer objects.

» To open the Raise Lower Control Interface:

- Right-click a raise/lower data object on the **One-Line Viewer** and select **Raise/Lower Control Interface**.

The **Raise Lower Control Interface** displays the following information:

- IED/Point descriptor (Secondary output point as well, if configured)
- [Quality Attributes](#)
- Analog Feedback point description and value (engineering units)
- Present state

The quality status of the Point value and Quality attribute are visually indicated according to configured color settings.

» To execute a raise/lower control command:

- Right-click a raise/lower control data object on the **One-Line Viewer** and select **Raise/Lower Control Interface**.
- Verify the point status.
- Click the **Raise** or **Lower** control state button.
NOTE: The selected state button displays in green.
- Click **Execute** to send the request.

A message confirms whether the command was successful.

If you do not complete an action within a pre-defined period, the operation is cancelled and the window closes.

Tag/Inhibit Interface

The **Tag/Inhibit Interface** allows you to view the point status and tag or inhibit the value of any type of data point. The MCP supports tagging on the following data types:

- Analog inputs
- Digital inputs
- Accumulators
- Analog outputs
- Digital outputs

» To open the Tag/Inhibit Interface:

1. Right-click a data object on the **One-Line Viewer** or right-click a point on the **Point Details** page.
2. Select **Point Forcing Interface**.

Result: The Point Status window appears.

The **Point Status** window displays the following information:

- Line ID/Device ID
- Data type
- Point Reference
- Point value
- Point quality
- Point name
- [Quality Attributes](#)

NOTES:

- Values are in engineering units for Analog Input and Analog Output points.
- The quality status of the Point value and Quality attribute are visually indicated according to configured color settings

Example Actions

» To add a tag (text label) to a One-Line Viewer diagram:

1. With the Point Status window open, click the **Tagged (T)** button.

Result: The Tag window appears.

2. Type in the desired text for the tag label.
3. Click **OK**.

Result: The Tag window closes.

Result: The tag text appears in the Tag field and as a tooltip for the elements in the One-Line Viewer.

» To inhibit an action:

- With the Point Status window, open, click either the **Scan Inhibit (S)** button and/or the **Alarm Inhibit (A)** button.

Result: The Old Data (OD) button automatically becomes active when the Scan Inhibit (S) button is clicked.

Result: The corresponding flag letters S, A and OD appear in the Point Summary, Point Groups table > Quality Attributes column, and in the One Line diagram.

Global Controls Disable

The MCP provides a **Global Controls Disable** feature that allows an operator to prevent all control commands from being executed.

Specifically, when the Global Controls Disable point is turned ON, a lock out is placed on all digital output commands. This means all control requests are rejected and digital output points are prevented from operating until the Global Controls Disable point is turned OFF. When an output command is rejected, a message appears to the operator that the command was rejected due to the "Global Control Lockout".

The Global Controls Disable point is a pseudo point owned by the System Status Manager. The Global Controls Disable point name and location is configured under the [RTDB configuration](#) options.

» To execute a Global Control, Disable command:

1. Go to the System Status Manager Point Details page.
2. On the Digital Output tab, right-click the DisableAllControls point and select Digital Output Interface. The Digital Control window displays.
3. Verify the Point Value. A value of 0 indicates the point is currently OFF.
4. Under Function Code, select Direct Operate.
5. Under Control Code, select Latch On.

NOTE: Pulse On and Close control commands can also be used, if supported by your protocol.

6. Click Execute to send the request.

Result: A message confirms whether the command was successful.

If you do not complete an action within a pre-defined period, the operation is cancelled and the window closes.

Control Lockout Feature

The [Control Lockout](#) feature of the System Point Manager allows you to ensure that only a single master station can access a group of controls at one time, and can lock out groups of controls to allow for safer local maintenance. You can create up to 8 remote control groups and up to 10000 local control groups. Any digital output (except for those owned by the System Point Manager application) can be included in one remote and one local group.

WARNING

The MCP Control Lockout feature is not a replacement or equivalent of LOTO (Lockout – Tagout). Use standard safety procedures to implement Lockout - Tagout and to perform maintenance operations.

Operator Notes

This chapter contains the following sections:

Operator Notes

[Operator Notes Log - Note records](#)

[Add a Note](#)

[Edit a Note](#)

[Operator Notes Log](#)

Operator Notes

The **Operator Notes** page lists all the operator notes that have been entered by users and stored in the MCP database.

Operator Notes Log - Note records

Each note record displays the following information:

Table 3-31: Operator Notes

Button	Description
Note Number	Automatically assigned number to identify the note.
Sequence Number	Sequence Number to identify the original note or comments added to the note. Sequence Number 0 indicates the original note and greater than 0 indicates the comment(s) added to the original note.
Operator Name	MCP HMI username of the note author (original or commented).
Date Modified	Date and time that the note or comment was created.
Notes	Free-form text entered by the note author.

Only a super user (root) can delete operator notes and operator notes log using mcpcfg configuration utility. Use **Option 9. Reset Database Tables > 4. Delete Operator Note records** from mcpcfg configuration utility to delete operator notes. This is the same as for all other entries (SOE, Alarm etc.).

If you type a PLUS (+) sign into an Operator Note, it appears as a blank space.

The following related actions can be performed from the GUI:

[Add a Note](#)

[Edit a Note](#)

[Operator Notes Log](#)

Add a Note

You enter a note from the **Operator Notes** page.

» To add a note:

1. Click  or press **[Ctrl]-n**.
Result: The Operator's Notes window appears.
2. Enter your note text into the **Operator's Notes** box. Text can be up to 256 characters.
3. Click **OK** to save the note.
Result: The note is saved and added to the list of notes in chronological order.

Edit a Note

You edit a note from the **Operator Notes** page.

» To edit a note:

1. Double-click a note row.
Result: The Operator Notes window appears.
2. Edit your note.

NOTE: An existing note can be updated by adding a new comment, but the initial note cannot be modified. This behavior is like paper-based operator logbooks. New Text and comment can be up to 256 characters, but the total size of the original note and all the comments for a note cannot exceed 2048 characters.

3. Click **OK** to save the note.
Result: The new comment for the note is saved.

Operator Notes Log

The MCP copies a mirror file of the Operator Note entries from the mSQL database into a file called "operator_notes.log", located under /mnt/datalog/Logs. This file is updated automatically every time the Operator Notes is updated in the mSQL database. This file can be used by the MCP Sync Manager to synchronize with higher level Enterprise systems.

The content of this file is in human readable format, delimited with "|" and with the times converted to the Local Time Zone that is configured in the MCP.

The format of the file content is:

Note Number | Operator Name | Date Created | Date Modified | Operator Note /Comment(s)

The Operator note comment(s) added to the note are separated by a semi colon ";".

Example of the file content:

```
1|supervisor|2015-05-26 13:16:57.936 MDT|2015-05-26 13:16:57.936 MDT |This Note is created
by Supervisor.

2|operator_abc|2015-05-27 05:18:23.111 MDT|2015-05-27 05:18:23.111 MDT |This is an Operator
ABC.

2|operator_abc|2015-05-27 05:18:23.111 MDT|2015-05-28 13:16:57.936 MDT |This is an Operator
ABC; Added a new Comment.
```

NOTE: While typing in the operator log note, if you press the:

- PLUS (+) key, a blank space appears in the operator notes log file.
- **Enter** key, "&&" appears in the operator notes log file.
- Single quote (') key, "~" appears in the operator notes log file

Chapter 4 - MCP Local Configuration Utility (mcpcfg)

This chapter provides settings instructions to users of **MCP Local Configuration Utility** (“*mcpcfg*”).

This interface is the Shell based equivalent of the [Chapter 5 - MCP Settings GUI](#).

Only one instance is allowed to run at any given time across both “*mcpcfg*” and “*MCP Settings GUI*”. When a second concurrent instance is attempted to run and is confirmed – the first instance will be closed automatically.

Date and Time

- Select Time Source
- Configure Time Output
- Timestamps and Time Zones on MCP
- Time Sync Settings and Runtime Functionality
- PTP Use Case Scenarios

Networking

- Network Modes
- Substation LAN IED Types
- Network Configuration
- Network LAN Scenarios
- Subnet Overlapping Rules
- Custom Routing
- Network Summary

User Management

- Default Users
- User Management Overview
- Configure User HMI Home Page
- Auto Login

Other Services/Settings

- Configure Remote HMI Non-Observer Privileges
- Configure Rsyslog service
- Configure Secure Access
- Configure Firewall
- Configure host names
- Configure Time & Time Sync
- Reset system logs
- Reset Database tables
- Reset file persistence data
- Local HMI
- Configure sync manager

Redundancy

- ARRM - Automatic Record Retrieval Manager
- Suppress forced qualities to masters
- Emulate D20 RTU IEC101 DPA Unbalanced Mode Functionality
- Configure IEC101+104 DPA Startup Quality Event Suppress Interval
- Configure Serial Port Modes (RS-232/485)
- Configure D.20 Port Hardware Settings
- EdgeOS Host
- Clear Chassis Intrusion State
- Restore Clone Snapshot
- Restore factory default
- Reboot device

Introduction

The MCP Gateway Local Configuration Utility (mcpcfg) is used to configure system level settings on the MCP. To launch **mcpcfg** from the MCP command line the user must type “**sudo mcpcfg**” and the user password when prompted.

“**sudo**” is a key cyber-security feature that strengthens the non-repudiation and protects from the attacks from of malware that will try to execute privileged operations while user is logged in under their account.

Typing “**sudo**” in front of functions in the MCP command line will prompt for the user’s password before executing the command. Failing to use “**sudo**” will prevent the command from executing.

Using the Gateway Local Configuration Utility, User can perform the following actions:

1. Configure Authentication
2. Configure Network Settings
3. Configure Network Interfaces
4. Configure Secure Access
5. Configure Firewall
6. Configure Host Names
7. Configure Time & Time Sync
8. Reset System Logs
9. Reset Database Tables
10. Reset File Persistence Data
11. Local HMI
12. Configure Sync Manager
13. Redundancy
14. ARRM
15. Suppress Forced Qualities To Masters
16. Configure Serial Ports
17. Configure D.20 Port Settings
18. EdgeOS Host
19. Clear Chassis Intrusion State
20. Restore Clone Snapshot
21. Restore Factory Default
22. Reboot Device

General Note: for consistency within the MCP family, the mcpcfg menu options in are kept the same between G100 and G500 and in same order but will return “functionality not available” when accessing a non-available option in G100. This allows users to use same scripted actions on both G100 and G500 common settings.

Date and Time

The **Configure Time & Time Sync** menu allows you to set the MCP's internal date and time as well as modify options associated with time synchronization. The Time and Time synchronization settings are described below.

Settings	Description
Show Time and Current Settings	: Use this function to display the time, time zone, and synchronization settings currently configured.
Set System Clock	: Use this function to configure the current calendar date and time of day. Note: The MCP system time is automatically set to the firmware build time whenever the MCP reboots and the system time is less than the firmware build time.
Set System Time Zone	: Use this function to configure the desired time zone. Note: This should be the first step to be performed when configuring date and time settings. Reboot the MCP device after changing the Time Zone.
Select Time Source	: Use this function to select and configure the time synchronization source (PTP, IRIG-B or NTP). More details are described below.
Configure Time Output	: Use this function to configure the time synchronization output. More details are described below.

NOTE: Whenever system time goes back in time after time sync, the clock on Task Bar in local HMI will stop updating till the updated time reaches back the time before time sync.

Refer to section [UEFI Settings](#) for time sources (IN) and signals (OUT) available options and combinations.

Select Time Source

Step 1: Connect to MCP and login using a user with Administrator privileges.

Step 2: Execute the command "**mcpcfg**" to launch the configuration Menu.

5. Profile

Enter Your Choice : ( Between 0 and 5 ): █

```

Use this menu to enable or disable the PTP time source. Also, this menu displays a list of PTP configuration parameters which the user can configure based on their PTP Network Design.

In G500, there are three PTP ports, which are NET1-2, NET3-4, NET5-6 respectively. If PTP input is enabled, all three PTP ports will be in listening mode at startup and then one port will go into slave mode if a valid master clock is present on the PTP port.

PTP functionality is not available on the front G500 Maintenance port.

To configure/enable the PTP output, PTP Input must be enabled first.

Step 2: The user can disable/enable PTP input and change the PTP parameters by selecting the individual options as the following table shows:

Option	Name	Description
1	Enable/Disable	Enable or Disable the PTP input. Default Value: 0 (disabled)
2	Domain	A logical grouping of clocks that synchronize to each other using the protocol, but that are not necessarily synchronized to clocks in another domain. It can be a value between 0 to 255. Default Value: 0
3	Priority 1	A user configurable designation that a clock belongs to an ordered set of clocks from which a master is selected. It can be a value between 0 to 255 Default Value: 128
4	Priority 2	A user configurable designation that provides finer grained ordering among otherwise equivalent clocks. It can be a value between 0 to 255 Default Value: 128

Option	Name	Description
5	Profile	The set of allowed Precision Time Protocol (PTP) features applicable to a device. In MCP we support two PTP profiles namely: - IEEE 1588-2008 Default Profile (<i>J.4 PEER-to-PEER Default PTP profile</i>) - IEEE C37.238-2011 Power System Profile Default Value: IEEE C37.238-2011 Power System Profile

Default values are according to IEC61850-9-3 Ed.1 2016-05, Clause 8/Table 1.

When the PTP input is enabled and the output is disabled (i.e., slave only), Priority 1 and Priority 2 settings will be ignored.

Any PTP setting changes require device reboot to take effect. This rule applies to both PTP IN and PTP OUT.

If the PTP IN is enabled, the system time will be synced to the configured and enabled PTP source only after seeing valid and good PTP signal once. Here “good” means the PTP master clock class is 6 or 7, and the UtcOffsetValid is true.

Configure IRIG-B IN

Configures the MCP to use IRIB-B as time synchronization source.

Step 1: In the “Time & Time Sync - Select Time Source” menu, select the option **IRIG-B**:

```

Gateway Settings Menu
Time & Time Sync - Select Time Source

Current Time Source      : PTP

0.  Back
1.  PTP
2.  IRIG-B
3.  NTP

Enter Your Choice : ( Between 0 and 3 ) :

```

The following “Select Time Source – IRIG-B Configuration” screen will be launched on the selection:

```

Gateway Settings Menu
Select Time Source - IRIG-B Configuration

Current IRIG-B Setting : Disabled / B006

0.  Back
1.  Enable
2.  IRIG-B Format

Enter Your Choice : ( Between 0 and 2 ) :

```

Step 2: User can disable/enable IRIG-B time source and change the IRIG-B time code format by selecting the individual options.

Option	Name	Description
1	Enable/Disable	Enable or Disable the IRIG-B input. Default Value for G100: 1 (enabled) Default Value for G500: 0 (disabled)
2	IRIG-B Format	Choose IRIG-B time code format: B002 or B006. Default Value: B006

Step 3: When user select the option **IRIG-B Format**, the “**IRIG-B Time Code Format Configuration**” screen will be launched as below:

```

Gateway Settings Menu
IRIG-B Time Code Format Configuration

Current IRIG-B Time Code Format : BCD_YEAR Code (B006)

0.  Back
1.  No BCD_YEAR Code (B002)
2.  BCD_YEAR Code (B006)

Enter Your Choice : ( Between 0 and 2 ):

```

The details about the two IRIG-B time code formats that MCP supports are as the below table presents:

Option	Name	Description
1	No BCD_YEAR Code (B002)	Binary Coded Decimal, coding of time and day of year (HH, MM, SS, and DDD); doesn't consider year.
2	BCD_YEAR Code (B006)	Binary Coded Decimal, coding of time, day of year, and year (HH, MM, SS, DDD, and YY).

NOTE

Any IRIG-B setting changes require device reboot to take effect. This rule applies to both IRIG-B IN and OUT.

NOTE

If IRIG-B IN is enabled, the system time will be synced to the configured and enabled IRIG-B source only after seeing valid and good IRIG-B signal once. Here “good” means:

- For B006, only when its OOSYNC is false.
- For B002, it is always treated as good.

Configure NTP IN

Configures the MCP to use NTP to calibrate the system clock (only IPv4 is supported).

Step 1: In the “Time & Time Sync - Select Time Source” menu, select the option **NTP**:

```
Gateway Settings Menu
Time & Time Sync - Select Time Source

Current Time Source      : PTP

0.  Back
1.  PTP
2.  IRIG-B
3.  NTP

Enter Your Choice : ( Between 0 and 3 ):
```

The “Select Time Source - NTP Configuration” screen will be launched as below:

```
Gateway Settings Menu
Select Time Source - NTP Configuration

Current NTP Setting      : Disabled / 0.0.0.0      / None

0.  Back
1.  Enable
2.  Primary Server IP Address
3.  Backup  Server IP Address

Enter Your Choice : ( Between 0 and 3 ):
```

The user can use this submenu to configure the Primary/backup NTP server IP Addresses and then enable/disable the NTP client in MCP.

Step 2: In the “**Select Time Source - NTP Configuration**” menu, select the option **Primary Server IP Address** to configure the IP Address of the preferred NTP server.

Below is an example for the Primary NTP server IP Address configuration steps:

```

=====
Gateway Settings Menu
Select Time Source - NTP Configuration
=====

Current NTP Setting : Disabled / 0.0.0.0          / None

    0.  Back
    1.  Enable
    2.  Primary Server IP Address
    3.  Backup Server IP Address

Enter Your Choice : ( Between 0 and 3 ): 2

Enter Primary Server IP Address[0.0.0.0]: 192.168.168.100

Do you want to save the change [Y/N]?: y

Primary Server IP address is saved.

Press ENTER Key to continue....

```

The user can select the option **Backup Server IP Address** to configure the IP Address of a backup NTP Server if needed. It is the same as the Primary server IP Address configuration.

Step 3: After the NTP server(s) are configured, the user can select the option **Enable/Disable** to enable or disable the NTP input in MCP. The option 1 depends on the current status of the NTP input. If it's already enabled, then the option 1 will be “**Disable**”. Otherwise, it will show “**Enable**”.

The Primary NTP server is the preferred server. The MCP will try to sync from this preferred server first. If not available, it will try the backup NTP server.

To change the NTP settings, it is not necessary to reboot the system. The user must re-enable NTP to put the new settings into effect. But after changing the NTP settings, it is necessary to restart the MCP to update the NTP time synchronization related HAMA points.

Configure Time Output

To configure the time synchronization services for time output, select the option **Configure Time Output** in the “**Time & Time Sync**” menu as below:

```

Gateway Settings Menu
Time & Time Sync

0.  Back
1.  Show Time and Current Settings
2.  Set System Clock
3.  Set System Time Zone
4.  Select Time Source
5.  Configure Time Output

Enter Your Choice : ( Between 0 and 5 ) : 

```

And the “**Time & Time Sync - Configure Time Output**” screen will be launched.

Below is an example of the “**Time & Time Sync - Configure Time Output**” screen when PTP IN is enabled:

```

Gateway Settings Menu
Time & Time Sync - Configure Time Output

Current Time Output      :  None

0.  Back
1.  PTP
2.  NTP

Enter Your Choice : ( Between 0 and 2 ) : 

```

The PTP Output is available only when the PTP Input is configured and enabled from “**Configure Time & Time Sync - Select Time Source**” menu. And the IRIG-B Output is available only when the IRIG-B Input is configured and enabled from “**Configure Time & Time Sync - Select Time Source**” menu. NTP Output doesn't have such restriction and is available all the time.

Configure PTP OUT

The “PTP” will be available in the “Time & Time Sync - Configure Time Output” menu only when the PTP input is configured and enabled.

Step 1: Select the option **PTP** in the “Time & Time Sync - Configure Time Output” menu:

```
Gateway Settings Menu
Time & Time Sync - Configure Time Output

Current Time Output      :  None

0.  Back
1.  PTP
2.  NTP

Enter Your Choice : ( Between 0 and 2 ): 1
```

And then the below “Configure Time Output - PTP Configuration” screen will be launched on the selection:

```
Gateway Settings Menu
Configure Time Output - PTP Configuration

Current PTP OUT Setting : Disabled

0.  Back
1.  Enable

Enter Your Choice : ( Between 0 and 1 ): 
```

Step 2: Select the option **Enable/Disable** to enable/disable the PTP Output:

```
Gateway Settings Menu
Configure Time Output - PTP Configuration

Current PTP OUT Setting : Disabled

0.  Back
1.  Enable

Enter Your Choice : ( Between 0 and 1 ): 1
```

If the Current PTP Output is disabled, option 1 in the “Configure Time Output – PTP Configuration” will be “Enable”. Otherwise, it will be “Disable”.

NOTE

The PTP Output will share same settings configured in the PTP Input, such as domain, priorities and so on.

Configure IRIG-B OUT

The “IRIG-B” will be available in the “Time & Time Sync - Configure Time Output” menu only when the IRIG-B input is configured and enabled.

Step 1: Select the option **IRIG-B** in the “Time & Time Sync - Configure Time Output” menu:

```

Gateway Settings Menu
Time & Time Sync - Configure Time Output

Current Time Output      :  None

    0.  Back
    1.  IRIG-B
    2.  NTP

Enter Your Choice : ( Between 0 and 2 ): 1
  
```

And then the below “Configure Time Output – IRIG-B Configuration” screen will be launched:

```

Gateway Settings Menu
Configure Time Output - IRIG-B Configuration

Current IRIG-B Output Setting : Disabled / Out When OOSYNC

    0.  Back
    1.  Enable
    2.  No Signal Out When Out Of Sync (OOSYNC)

Enter Your Choice : ( Between 0 and 2 ): 
  
```

Step 2: Select the option **Enable/Disable** to enable/disable the IRIG-B Output:

```

Gateway Settings Menu
Configure Time Output - IRIG-B Configuration

Current IRIG-B Output Setting : Disabled / Out When OOSYNC

    0.  Back
    1.  Enable
    2.  No Signal Out When Out Of Sync (OOSYNC)

Enter Your Choice : ( Between 0 and 2 ): 1
  
```

NOTE

If the Current IRIG-B Output is disabled, option 1 in the “Configure Time Output – IRIG-B Configuration” will be “Enable”. Otherwise, it will be “Disable”.

NOTE

The IRIG-B output will share same IRIG-B time code format as configured in the IRIG-B Input.

Step 3: Select the option **(No) Signal Out When Out Of Sync (OOSYNC)** to control whether to allow/suppress the IRIG-B Output when the IRIG-B Input signal is out of sync.

By default, the IRIG-B output signal is suppressed when the IRIG-B input signal is out of sync. In order to allow the IRIG-B output signal when the IRIG-B input signal is out of sync, select the option **Signal Out When Out of Sync (OOSYNC)** in the “Configure Time Output – IRIG-B Configuration” menu:

```
Gateway Settings Menu
Configure Time Output - IRIG-B Configuration

Current IRIG-B Output Setting : Disabled / No Out When OOSYNC

0.  Back
1.  Enable
2.  Signal Out When Out Of Sync (OOSYNC)

Enter Your Choice : ( Between 0 and 2 ) : 2
```

If the IRIG-B output signal is not suppressed when the IRIG-B input signal is out of sync, the user can select the option **No Signal Out Of Sync (OOSYNC)** in the “Configure Time Output – IRIG-B Configuration” menu to suppress it:

```
Gateway Settings Menu
Configure Time Output - IRIG-B Configuration

Current IRIG-B Output Setting : Disabled / Out When OOSYNC

0.  Back
1.  Enable
2.  No Signal Out When Out Of Sync (OOSYNC)

Enter Your Choice : ( Between 0 and 2 ) : 2
```

Configure NTP OUT

The “NTP” will be always available in the “Time & Time Sync - Configure Time Output” menu no matter the NTP input is enabled or not.

Step 1: Select option 2-> NTP in the “Time & Time Sync - Configure Time Output” menu:

```
Gateway Settings Menu
Time & Time Sync - Configure Time Output

Current Time Output      :  None

    0.  Back
    1.  IRIG-B
    2.  NTP

Enter Your Choice : ( Between 0 and 2 ) : 2
```

NOTE:If there is no PTP or IRIG-B input enabled, the option for NTP will be 1 as below:

```
Gateway Settings Menu
Time & Time Sync - Configure Time Output

Current Time Output      :  None

    0.  Back
    1.  NTP

Enter Your Choice : ( Between 0 and 1 ) : 1
```

After selecting the NTP option, the below “Configure Time Output – NTP Configuration” screen will be launched:

```
Gateway Settings Menu
Configure Time Output - NTP Configuration

Current NTP Output Setting : Disabled

    0.  Back
    1.  Enable

Enter Your Choice : ( Between 0 and 1 ) :
```

Step 2: Select option **1->Enable/Disable** to enable/disable the NTP Output:

```

Gateway Settings Menu
Configure Time Output - NTP Configuration

Current NTP Output Setting : Disabled

0.  Back
1.  Enable

Enter Your Choice : ( Between 0 and 1 ): 1

```

If the Current NTP output is disabled, option 1 in the “Configure Time Output – NTP Configuration” will be “Enable”. Otherwise, it will be “Disable”.

Timestamps and Time Zones on MCP

All timestamps on the MCP are stored in UTC (coordinated universal time). The below table explains how time zones are handled by various components of the MCP and how this behavior can be configured.

Component	Time zone handling	Configuration Method
MCP system clock	For all the time zone features described in this document to work properly, the MCP hardware clock must be set to UTC using the appropriate MCP UEFI setting.	Configured using the <i>mcpcfg</i> utility.
Device and master station internal clocks	Can be set to local time or UTC, as desired.	Refer to the user documentation provided with the device or master station. If the device's clock is offset from UTC, the same offset should be configured in the corresponding client map file (see below).
Time-stamped data communicated to the MCP	The timestamp is converted to UTC from the configured offset or is left unmodified if no offset is configured.	Defined by the Time Offset field in the client map files. Refer to MCP Online Help > DNP3 Client topic, IEC 60870-5-103 with MCP Master Application topic, or IEC 60870-5-101+104 with MCP Master Application topic, See notes below table).
Time-stamped data communicated from the MCP	The timestamp is converted from UTC to the configured offset or is left at UTC if no offset is configured.	Defined by the <i>Time Offset</i> field. See the MCP Online Help > DNP Server topic.
Local console (including local HMI) and command line via SSH	All time-stamped data is shown to you using the configured MCP time zone setting.	Configured using the <i>mcpcfg</i> utility.
MCP Runtime HMI	All time-stamped data is shown to you using the time zone configured on the remote PC.	For more details, refer to the user documentation provided with the operating system installed on the remote PC.

The IEC 60870-5-101+104 application uses a slightly different concept for local to UTC time conversion to be consistent with the D2x product family. If the master is in a different time zone, you should set the Time Mode field to set local/use local time. When the master time synchronizes the application, the application calculates the difference between the internal MCP UTC clock and the master's time. The application then applies this difference to the UTC timestamps it reports to the master. In effect, it automatically calculates the time offset.

Example System Configuration

Below Table 4.1 shows an example of system configuration.

Table 4-1: Sample system configuration

Remote access via Runtime HMI	Local access to command line via RS232 port	Even though the MCP device is in the local time zone of UTC -7, the MCP system clock is set to UTC time.	Local device with clock set to UTC -7	Remote client with clock set to UTC -5
				
PC clock is set to local time zone (-8)	No configuration necessary	<i>mcpcfg</i> System Clock: UTC time <i>mcpcfg</i> Time Zone: -7	DNP Client Map File Time Offset: -7[†]	DNP Server Application Parameters Time Offset: -5[†]
If an event occurs at 13:00 UTC...				
Event timestamp is displayed as 05:00	Event timestamp is displayed as 06:00	The MCP system database records the event timestamp as 13:00	Local device reports the event at 06:00	Remote client receives the event timestamp as 08:00

† This field is configured in minutes, so the value entered in the configuration tool would be -420 and -300 respectively. However, hours are shown in Table 4.1 for clarity.

Time Sync Settings and Runtime Functionality

Current Time Sync Settings

On the Main Time Synch Menu, Option 1 → "Show Time and Current Settings" gives a summary of the Time Sync configuration.

Gateway Settings Menu	
Time & Time Sync - Current Time Sync Settings	
=====	
The current Date and Time	: Fri Feb 4, 2000 22:28:05
Time Zone	: UTC
PTP IN	: Disabled
PTP OUT	: Disabled
IRIG-B IN	: Enabled
IRIG-B IN Format	: BCD_YEAR Code (B006)
IRIG-B OUT	: Disabled
NTP IN	: Disabled
NTP OUT	: Disabled
Press ENTER Key to continue....	

NOTE: The above example is with IRIG-B B006 Input enabled and all other inputs and all outputs are disabled.

Time Sync Runtime Functionality

The runtime status of Time Sync can be viewed from the Local/ Remote HMI in

Point Details → Application → "HAMA_LOCAL"

This menu can take up to 10 seconds to refresh/ update HAMA point values. Refer to HAMA page to get detailed description of the HAMA points and their runtime values.

The following two snapshots are showing an example for the Analog Input/Digital Input displays about the Time Sync when only IRIG-B input is enabled and active.

PTP Use Case Scenarios

NOTE: PTP is not supported in G100.

Below are a few commonly used PTP use cases that have been derived to give the user an overview on how PTP can be configured and used in the MCP context.

User must be cautious while configuring the network interfaces as the PTP functionality is tightly coupled with the mode of the network interfaces.

PTP functionality is available only on the 6 rear network interfaces (G500).

In every Configuration Type listed below, NTP OUT can be enabled and used to synch other devices.

MCP can act as a Master Clock, Slave Clock or both based on the Network port configuration and the PTP devices connected.

There are different states available for the PTP ports and are described in HAMA - Hardware Asset Management Application.

Configuration Type 1 – Slave Clock

PTP IN is enabled, PTP OUT is disabled, and at least one pair of network ports is configured as independent (SINGLE mode, port 1 and port 2 in this example). The MCP is connected to a valid PTP signal (a clock that is connected to a valid GPS signal).

Figure 4-1 represents a scenario in which the MCP operates as a slave clock.

Figure 4-1: MCP operates as a slave clock

In this state, the MCP will sync to the connected master clock and cannot sync any downstream devices. All ports are in listening or slave mode.

PTP operates independently of the configured network mode.
It is not possible for one Ethernet port of the PTP port pair to be a master and the other to be a slave.

Configuration Type 2 – PTP-aware forwarding device

The MCP has PTP IN and PTP OUT enabled. The Figure 4-2 represents a scenario where the MCP acts as a PTP-aware forwarding device:

Figure 4-2: MCP operates as a PTP-aware forwarding device

In Figure 4-2, MCP rear Ethernet port pair Net1-Net2 are connected to a master clock. The MCP synchronizes with the master clock and the port pair connected to the clock becomes a slave and the remaining 2 pairs become Masters. Note here that UR1 will not synchronize to the MCP because the Net1-Net2 pair is in slave mode.

Since UR2 is connected to the Net3-Net4 pair, the MCP acts as Master and synchronizes time to UR2.

The MCP Grandmaster Clock ID, MCP Master Clock ID, and the MCP Output Clock ID are updated in the Text Points section of HAMA_LOCAL application as part of the runtime GUI, refer HAMA - Hardware Asset Management Application.

Configuration Type 3 – Best Master Clock Scenario

The MCP has PTP IN and PTP OUT enabled. The Figure 4-3 gives an example of a MCP connected to multiple time sources which requires the Best Master Clock (BMC) algorithm.

Figure 4-3: Best Master Clock Scenario

From the above, assume that:

- Clock 1 : Connected to GPS with priority 120
- Clock 2 : Connected to GPS with priority 128
- UR : Slave Only Device

Since clock 1 is a better clock, MCP synchronizes with clock 1 and the Net1-Net2 pair becomes slave.

MCP acts as master and synchronizes the UR connected to Net4.

Networking

This section contains the following topics:

Background

Network Modes

Network Summary

Background

Refer to the G500 Substation Gateway Instruction Manual (*GE Vernova Part Number 994-0152*) or G100 Substation Gateway Instruction Manual (*GE Vernova Part Number 994-0155*) for details on the MCP Network ports and their supported connection types.

Network Modes

G500 supports three modes of network operation. At FPGA level, six rear ports are grouped together in to three pairs. Front port cannot be grouped with rear ports.

In G100, upto V4.1 release, the four ports are all independent, but presented in the settings in pairs to be consistent with G500.

From V4.1 release onwards, G100 supports two modes of network operation. The four ports can be configured to be independent or only one pair can be configured as redundant.

Supported network modes are classified as:

- [Single Mode](#)
- [Redundant Mode](#)
- [PRP Mode](#)

NOTE: G100 does not support PRP mode.

Single Mode

In this mode, ports in the pair would be independent to each other. Both network interfaces in that pair are available for network configuration.

This type of mode can also be used to communicate with Dual LAN IEDs.

For e.g.: Say you have an IED with dual LAN communication. Dual LAN IED would have two IP (172.12.232.18 & 192.168.4.16). MCP Net1 can be configured with 172.x network & Net2 can be configured in 192.x network. Now in DCA, while configuring this IED, 172.12.232.18 can be configured as Primary IP & 192.168.4.16 as Secondary IP.

NOTES:

1. It is **not** recommended to use Net0 (G500) for IED communication.
2. By default, Net0 (G500) is in single mode & cannot be configured in PRP or Redundant mode.
3. Subnet overlap is not allowed in MCP. If same subnets are configured warning would be displayed.

For e.g.: Suppose say Net1 is configured with 172.12.232.56/16. Net2 IP cannot be 172.12.232.128/16.

Redundant Mode

In this mode, each pair can be configured as redundant and available for network configuration. This type of mode is used to communicate with Redundant LAN IEDs. In this type of communication, one port would be active at a time. If communication lost on one port, then Secondary port would become active.

For e.g.: Say configured Net1 – Net2 in this mode. Connect a Redundant LAN IED with MCP. In this topology Net1 & Net2 must be part of two different LAN switches. If network failure occurred on Net1 then communication would switch to Net2 port. If communication restored on Net1, then communication will switch back to Net1 & Net2 would become inactive.

Note for G100:

The following limitations exist for G100 Redundant LAN. Please refrain from using unsupported functionalities.

1. An Active IP cannot be configured on a Redundant LAN interface.
2. The Static IP of a Redundant LAN interface cannot be used as the PEER IP used for pairing a Hot-Hot MCP system.
3. VLAN's cannot be configured on a Redundant LAN interface.
4. DHCP cannot be configured on a Redundant LAN interface.
5. Only one Redundant LAN interface can be configured, either on Net 1/Net 2 or on Net 3/Net 4.

Despite limitations 1 and 2, G100 Redundant LAN can be used in a Hot-Hot G100 system. For example, a valid configuration for a Hot-Hot G100 system would be the following:

- Net 1 and Net 2 configured as Single LAN Interfaces, each having an Active and Static IP.
- PEER IP using either Net 1 or Net 2 Static IP of the peer G100.
- Net 3 and Net 4 configured as a Redundant LAN interface with only a Static IP.

Note that limitations 1 and 2 imply that in a Hot-Hot G100 redundant system, only the following applications can communicate over the Redundant LAN interface.

- DNP 3.0 Network Client
- IEC 61850 Client and Server
- Modbus TCP Client

The reason is that these applications will use the Static IP of the interface when communicating in Hot-Hot mode.

Typical failover time for G100 Redundant LAN is 3 seconds. Better performance can be expected with the G500 Redundant LAN.

PRP Mode

NOTE: PRP is not supported in G100.

In this mode, each pair can be configured for PRP and available for network configuration. This type of mode is used to communicate with PRP LAN IEDs. In this type of communication, both ports would be active all the times. If communication lost on one Network, then communication would continue another Network.

Substation LAN IED Types

IEDs connected to the substation LAN can be classified as:

- **Single LAN IED**
- **Dual LAN IED**
- **Redundant LAN IED**
- **PRP LAN IED**

MCP supports only Single LAN IED's.

Single LAN IED

This type of IED only has one physical LAN port (connection) and communicates only on one single LAN.

Two sample connection scenarios are:

- Two IEDs may be deployed in IED redundant mode, with each Single LAN IED using a single LAN connection on separate substation LAN sides. The LAN sides may (but are not required to) be connected, since redundancy between the multiple (x2) IEDs is provided at the application layer.
- The MCP may be monitoring non-essential IEDs that are not redundant and do not contain multiple LAN ports (for example, Meters, LAN printer).

Network Configuration

This section describes how to configure IP, selecting type of mode & viewing stats of configured ports. This section is divided in to:

- [D2x Configured LAN ports](#)
- [Network Interfaces](#)
- [IP Configuration](#)
- [Gateway Configuration](#)
- [VLANS](#)
- [Configure Network Interfaces](#)
- [Run Time Statistics](#)

D2x Configured LAN ports

Starting with MCP version 4.00 is possible to enable and configure D2x applications which use LAN ports (LAN-A, LAN-B, LAN-C, LAN-D).

When LAN ports are configured in the D2x environment – the corresponding Net interfaces (Net1, Net2, Net3, Net4 - respectively) will show “by D2x” in the address field and will be under the control of the D2x configuration in pairs.

Refer to [Chapter 7 – D2x Configuration and Operation](#) for details.

The G500 Network Modes are still controlled by “mcpcfg” utility.

Below table summarizes the effect on Netx ownership based on D2x LAN selections:

D2x LAN choices				MCP Netx ownership			
LAN A	LAN B	LAN C	LAN D	Net1	Net2	Net3	Net4
Yes	Any	No	No	By D2x Bridged with MCP in G100	By D2x	By MCP	By MCP
Any	Yes	No	No	By D2x Bridged with MCP in G100	By D2x	By MCP	By MCP
No	No	Yes	Any	By MCP	By MCP	By D2x	By D2x
No	No	Any	Yes	By MCP	By MCP	By D2x	By D2x
No	No	No	No	By MCP	By MCP	By MCP	By MCP

Network Interfaces

The Network Interface workflow allows you to configure the settings for the MCP's network connections.

Default enabled network interface is configured with IP: **192.168.168.81/24** and is enabled as:

- Net0 in G500
- Net1 in G100

Due to hardware differences, Net0, Net5, Net6 are present only in G500.

NOTES: The MCP must be rebooted to activate any changed network settings.

The first time the MCP is started, you must configure the network interface locally through the default enabled network port.

IP Configuration

The Internet Protocol (IP) can be configured as a:

- Static IP Address: Adapter, Active, or Alias IP Addresses
- Dynamic IP Address: Static or DHCP

SFP Configuration (G100 only)

The SFP types are detected automatically in G500, after startup / reboot.

G100 does not have hardware support to detect automatically the inserted SFP type in Net3 or Net4; these must be set by the user using the Local configuration utility (mcpcfg) or MCP Settings GUI.

The selection of the SFP type is performed only for Net3 and Net4, and is consistent with the order code options:

1. Option C: 10/100BASE-TX
2. Option T: 1000BASE-TX
3. Option F: 100BASE-FX
4. Option S: 1000BASE-SX
5. Option L: 1000BASE-LX
6. Option U: Not Installed

Gateway Configuration

The Default Gateways can be configured for the Adapter and Active Interfaces.

Provide the Active Gateway Address if the MCP is configured to be operating in Redundant mode (either Warm or Hot Standby or Hot-Hot).

In case of Hot-Hot Redundancy mode, both Active and Standby MCP devices will always communicate with the *Adapter* IP address with the IEDs **if** the client instances are enabled with Hot-Hot communication mode.

VLANS

MCP supports VLAN configuration. VLAN IP can be created with IDs from 2-4094. These IDs are common to all interfaces i.e., say a VLAN ID 2 created one network port cannot be used in other network port. Each NetX interface supports maximum 8 VLAN interfaces excluding Net0.

Configure Network Interfaces

The Configure Network Interfaces menu in MCP Local Command Line Utility (**mcpcfg**) includes settings for the MCP's network connections. The Network Interface settings are described in Table 4-2.

The MCP must be rebooted to activate any changed network settings. The first time the MCP is started up, user must configure the network interface locally through the Adapter Net port, maintenance serial port or local HMI terminal.

Table 4-2: Network Interface Settings

Setting	Description
Net0 (only G500)	<u>Network Interface Settings Edit</u>
Net1 – Net2	Current Configuration Use this function to view the current state of the available MCP network interfaces.
Net3 – Net4	Static IP Address Use this function to configure the MCP to use manually defined network parameters. Configurable addresses include:
Net5 – Net6 (only G500)	Adapter: Also referred to as the static address, this is the Primary IP Address, subnet mask, and default gateway for use by this MCP. Note: In a non-redundant system, the adapter address is used as the network address of the device. Active: Used for MCP system redundancy. Whichever redundant MCP is active at the time assumes this IP Address; the standby unit reverts to its own Adapter IP Address. The active address settings should be the same on both redundant units. Alias: An alternate address that can be configured to allow a Secondary communications link with the MCP. This is typically used for redundant LAN D25s. When used within a redundant MCP system setup, the alias address settings should be the same on both redundant units. The alias addresses must be on a different subnet mask than the adapter and active addresses.
	Dynamic Address Configure the MCP to use network parameters that are provided by a DHCP server. This requires a DHCP server to be on the same network as the MCP.
	Note: Dynamic addressing is not compatible with MCP system redundancy as the active and alias addresses are not provided by DHCP.
	Network Zone By default, all network interfaces except initial enabled adapter IP addresses are set to the External firewall mode, which restricts the type of traffic permitted. You can change the selected network interface to the Internal or External modes with this option. For more information on the MCP firewall, refer to section Configure Firewall .
	VLAN It is possible to use a VLAN when connecting MCP and VLAN supported device over a network. By assigning your VLAN supported device to a VLAN, you can ensure a higher priority for data transmitted from it and you can reduce the amount of extraneous information the VLAN supported device receives from other devices on the network.

Setting	Description
	Figure 4-4: Sample VLAN configuration of Net1  In Figure 4-4 a VLAN has been created on the NET1 interface on the MCP. NET1 is connected to a third-party switch, which is also connected to another third-party switch. These connections are called the trunks since they carry the VLAN data as well as all other data transmitted on the interface. The switch B is also configured to support a VLAN on a certain network port, which is connected to an IED. Since this port is dedicated to the VLAN, only information flagged for the VLAN is transmitted to that IED. As well, information sent on this VLAN from the IED to device can be classified with a higher priority, which ensures a higher likelihood of transmission during times of network congestion. You can configure the following options on each VLAN you create: • IP Address, subnet mask, and default gateway: You can assign static IP Address / dynamic IP Address. Once you have configured these values, you can use them to access your VLAN. • Network zone: Assign the VLAN to either the internal or external network zone. For more information on network zones, refer to section Configure Firewall. Note: You can always assign a VLAN to the external network zone. However, you cannot assign it to the internal zone when the associated physical interface is configured to the external zone. • EGRESS priority mapping: Set the QoS priority level for data transmitted on this VLAN. Priority levels range from 0 to 7 with 7 being the highest priority. If a QoS-enabled device receives packets transmitted on this VLAN, it should apply a priority based on the level you specify. • Ethernet reorder flag header: This option is reserved for use by MCP staff for Technical Support tasks. Remove Configuration Use this command to remove the current Network Interface settings. All configured Adapter IP Addresses, Alias IP Addresses, Network Zones and VLANs are removed. This command also allows you to back up the current configuration.

Setting	Description
Net1 (only G500)	<u>EdgeManager Connectivity Configuration</u> . Refer to Chapter 9 - EdgeManager and PETC for port availability and additional information.
Net2 (G100, G500)	This option is used to enable EdgeManager connectivity on that port. Current EdgeManager Configuration: To view the configuration
Net3 – Net4 (only G100)	Configure EdgeManager Static IP Address: Option to configure Static IP Address, which will be used to enable connectivity to EdgeManager in the cloud/EdgeManager App.
Net5 – Net6 (only G500)	Configure EdgeManager Dynamic IP Address: Option to configure Dynamic IP Address, which will be used to enable connectivity to EdgeManager in the cloud / EdgeManager App. EdgeManager Remove Configuration: Option to remove the configuration
Net1 – Net2	<u>Network port mode</u> Single
Net3 – Net4	Use this option to configure the network pair in single mode. This mode is useful to communicate LAN devices.
Net5 – Net6 (only G500)	Redundant (G500, and supported also in G100 from V4.1 release onwards) Use this option to configure a network pair in Redundant mode. This mode is useful to communicate with Redundant IEDs. - In G100, this will remove both the existing ports configuration - In G500, this will remove the existing Secondary port configuration - If configuration not removed, then Redundant communication will not be enabled Disable Redundant mode: go to that pair & select single mode for that pair. This would update the setting of that pair to single mode from redundant mode. PRP (only G500) Use this option configure a network pair in PRP mode. This mode is useful to communicate with PRP IEDs - This will remove existing Secondary port configuration. - If configuration not removed, then PRP will not be enabled Disable PRP mode: go to that pair & select single mode for that pair. This would update the setting of that pair to single mode from PRP mode. Current/Edit Configuration This option is used to view the current configuration of a pair or to edit the configuration of the pair.

Setting	Description
Net3 – Net4 (only G100)	<u>SFP Configuration</u> Use this option to configure the SFP type inserted in Net3 and Net4: - Option C: 10/100BASE-TX - Option T: 1000BASE-TX - Option F: 100BASE-FX - Option S: 1000BASE-SX - Option L: 1000BASE-LX - Option U: Not Installed
PRP Parameters	Use this command to enable or disable the PRP on the MCP network ports. Enabling PRP: - Removes the existing Network Interface settings. - Uses the PRP LANID and PRP Supervision Frame Interval. Moves the network interface to internal zone of the firewall.
Default Gateway	Use this command to set the Default Gateway IP Address (optional). The IP Address of the Gateway can be configured for all Network Interfaces. If redundancy is configured, you are advised to configure the Active Gateway IP Address. NOTE: Gateway address must be re-entered after editing the sub-net mask.
Custom Routing	Use this command to display, enable and disable custom routes in the MCP. For addition of custom routes in the MCP, you may need to provide the following: - Destination IP Address, - Destination subnet mask - Next Gateway IP Address (optional) - Network interface of MCP that needs to be used.
Networking Summary	Use this command to display a summary of all the configured network interfaces in the MCP.

To configure the network interface

1. To navigate to this menu in Figure 4-5, type mcpcfg in MCP command prompt and select option **3. Configure Network Interfaces**.

Figure 4-5: Configure Network Interfaces

```

Enter Your Choice : ( Between 0 and 8 ) : █

```

2. In the sub-menu, select Option **1. Net0**.
 - a. In this option 1. Current configuration is used to see the configure IP details.
 - b. MCP can be configured with static or dynamic networks.
 - c. To configure static network, select option **2. Static IP Address**.
 - d. In the static network, Adapter IP, Active IP & Alias IP can be configured.
 - e. Dynamic Address can be configured on any port, by with option **3. Dynamic Address**.
 - f. Option **4. Network Zone** is used to select configure that port to an Internal or External zone. Used for firewall communication.
 - g. Option **5. VLAN**, is used to create VLANs on that port. VLANs can be created in MCP with ID ranging from 2-4094. This ID is common to all ports.
For e.g., A VLAN with ID 3 is created on Net0. Now VLAN with ID 2 cannot be created on another port.
 - h. Select option **0. Back** to return to previous menu.

Note: Dynamic IP & Static cannot be configured together.

Enter Your Choice : ( Between 0 and 4 ) : █

```

4. If Single mode is selected in Figure 4-7, Net1 & Net2 can be configured separately as described in step 2.

Enable and disable Redundant mode

For G500:

1. Select option **2. Redundant** then, below message (Figure 4-8) would appear.
 - a. Select **Y (yes)**, to change mode.
 - b. Select Yes, to remove the Net2 configuration.
 - c. If second port configuration is not removed when asked, redundant mode will not be enabled. Only Net2 configuration is removed & Net1 configuration is retained (if present).

- d. Press Enter, a submenu would appear as shown in the Figure 4-8.
- e. As Net1 – Net2 is combined as a single network interface (Redundant 1), this interface can be configured as in step 2 and reboot the device.
- f. Reboot of device is required, for Network related changes.
- g. To disable Redundant mode, enter to menu shown in Figure 4-8, select option **1. Single** and follow step 4 and reboot device.

1.  Peer IP #1 (Required): <Not Set>
2.  Peer IP #2 (Optional): <Not Set>

Enter Your Choice : ( Between 0 and 2 ) : █

```

These are the IP addresses of the designated peer devices on the local network to which the G100 sends periodic (once per second) ARP requests to determine the health of both links used in the Redundant LAN mode.

At least “Peer IP #1 (Required)” must be configured. Configure “Peer IP #2 (Optional)” to increase the reliability of the Redundant LAN functionality. It will ensure the G100 can detect the health of the link even if Peer IP #1 goes down temporarily.

The G100 must be able to reach the designated peer devices at the data link layer (Layer 2) on both interfaces of the Redundant LAN. This involves ensuring that the designated peer

devices are part of the same broadcast domain as the Redundant LAN interface and can communicate with the G100 without needing to route traffic through a Layer 3 device.

Note: You must configure the "Static IP Address" before configuring the "ARP Monitoring Peer IP List", else a message is prompted to configure "Static IP Address" first.

Enable and disable PRP mode

This mode is not supported in G100.

1. Select Option **3. PRP** in Figure 4-7 to enable PRP.
 - a. Select **Y (yes)**, to change mode.
 - b. Select Yes, to remove the Net2 configuration.
 - c. If second port configuration is not removed when asked, PRP mode will not be enabled. Only Net2 configuration is removed & Net1 configuration is retained (if present).
 - d. Press Enter.
 - e. As Net1 – Net2 is combined as a single network interface (PRP 1), this interface can be configured as in step 2 and reboot device.
 - f. To disable PRP, change the Network mode to Single, follow step 4 and reboot device.
2. Similarly, configuration can be done for Net3- Net4 & Net5 -Net6
3. Select Option 5. PRP Parameters

- a. In this option PRP Life Check Interval can be configured.
- b. PRP Life Check Interval can be between a range of 2sec to 10sec.
- c. This parameter is common to all Interfaces configured in PRP.

Network LAN Scenarios

PRP is not supported in G100.

This section describes network LAN scenarios when enabling PRP in the G500 for operation in substations containing various IED types.

The following scenarios are provided:

- Legacy Single and Dual LAN Scenario
- Legacy Single, Dual LAN + PRP Scenario
- Legacy Single, Redundant and Dual LAN Scenario (Mixed System)
- PRP Only Scenario
- Mixed: Legacy Single/Redundant/Dual LAN + PRP Scenario

Legacy Single and Dual LAN Scenario

G500 operation within a current substation LAN containing only legacy Single and/or Dual LAN IEDs (see Figure 4.12).

- All network ports must be configured in single mode. Both FX & Copper are supported.
- In single mode, one FX & one copper each is supported per pair.
- SFP 1 – FX.
- SFP 2, 3, 4, 5, 6 – Copper.

NOTE: The VLAN ID must be explicitly configured on switch ports (all others are blocked). Dual LAN is achieved in the G500 using a network pair in Single mode.

Figure 4-18 shows the one possible method for this scenario with MCP in the current network.

Legacy Single, Dual LAN + PRP Scenario

G500 operation within a current substation LAN containing only legacy Single and/or Dual LAN IEDs (see Figure 4.14):

- SFP 1, 2 – FX
- SFP 3, 4, 5, 6 – Copper
- VLAN tagging is optional for all traffic
- G500 must be configured as Trunk port or PRP/Redundant mode both SFP must be of same type.

Figure 4-18: MIXED: Single/Dual LAN + PRP Scenario Diagram

Legacy Single, Redundant and Dual LAN Scenario (Mixed System)

G500 operation within a current substation LAN containing only legacy Single and/or Dual, and Redundant LAN IEDs (see Figure 4.15):

- SFP 1 – FX
- SFP 2, 3, 4, 5, 6 – Copper
- The VLAN ID must be explicitly configured on switch ports (all others are blocked).

- At least one pair must be configured in Redundant mode & other as single mode.

Figure 4-19: Legacy Single, Redundant and Dual LAN Scenario Diagram

PRP Only Scenario

G500 operation within a current substation LAN containing only PRP IEDs (see Figure 4.16):

- All port pairs must be configured in PRP mode.
- The VLAN ID must be explicitly configured on switch ports (all others are blocked).
- VLAN tagging is optional for all traffic.

Figure 4-20: PRP only Scenario

Mixed: Legacy + PRP LAN Scenario

G500 operation within a substation LAN containing legacy Single and/or Dual, Redundant LAN, and PRP IEDs:

- Supported SFPs must be inserted in G500 rear ports.
- One port pair must be configured in Redundant mode, one in PRP mode and one in single mode.
- Figure 4-21 and Figure 4-22 shows a possible configuration of this scenario network that contains legacy single, redundant and Dual LAN IEDs.

Figure 4-21: Mixed: Legacy Single/Redundant/Dual LAN + PRP Scenario

Figure 4-22: Legacy Single and Dual LAN Scenario Diagram

Subnet Overlapping Rules

In MCP, overlapping of subnet validations are done across all the physical and logical interfaces (Net0-Net6). Validations are done for Host, Container as well as VLAN IP configurations.

Below are the IP configurations in MCP which are considered for subnet overlapping validations.

All Network Interfaces in firmware container (Adapter, Alias).

- Net1 interface in Host.
- EdgeManager.
- VLAN (Can be in any of/all the interfaces).

Subnet Overlapping Rules for same Interface

The Subnet Overlapping Rules for the same Interface are given below.

Table 4-3: Subnet Overlapping Rules for same Interface

	Net1-Net6 Subnet Overlapping same Interface			
	Adapter	Alias	EdgeManager	VLAN
Adapter	NA	Allowed	Allowed	Not Allowed
Alias	Allowed	NA	Allowed	Not Allowed
EdgeManager	Allowed	Allowed	Not Allowed	Not Allowed
VLAN	Not Allowed	Not Allowed	Not Allowed	Not Allowed

Subnet Overlapping Rules for two different Interface

The Subnet Overlapping Rules for the two different Interfaces are given below.

Table 4-4: Subnet Overlapping Rules for two different Interface

Interface 1		Interface 2			
		Adapter	Alias	EdgeManager	VLAN
	Adapter	Not Allowed	Not Allowed	Not Allowed	Not Allowed
	Alias	Not Allowed	Not Allowed	Not Allowed	Not Allowed
	EdgeManager	Not Allowed	Not Allowed	Not Allowed	Not Allowed
	VLAN	Not Allowed	Not Allowed	Not Allowed	Not Allowed

1. Overlapping of subnet across Adapter, Alias, Host / EdgeManager IPs within same network interface are ALLOWED.

```

Net1 Adapter      : 192.168.72.140/24
Net1 Alias        : 192.168.72.142/16
Net1 host         : 192.168.72.145/8
Net2 Adapter      : 172.169.73.11/8
Net2 Alias        : 172.169.73.13/8
Net2 EdgeManager  : 172.169.73.15/8
  
```

2. Overlapping of subnet for VLAN IP configurations within same or different network interfaces are NOT ALLOWED.
 - Net1/VLAN2 : 192.168.72.151/24 is not ALLOWED as it overlap with Net1 subnet configurations.
 - Net1/VLAN2 : 172.169.73.25/24 is not ALLOWED as it overlap with Net2 subnet configurations.
 - Net1/VLAN2 : 10.168.8.101/24 is ALLOWED as there is no overlap.
 - Net1/VLAN3 : 10.168.8.102/24 is not ALLOWED as it overlap with Net1/VLAN2 subnet.
 - Net2/VLAN3 : 10.168.8.102/24 is not ALLOWED as it overlap with Net1/VLAN2 subnet.
3. Overlapping of subnets across the interfaces are NOT ALLOWED.
 - Net2 Adapter : 192.168.72.147/24 is not ALLOWED as it overlap with Net1 subnet configurations.
 - Net3 Adapter : 172.169.73.18/24 is not ALLOWED as it overlap with Net2 subnet configurations.
 - Net2 EdgeManager : 10.8.5.115/8 is ALLOWED as there is no overlap with any other interfaces
 - Net1 host : 101.121.172.25/8 is ALLOWED as there is no overlap with any other interfaces.
 - Net3 Adapter : 101.121.172.101/24 is not ALLOWED as it overlap with Net0 Host subnet configurations.
 - Net4 Adapter : 10.8.5.11/24 is not ALLOWED as it overlap with Net2 EdgeManager subnet configurations.
4. IP conflict checks between Adapter, Alias, Host / EdgeManager IPs within same interface are done.

Custom Routing

The MCP provides the user with an option to define custom routes through which the network traffic may be forwarded.

The default gateway of the MCP is used to forward the packets to the destination IP if the destination IP is not directly connected to the MCP. The assumption is that the default gateway will know how to reach any network that the MCP itself cannot reach through one of its own interfaces.

Custom routing, on the other hand, defines static rules which specify the route through which the packet is forwarded to reach the pre-defined destination subnet when MCP cannot reach it through one of its own interfaces.

For the addition of custom routes in the MCP, the user may have to provide the following inputs:

- Destination IP Address
- Destination subnet mask
- Next Gateway IP Address (optional)
- Network interface of MCP that needs to be used

The IP Address of the Next Gateway should be in the same subnet as the network chosen for the MCP, or else an error is displayed. For the addition of an individual IP Address on destination subnet, you need to set the subnet mask to 255.255.255.255 or define the destination as single host.

If redundancy is configured, the user may have to cautiously configure the static routes in both MCPs.

The user may define multiple static routes in the MCP using the custom routing option for each of the available network interfaces including VLAN and PRP.

Custom Routing Example

An example of a configuration that requires custom routing in the MCP is an intranet that has two private Substation Intranets, 10.1.1.X Subnet Mask 255.255.255.0, 10.1.2.X Subnet Mask 255.255.255.0 and Enterprise Network 192.168.1.X Subnet Mask 255.255.255.0. The configuration has one default gateway 10.1.1.102 that forwards traffic between the Substation Intranets 1 and Substation Intranets 2 and one custom route with destination address 192.168.1.X Subnet Mask 255.255.255.0 4 though the gateway 10.1.1.101 that forwards the traffic between Substation IntraNet1 and Enterprise Network.

Note: IP Addresses shown in the diagram below are provided for example purposes only.

Figure 4-23: Custom Routing Example - Block Diagram

Configure Custom Routes in the MCP

When configuring custom routes in the MCP, you can:

- Display Custom Route
- Add Custom Route
- Delete Custom Route
- Add Custom Route

A custom route in the MCP is enabled using the Gateway Configuration Utility (mcpcfg).

Note: If an IP Address of an available network interface is changed or deleted, the custom routes for that interface are automatically deleted.

» To add Custom Routes:

1. Log into the MCP **Utilities** page.
Result: The MCP #>> prompt appears.
2. Type **mcpcfg** and press **Enter**.
Result: The Gateway Configuration Utility menu appears.
3. Select option **3. Configure Network Interfaces**.
Result: The Available Network Interfaces sub-menu appears.
4. Select option **7. Custom Routing**.
Result: The Custom Routes Configuration Settings sub-menu appears.
5. Select option **2. Add Custom Route**.
6. Enter the **Destination IP Address** and press **Enter**.
Result: You are prompted: **Is Destination IP an individual host: [Y/N]?**
7. Type **Y** or **N** and press **Enter**.
8. If you enter **Y**, the destination is added as a single host.
9. If you enter **N**, you will then enter the destination subnet mask and press Enter
Result: You are prompted: **Do you want to add this route to an interface: [Y/N]**.
10. Type **Y** or **N** and press **Enter**.
11. If you select **Y**, the list of available subnets to the MCP appears.
12. If you select **N**, you add the gateway IP Address and press Enter.

Result: The list of subnets available in MCP appears. You then select the destination subnet.

Note: The IP Address of the Next hop router must be in the same subnet as the network of MCP that will be chosen; otherwise, an error occurs.

13. Reboot the MCP.
Result: The custom routing settings take effect.

Display Custom Routes

» To display custom routes:

1. Log into the MCP Utilities page.
Result: The MCP #>> prompt appears.

2. Type **mcpcfg** and press **Enter**.
Result: The Gateway Configuration Utility menu appears.
3. Select option **3. Configure Network Interfaces**.
Result: The Available Network Interface sub-menu appears.
4. Select option **7. Custom Routing**.
Result: The Custom Routes Configuration Settings sub-menu appears.
5. Select option **1. Display Custom routes**
Result: The list of custom routes available in the MCP are displayed in tabular format.

Delete Custom Routes

» To delete Custom Routes:

1. Log into the MCP Utilities page.
Result: The MCP #>> prompt appears.
2. Type **mcpcfg** and press **Enter**.
Result: The Gateway Configuration Utility menu appears.
3. Select option **3. Configure Network Interfaces**.
4. Select option **7. Custom Routing**.
Result: The Custom Routes Configuration Settings sub-menu appears.
5. Select option **3. Delete Custom routes**.
Result: The list of static routes configured in the MCP appears.
6. Select the static route to be deleted, e.g., **Select the Static route to delete [1-1]:**
7. Select the Subnet number of the route to be deleted and press **Enter**.
Result: The selected static route is deleted.
8. Reboot the MCP.
Result: The custom routing settings take effect.

Network Summary

The user can view a summary of all configured network interfaces in the MCP along with the type of interface.

Use MCP local configuration utility (mcpcfg) to access this feature.

```
=====
Gateway Settings Menu
EdgeOS Host - Net0 Info
=====

Press ENTER Key to continue....
```

Administrators User Management

The MCP from the factory has two default users.

1. Default Root User – **root** (root has all permissions to the MCP but only available via the serial maintenance port).
2. Default Administrator user – **defadmin** (restricted permissions - used for initial setup).

Note: There are no other default HMI users on a from factory MCP.

Default Users

defadmin

MCP supports a default administrator defadmin that is used to connect to MCP from SSH client and from the command line interface of Local HMI. The default password of default administrator user is **defadmin**. When user logs in using defadmin, only minimal configuration (adding new administrator group user, adding new emergency group users, configuring network interface settings, rebooting the unit, restore snapshots using DSAS) will only be available. Using this Default Administrator User would need to configure a nominated/custom administrator-level user(s) to login and configure MCP.

- User: **defadmin**
- Password: **defadmin**

Steps to create New user:

1. After success login with defadmin/defadmin.
2. Launch **sudo mcpcfg** => user will be prompted with the below message.

```
defadmin@G500:~$ sudo mcpcfg
[sudo] password for defadmin:

Please create an Administrator account in order to access the full mcpcfg menu.

Press ENTER Key to continue....
```

Result: On Entering, configuration screen with below options will be displayed.

```

```

5. Now, **Enter 2** option to Add New user => here user is prompted provide the username and the password with which it must be created. Once done it will prompt with a note:

Note: The defadmin user will be removed automatically once

1. The defadmin user is logged out and
2. Logs in successfully with the newly added administrator user

```
=====
Gateway Settings Menu
Admin Group Users - Add user in Admin group
=====

Enter user name : admin

Enter user's full name : admin

Enter the password for admin:
Re-enter the password :

You entered:
User Name      : admin
User Full Name : admin

Confirm that you want to add this user ? <Y/N> :      y

Successfully added user : admin

Note:
The defadmin user will be removed automatically once
1. The defadmin user is logged out and
2. Logs in successfully with the newly added administrator user

Press ENTER Key to continue....
```

Note: This happens when the device is logged in for the first time and trying to create the User.

6. Press Enter and option '0' to go back to previous menu screen.
7. Login with any of the newly added User. On successful Login the defadmin credentials will be deleted.

root

MCP supports a default **root** user that is used to connect to MCP from serial maintenance port. The default password for the **root** user is **geroot**.

NOTICE The root account password must be changed by end users, using MCP Local Configuration Utility (sudo mcpcfg).

To configure users, go to the Configure Authentication option in mcpcfg, and select the authentication mode and change the system access settings. The Authentication settings are described in Table 4-5.

Table 4-5: Authentication setting descriptions

Setting	Description
Root Administrator Settings	Use this function to change the password associated with the system root user account.
Pass-Through Password Authentication	Use this function to enable or disable pass-through password authentication. When authentication is enabled, a valid username and password is required to access client applications through pass-through ports. Enabled by default.
Administrator Group Users	Use this function to create administrator-level users (if you are using local authentication mode) and to change details associated with existing administrator user accounts.
Emergency Group Users	Note: Starting with MCP V520, Cisco® TACACS+ is no longer available. This function allows user to add/delete/modify emergency administrator users for MCP. Adding emergency user is mandatory before changing the authentication from Local to Remote (LDAP /TACACS) Authentication. An emergency user can be used only when remote authentication has been enabled and only if the remote authentication server is not available. In this case emergency user will be allowed to login MCP and perform two key functions: Change the mode authentication from remote to local mode Generate emergency code to login HMI without changing authentication from remote to local mode. User can perform above two functions by using “sudo emergcfg” command after login emergency user on any of the below three interfaces: SSH session to MCP (Port-922) Maintenance serial port connection to MCP (Baud Rate- 115200) MCP Emergency option in local console

Administrator Group Users

1. An Administrator Group user is created using the following menu. Enter option **1. Configure Authentication**.

Emergency Group Users

Note: Starting with MCP V520, Cisco® TACACS+ is no longer available.

The purpose of the emergency access is to allow user(s) to login to the MCP HMI in case of failure to connect to Remote Authentication servers when using LDAP and TACACS authentication mechanisms.

1. By using emergency group users, we can change from remote authentication mode to local authentication mode. Then user(s) are able to use local authentication mode user credentials to login into the runtime HMI (Local and Remote).
2. By using emergency group users, we can generate emergency access code, this generated emergency access code can be used to login into the runtime HMI (Local and Remote) as operator user role only.

NOTE:

1. At least one user must be present in the “Emergency Group users” to change the mode from local authentication to Remote Authentication. A dialog “Please add Emergency User before switching to LDAP/TACACS Authentication” will be present if this condition is not met.
2. The emergency group users are not allowed sudo **su** command from SSH port 922 and maintenance serial port to avoid root permissions to the MCP.
3. The emergency group users are not allowed to connect to SSH port 22 unless mapped in both administrator group users and emergency group users.
4. The logon for emergency group users will be allowed only when Remote Authentication is configured, and server(s) are not available.

An Emergency group User is created using the following menu. Enter option **1. Configure Authentication** and then option **4. Emergency Group Users**.

1. Enter 1 option to see the **List Users**.

```

Emergency Access User Configuration and Privileges:

Emergency Group Users can connect to MCP by using below three interfaces, only when remote authentication has been enabled and only if the remote authentication server is not available:

1. SSH session to MCP (Port-922)
2. Maintenance serial port connection to MCP
3. MCP Emergency option in local HMI console

After selecting any one interface then Emergency user can login in to MCP. After login got successful need use command “**sudo emergcfg**”. User can perform below two key functions.

1. Change the Authentication mode from remote to local mode
2. Generate Emergency Access code to login HMI without changing authentication from remote to local mode.

```
emadmin@G500:~$ sudo emergcfg
```

3. Below menu will come after “sudo emergcfg” command.

```
=====

1.  Generate Emergency Access Code

Enter Your Choice : ( Between 0 and 1 ): 1

Emergency access code is already generated
Access code : YT5E9D168IDBH05PB923
Status      : Valid

Do you want to re-generate emergency access code [Y/N]?: █
```

User Management Overview

The User Management tab on the **Configuration** page in MCP Runtime HMI allows you to set up accounts for MCP users, including usernames, passwords and access level.

Add a User

» To add a user:

1. Click **Add** to create a new user account.
Result: The Add User window appears.
2. Enter the user information.
3. Click **OK**.

Result: The User Management table is saved.

Change a User Account

» To change a user account:

1. Click on the user record from the list in the User Management table.
Result: The Update User window appears.
2. Change the user information as required.
3. Click **OK**.

Result: The User Management table is saved.

Delete a User

» To delete a user:

1. Click on a user record from the list in the User Management table.
Result: The Update User window appears.
2. Click **Delete**.
Result: The Delete confirmation popup appears.
3. Click **Yes** to confirm the deletion.

Configure User HMI Home Page

» To configure the User Homepage:

1. Click on the user record from the list in the User Management table.
Result: The Update User window appears.
2. Update the user information as required.
3. Select the user Home Page from the dropdown list.
4. Click **OK**.

Result: The User Management table is saved.

NOTE:

1. For existing configured users, the User Home Page can be changed from the dropdown list directly. There are no “Save” or “Commit” actions required. The changes take effect when navigating away from the page.
2. The successful login and display of the intended page depend on the configured user’s access rights. i.e., When attempting to access a page, which requires higher user right level than the one used in the session – a message of “Access Forbidden” is displayed.
3. If the “User Defined Screens” is selected, users can specify additional parameters for example: dra=<dra filename>.

Auto Login

The MCP allows users to view a custom UI page both for Local and Remote HMIs sessions after a successful login; for example: when choosing a one-line drawing (.dra file) or ActiveAlarmViewer.

The User Home Page field is available under the **Access/User Management** tab, allowing users to select a home page for each configured user. See the User Management section for configuring a custom UI page per user.

Log in to Specific Custom UI Page in Remote HMI when Auto Login is DISABLED

Logging into a Specific Custom UI Page in Remote HMI mode upon successful login follows the below priority when Remote UI Auto Login is disabled (to disable Remote UI Auto Login refer to section: >> Access > Automatic Login) in the DS Agile MCP Studio:

1. User Home Page configured in the User Management tab.
2. **RemoteUIMainPage** is configured in the **Systemwide**-> Runtime GUI-> Global configuration settings when User Home Page is not selected.

Default Home Page when above (1) and (2) are not configured.

Log in to Specific Custom UI Page in Remote HMI when Auto Login is ENABLED

Logging into a Specific Custom UI Page in Remote HMI upon successful login follows the priority below when Remote UI Auto Login is enabled. (To enable Remote UI Auto Login, refer to section: >> Access -> Automatic Login) in the DS Agile MCP Studio.

1. **RemoteUIMainPage** is configured in the Systemwide-> Runtime GUI -> Global configuration settings.
2. User Home Page configured in the User Management tab settings when **RemoteUIMainPage** is not selected.
3. Default Home Page when above (1) and (2) are not configured.

NOTE: When Remote UI Auto Login is enabled – remote users can still logout from the default auto login account and log back with different credentials, within the “Remote UI Automatic Login Wait Time”; in this case, the Specific Custom UI Page will be associated with the User Home Page as a priority, if configured.

Log in to Specific Custom UI Page in Local HMI when Auto Login is DISABLED

Logging into a Specific Custom UI Page in Local HMI follows upon successful login the below priority when Auto Login is disabled. (To disable Local UI Auto Login, refer to section: >> Access -> Automatic Login) in the DS Agile MCP Studio.

1. User Home Page configured in the User Management tab.
2. If User Home Page is not configured, then
 - a. If MCP redundancy is not configured, then **LocalUIMainPage** configured in the Systemwide -> Runtime GUI -> Global configuration settings.
 - b. Or, if MCP redundancy is configured and the designation of MCP is Gateway A, then **LocalUIMainPageA** configured in the Systemwide -> Runtime GUI -> Global configuration settings.
 - c. Or, if MCP redundancy is configured and the designation of MCP is Gateway B, then **LocalUIMainPageB** configured in the Systemwide -> Runtime GUI -> Global configuration settings.
3. Default Home Page when above (1) and (2) are not configured.

Log in to Specific Custom UI Page in Local HMI when Auto Login is ENABLED

Logging into a Specific Custom UI Page in Local HMI upon successful login follows the below priority when Auto Login is enabled. (To enable Local UI Auto Login; refer to section: >> Access -> Automatic Login in the DS Agile MCP Studio

1. If MCP redundancy is not configured, then
 - a. **LocalUIMainPage** configured in the Systemwide -> Runtime GUI -> Global configuration settings.
 - b. User Home Page if **LocalUIMainPage** is not configured.
 - c. Default Home Page when above (a) and (b) are not configured.
2. Or, if MCP redundancy is configured and the designation of MCP is Gateway A, then
 - a. **LocalUIMainPageA** configured in the Systemwide -> Runtime GUI -> Global configuration settings.
 - b. User Home Page if **LocalUIMainPageA** is not configured.
 - c. Default Home Page when above (a) and (b) are not configured.
3. Or, if MCP redundancy is configured and designation of MCP is Gateway B, then
 - a. **LocalUIMainPageB** configured in the Systemwide -> Runtime GUI -> Global configuration settings.
 - b. User Home Page if **LocalUIMainPageB** is not configured.
 - c. Default Home Page when above (a) and (b) are not configured.

NOTE: When Local UI Auto Login is enabled – local users can still logout from the default auto login account and log back with different credentials, within the “Local UI Automatic Login Wait Time”; in this case, the Specific Custom UI Page will be associated with the User Home Page as a priority, if configured.

Other Services/Settings

Configure Remote HMI Non-Observer Privileges

This feature prevents users with MCP operator and supervisor role (class) credentials from logging into the MCP from the Remote HMI and consequently prevents them from executing commands and other controllable actions (force, ACK alarms, etc.), or from changing configurations.

When this feature is enabled, all Remote HMI users are granted the observer role (class) after successful login. There is no impact on users logged in through Local HMI.

This feature is enabled or disabled using the Gateway Configuration Utility (mcpcfg). For security reasons, only a super user or users with elevated admin class privileges in Linux mcpcfg can update the configuration of this feature.

NOTE:When Redundancy is configured, this parameter must be enabled or disabled both in the Active MCP and the Standby MCP for proper operation.

Disable controls from Remote HMI procedure

To disable controls from Remote HMI:

1. Log into the MCP through serial maintenance port or KVM.

Result: The **MCP#>>** command prompt appears.

2. Type **mcpcfg** and press **Enter**.

Result: The Gateway Configuration Utility Menu appears.

3. Select option 4. Configure Secure Access.

Result: The **Secure Access** sub-menu appears.

4. Select option 4. Configure Remote HMI Non-Observer Privileges.

Result: The following message appears:

Currently Remote HMI Non-Observer privileges are Enabled.

IMPORTANT!!!

Disabling Remote HMI Non-Observer privileges will log off all Non-Observer remote HMI sessions.

Do you want to disable Remote HMI Non Observer privileges [Y/N]?

```

=====
Gateway Settings Menu
Secure Access - Configure Remote HMI Non Observer Privileges
=====

Currently Remote HMI Non Observer privileges are Enabled.

IMPORTANT !!!
Disabling Remote HMI Non Observer privileges will log off all
Non Observer remote HMI sessions.

Do you want to disable Remote HMI Non Observer privileges [Y/N]?:

```

5. If you enter **Y**, then the controls from the Remote HMI are disabled.
If you enter **N**, then the controls from the Remote HMI are not disabled.

Result: The settings take effect.

```
=====
Gateway Settings Menu
Secure Access - Configure Remote HMI Non Observer Privileges
=====

Currently Remote HMI Non Observer privileges are Enabled.

IMPORTANT !!!
Disabling Remote HMI Non Observer privileges will log off all
Non Observer remote HMI sessions.

Do you want to disable Remote HMI Non Observer privileges [Y/N]?:      y

Settings have been saved and applied

Press ENTER Key to continue...[ ]
```

Enable controls from Remote HMI procedure

To enable controls back from Remote HMI:

1. Log into the MCP through serial maintenance port or KVM.
Result: The **MCP#>>** command prompt appears.
2. Type **mcpcfg** and press **Enter**.
Result: The Gateway Configuration Utility Menu appears.
3. Select option 4. Configure Secure Access.
Result: The Secure Access sub-menu appears.
4. Select option 4. Configure Remote HMI Non-Observer Privileges.
Result: The following message appears:

Currently Remote HMI Non Observer privileges are Disabled.

Do you want to enable Remote HMI Non Observer privileges [Y/N]?

If you enter **Y**, then the controls from the Remote HMI are enabled.

If you enter **N**, then the controls from the Remote HMI is not enabled.

Result: The settings take effect.

Configure Rsyslog service

The MCP can be configured to accept system logs from an IED or any substation equipment that can support the syslog remote logging feature. The MCP supports both TCP- and UDP-based remote connections to the IEDs on the standard port numbers.

When configuring Rsyslog service in a redundant MCP setup:

1. Start configuring Rsyslog service in the Active MCP (see section: Rsyslog service configuration procedure).
2. Reboot the device. Rebooting the device initializes Rsyslog with the newly committed configuration.
3. Once Active MCP is back online, sync the configuration to the Standby MCP and reboot the Standby MCP as well. This ensures that both Active MCP and Standby MCP configurations and firewall settings are in sync.

NOTICE

The MCP Rsyslog service changes the firewall settings to allow messages/logs on the configured port numbers for UDP/TCP based connections. These rules update the Firewall rulesets once configured and rebooted.

While choosing a different port number configured for either TCP/UDP based connections, ensure that no other application is using/running with the same port number in the MCP.

In the firewall configuration, it is the user's responsibility to connect Internal zone interfaces to networks that are protected from unauthorized use.

Rsyslog service configuration procedure

To configure Rsyslog Service:

1. Navigate to the Rsyslog Service configuration menu.
Choose option 4. Configure Secure Access > 5. Configure Rsyslog Service.

Result: The **Configure Rsyslog Service** menu appears.

2. Choose option **1. Current Settings** to view the current settings configured.
3. Return to the Configure Rsyslog Service menu.
4. Choose option 2. Configure Rx via UDP.

Result: Receiving Messages via UDP - Settings menu appears.

```

=====
Gateway Settings Menu
Secure Access - Configure Rsyslog service
=====

0.  Back
1.  Current Settings
2.  Configure Rx via UDP
3.  Configure Rx via TCP
4.  Configure Hosts/Subnets filters

Enter Your Choice : ( Between 0 and 4 ) : 

```

5. Choose option 1. Enable/Disable Rsyslog Logging service.

By default, syslog UDP uses the 514-port number. If this is to be changed, choose option 2. **Edit UDP Port Number.**

```
=====
Gateway Settings Menu
Configure Rsyslog service - Receiving Messages via UDP - Settings
=====

0.  Back
1.  Enable/Disable Rsyslog Logging service
    (Reception of Messages via UDP)
2.  Edit UDP Port Number

Enter Your Choice : ( Between 0 and 2 ):
```

NOTE: Before proceeding with this step, ensure that no other MCP applications/services are using the same port number. You can do this by manually checking the Connections tab of the MCP web/local HMI.

6. Return to the Configure Rsyslog Service menu.
7. Choose option 3. Configure Rx via TCP.

Result: The Receiving Messages via TCP - Settings menu appears.

```
=====
Gateway Settings Menu
Secure Access - Configure Rsyslog service
=====

0.  Back
1.  Current Settings
2.  Configure Rx via UDP
3.  Configure Rx via TCP
4.  Configure Hosts/Subnets filters

Enter Your Choice : ( Between 0 and 4 ):
```

The configuration options are like UDP.

```
=====
Gateway Settings Menu
Configure Rsyslog service - Receiving Messages via TCP - Settings
=====

0.  Back
1.  Enable/Disable Rsyslog Logging service
    (Reception of Messages via TCP)

2.  Edit TCP Port Number

Enter Your Choice : ( Between 0 and 2 ):
```

8. Return to the Configure Rsyslog Service menu.
9. Choose option 4. Configure Hosts/Subnets filters.

Result: The Configure Hosts/Subnets filters menu appears.

```
=====
Gateway Settings Menu
Secure Access - Configure Rsyslog service
=====

0.  Back
1.  Current Settings
2.  Configure Rx via UDP
3.  Configure Rx via TCP
4.  Configure Hosts/Subnets filters

Enter Your Choice : ( Between 0 and 4 ) : █
```

This setting allows the MCP Rsyslog service to bind to the subnet/Host address. By default, no binding filter rules are applied. That is, the MCP syslog application logs messages being pushed IEDs connected through all available MCP's network interfaces.

10. Choose option 2. Add Hosts/Subnets to add Subnets and IP Address of the Hosts/IEDs.

```
=====
Gateway Settings Menu
Configure Rsyslog service - Configure Hosts-Subnets Filters
=====

0.  Back
1.  Current Settings
2.  Add Hosts/Subnets
3.  Delete Hosts/Subnets

Enter Your Choice : ( Between 0 and 3 ) : █
```

11. Select the applicable interface from the list of available interfaces in the MCP.
If the subnet is missing in the list, choose one of the Custom Filters options.

Adding a subnet configures the MCP Rsyslog to log messages only being sent from the IED-IP Addresses which are in range of the configured subnet.

```
=====
Gateway Settings Menu
Configure Hosts-Subnets Filters - Add Hosts/Subnets
=====

      (4 ) Subnet address

-----
Note:
  Use Custom filters when the IED IP add does not
  fall in the above listed available subnet range.
-----

Enter your choice (No.): ( Between 0 and 4 ): █
```

12. Choose option 3. Delete Hosts/Subnets to delete any of the added addresses.
13. Choose option 1. Current Settings to view the current settings configured.

Configure Secure Access

SECURITY NOTICE: HTTPS, SFTP, and SSH services are automatically configured in MCP by default.

The **Configure Secure Access** menu allows you to configure the modes through which users can access the MCP.

Table 4-6: Secure access setting descriptions

Setting	Description
Current Configuration	Use this function to view the current state of the MCP secure access settings.
Configure SSH Service	Use this function to enable or disable access to the MCP through the SSH protocol for Pass Through and Terminal Server Connections. Note: Before MCP v5.40: Use this function to enable or disable access via SSH. Note: Starting with MCP v5.40 - this setting is not available, instead please use Custom Firewall Rules to control SSH_Inbound on TCP port 22.
Configure SFTP Service	Use this function to enable or disable access to the MCP through the Secure FTP protocol (SFTP or SCP) Note: When transferring files to and from the MCP, you may receive file permission errors. Disable “permission change error reporting” in your file transfer utility to prevent these messages from appearing. Note: Before MCP v5.40: Use this function to enable or disable access via SFTP/SCP. Note: Starting with MCP v5.40 - this setting is not available, instead please use Custom Firewall Rules to control SSH_Inbound on TCP port 22.
Configure Emergency Access ports	Use this function to configure Access ports: • Display and serial maintenance port • Display port only • Serial maintenance port only
Configure Remote HMI Non-Observer Privileges	Use this command to enable or disable privileges for the Non-Observer users from the Remote HMI. It is necessary to reboot the MCP after configuring this parameter. If redundancy is configured, this parameter must also be configured in the Standby MCP.
Configure Rsyslog Service	Use this command to enable or disable Remote Syslog service in the MCP. Rsyslog service supports the following features: • Receiving of Syslog Messages through UDP. • Receiving of Syslog Messages through TCP. • Add or Delete Subnets/Hosts for receiving Syslog Messages. Note: The MCP Rsyslog service changes the firewall settings to allow messages/logs on the configured port numbers for UDP/TCP based connections. These rules update the Firewall rulesets once configured and rebooted. While choosing a different port number configured for either TCP/UDP based connections, ensure that no other application is using/running with the same port number in the MCP. In the firewall configuration, it is the user's responsibility to connect Internal zone interfaces to networks that are protected from unauthorized use.

Enter Your Choice : ( Between 0 and 6 ) : █
```

Configure Firewall

The MCP contains a firewall capable of stateful packet inspection to protect your device from unauthorized access. By default, network interfaces on the MCP drop packets that are determined to be invalidly routed or unsolicited.

SECURITY NOTICE: The MCP firewall is intended only to protect itself and does not extend protection to other devices on the network. As such, it does not replace the need for a network firewall which offers deep packet inspection and detailed configuration capabilities.

The MCP firewall is automatically configured by default to its most secure setting. The user assumes all responsibility for associated security risks if the firewall configuration is manually changed.

It is the user's responsibility to connect Internal zone interfaces to networks that are protected from unauthorized use.

Also, if the firewall is disabled then all the ports that are internal to the MCP will be visible/available to the external scanner tools.

Network interfaces can operate in one of two modes:

- Internal : The Internal mode permits traffic from known protocols and should only be enabled on interfaces connected to known devices only. The Internal mode is typically used when the interface is connected to the substation LAN.
- External : The External mode offers a stricter set of rules and is the default mode for all interfaces except Net0 and Net1. The External mode would typically be used when the interface is connected to a WAN.

By default, the firewall allows outbound traffic on internal interfaces and blocks all outbound traffic except outbound SSH on external interfaces. If you want the firewall to allow outbound traffic for a protocol on an external interface, you must create a "custom" rule. See section: Add/Edit/Remove Custom Rules.

By default, the firewall blocks inbound traffic on both internal and external interfaces. The MCP automatically generates rules allowing inbound traffic on internal interfaces for all configured services. If you want the firewall to allow inbound traffic on an external interface, you may modify the associated "generated" rule to allow the traffic on ALL interfaces rather than only the "Internal" interface. See section: Add/Edit/Remove Custom Rules.

Table 4-7: Service traffic defaults through the firewall

Service Name	Notes	External Mode	Internal Mode
Modbus/TCP Server (Inbound)		Deny	Allow
DNP/UDP Server (Inbound)		Deny	Allow
DNP/TCP Server (Inbound)		Deny	Allow
DNP/TCP Client (Inbound)	Dual Endpoint Enabled	Deny	Allow
DNP/UDP Client (Inbound)			
IEC 60870-5-104 Server (Inbound)		Deny	Allow
Terminal Server (Inbound)	TLS Disabled	Deny	Allow
DCA Pass-Through (Inbound)	TLS Disabled	Deny	Allow
Secure Connection Relay (Inbound)		Allow	Allow
Secure DCA Pass-Through (Inbound)	TLS Enabled	Allow	Allow
Secure Terminal Server (Inbound)	TLS Enabled	Allow	Allow
SNMP Client (Inbound)		Deny	Allow
LogicLinx Executor (Inbound)		Deny	Allow
HTTPS (Inbound)	When enabled in mcpcfg, see note below	Deny	Allow
DHCP Client (Inbound)	When enabled in mcpcfg	Deny	Allow
NTP Client (Inbound)	When enabled in mcpcfg	Deny	Allow
NTP Server (Inbound)	When enabled in mcpcfg	Deny	Allow
SSH/SFTP/SCP (Outbound)	When enabled in mcpcfg for SCP/SFTP.	Allow	Allow
Secure Tunnel -Redundancy (Inbound)	When enabled in mcpcfg	Deny	Allow
Standby Local HMI Redirection to Active (Inbound)	When enabled in mcpcfg	Deny	Allow
Settings GUI(Inbound)		Deny	Allow
Emergency SSH Server (Inbound)		Deny	Allow
Emergency SSH Serve (Outbound)		Allow	Allow
LDAP Client (Outbound)		Allow	Deny
Modbus/TCP Server (Inbound)		Deny	Allow
DNP/UDP Server (Inbound)		Deny	Allow
DNP/TCP Server (Inbound)		Deny	Allow
DSAS CONFIG (Inbound)		Deny	Allow
Note: By default, HTTPS and SSH do not provide strong client authentication since only a password is required to access the system. Therefore, these protocols are not considered secure enough for use over external interfaces. They can be considered secure if you employ a remote authentication server that provides two-factor authentication. In that case, you may opt to modify the firewall rule and allow HTTPS and SSH on external interfaces.			

The default firewall rules should be enough for most users. However, you may create a set of custom rules if you desire more granular permissions for the protocols you are accessing.

These firewall rules in the table are used for whitelisting the IP connections and ports on the Network Interfaces.

Additional notes on the MCP firewall:

- In a redundant setup, the same firewall rules above apply to both the active and standby device.
- When the firewall is active, you cannot perform IP routing between an external and internal interface. The only way to pass through the firewall is by using a secure TLS connection or the proxy.

You can configure the settings of the firewall through the **Firewall** menu. The Secure Access settings are described in Table 4-8.

Table 4-8: Firewall setting descriptions

Setting	Description
Current Configuration	Use this function to view the status of the firewall and the rules currently being enforced.
Enable/Disable Firewall	Use this function to turn the firewall feature on or off. By default, the firewall is enabled when the MCP is received from the factory. If you disable the firewall, incoming traffic is not filtered.
Edit Generated Rules	When the firewall is active, rules are generated for the services in use on your MCP based on the parameters specified in the table above. Use this option to modify these generated rules.
Add/Edit/Remove Custom Rules	Use this option to create a custom firewall rule that is applied in addition to the system generated rules.
Configured Network Ports	List of ICMP protocol types and TCP/UDP ports opened for inbound and outbound traffic. Refer to Appendix H for list of supported TCP/UDP ports.

Configure Firewall Rule Parameter

In the firewall screen, you will see the following parameters:

Service	I/O	Prot	Port	Ifaces	IsModified	Standby
SNMP	IN	UDP	162	Internal	No	Yes
HTTPS	IN	TCP	443	Internal	No	Yes
DSASCONFIG_Inbound	IN	TCP	8082	Internal	No	Yes
HTTP	IN	TCP	80	Internal	No	
SSH_Inbound	IN	TCP	22	Internal	No	Yes

Table 4-9: Firewall Rule Parameter

Firewall Rule Parameter	Description	Possible Values
Service	Specifies the name of the Service.	Combination of letters, numbers, hyphens, under-scores and forward slashes. Must start with a letter. Below are the Services examples: • SNMP • HTTPS • DSASCONFIG_Inbound • HTTP • SSH_Inbound
I/O	Specifies the type of direction (for Inbound or Outbound traffic).	IN OUT
Prot	Specifies the type of the Protocol that the service will use.	TCP UDP ICMP
Port	Specifies the port(s) that the service will be listening on.	valid port number (1-65535) range of valid port numbers (23-27) comma-separated list of valid port numbers (21,22)
Ifaces	Specifies the list of allowed network interfaces for firewall rules to apply. Note: In G500: when a pair of interfaces is configured as PRP or Redundant – select (or un-select) both Net numbers within the pair (e.g. for PRP1 made of Net1-2 select/un-select Net1 and Net2).	Internal External All valid interface name (Net0,Net1) comma-separated list of valid interface names (Net1,vlan2)
IsModified	This flag specifies whether the rules are modified or edited for a service. The default value for this flag is "No".	Yes No - Default is "No"
Standby	Specifies whether the service is enabled or not when the MCP device is switched to Standby mode. If not specified or if this parameter is empty then "No" is assumed.	Yes "" Default is empty i.e., ""

Configure Host Names

The **Configure Host Names** menu allows you to assign a host name to your MCP and to view, add, and delete entries in the hosts file. The Host Name settings are described in Table 4-10.

NOTE: The MCP only allows you to enter IPV4 addresses.

Table 4-10: Host name setting descriptions

Setting	Description
Add a New Host	Use this function to add a host name and IP Address to the host's file.
Delete a Host	Use this function to view a list of configured hosts. Select an item number to delete the associated host entry.
Modify a Host	Use this function to view a list of configured hosts. Select an item number to modify the associated host name and IP Address. Press Enter to use the previously entered value.
Delete All Hosts	Use this function to remove all entries from the hosts file.
View All Hosts	Use this function to view a list of configured hosts.

Configure Time & Time Sync

Refer to the section [Date and Time](#) for configuring Time & Time Sync.

Reset System Logs

Use the **Reset System Logs** menu to clear various system logs that are stored in the MCP. The Reset System Log settings are described in Table 4-11.

Table 4-11: Reset System Log setting descriptions

Setting	Description
Check Size of Archived Logs	Active system logs are automatically archived when they reach a size of 256 KB. Up to 10 archives are kept within the MCP, with newer logs overwriting older stored logs. Check Size of Archived Logs lets you view the amount of disk space occupied by these archived log files. The value is shown in KB.
Check Size of Current Application Logs	Use this function to view the amount of disk space occupied by the current application logs. The value is shown in KB.
Delete Archived Logs	Use this function to permanently delete archived logs from the MCP.
Delete Current Logs	Use this function to permanently delete current application logs from the MCP.

Reset Database Tables

Modify tables in the SQL database through the **Reset Database Tables** menu. The Reset System Log settings are described in Table 4-12.

Use the DB Exporter tool on the Utilities page of the MCP HMI to save a backup of the SQL database tables before deleting them.

Some of these actions should be performed after configurations were changed in the corresponding areas – to avoid mismatch of data between the already stored records and the new configuration.

Table 4-12: Reset database table setting descriptions

Setting	Description
Delete Digital Event Data: SOE and Alarm records	Use this command to clear or delete the Digital Event Data from the SQL database of the MCP. Should be performed after changes in <i>Alarm</i> configuration. - This action stops all running applications and permanently deletes entries from the digital events database. - If NVRAM based persistence is configured for SOE and Alarm records, also reset NVRAM using mcpcfg.
Delete Quality Records	Use this command to clear or delete the Quality Data from the SQL database of the MCP. The quality status and quality attributes (also referred to as the quality flags) are stored in the MCP SQL database along with the point or object and are updated as the status or value of the point or object changes.
Delete PRF Event Records	Use this command to clear or delete the Protective Relay Faults (PRF) stored in the SQL database of the MCP. Should be performed after changes related to PRF configuration. All PRF fields including the Event ID, Trip Description, Fault code etc. are deleted permanently from the SQL database of the MCP.
Delete Operator Records	Use this command to delete the operator notes that have been entered by users and stored in the SQL database of the MCP. Each Operator Note record entered in the SQL database of the MCP contains a custom Note/Text message entered by an operator. This record also contains the last modified record date and time details.
Delete Accumulator Records	Use this command to clear or delete the Accumulator records from the SQL database of the MCP.

```

Reset File Persistence Data

You can reset the data being held in the MCP's database with the File Based Persistence setting provided through the Reset File Persistence Data menu. Reset File Persistence Data Settings

Use this command to reset the data being stored by the File Based Persistence application in the MCP. This command permanently deletes data stored in the Persistence Files of the MCP.

After you have reset the data stored in the Persistence Files, you must restart the MCP. It is advised to restart the File Based Persistence application when the **mcpcfg** prompts for user action.

Local HMI

You can configure the settings of the monitor connected to display port of the MCP output through the **Local HMI** menu. The Local HMI settings are described in Table 4-13.

Table 4-13: Local HMI setting descriptions

Setting	Description
Current Settings	Use this command to view the existing Local HMI Settings.
DPMS	Use this function to enable or disable DPMS (Display Power Management Signaling). These settings determine how much time must pass without user interaction before your monitor is put into a reduced power mode. A setting of "00" prevents the MCP from triggering the power mode. The following modes are available: • Stand-by: Monitor blanks but power supply remains on; screen restores in approximately one second when reactivated by keyboard or mouse input by user. • Suspend: Monitor power supply shuts off; screen restores in approximately 2-3 seconds. • Turned off: Monitor is fully powered down except for an auxiliary circuit to detect a wake-up signal; screen restores in approximately 8-10 seconds Note: Refer to the manual that came with your monitor for more information on how it receives and responds to DPMS signals.
Standby Local HMI (Redundancy)	Use this command to enable or disable Standby Local HMI redirects to the Active MCP feature. Note: This parameter must be configured in both MCPs for proper operation.

```

Enter Your Choice : ( Between 0 and 3 ) : █

```

Standby local HMI redirects to the Active MCP

This feature applies to redundant MCP units, where both MCPs are equipped with a Local HMI. When this feature is enabled, it is recommended to enable auto-login in both the redundant MCP units.

If the MCP units are configured in non-redundant configuration, this feature is not applicable.

This feature allows a user to interact with the Local HMI of the active MCP of both units at the same time, allowing two separate Local HMIs to show data from the same active MCP.

When auto-login is enabled, the Local HMI screens of redundant MCPs display default pages as per their designation (Gateway_A or Gateway_B) and the configured Local UI Main Page for Gateway_A / Gateway_B. This allows the Local HMI screen of a MCP to display same UI page, regardless of its active or standby state.

Table 4-14: Redundant MCP display default pages

MCP Designation	Default UI Page as per Parameter
GatewayA	Local UI Main Page for GatewayA (MCP)
GatewayB	Local UI Main Page for GatewayB (MCP)

These parameters can be configured using **MCP Configuration GUI > Systemwide > Runtime GUI > Global configuration** tab in DS Agile MCP Studio.

NOTES:

- The Standby HMI redirects to Active MCP parameter must be enabled or disabled both in Active and Standby MCPs for proper operation.
- When auto-login is not enabled, the Local HMI screens of redundant MCPs display the configured User Home page in the User Management tab. Refer to section User Management tab for details.
- Standby Local HMI redirecting to Active MCP depends on the configured PEER MCP IP Addresses and Keys transferred to the PEER MCP but is independent of the Heart Beat communications options.
- The Local HMI on the Standby MCP behaves same as Local HMI on the Active MCP for all access purposes. As a result, the Configure Remote HMI Non-Observer Privileges feature does not take effect on the StandbyMCP.
- The Utilities Login feature to login to the Standby MCP only though the Local HMI is redirected to the Active MCP.
- The Export Database feature in MCP Utilities downloads the database into the USB mounted on the Standby MCP.
- The Export Database CSV Files feature in MCP Utilities stores the files on the Standby MCP.
- If Serial Only heart-beat option is configured in Warm Standby Redundancy, then both PEER User and IP Address needs to be configured in both the MCPs using mcpcfg to make Standby Redirects to Active functional.

To enable Standby Local HMI redirects to Active MCP:

1. Log into the MCP Utilities page.
Result: The **MCP#>>** command prompt appears.
2. Type **mcpcfg** and press **Enter**.
Result: The Gateway Configuration Utility Menu appears.
3. Select option **11. Local HMI**.
Result: The **Local HMI** sub-menu appears.

4. Select option 3. Standby Local HMI (Redundancy).

Result: The following prompt appears:

IMPORTANT!

***Currently Redundancy configuration is Disabled.**

***Active Gateway Access from Standby Local HMI configuration is applicable only when Redundancy is Enabled.**

***Number of simultaneous users must be a minimum of 2 for the configured user role in both Gateways, which can be configured from HMI (Configuration → Systemwide → AccessManager) menu.**

Currently Active Gateway Access from Standby Local HMI is Disabled.

Are you sure you want to Enable Active Gateway Access from Standby Local HMI [Y/N]?

5. If you enter **Y**, then this feature is enabled.

If you enter **N**, then this feature is not enabled.

```

=====
Gateway Settings Menu
Standby Local HMI (Redundancy)
=====

IMPORTANT !
* Currently Redundancy configuration is Disabled.

* Active Gateway Access from Standby Local HMI configuration
  is applicable only when Redundancy is Enabled.

* Number of simultaneous users must be minimum 2 for the
  configured user role in both Gateways which can be configured
  from HMI (Configuration->Systemwide->AccessManager) menu.

Currently Active Gateway Access from Standby Local HMI is Disabled

Are you sure you want to Enable Active Gateway Access from Standby Local HMI [Y/N]:y

Settings have been saved and applied

Press ENTER Key to continue...

```

To disable Standby Local HMI redirects to Active MCP:

1. Log into the MCP Utilities page.

Result: The **MCP#>>** command prompt appears.

2. Type **mcpcfg** and press **Enter**.

Result: The Gateway Configuration Utility Menu appears.

3. Select option **11. Local HMI**.

Result: The Local HMI sub-menu appears.

4. Select option 3. Standby Local HMI (Redundancy).

Result: The following prompt appears:

Currently Active Gateway Access from Standby Local HMI is Enabled.

Are you sure you want to Disable Active MCP Access from Standby Local HMI [Y/N]?

5. If you enter **Y**, then this feature is disabled.

6. If you enter **N**, then this feature is not disabled.

Configure Sync Manager

The Configure Sync Manager utility can be used to securely copy files from a location on your MCP device to a specified directory on a remote device. The utility monitors the specified local directory for changed or added files. To reduce bandwidth demands on your network, only files found to have been changed or created since the last synchronization are transferred. This utility employs the Linux-based rsync/ftp/sftp command to perform this function.

You can configure the settings of the Sync Manager through the **Sync Manager** menu. The Sync Manager settings are described in Table 4-15.

Reboot the MCP after the Sync manager configuration is complete.

Table 4-15: Sync Manager setting descriptions

Setting	Description
Enable Sync Manager	Use this command to enable the Sync Manager application. This command deletes the old pair of Public-Private Keys and generates a new pair of Public-Private Keys. The existing / newly generated keys are available at: /mnt/datalog/SSHKeys/SyncMgr/id_rsa. This command provides an option to configure the “sync set” through the rsync, ftp, and sftp features. Rsync is a software utility and network protocol for Unix-like systems (with a port to Microsoft Windows) that synchronizes files and directories between one location and another location while minimizing data transfer. It also includes the option to provide encrypted transfer by using the SSH. FTP (File Transfer Protocol) is a popular method of transferring files between two remote systems. SFTP (Secure File Transfer Protocol) is a separate protocol packaged with SSH that works in a similar way over a secure connection.
Generate SSH Authentication Keys	Files from the MCP are securely copied to the remote device over an SSH connection. To facilitate authentication on this link, a private/public key pair must be generated and transferred to the remote device. When a key set is generated, the files are stored in /mnt/datalog/SSHKeys/SyncMgr/. You should copy the public key file (id_rsa.pub) from this location and store it in the appropriate location on the remote device. This file needs to be renamed as "authorized_keys" before copying to the remote device. Refer to the user documentation provided with your remote device to determine the file path. If configuring multiple MCP units to sync files to a remote device using the same username, the public key content (one text line) from the id_rsa.pub of each MCP shall be appended to the existing “authorized_keys” file on the remote device using a text editor. Each public key is a single line entry in “authorized_keys” file in the remote device; ensure that it is not broken in multiple lines while copying and pasting. Note: Do not remove the private key from this location since the Sync Manager will not be able to establish a secure connection. These keys are used with either rsync or sftp server for authentication. Note: In case you are unable to access the folder, enter the below command from the command prompt as an administrator user. sudo chmod ug+x /mnt/datalog/SSHKeys/SyncMgr
Configure Sync Sets	Up to 8 sync sets can be created at any time. Table 4.16 lists the settings can be configured for each set:

Table 4-16: Settings for each sync set

Setting	Description	Range
Configure Server	File transfer to Enterprise server from MCP occurs on selected Protocol	Rsync, ftp, or sftp
Sync Set ID	A unique number used by the system to identify the sync set. Not editable; automatically assigned.	Auto-incremented from 1. Once a number has been assigned, it is never reused.
Destination IP Address	The IP Address of the remote device where the files are to be copied.	Valid IPv4 address
Destination Username	The username used for SSH authentication on the remote system.	1 to 128 ASCII characters
Password	The password required for establishing a session on FTP. This is not applicable to rsync and sftp protocols.	Text string; 1 to 22 characters Alphabetic letters, numbers 0 to 9, and special characters are allowed
Source Path Name	The absolute directory pathname that is synced to the remote device.	2 to 120 ASCII characters pointing to a valid location on the MCP file system
Destination Path Name	The absolute directory pathname that the files are to be copied to	2 to 120 ASCII characters pointing to a valid location on the remote device's file system
Check and sync Interval	The amount of time, in seconds, that the Sync Manager waits before checking the source path for changes. If changed or created files are detected, an rsync/ftp/sftp operation is triggered.	60 to 86400 seconds
Forced sync Interval	The amount of time, in seconds, that the Sync Manager waits before a forced sync operation is triggered, regardless of detected changes. If rsync is configured, then forced sync recreates files that have been deleted from the remote device as well as forcing the transfer of files whose changes may not have been detected due to MD5 collision, an extremely rare occurrence.	60 to 86400 seconds

Table 4-17: Sync Set Example 1

Field	Value
Configure Server	rsync
Sync Set ID	1
Destination IP Address	192.168.1.1
Destination User Name	admin
Password	xxxxxx
Source Path Name	/mnt/datalog/arm
Destination Path Name	/cygdrive/c/Stations_Data
Check and sync Interval	60
Forced sync Interval	60

Table 4-18: Sync Set Example 2

Field	Value
Configure Server	rsync
Sync Set ID	2
Destination IP Address	192.168.1.2
Destination Username	admin
Password	xxxxxx
Source Path Name	/mnt/datalog/arm
Destination Path Name	/cygdrive/c/Stations_Data/GW/Station_1/MCP_Name_1
Check and sync Interval	60
Forced sync Interval	60

Table 4-19: Sync Set Example 3

Field	Value
Configure Server	rsync
Sync Set ID	3
Destination IP Address	192.168.1.3
Destination Username	admin
Password	xxxxxx
Source Path Name	/mnt/datalog/arm
Destination Path Name	/cygdrive/c/Stations_Data/GW/[Station_1,Station_2,Station_3]/MCP_Name_1
Check and sync Interval	60
Forced sync Interval	60

NOTE: The Sync Manager only copies files to the remote device. Files are not deleted from the remote device if they are deleted from the MCP after synchronization. Instead, they are recreated during the next sync operation.

A forced sync is performed upon each startup of your MCP device.

The MCP Designation Place holder %MCP_DESIGNATION is only to be used with redundant MCPs.

In the configured Syncset, ensure that the total text string length does not exceed 200 characters for the Source Path and Destination Path fields.

Redundancy

If you are configuring your MCP for use within a redundant setup, you can configure redundancy application settings through the **Redundancy** menu. The Redundancy settings are described in Table 4.19.

Table 4-20: Redundancy setting descriptions

Setting	Description
Current Configuration	Use this command to view the current redundancy configuration.
Enable/Disable Redundancy	Use this function to enable or disable redundancy functionality within the MCP. Redundancy Type: The available types of redundancy that can be configured are: • Warm Standby

Setting	Description
	- Hot Standby - Hot-Hot Note: This configuration parameter must be set to the same value on both MCPs.
Heart Beat Configuration	Configure Heart Beat Timeout The interval within which the MCP must receive at least one message or Heart Beat from the other MCP. The valid range is 100 to 1000 msec; the default is 300 msec. Note: This configuration parameter must be set to the same value on both MCPs. Configure Heart Beat retries Use this function to set the number of times the MCP re-transmits a Heart Beat message before assuming that the other MCP has failed. The valid range is 1 to 10; the default is 3. Note: This configuration parameter must be set to the same value on both MCPs. Configure Heart Beat Communication Mechanism through Hot standby or Hot-Hot Select the Heart Beat communication option: 1. Single LAN (Default) 2. LAN1 and LAN2 3. LAN and Serial 4. LAN1, LAN2 and Serial Configure Heart Beat Communication Mechanism through Warm standby Select the Heart Beat communication option: 1. Serial Only 2. Single LAN 3. LAN1 and LAN2 4. LAN and Serial 5. LAN1, LAN2 and Serial Note: In Hot Standby and Hot-Hot Redundancy, the Heart Beat communication option must include LAN and an optional serial. Note: This configuration parameter must be set to the same value on both MCPs Note: If the Heart Beat communication option includes a serial link, then a Primary and an optional backup serial port must be configured on the Connection configuration page of online HMI.
Configure IP Address of PEER Gateway	Use this function to set the unique IP Address of the other MCP device configured within the redundant system. If the PEER MCP has a second Ethernet interface, you can configure it as well. The adapter IP Addresses of the PEER MCP must be entered here (see the <i>Ethernet Connections</i> topic in the MCP online help).
Configure Time Sync with Standby	Use this function to enable or disable time synchronization of the standby MCP from the active MCP. This option should be enabled only if the standby MCP does not have an IRIG-B or NTP/SNTP based time synchronization mechanism. Note: This configuration parameter must be set to the same value on both MCPs.
Configure Enable/Disable DTAs in Standby	Use this function to enable DTA applications to run normally on the standby MCP. If set to False, DTA applications suspend processing on the standby MCP. This setting is applicable to LogicLinx, Calculator, and Load Shed DTAs only. Note: This configuration parameter must be set to the same value on both MCPs.

Setting	Description
Configure Gateway A/B Designation	Use this function to configure the A/B designation of the MCP. This parameter is only used if a switch panel is not configured. If a switch panel is configured, the Gateway A/B Designation is read from the switch panel and this parameter is not used.
Setup Public Key Authentication with Peer Gateway	Use this function to copy the public key of each MCP unit to the peer MCP. User shall need to enter username of an administrator user account of PEER MCP unit (see List Users in Administrator Group Users option in the Peer MCP unit mcpcfg settings) Note: This function must be done on both MCPs.
Configure Switch Panel Type	Use this function to configure the type of switch panel: MASTER: A change-over can be initiated from the switch panel. The switch panel is also used to route external serial connections to the active unit. Must also be configured in "Connections", see Redundancy Switch Panels . SLAVE: The switch panel is only used to route external serial connections to the active unit, a change-over cannot be initiated from the switch panel. Must also be configured in "Connections", see Redundancy Switch Panels . SLAVE option is selected also when a switch panel is not present / not required, in which case do not configure it neither in "Connections", see Redundancy Switch Panels . Note: This parameter is applicable for Warm Standby, Hot Standby and Hot-Hot Redundancy modes). Note: This configuration parameter must be set to the same value on both MCPs.
Enable/Disable Non-Sync Mode	If Non-Sync mode is disabled, then the standby MCP does not enter non-sync mode at startup, even if the firmware or configurations are not the same on both MCPs (see the Non-Sync Mode topic in the MCP online help). Note: This configuration parameter must be set to the same value on both MCPs.

```

ARRM - Automatic Record Retrieval Manager

From the **ARRM** menu, you can configure the Automated Record Retrieval Manager (ARRM) which retrieves and stores record files from devices connected to the MCP. For example, the SEL Binary DCA application retrieves and archives the Event Log files from the SEL IEDs/numerical relays.

The Automated Record Retrieval Manager settings are described in Table 4-21.

ARRM uses the Distributed Network Protocol (DNP), MODBUS, SELBIN, GENASCII and the IEC 61850 protocol to communicate with a variety of devices and uses the Trivial File Transfer Protocol (TFTP), File Transfer Protocol (FTP), Secure File Transport Protocol (SFTP), MMS or ASCII (for SEL devices) to archive the files from the IED to the device over a local area network (LAN) or serial connection.

Retrieved files are stored on the MCP file system in the folder /mnt/datalog/arm/ with the structure Company > Station > Device.

Table 4-21: Automated Record Retrieval Manager setting descriptions

Setting	Description
Delete Records	You can use the ARRM menu to delete the contents of these folder structures, as well as temp and cache files, while leaving the directory structure intact for future downloads. You can also retrieve downloaded records from the MCP using any FTP/SCP/SFTP client as needed or on a scheduled basis

Suppress Forced Qualities To Masters

From the **Suppress Forced Qualities To Masters** menu, you can suppress forced qualities being reported to the IEC101-104 Master for a configured duration of time.

When a master is configured in this mode:

- All the values with Forced/Substituted flags are communicated to the Master as value changes only.
- All other flags are still communicated normally.

Only elevated users (that is, administrator users with root access privileges) can execute this functionality.

Re-starting the processes has no impact on the functionality.

This functionality is canceled (and the forced qualities are reported back to the master):

- Upon time expiration, or
- When the MCP is rebooted.

```

EdgeOS Host

In MCP, normally users do not need to access the Predix EdgeOS host shell. In case there is a need to access the Predix EdgeOS host shell under some special circumstance, PETC provides a way for users to enable the Predix EdgeOS host SSH/SCP service temporally. To know how to access the PETC online documentation, refer to [Chapter 9 - EdgeManager and PETC](#).

The function is used to perform the following actions:

- Host Net Info (in G100 is Net1, in G500 is Net0)
- Host Version Info
- Change Host Shell Idle Timeout
- Host Logoff
- Reset PETC Login User Credentials

```

Restore Clone Snapshot

A root user or a super (“sudo”) user can restore a Clone Snapshot, and the existing configuration will be replaced with the snapshot configuration.

Below are the ways to proceed with the restore:

- 1) In this scenario, user needs to connect a FAT32 formatted USB device containing clone snapshot file(s) with extension *. MCPClonesnapshot.DS7zip (taken using DSAS).

GE Vernova doesn't recommend using more than one USB connected at a time for this operation.

- 2) Below two cases are applicable:

If USB is not mounted: User will be prompted with 'Automatic mount of USB'

- o On Failure: Possible reasons for USB mount failure will be displayed:
 - a. No USB drive inserted into one of the available slots.
 - b. The inserted USB drive is malfunctioning.
 - c. The inserted USB drive is not compatible with MCP drivers (only FAT32 is supported in this release).

d. Device(s) busy (some other process is using the device(s)).

```

=====
Gateway Settings Menu

USB not mounted. Insert USB device and select Yes to initiate auto-mounting [Y/N]: y

Initiating auto-mounting. Please wait...

Could not auto-mount USB.

Possible reasons:

    1. No USB drive inserted into one of the available slots.
    2. The inserted USB drive is malfunctioning.
    3. The inserted USB drive is not compatible with G500 drivers.
    4. Device(s) busy (some other process is using the device(s)).

Press ENTER Key to continue...

```

o On Success:

- If Single USB is Present, then the list of Clone Snapshots will be listed or If no snapshots are present, then folder EMPTY message will be displayed.
- If More than one USB is detected, then the list of detected USBs will be listed. On Selection of the USB, the list of Clone Snapshots present in the USB will be listed. If no snapshots are present, then folder EMPTY message will be displayed.

If USB is already mounted successfully:

- o If Single USB is Present, then the list of Clone Snapshots will be listed or If no snapshots are present, then folder EMPTY message will be displayed.
 - o If More than one USB is detected, then the list of detected USBs will be listed. On Selection of the USB, the list of Clone Snapshots present in the USB will be listed. If no snapshots are present, then folder EMPTY message will be displayed.
- 3) Once the snapshot is selected, user checks the below conditions and then copy the file to MCP for restoring to the device.
- o Checks for *. MCPCloneSnapshot.DS7zip extension
 - o Clone snapshots are password protected; It will provide 3 attempts for user to enter the correct password
 - o Checks for schema version of the clone snapshot matches with the device schema version
 - o Replace the existing configuration and settings with the new ones from the selected clone snapshot
- 4) Automatic reboot of the device takes place to make the changes effective.

Restore Clone Snapshot with correct password

In this scenario, User connects a USB to device with file/files with extension *.MCPClonesnapshot.DS7zip and enters correct password.

```

Restore to Factory Default

A root user or a super (“sudo”) user can restore a MCP to the factory default (or “clean”) configuration.

When restored to default factory settings, all user configuration files, and system settings will be lost.

In case all root / administrator user credentials have been lost, and the MCP cannot be accessed with these roles – the MCP can be restored to a clean and defaulted state using an external USB workflow; for detailed steps, refer to the technical note: *TN0116 MCP Firmware Upgrade and Restore to Defaults Workflows*.

Factory default of current configuration

Once the command is initiated, user will be prompted with confirmation message whether to proceed with Restore Operation or not.

On confirmation, Warning message prompts with the information of that is going to be lost by user during restore process and Re-confirmation will be prompted.

Here the user still has the possibility of exiting the current operation and go back to the Gateway Main Settings Menu.

- On yes, the following operations will be performed in background:
 - o All the content and container's will be cleaned up.
 - o Reboot will be triggered automatically.
 - o On Reboot, the system will be set to factory default settings.

Below screenshot refers to the "Restore to factory default settings screen that is been explained above:

```

```

Reboot device

This option allows user to reboot the MCP unit.

To reboot the MCP unit:

1. Log into the MCP Utilities page.

Result: The **MCP#>>** command prompt appears.

2. Type mcpcfg and press **Enter**.

Result: The **Gateway Configuration Utility Menu** appears.

3. Select the option to **Reboot Device**.

Result: The following prompt appears: **Do you want to reboot Gateway? [Y/N]:**

If you enter **Y**, then **MCP unit will start rebooting**.

If you enter **N**, then it navigates back to earlier menu.

The user can reboot the unit using the following command “mcpreboot” at the command prompt.

```

Chapter 5 - MCP Settings GUI

Introduction

This chapter provides settings instructions to users of **MCP Settings GUI Web Interface**.

This interface is the Web based equivalent of the [Chapter 4 - MCP Local Configuration Utility \(mcpcfg\)](#).

The functionality of the system is identical as when settings are performed via MCP Local Configuration Utility (mcpcfg). The difference is only this is a Web based GUI.

Only one instance is allowed to run at any given time across both “mcpcfg” and “MCP Settings GUI”. When a second concurrent instance is attempted to run and is confirmed – the first instance will be closed automatically.

How to access/logout

- Login – Local MCP
- Login – Remote MCP
- Initial Setup
- Logout

MCP Settings Workflows

- Configure Authentication
- Configure Network Settings
- Configure Network Interfaces
- Configure Firewall
- Configure Host Names
- Configure Time & Time Sync
- Reset System Logs
- Reset Database Tables
- Reset File Persistence Data
- Local HMI
- Configure Sync Manager
- Redundancy
- ARRM
- Suppress Forced Qualities To Masters
- Emulate D20 RTU IEC101 DPA Unbalanced Mode Functionality
- Configure IEC101+104 DPA Startup Quality Event Suppress Interval
- Configure Serial Port Modes (RS-232/485)
- Configure D.20 Port Settings
- EdgeOS Host
- Clear Chassis Intrusion State
- Restore Clone Snapshot
- Restore to Factory Default
- Reboot Device

How to access/logout

Users can access MCP Settings Web Interface through Local or Remote MCP connection. Remote access must be completed using a supported web browser (Internet Explorer, Microsoft Edge, Mozilla Firefox, Google Chrome). This section provides information on the following:

- [Login – Local MCP](#)
- [Login – Remote MCP](#)
- [Initial Setup](#)
- [Logout](#)

Login – Local MCP

1. Connect an available mouse/keyboard/monitor to the MCP.
2. Once the MCP device is powered up and has a valid license installed, click on the **MCP** name via the taskbar.
3. Click **System Settings**.

A default web browser will be opened showing **MCP Settings** Login screen.

Login – Remote MCP

1. Using a supported web browser, disable proxy and type the default IP 192.168.168.81 with port 8081 into the address bar and press the 'Enter key'. i.e., `https://192.168.168.81:8081`
2. User is required to **confirm security certificate** exception.

The **MCP Settings** Login screen is displayed.

Initial Setup

NOTE: Initial Setup section is identical between Local/Remote access.

1. Enter the default **Username** (defadmin), default **Password** (defadmin) and click **Login**.

2. If the defadmin account is used to login, you will be prompted to create an Administrator account in order to access the full mcpcfg menu. Click **OK**.

3. The Gateway Settings main menu appears:

4. Select **Configure Authentication** tab from main menu.

5. Select **Administrator Group Users** tab from Configure Authentication menu.

6. This function is used to perform the following actions:

- List Users
- Add User
- Change Password
- Remove User

7. Select **Add User** tab to create administrator-level users.

- Enter the desired **Username**, conforming to the username rules as listed below:
 - o Username must be between 2 and 31 characters.
 - o Username must start with a lowercase alphabetical character.
 - o Username must only contain [a-z][0-9][-._] characters.
- Enter the **Full Name** of the user.
- Enter the **Password**, conforming to the password security rules as listed below:
 - o Password must be between 8 and 199 characters in length
 - o Password must contain:
 - 1 character from [a-z]
 - 1 character from [A-Z]
 - 1 digit from [0-9]
 - 1 special character from the set [\$%@!&]

- **Re-enter password** and click **Confirm**.

A user registration form with the following fields: Username (admin), Full Name (admin), Password (masked with dots), and Re-enter Password (masked with dots and highlighted with a green border and a green checkmark). At the bottom right are 'Confirm' and 'Cancel' buttons.

Result: Pop-up window appears showing the Operation Status, click **OK**.

NOTE: defadmin account will be removed the next time you log in with the newly-created user and are signed out of all defadmin sessions.

An 'Operation Status' pop-up window with the message: 'New user successfully added. Your defadmin account will be removed the next time you log in with the newly created user and are signed out of all defadmin session(s).' and an 'Ok' button.

8. Navigate back to the main menu by clicking on the **HOME** link located at the upper left corner of the page.

A navigation bar showing 'Home' (highlighted with a red box), 'Configure Authentication', and 'Administrator Group Users'. Below is a list of links: Back, List Users, Add User, Change Password, and Remove User.

9. Select **Configure Network Interfaces** tab from main menu.

The 'Gateway Settings' main menu. It features the GE logo, the title 'Gateway Settings', and a 'Logged in as: defadmin' status with a 'Logout' button. A list of tabs is shown: 'Configure Authentication', 'Configure Network Interfaces' (highlighted with a red box), and 'Reboot Device' (highlighted with a red background).

10. Select the desired Network port (default 192.168.168.81) which is connected to MCP device from the list.

11. Select **Static IP Address** tab.

12. Select **Configure Adapter IP Address** tab.

13. Enter **IP Address** and **Subnet Mask**. Click **Confirm**.

The screenshot shows a form for entering IP Address and Subnet Mask. The 'IP Address' field contains '172.12.222.222' and the 'Subnet Mask' field contains '255.255.0.0'. Below the fields are two buttons: 'Confirm' and 'Cancel'.

14. Click **Yes** to confirm the newly-configured static IP settings.

NOTE: Reboot the device for changes to take effect.

A confirmation dialog box titled "Confirm". It displays the following information: "Newly configured static IP settings", "IP Address is: 172.12.222.222", "Netmask is: 255.255.0.0", and "Broadcast Address is: 172.12.255.255". Below this, it asks "For these settings to take effect, reboot" and "Do you wish to accept this?". At the bottom right, there are two buttons: "Yes" (blue) and "No" (grey).

15. Navigate back to main menu and select **Reboot Device** tab.

The "Gateway Settings" main menu. It features the GE logo on the left. On the right, it says "Logged in as: defadmin" with a green "Logout" button. In the center, there is a list of settings tabs: "Configure Authentication", "Configure Network Interfaces", and "Reboot Device". The "Reboot Device" tab is highlighted with a red background.

16. Click **Yes** to confirm Reboot the device.

A confirmation dialog box titled "Confirm". It asks "Do you want to reboot this device?". At the bottom right, there are two buttons: "Yes" (blue) and "No" (grey).

17. Type **"YES"** and click **Confirm**.

NOTE: Rebooting the device will cause it to disconnect from the network for a few minutes.

A confirmation dialog box titled "Confirm". It asks "Do you want to reboot this device?". Below the question, there is a yellow warning triangle icon and a red text message: "Rebooting this device will cause it to disconnect from the network for a few minutes." Below this, it says "Type 'YES' to confirm:" followed by a text input field containing the word "YES". At the bottom right, there are two buttons: "Confirm" (blue) and "No" (grey).

Result: The device reboot takes place. Click **OK**.

18. Upon MCP reconnect, users can access MCP Web Interface remotely via the newly-configured IP Address and a supported web browser. In the supported browser address bar, type in the new MCP device IP (ex.: **172.12.222.222**) as shown in figure below.

OR

19. Press the 'Enter key' and the MCP Settings Login page appears.
20. Login using the newly-created admin username/password and click on the "Login" button.
21. Select **Configure Time & Time Sync** tab.

22. Select **Set System Time Zone** tab.

23. Select **Set Time Zone** tab. Configure the MCP to the same time zone as remote PC.

24. Select applicable time zone. User can navigate the menu using Prev/Next buttons.

25. Select applicable region within the selected time zone.

Choose proper Time Zone File/Directory

Total number of entries [8] [*]-directories

Central	Eastern
Mountain	Newfoundland
Pacific	Saskatchewan
Yukon	

Prev Next Cancel

Result: The Operation Status dialog shows success message. Click **OK**.

Operation Status

Restarting the System Logger : Done

Search Time Zone

27. Select the **Set System Clock** tab.

28. A dialog is displayed informing the user to enter a date using the format **YYYY-MM-DD**. Enter **today's date** and select the **Confirm** button

Note: The Gateway system time is automatically set to the firmware build time whenever the Gateway reboots and the system time is less than the firmware build time during boot time.

Enter Date[YYYY-MM-DD]:

Confirm **Cancel**

29. A dialog is displayed informing the user to enter time, using the **24 Hr Format hh:mm:ss**. Enter **remote PC time** and select the **Confirm** button

Enter Time (24 Hr Format) [hh:mm:ss]:

Confirm **Cancel**

Result: The Operation Status dialog shows success message. Click **OK**.

Operation Status

The System time is successfully updated to 2020-02-14 06:45:22.....

Ok

Logout

To logout, click on the link to “Logout” located at the upper right corner of the page as shown in figure below.

When you have successfully logged-out of the system, the screen below will be displayed.

Note that after 20 minutes of inactivity, the session is automatically timed out and a message will be displayed as shown in below figure. In such cases, either click on “OK” and login again or click on any of the links to be redirected to the log in page.

MCP Settings Workflows

1. Users who have previously configured MCP device IP must login by:
 - Entering their Username.
 - Entering their Password.
 - Selecting Login to advance to the next screen and begin using the application.

The image shows a login screen for the MCP Settings GUI. It has a blue background with rounded corners. At the top center is the GE logo. Below the logo, the text "MCP Settings" is displayed in white. Underneath, there are two input fields: the first is labeled "Username" with a person icon to its left, and the second is labeled "Password" with a lock icon to its left. At the bottom center, there is a green button with the text "Login" in white.

2. Once you have logged in to the MCP Settings, you can see a menu on the center and Logout option on the top right of the screen. To explore the MCP settings use the menu options shown on the home page:

Configure Authentication

1. Click **Configure Authentication** from the main menu.

2. Click **Back** to return to the **Main Menu**.

Root Administrator Settings

1. Click **Root Administrator Settings** tab.

2. Click Change Root Password to change the password associated with the system root user account.

3. Change Password:
 - Password cannot contain the user's account name or parts of the user's full name that exceed two consecutive characters.
 - Password must be at least 8 characters in length.
 - Password must contain characters from all the following four categories:
 - o Should contain at least 1 character from [a-z]
 - o Should contain at least 1 character from [A-Z]
 - o Should contain at least 1 digit from [0-9]
 - o Should contain at least 1 special character from set [\$%@!&]

- Re-enter password.

Ok		

5. Click **Add User** tab.

Home > Configure Authentication > Administrator Group Users

Back
List Users
Add User
Change Password
Remove User

6. Enter the desired **Username**, conforming to the username rules as listed below:
- Username must be between 2 and 31 characters.
 - Username must start with a lowercase alphabetical character.
 - Username must only contain [a-z][0-9][-,_] characters.
7. Enter the **Full Name** of the user.
8. Enter the **Password**, conforming to the password security rules as listed below:
- Password must be between 8 and 199 characters in length
 - Password must contain:
 - o 1 character from [a-z]
 - o 1 character from [A-Z]
 - o 1 digit from [0-9]
 - o 1 special character from the set [\$%@!&]

- Re-enter password and click **Confirm**.

A user registration form with the following fields and error messages:

- Username**: A text input field with a blue border. Below it, red error messages state: "Please enter the field", "Username must be between 2 and 31 characters", "Username must start with a lowercase alphabetical character", and "Username must only contain [a-z][0-9][-_] characters".
- Full Name**: A text input field.
- Password**: A text input field with a blue border. Below it, red error messages state: "Please enter the field", "Password must be between 8 and 199 characters in length", and "Password must contain:
 - 1 character from [a-z]
 - 1 character from [A-Z]
 - 1 digit from [0-9]
 - 1 special character from the set [!&@%\$]".
- Re-enter Password**: A text input field with a red border and a red 'X' icon on the right. Below it, a red error message states: "Passwords must match".

At the bottom right are two buttons: "Confirm" (disabled, grey) and "Cancel" (active, dark grey).

9. Click **Confirm**.

The same user registration form as above, but with the following changes:

- Username**: The input field now contains the text "admin".
- Full Name**: The input field now contains the text "admin".
- Password**: The input field now contains seven dots ".....".
- Re-enter Password**: The input field now contains seven dots "....." and has a green border with a green checkmark icon on the right.

The "Confirm" button is now active and blue, while the "Cancel" button remains grey.

Result: Pop-up window appears showing the Operation Status, click **OK**.

A pop-up window titled "Operation Status" with a light grey background. It contains the message "New user successfully added." and a single blue button labeled "Ok" at the bottom.

10. Click **Change Password**.

Re-enter password

✔

Confirm Cancel

13. Re-enter password and click **Confirm**.

The 'Change User Password' dialog box contains three input fields: 'Username' with a dropdown menu showing 'admin', 'Password' with masked characters and a green checkmark, and 'Re-enter password' with masked characters and a green checkmark. At the bottom right are 'Confirm' and 'Cancel' buttons.

Result: Pop-up window appears showing the Operation Status: **Successfully changed the Password of User**, click **OK**.

The 'Operation Status' pop-up window displays the message 'Successfully changed the password of admin' and features a single 'Ok' button at the bottom.

14. Click **Remove User** tab.

The 'Administrator Group Users' menu shows a list of options: 'Back', 'List Users', 'Add User', 'Change Password', and 'Remove User'. The 'Remove User' option is highlighted with a red rectangular border.

15. Enter the Username which needs to be removed and click **Confirm**.

The 'Remove User' dialog box has a 'Username' input field containing the text 'admin'. It includes 'Confirm' and 'Cancel' buttons at the bottom right.

Result: Pop-up window appears showing message “**Successfully deleted user : <Username>**”

The pop-up window displays the message 'Successfully deleted user : admin' and contains an 'OK' button.

16. Click **OK**.

Emergency Group Users

1. Click **Emergency Group Users** tab.

2. This function allows user to add/delete/modify emergency users for MCP. Adding emergency user is mandatory before changing the authentication from Local to Remote (LDAP / TACACS) Authentication. This emergency user can be used when remote authentication server is not available, and user is not able to access MCP with remote authentication. In this case emergency administrator user will be allowed to login MCP and perform two key functions:

Note: Starting with MCP V520, Cisco® TACACS+ is no longer available.

3. Change the mode authentication from remote to local mode.
 4. Generate emergency code to login HMI without changing authentication from remote to local mode.
- User can perform above two functions by using “**emergcfg**” command after login emergency user on any of the below three interfaces:
1. SSH session to MCP (Port-922).
 2. Serial maintenance port connection to MCP (Baud Rate- 115200).
 3. MCP Emergency option in local console (KVM).

5. Click **List Users** tab to view the **Emergency Group Users**.

6. A **Table** appears showing the **Emergency Group User's** list.

Table		
User Name	UID	Full Name
1. emergencyuser	1005	Emergency User
Ok		

7. If no users are added, then a pop-up window appears showing a message “**No users in the Emergency group found.**” Click **OK**.

8. To add new emergency user, click **Add User** tab.

9. Enter the desired Emergency Group **Username**, conforming to the emergency group username rules as listed below:

- Emergency Group Username must be between 2 and 31 characters.
- Emergency Group Username must start with a lowercase alphabetical character.
- Emergency Group Username must only contain [a-z][0-9][-,_] characters.

10. Enter the **Full Name** of the emergency group user.

11. Enter the **Password**, conforming to the password security rules as listed below:

- Password must be between 8 and 199 characters in length
- Password must contain:
 - o 1 character from [a-z]
 - o 1 character from [A-Z]
 - o 1 digit from [0-9]
 - o 1 special character from the set [\$%@!&]
 - o Re-enter password and click **Confirm**

The image shows the "Add User" form in the MCP Settings GUI. It contains four input fields: "Username" with the value "emergencyuser", "Full Name" with the value "Emergency User", "Password" with masked characters "*****", and "Re-enter Password" with masked characters "*****". A green checkmark is visible in the "Re-enter Password" field, indicating the passwords match. At the bottom right of the form are two buttons: "Confirm" (blue) and "Cancel" (grey).

Result: Pop-up window appears showing the Operation Status: **New user successfully added**, click **OK**.

Operation Status

New user successfully added.

Ok

12. Select **Change Password** tab to modify the password of existing emergency user.

Change Password
Remove User

13. Select the **Emergency Group Username** from the drop-down list.

14. Enter the **Password**, conforming to the password security rules.

Change User Password

Username

Password

Re-enter password

Confirm Cancel

Password cannot contain the user's account name or parts of the user's full name that exceed two consecutive characters

Password must be at least 8 characters in length

Password must contain characters from all of the following four categories:

- Should contain at least 1 character from [a-z]
- Should contain at least 1 character from [A-Z]
- Should contain at least 1 digit from [0-9]
- Should contain at least 1 special character from set [\$%&!&]

15. Re-enter password and click **Confirm**.

Operation Status

Successfully changed the password of emer

Ok

16. Click **OK**.
17. Select **Remove User** tab to delete the existing emergency user.

18. Enter **Emergency Group Username** which needs to be removed and click **Confirm**.

A 'Remove User' dialog box. It has a title bar 'Remove User'. Below the title bar is a text input field labeled 'Username' containing the text 'emergencyuser'. At the bottom right of the dialog are two buttons: 'Confirm' (in blue) and 'Cancel' (in grey).

Result: A pop-up window appears showing a message “**Successfully deleted user : <Emergency Group User>**”, click **OK**.

19. To navigate back to the **Main Menu**, click on the **Home** link which is located at the upper left corner of the page as shown in figure below.

Configure Network Settings

1. Click **Configure Network Settings** tab from the main menu.

2. Click **Current Settings** tab to view the current **Network Settings**.

Current Settings

Result: A pop-up window appears showing the **Current Network Settings**. Click **OK**.

Enable IP Forwarding

1. Click **Enable IP Forwarding** tab.

Result: A pop-up message appears showing the **Operation Status**. Click **OK**.

Enable ICMP Echo

1. Click **Enable ICMP Echo** tab (Disabled by Default).

Result: A pop-up message appears showing the **Operation Status: Successfully enabled ICMP echo**, click **OK**.

Configure Machine Host Name

1. Click **Configure Machine Host Name** tab.

2. Enter new Machine Name [MCP] : **<new machine name>** and click **Confirm**.

A form titled "Enter new Machine Name [G500] :". It has a text input field containing "G500GW". Below the field are two buttons: "Confirm" (blue) and "Cancel" (gray).

Result: A pop-up message appears showing the **Operation Status**, click **OK** and reboot for changes to take effect.

3. Click **Back** or click on the **Home** link which is located at the upper left corner of the page as shown in figure below to navigate back to the **Main Menu**.

Configure TCP Keepalive Time

1. Click Configure TCP Keepalive Time and then click on the TCP Keepalive Time. The default is 20sec.

The screenshot shows the 'Gateway Settings' page. At the top left is the GE logo. Below it, the breadcrumb path is 'Home > Configure Network Settings > Configure TCP Keepalive Time'. There is a 'Back' button and a text field labeled 'TCP Keepalive Time (10-7200s; default 20s)'.

2. Update the TCP Keepalive Time in secs in the below window.

The screenshot shows a window titled 'Enter the TCP Keepalive Time[10-7200s]:'. It contains a text input field with the value '30'. At the bottom right are 'Confirm' and 'Cancel' buttons.

Result: A pop-up message appears showing the Operation Status, click OK and reboot for changes to take effect.

The screenshot shows a pop-up window titled 'Operation Status'. The message inside says 'TCP Keepalive Time is successfully updated to 30 seconds.....'. At the bottom is a large blue 'Ok' button.

3. Click Back or click on the Home link which is located at the upper left corner of the page below to navigate back to the Main Menu.

Configure Network Interfaces

The Network Interface allows you to configure the settings for the MCP's network connections.

NOTE: The MCP must be rebooted to activate any changed network settings.

On first time use of MCP, user can login to web interface using default enabled network interface (G100 Net1 / G500 Net0 with IP: 192.168.168.81) with defadmin credentials. The user will then be prompted to create an admin user; who can then login later and continue to setup the MCP.

1. Click **Configure Network Interfaces** tab from the main menu.

2. You can see a menu showing the Network Interfaces on the screen. To explore them use the menu options shown on the Configure Network Interfaces page as shown below:

Net0 (G500 only)

1. Click **Net0** tab.

2. Click **Current Configuration** tab. Click **OK**.

3. Click **Static IP Address** tab.

4. Click **Configure Adapter IP Address** tab. Enter IP Address and Subnet Mask. Click **Confirm**.

5. A pop-up message appears showing the newly-configured static IP settings, click Yes to accept it and reboot the device for changes to take effect or click No to abort the changes.
6. Click Configure Active IP Address (for redundancy) tab from the Net0 > Static IP Address menu.
7. Enter IP Address, Subnet Mask and click Confirm.
8. A pop-up message appears showing the newly-configured static IP settings, click Yes to accept the settings or No to abort the settings.
9. Click Configure Alias IP Address (alternate subnet) tab from the Net0 > Static IP Address menu.
10. Enter IP Address, Subnet Mask and click Confirm.
11. A pop-up message appears showing the newly-configured static IP settings, click Yes to accept the settings or No to abort the settings.
12. Click Back to navigate to Net0 menu.
13. Click Dynamic Address tab from the Net0 menu.

14. A pop-up message appears if the Static IP Address is already configured, click Yes to remove static IP Address and enable dynamic address.

15. A pop-up message appears to enable dynamic addressing for Net0.

- Click Yes to enable.

- Click No to keep static IP settings.

16. Click Network Zone tab from the Net0 menu.

17. Click Yes to move the Net0 interface from Internal to External zone.

18. A WARNING message appears stating that all the interfaces VLANs will be assigned to the External zone.

- Click No to abort the operation.
- Click Yes to continue the operation and click OK.

19. Navigate Back to Net0 menu and click VLAN.

20. Click Create VLAN tab.

- Enter new VLAN ID (2-4094).

- A pop-up message appears to confirm the VLAN used for adapter.

A dialog box titled "Confirm" with a light gray background. It contains the text "Is this VLAN used for Adapter?" and two buttons at the bottom right: "Yes" (blue) and "No" (gray).

- - o Network Interface message appears, select address type: Static or Dynamic IP Address.

A dialog box titled "Network Interface : Net0/VLAN2222". It contains the text "Select address type:" and three blue buttons: "Static IP Address", "Dynamic IP Address", and "Cancel".

- - o Enter the IP Address and Subnet Mask credentials and click Confirm.
 - o A confirmation message appears showing the newly-configured IP settings, click Yes to accept it and reboot the device for changes to take effect or click No to abort the changes.

Result: VLAN ID created, click OK.

21. Navigate back to VLAN menu and click Remove VLAN.

22. Select the VLAN ID which needs to be removed from the list shown on the screen.

23. Click Yes to confirm or No to abort.

Result: Operation Status appears on the screen based on your action.

24. Navigate back to VLAN menu and click Update VLAN.

25. For updating the VLAN IP Address, click Update IP Address and select address type: Static or Dynamic IP Address.

26. Enter the IP Address and Subnet Mask credentials and click Confirm.

27. A confirmation message appears showing the newly-configured IP settings, click Yes to accept it and reboot the device for changes to take effect or click No to abort the changes.

Result: VLAN ID created, click OK.

28. Click Network Zone to check the current status of VLAN and select Yes or No to move the interface from External zone to Internal zone and vice-versa.

29. Navigate back to VLAN menu and click Remove VLAN.

30. Select EGRESS Priority Mapping and select the VLAN ID from the list.

31. Select Current Configuration to view the socket priority.

32. Select Set Priority Mapping and enter the value based upon the credentials listed below and click Confirm.

- 7 (Highest) - Network management
- 6 - Voice
- 5 - Video
- 4 - Controlled load
- 3 - Excellent effort
- 2 - Undefined

- 1 (Lowest) - Background
- 0 (Routine) - Best effort

33. Navigate back to VLAN menu and click Remove VLAN.
34. Select Ethernet Reorder Header Flag (Debugging) and select the VLAN ID.
35. Click Yes to set VLAN Ethernet reorder header flag or No to abort.
36. Navigate Back to Net0 menu and select Remove Configuration.
37. Click Yes to take Net0 Settings Backup or No to continue.
38. A confirmation message appears showing the Backup file location and the settings which will be removed for Net0. Click Yes to confirm or No to abort.
Result: A message appears showing the Operation Status: Net0 successfully assigned into its default network zone.
39. Click OK and reboot the device for changes to take effect.

D2x Configured LAN ports

Starting with MCP version 4.00 is possible to enable and configure D2x applications which use LAN ports (LAN-A, LAN-B, LAN-C, LAN-D).

When LAN ports are configured in the D2x environment – the corresponding Net interfaces (Net1, Net2, Net3, Net4 - respectively) will show “by D2x” in the address field and will be under the control of the D2x configuration in pairs.

Refer to the [Chapter 7 – D2x Configuration and Operation](#) for details.

The G500 Network Modes are still controlled by “mcpcfg” utility.

Below table summarizes the effect on Netx ownership based on D2x LAN selections:

<i>D2x LAN choices</i>				<i>MCP Netx ownership</i>			
LAN A	LAN B	LAN C	LAN D	Net1	Net2	Net3	Net4
Yes	Any	No	No	By D2x	By D2x	By MCP	By MCP
Any	Yes	No	No	By D2x	By D2x	By MCP	By MCP
No	No	Yes	Any	By MCP	By MCP	By D2x	By D2x
No	No	Any	Yes	By MCP	By MCP	By D2x	By D2x
No	No	No	No	By MCP	By MCP	By MCP	By MCP

Other Network Interfaces

Note for G100:

The following limitations exist for G100 Redundant LAN. Please refrain from using unsupported functionalities.

1. An Active IP cannot be configured on a Redundant LAN interface.
2. The Static IP of a Redundant LAN interface cannot be used as the PEER IP used for pairing a Hot-Hot MCP system.
3. VLAN's cannot be configured on a Redundant LAN interface.
4. DHCP cannot be configured on a Redundant LAN interface.
5. Only one Redundant LAN interface can be configured, either on Net 1/Net 2 or on Net 3/Net 4.

Despite limitations 1 and 2, G100 Redundant LAN can be used in a Hot-Hot G100 system. For example, a valid configuration for a Hot-Hot G100 system would be the following:

- Net 1 and Net 2 configured as Single LAN Interfaces, each having an Active and Static IP.
- PEER IP using either Net 1 or Net 2 Static IP of the peer G100.
- Net 3 and Net 4 configured as a Redundant LAN interface with only a Static IP.

Note that limitations 1 and 2 imply that in a Hot-Hot G100 redundant system, only the following applications can communicate over the Redundant LAN interface.

- DNP 3.0 Network Client
- IEC 61850 Client and Server
- Modbus TCP Client

The reason is that these applications will use the Static IP of the interface when communicating in Hot-Hot mode.

Typical failover time for G100 Redundant LAN is 3 seconds. Better performance can be expected with the G500 Redundant LAN.

Steps:

1. Navigate Back to Configure Network Interfaces menu and select Net1-Net2.

2. Select Single tab and click Yes to change the mode for Net1-Net2.

Result: Operation Status – Net1-Net2 Mode is updated to Single. Click OK.

3. Select Redundant tab from Net1-Net2 menu;

- Until V4.0 release, Redundant LAN is supported only in G500, is not supported in G100.
- From V4.1 release onwards, Redundant LAN is supported in both G500 and G100, only one Net Pair being redundant for G100.

When configuring **Redundant LAN in G100**, please follow these additional steps:

I. Select option **Redundant**.

NOTE: If the other Net Pair is already configured in Redundant mode, a message will appear to remove that configuration first as only one Redundant pair can be configured in G100.

II. This action shall **remove both Net1 and Net2 configuration** and enables Redundant mode.III. Click **Current/Edit Configuration** tab.

IV. The “**ARP Monitoring Peer IP List (Required)**” parameter specifies the IP Addresses to use as ARP monitoring peers when Redundant LAN is enabled. This parameter **must** be configured for G100 Redundant LAN to function. When you select “ARP Monitoring Peer IP List (Required)”, you will be given two further parameters:

- i. Peer IP #1 (Required)
- ii. Peer IP #2 (Optional)

Gateway Settings

Home > Configure Network Interfaces > Net1-Net2 > Current/Edit Configuration > ARP Monitoring Peer IP List (Required)

Back
Peer IP #1 (Required): <Not Set>
Peer IP #2 (Optional): <Not Set>

ARP Monitoring Peer IP List (Required) parameters are the IP addresses of the designated peer devices on the local network to which the G100 sends periodic (once per second) ARP requests to determine the health of both links used in the Redundant LAN mode.

At least “Peer IP #1 (Required)” must be configured. Configure “Peer IP #2 (Optional)” to increase the reliability of the Redundant LAN functionality. It will ensure the G100 can detect the health of the link even if Peer IP #1 goes down temporarily.

The G100 must be able to reach the designated peer devices at the data link layer (Layer 2) on both interfaces of the Redundant LAN. This involves ensuring that the designated peer devices are part of the same broadcast domain as the Redundant LAN interface and can communicate with the G100 without needing to route traffic through a Layer 3 device.

Note: In G100 you must configure the “Static IP Address” before configuring the “ARP Monitoring Peer IP List”, else a message is prompted to configure “Static IP Address” first.

4. Select PRP tab from Net1-Net2 menu

- PRP is supported only in G500, is not supported in G100.

Select Current/Edit Configuration and select specified network interface.

Note: Refer to the [Chapter 9 - EdgeManager and PETC](#) for port availability and additional information.

Home > Configure Network Interfaces > Net1-Net2 > Current/Edit Configuration > Net2

Back
Current Configuration
Static IP Address
Dynamic Address
Network Zone
EdgeManager Connectivity Configuration
VLAN
Remove Configuration

5. Select Current Configuration to view the IP details and click OK.

The screenshot shows a window with the following text:

Interface: PRP3
Network Zone: Internal
Address Type: static

ADAPTER IP Details
IP Address: 172.13.222.222
Netmask: 255.255.0.0
Broadcast Address: 172.13.255.255

ACTIVE IP Details
 You need to configure an active IP Address!

ALIAS IP Details
 You have not configured an alias IP Address.

At the bottom is a large blue button labeled **OK**.

6. Select Static IP Address to perform the following operations:
- Configure Adapter IP Address
 - Configure Active IP Address (optional for non-redundant units, required for redundancy) – Not available in G100
 - Configure Alias IP Address (optional, for IP on alternate subnet)
7. Select the specified option as per your requirement and enter the IP Address and Subnet Mask credentials and select Confirm to proceed.
8. Navigate back to Current/Edit Configuration menu and select Dynamic Address.
9. If the static IP Address is already configured, then a confirmation message appears to remove static IP Address and enable dynamic address.

The screenshot shows a dialog box titled **Confirm**. The text inside says: "Do you want to remove static IP Address and enable dynamic address?". At the bottom right, there are two buttons: a blue **Yes** button and a grey **No** button.

- Click No to abort.
 - Click Yes to Enable Dynamic Addressing for a specific Network Interface Mode.
 - Click Yes to confirm.
- Result:** Operation Status – Dynamic Addressing enabled for a specific Network Interface mode.
10. Click Network Zone to check the current status of Network Interface and select Yes or No to move the Interface from External zone to Internal zone and vice-versa.

11. Navigate Back to Net1-Net2 > Current/Edit Configuration menu and click EdgeManager Connectivity Configuration.

12. This function enables you to configure:

13. Select Current EdgeManager Configuration tab to view available configuration for EdgeManager Connectivity.
14. Select Configure EdgeManager Static IP Address tab and enter IP Address and click confirm:

Enter IP Address :

Confirm Cancel

15. Enter Netmask and click confirm:

Enter Netmask :

Confirm Cancel

16. Enter Gateway and click confirm:

Enter Gateway :

Confirm Cancel

17. Click Yes to accept the changes and reboot the device for the settings to take effect or No to abort:

Confirm

Newly-configured EdgeManager configuration is as below

IP Address : 172.12.222.22

Netmask : 255.255.0.0

Gateway address : 172.12.222.22

For these settings to take effect, reboot the device

Do you wish to accept this?

Yes No

18. Select Configure EdgeManager Dynamic IP Address tab from EdgeManager Connectivity Configuration menu:

Home > Configure Network Interfaces > Net1-Net2 > Current/Edit Configuration > Net2 > EdgeManager Connectivity Configuration

Back
Current EdgeManager Configuration
Configure EdgeManager Static IP Address
Configure EdgeManager Dynamic IP Address
EdgeManager Remove Configuration

19. Click Yes to Enable EdgeManager Dynamic Addressing for selected port, or No to abort:

Confirm

Enable EdgeManager Dynamic Addressing for Net2?

Yes No

Result: Operation Status window appears stating the Dynamic Addressing enabled for EdgeManager Interface for the selected port.

Note: Reboot the device for the settings to take effect.

20. Select EdgeManager Remove Configuration tab from EdgeManager Connectivity Configuration menu:

Home > Configure Network Interfaces > Net1-Net2 > Current/Edit Configuration > Net2 > EdgeManager Connectivity Configuration

Back
Current EdgeManager Configuration
Configure EdgeManager Static IP Address
Configure EdgeManager Dynamic IP Address
EdgeManager Remove Configuration

21. Click Yes to continue or No to abort:

A dialog box titled "Confirm" with the question "Do you want to continue?". At the bottom right, there are two buttons: "Yes" (blue) and "No" (grey).

- If Yes, the configuration is removed, reboot the device for changes to take effect. Click Ok.

A dialog box titled "Operation Status" with the text "Configuration Removed...." and "Reboot the device for changes to take effect". At the bottom center, there is a blue button labeled "Ok".

22. Navigate Back to Net1-Net2 > Current/Edit Configuration menu and click VLAN.

A navigation menu with the breadcrumb "Home > Configure Network Interfaces > Net1-Net2 > Current/Edit Configuration > Net2". Below the breadcrumb is a list of options: "Back", "Current Configuration", "Static IP Address", "Dynamic Address", "Network Zone", "EdgeManager Connectivity Configuration", "VLAN", and "Remove Configuration". The "VLAN" option is highlighted.

23. Click Create VLAN tab.

- Enter new VLAN ID (2-4094).
- A pop-up message appears to confirm the VLAN used for adapter.

A dialog box titled "Confirm" with the question "Is this VLAN used for Adapter?". At the bottom right, there are two buttons: "Yes" (blue) and "No" (grey).

- o Network Interface message appears, select address type: Static or Dynamic IP Address.

- o Enter the IP Address and Subnet Mask credentials and click Confirm.
- o A confirmation message appears showing the newly-configured IP settings, click Yes to accept it and reboot the device for changes to take effect or click No to abort the changes.

Result: VLAN ID created, click OK.

24. Navigate back to VLAN menu and click Remove VLAN.

25. Select the VLAN ID which needs to be removed from the list shown on the screen.

26. Click Yes to confirm or No to abort.

Result: Operation Status appears on the screen based on your action.

27. Navigate back to VLAN menu and click Update VLAN.

28. Select the VLAN ID which needs to be removed from the list shown on the screen.

29. For updating the VLAN IP Address, click Update IP Address and select address type: Static or Dynamic IP Address.

30. Enter the IP Address and Subnet Mask credentials and click Confirm.

31. A confirmation message appears showing the newly-configured IP settings, click Yes to accept it and reboot the device for changes to take effect or click No to abort the changes.

Result: VLAN ID created, click OK.

32. Click Network Zone to check the current status of VLAN and select Yes or No to move the interface from External zone to Internal zone and vice-versa.

33. Navigate back to VLAN menu and click Remove VLAN.

34. Select EGRESS Priority Mapping and select the VLAN ID from the list.

35. Select Current Configuration to view the socket priority.

36. Select Set Priority Mapping and enter the value based upon the credentials listed below and click Confirm.

- 7 (Highest) - Network management
- 6 - Voice
- 5 - Video
- 4 - Controlled load
- 3 - Excellent effort
- 2 - Undefined
- 1 (Lowest) - Background
- 0 (Routine) - Best effort

37. Navigate back to VLAN menu and click Remove VLAN.

38. Select Ethernet Reorder Header Flag (Debugging) and select the VLAN ID.
39. Click Yes to set VLAN Ethernet reorder header flag or No to abort.
40. Navigate back to Net1-Net2 > Current/Edit Configuration and select Remove Configuration.
41. Click Yes to take Network Interface Mode Settings Backup or No to continue.
42. A confirmation message appears showing the Backup file location and the settings which will be removed for that Network Interface. Click Yes to confirm or No to abort.
Result: A message appears showing the Operation Status: Net1 successfully assigned into its default network zone.
43. Click OK and reboot the device for changes to take effect.
44. Navigate back to Configure Network Interfaces menu and follow the same Net1-Net2 procedure for configuring Net3-Net4 Default Gateway

Default Gateway

1. Navigate back to Configure Network Interfaces menu and select Default Gateway tab.

2. Select Configure Adapter Default Gateway.

For G100, when Redundant LAN is enabled, the interface shows up as RLAN0 in the Adapter list.

3. Select new gateway interface (adapter) from the list and enter the Gateway IP Address and click Confirm.

NOTE: Create an Adapter configuration for Network Interface mode before adding a gateway for it.

Result:

4. Click OK and reboot the device for changes to take effect.

Custom Routing

1. Navigate back to the Configure Network Interfaces menu and select Custom Routing.

2. Select Add Custom Route and enter destination IP Address and click Confirm.
3. A message appears to confirm the destination IP and individual host.
 - Click No and enter the Subnet mask and click confirm or click Yes to continue.
 - Click Yes to add the specified route to an interface.
 - A pop-up window appears showing the network details.

- Click **Confirm**
4. Navigate back to Custom Routing menu and select Delete Custom Route.
 5. Select the Network Interface which needs to be deleted and click Confirm.

Network Summary

1. Navigate back to Configure Network Interfaces and select Network Summary.
2. A message appears showing the Network Interface Adapter IP, Address type, Network Zone and EdgeOS Host Details. Click OK.

The dialog box displays network configuration details for two interfaces, Net0 and Net1, and provides summary information for the EdgeOS Host and EdgeOS Manager.

Interface	Adapter IP	Static	Internal Zone
Net0	172.12.222.222/16	Static	Internal Zone
Net1	172.11.236.215/16	Static	Internal Zone

EdgeOS Host Details
Net0 IP: 192.168.168.82
Subnet: 255.255.255.0

EdgeOS Manager Details
Net1 IP: 172.11.236.251
Subnet: 255.255.0.0

Ok

NOTE: For G100, when Redundant LAN is enabled, the interface shows up as RLAN0 in the Network Summary. The EdgeOS Host interface remains only on a single Net even though the Net1-2 physical ports are redundant.

The dialog box displays network configuration details for the RLAN0 interface and provides summary information for the EdgeOS Host.

Interface	Adapter IP	Static	Internal Zone
RLAN0	172. [REDACTED]/16	Static	Internal Zone

EdgeOS Host Details
Net1 IP: 192.168.168.82
Subnet: 255.255.255.0

Ok

Configure Secure Access

1. Select Configure Secure Access tab from main menu.

Current Configuration

1. Select Current Configuration tab from Configure Secure Access menu.

2. A message appears showing the Secure Access parameters:

3. Click **OK**.

Configure SSH Service

Note: Before MCP v5.40: Use this function to enable or disable access via SSH.

Note: Starting with MCP v5.40 - this setting is not available, instead please use Custom Firewall Rules to control SSH_Inbound on TCP port 22.

1. Select Configure SSH Service from Configure Secure Access menu.
 - Select Yes to close the current SSH session and disable SSH:

- Select No to abort.

Configure SFTP Service

Note: Before MCP v5.40: Use this function to enable or disable access via SFTP/SCP.

Note: Starting with MCP v5.40 - this setting is not available, instead please use Custom Firewall Rules to control SSH_Inbound on TCP port 22.

1. Select Configure SFTP Service tab from Configure Secure Access menu.

NOTE: The SSH service must be Enabled to change SFTP configuration.

- Select Yes to close current SSH session and Enable SFTP.

Result: Operation Status – Completed.

Configure Emergency Access Ports

1. Select Configure Emergency Access Ports.

2. Select access ports from the list to configure and click OK once updated successfully.

Configure Remote HMI Non Observer Privileges

1. Navigate back to Configure Secure Access menu and select Configure Remote HMI Non Observer Privileges tab.
2. A message appears showing the current status of Remote HMI Non Observer privileges whether Enabled or Disabled. Select Yes to change the mode from one state to another or No to abort.

Result: If Yes, Operation Status – Settings have been saved and applied. Click OK.

Configure Rsyslog Service

1. Navigate back to Configure Secure Access menu and select Configure Rsyslog Service tab.

2. Select Current Settings to view Receiving Remote Logs via UDP/TCP and Assigned UDP/TCP port no's. Click OK.

3. Select Configure Rx via UDP from Configure Rsyslog Service menu to Enable/Disable Rsyslog Logging service and Edit UDP Port number.
4. Select Enable/Disable Rsyslog Service to view the current Rsyslog remote-host message reception service via UDP status (Enable/Disable) and select Yes to change its state accordingly or select No to abort.

5. Select Edit UDP Port number to view the current port number configured and select Yes to configure different port or No to continue with same port.

NOTE:

- It is recommended to use the Default 514 port.
- In case you really need to assign a new port number, ensure that no other Gateway applications/services are using the same port number.

Click Yes to assign new port number and enter the new port number and click Confirm.

6. Select Configure Rx via TCP from Configure Rsyslog Service menu to Enable/Disable Rsyslog Logging service and Edit TCP Port Number.
7. Select Enable/Disable Rsyslog Service to view the current Rsyslog remote logging service via TCP status (Enable/Disable) and select Yes to change its state accordingly or select No to abort.
8. Select Edit TCP Port number to view the current port number configured and select Yes to configure different port or No to continue with same port.

NOTE:

- It is recommended to use the Default 10514 port.
- In case you really need to assign a new port number, ensure that no other Gateway applications/services are using the same port number.

Click Yes to assign new port number and enter the new port number and click Confirm.

9. Select Configure Hosts/Subnet filters tab from Configure Rsyslog Service menu.

10. Select Current Settings to view Hosts/Subnets configured in allowed senders list.
11. Select Add Hosts/Subnets, select the listed Network Interfaces and enter Custom Filters by selecting IP Address and Subnet address.
NOTE: Use Custom filters when the IED IP add does not fall in the Configure Hosts-Subnets Filters listed available subnet range.
12. Select Delete Hosts/Subnets tab from Configure Hosts/Subnets filters menu and select the Hosts/Subnets from the list and select Yes to confirm.

Configure Firewall

1. Select Configure Firewall tab from main menu.

- A list of Firewall Rules appears on screen displaying Input/Output, protocol, port, interfaces, Mdf, type standby and status.

Enable Firewall ☒

Rule	I/O	Protocol	Port	Interfaces	Modified	Type	Standby	Status	Actions
HTTPS	IN	TCP	443	Internal	No	Generated	Enabled	Enabled	
DSASCONFIG_Inbound	IN	TCP	8082	Internal	No	Generated	Enabled	Enabled	
HTTP	IN	TCP	80	Internal	No	Generated	Disabled	Enabled	
SSH_Inbound	IN	TCP	22	Internal	No	Generated	Enabled	Enabled	
SSH_Outbound	OUT	TCP	22	All	No	Generated	Enabled	Enabled	
SSH_HOST_Inbound	IN	TCP	922	Internal	No	Generated	Enabled	Enabled	
SSH_HOST_Outbound	OUT	TCP	922	All	No	Generated	Enabled	Enabled	
MCPSettings_Inbound	IN	TCP	8081	Internal	No	Generated	Enabled	Enabled	
LDAP_Outbound	OUT	TCP	389	External	No	Generated	Enabled	Enabled	

« < 1 > »

- To Enable Firewall, click on the toggle switch icon on the top left of the window.

Enable Firewall ☒

- To Edit the firewall rule, click on the icon on the Actions column of a rule.

MCPSettings_Inbound IN TCP 8081 Internal Disabled Generated Enabled Enabled

Rule Name	MCPSettings_Inbound	Interfaces
I/O	IN	☐ Select All ☒ Internal ☐ External
Protocol	TCP	☒ net0 ☐ net3
Port	8081	☒ net2 ☐ net4
Status	Enabled	☒ net1 ☐ net5
Mdf	Disabled	☐ net6
Standby	Enabled	

- Select the Status of firewall rule from the dropdown list (Enable/Disable) and check in/out the Interfaces required and click Confirm.

Note: In G500: when a pair of interfaces is configured as PRP or Redundant – select (or un-select) both Net numbers within the pair (e.g. for PRP1 made of Net1-2 select/un-select Net1 and Net2).

6. To Add a New rule, select Add button on the bottom left
 - Select I/O,
 - Select Protocol type
 - o UDP – 0 to 65535
 - o TCP – 0 to 65535
 - o ICMP – 0 to 255
 - Select Status (Enabled/Disabled)
 - Check in the Interfaces required and click Confirm to add.
7. Only the Custom rules can be deleted. To Delete rules, click on the  icon on the respective rule. By default, the generated rules cannot be deleted.
8. Once all the changes are done, click Apply button on the bottom right of the page and restart the device for the changes to take effect.
9. Select Delete All Custom Rules to delete all custom rules except Generated Rules, select Apply and restart the device for the changes to take effect.

In the firewall screen, you will see the following columns:

Table 5-1: Firewall Screen Columns

Column	Description	Possible Values
Rule	Specifies the name of the Rule.	Combination of letters, numbers, hyphens, under-scores and forward slashes. Must start with a letter.
I/O	Specifies the type of direction (for Inbound or Outbound traffic).	IN OUT
Protocol	Specifies the type of the Protocol that the service will use.	TCP UDP ICMP
Port	Specifies the port(s) that the service will be listening on.	valid port number (1-65535) or range of valid port numbers (23-27) or comma-separated list of valid port numbers (21,22)
Interfaces	Specifies the list of allowed network interfaces for firewall rules to apply.	Internal External All selection
Modified	This flag specifies whether the default rules are modified or edited for a service. The default value for this flag is "No".	Yes No Default is "No"
Standby	Specifies whether the rule is enabled or not when the MCP device runs in Standby mode. If not specified or if this parameter is empty then "No" is assumed.	Yes "" Default is empty i.e., ""
Status	Indicates of the rule is enabled or not	Enabled Disabled
Actions	Buttons allowing user to Edit or Delete rule.	Automatically generated rules cannot be deleted. Only Custom rules can be deleted.

Configure Host Names

1. Select Configure Host Names from the Main menu.

2. This function enables you to Add/Delete/Modify a Host.

Add a new Host

1. Select Add a new Host tab from the Configure Host Names.
2. Enter Hostname, IP Address and click Confirm.

Result: Operation Status – Host <Hostname> added successfully. Click OK.

Delete a Host

1. Select Delete a Host and click on the host which needs to be removed.

Result: Deleted the selected host successfully. Click OK.

Modify a Host

1. Select Modify a Host tab from the Configure Host Names menu.
2. Select the Host which needs to be modified.

NOTE: Change in Host name will change Machine host name also.

- Click No to abort.
- Click Yes to continue and enter Host name, IP Address and click Confirm to save changes.
- Reboot the device for changes to take effect.

Delete all Hosts

1. Select Delete all Hosts tab from the Configure Host Names menu.
2. Click No to abort or Yes to delete all hosts.

Result: If Yes, all hosts deleted successfully, click OK.

View all Hosts

1. Select View all Hosts tab from the Configure Host Names menu.

Result: List of Hosts configured are displayed. Click OK.

Configure Time & Time Sync

1. Select Configure Time & Time Sync tab from the Main menu.

Configure Authentication
Configure Network Settings
Configure Network Interfaces
Configure Secure Access
Configure Firewall
Configure Host Names
Configure Time & Time Sync
Reset System Logs
Reset Database Tables
Reset File Persistence Data
Local HMI
Configure Sync Manager
Redundancy
ARRM
Suppress Forced Qualities To Masters
Configure Serial Ports
Configure D.20 Port Settings
EdgeOS Host
Clear Chassis Intrusion State
Restore Clone Snapshot
Restore Factory Default
Reboot Device

2. Configure Time & Time Sync options:

Note: “Set System Time Zone” should be the first step to be performed when configuring time settings. Reboot the MCP device after changing the Time Zone.

Show Time and Current Settings

1. Select Show Time and Current Settings tab.

Set System Clock

1. Select Set System Clock tab.

NOTE: The Gateway system time is automatically set to the firmware build time whenever the Gateway reboots and the system time is less than the firmware build time during boot time.

2. Enter Date in YYYY-MM-DD format and click Confirm.

3. Enter Time (24 Hr Format) in hh:mm:ss format and click Confirm.

Result: The System time is successfully updated according to the input credentials. Click OK.

Set System Time Zone

1. Select Set System Time Zone tab from Configure Time & Time Sync menu.

2. Select Show Current Time Zone to view current date, time and time zone.
3. Select Set Time Zone and choose proper Time Zone File/Directory from the list. Choose Previous, Next options to view all the available time zones.

Result: System Logger restarted; the time zone is successfully set to predefined zone.

NOTE: Restart Local HMI if it is running.

4. Select Search Time Zone and enter your specified time zone and click search to view the available time zones and select it accordingly.

Result: System Logger restarted, the time zone is successfully set to predefined zone.

NOTE: Restart Local HMI if it is running.

Select Time Source

This function enables you to configure which time source is active:

- PTP - not available in G100
- IRIG-B
- NTP

Only one time source can be enabled at a time.

PTP IN

NOTE: This feature is not supported in G100.

1. Select PTP tab to perform the following functions.
 - Enable/Disable
 - Domain
 - Priority 1
 - Priority 2
 - Profile
2. Select Enable/Disable tab to switch the mode accordingly.
3. Select Domain tab and enter configure PTP Domain value (0 - 255) and click Confirm.
4. Select Priority 1 and enter configure Priority 1 value (0-255) and click Confirm.
5. Select Priority 2 and enter configure Priority 2 value (0-255) and click Confirm.
6. Select Profile tab to view the current PTP Profile:

- Select required profiles available from the list to activate them and reboot the device for the changes to take effect.

IRIG-B IN

1. Navigate back to the Select Time Source menu from the Configure Time & Time Sync menu.

Home > Configure Time & Time Sync > Select Time Source

Current Time Source : PTP

Back

PTP

IRIG-B

NTP

2. Select IRIG-B tab.

Home > Configure Time & Time Sync > Select Time Source > IRIG-B

Current IRIG-B Setting : Disabled / B006

Back

Enable

IRIG-B Format

3. Select Enable/Disable tab to switch the mode accordingly.
4. Select IRIG-B Format to view the status.

Current IRIG-B Time Code Format : BCD_YEAR Code (B006)

Back

No BCD_YEAR Code (B002)

BCD_YEAR Code (B006)

5. Select required Format available from the list to activate them and reboot the device for the changes to take effect.

NTP IN

1. Navigate back to the Select Time Source menu from the Configure Time & Time Sync menu.

Home > Configure Time & Time Sync > Select Time Source

Current Time Source : PTP

Back

PTP

IRIG-B

NTP

2. Select NTP tab.

Home > Configure Time & Time Sync > Select Time Source > NTP

Current NTP Setting : Disabled / 0.0.0.0 / None

Back

Enable

Primary Server IP Address

Backup Server IP Address

3. Select Enable/Disable tab to switch the mode accordingly.
4. Select Primary Server IP Address tab and enter Primary Server IP Address [0.0.0.0] and click Confirm. Click Yes to save changes.
Result: Primary Server IP Address is saved. Click Ok.
5. Select Backup Server IP Address tab and enter Backup Server IP Address [None] field with appropriate either of the following values.
 - a. Enter 'None' to delete the Secondary configuration
 - b. Enter Secondary Server IP Address [0.0.0.0]
6. Click Confirm. Click Yes to save changes.

Configure Time Output

1. Select **Configure Time Output** tab from **Configure Time & Time Sync** menu.

Configure PTP OUT

NOTE: Not supported in G100.

The “PTP” will be available in the “**Configure Time & Time Sync - Configure Time Output**” menu only when the PTP input is configured and enabled.

1. Select **PTP** from Configure Time Output menu:

2. Current status of PTP OUT Settings is displayed on the screen, Select **Enable/Disable** tab to change the status accordingly and reboot the device for the changes to take effect.

NOTE: If the Current PTP Output is disabled, “Enable” option is displayed on the “**Configure Time Output – PTP**” menu. Otherwise, it will be “Disable”.

NOTE: The PTP Output will share same settings configured in the PTP Input, such as domain, priorities and so on.

Configure IRIG-B OUT

NOTE:Not supported in G100.

The “IRIG-B” will be available in the “**Configure Time & Time Sync - Configure Time Output**” menu only when the IRIG-B input is configured and enabled.

1. Select **IRIG-B** from Configure Time Output menu:

2. Current status of IRIG-B OUT Settings is displayed on the screen, select **Enable/Disable** tab to change the status accordingly and reboot the device for the changes to take effect.

NOTE: If the Current IRIG-B Output is disabled, “Enable” option is displayed on the “**Configure Time Output – IRIG-B**” menu. Otherwise, it will be “Disable”.

NOTE: The IRIG-B output will share same IRIG-B time code format as configured in the IRIG-B Input.

3. Select **Signal Out/No Signal Out - When Out OF Sync (OOSYNC)** tab to allow/suppress IRIG-B output when the IRIG-B input signal is out of sync.

By default, the IRIG-B output signal is suppressed when the IRIG-B input signal is out of sync.

- Click Yes to confirm or No to abort.

Configure NTP OUT

The “NTP” will be always available in the “**Configure Time & Time Sync - Configure Time Output**” menu no matter the NTP input is enabled or not.

1. Select **NTP** from Configure Time Output menu:

2. Current status of NTP OUT Settings is displayed on the screen, Select **Enable/Disable** tab to change the status accordingly and restart the applications for proper update of HAMA Pseudo points.

NOTE: If the Current NTP Output is disabled, “Enable” option is displayed on the “**Configure Time Output – NTP**” menu. Otherwise, it will be “Disable”.

Reset System Logs

1. Select Reset System Logs tab form main menu.

2. This function is used to perform the following actions:

- Check Size of Archived Logs
- Check size of current Application Logs
- Delete Archived Logs
- Delete current Logs

Check Size of Archived Logs

1. Select Check Size of Archived Logs.

Result: Operation Status: The size of the Archived Gateway logs is displayed. Click OK.

Check size of current Application Logs

1. Select Check size of current Application Logs.

Result: Operation Status: The size of the Archived Gateway logs is displayed. Click OK.

Delete Archived Logs

1. Select Delete Archived Logs tab and click Yes to confirm or No to abort.

Result: If Yes, the Archived log files are Deleted. If No, the archived log files are not deleted. Click OK.

Delete Current Logs

1. Select Delete current Logs tab and click Yes to confirm or No to abort.

Result: If Yes, the Current log files are Deleted, and System Logger is restarted. If No, the Current log files are not deleted. Click OK.

Reset Database Tables

Some of these actions should be performed after configurations were changed in the corresponding areas – to avoid mismatch of data between the already stored records and the new configuration. If required by operations – record backups can be taken before performing such changes, using the corresponding Runtime HMI interfaces.

1. Select Reset Database Tables from Main menu.

2. The function is used to perform the following actions:

- Delete Digital Event Data: SOE and Alarm records
- Delete Quality records
- Delete PRF Event records
- Delete Operator Note records
- Delete Accumulator records

Delete Digital Event Data: SOE and Alarm records

Should be performed after changes in *Alarm* configuration.

1. Select Delete Digital Event Data: SOE and Alarm records tab.

NOTE: This will stop all applications and permanently delete entries from the digital events database.

2. Click Yes to confirm or No to Abort.

- If No, no records deleted from the database. Click OK.
- If Yes, a message appears confirming to stop all applications on Gateway and to restart applications. Click Yes.

Result: Restarting all applications on Gateway. Click OK.

Delete Quality records

1. Select Delete Quality records tab from Reset Database Tables menu.

2. Click Yes to confirm or No to abort.

- If No, no records deleted from the database. Click OK.
- If Yes, a message appears confirming to stop all applications on Gateway, Quality Tag Records - Deleting and to restart applications. Click Yes.

Result: Restarting all applications on Gateway. Click OK.

Delete PRF Event records

Should be performed after changes related to PRF configuration.

1. Select Delete PRF Event records tab from Reset Database Tables menu.

2. Click Yes to confirm or No to abort.

- If No, no records deleted from the database. Click OK.
- If Yes, a message appears confirming to stop all applications on Gateway, PRF Records - Deleting and to restart applications. Click Yes.

Result: Restarting all applications on Gateway. Click OK.

Delete Operator Note records

1. Select Delete Operator Note records tab from Reset Database Tables menu.

2. Click Yes to confirm or No to abort.

- If No, no records deleted from the database. Click OK.
- If Yes, a message appears confirming to stop all applications on Gateway, Operator Note Records - Deleting and to restart applications. Click Yes.

Result: Restarting all applications on Gateway. Click OK.

Delete Accumulator records

1. Select Delete Accumulator records tab from Reset Database Tables menu.

2. Click Yes to confirm or No to abort.

- If No, no records deleted from the database. Click OK.

- If Yes, a message appears confirming to stop all applications on Gateway, Accumulator Records - Deleting and to restart applications. Click Yes.

Result: Restarting all applications on Gateway. Click OK.

Reset File Persistence Data

1. Select Reset File Persistence Data form the Main menu.

2. Select Reset File Persistence Data, click Yes to confirm or No to abort.
 - If No, Operation Status – No application restarts and commit operation from HMI.
 - If Yes,
NOTE: “Last Fault number” saved in persistent memory for “Fault Number File retrieval” method in ARRM is also cleared.
Click Yes to confirm.
Result: Restarting all applications on Gateway. Click OK.

Local HMI

1. Select Local HMI from the main menu.

2. Local HMI Settings window appears:

Local HMI Settings

General Settings

Active gateway access from standby HMI (redundancy): Disabled

Screen Settings		DPMS Settings	
Desktop Mode:	Window	Standby Timeout (in mins, 0=disabled):	10
Monitor Horizontal Refresh Rate (hz):	30-64	Suspend Timeout (in mins, 0=disabled):	20
Monitor Horizontal Refresh Rate (hz):	50-90	Off Timeout (in mins, 0=disabled):	00

Apply Cancel

3. Select General Settings: Active gateway access from standby HMI (redundancy): Disabled/Enabled.
NOTE: This is not supported in G100.
4. Screen Settings are displayed on the Local HMI Settings window:
- Desktop Mode: Window
 - Monitor Horizontal Refresh Rate (hz): 30-64
 - Monitor Horizontal Refresh Rate (hz): 50-90
5. DPMS Settings are displayed on the Local HMI Settings window:
- Standby Time (in mins, 0=disabled): 10
 - Suspend Timeout (in mins, 0=disabled): 20
 - Off Timeout (in mins, 0=disabled): 00
6. Click Apply to apply settings successfully.
7. Click Close.

Configure Sync Manager

1. Select Configure Sync Manager from the main Menu.

2. The function is used to perform the following actions:

- Enable/Disable Sync Manager
- Generate SSH Authentication Keys
- Configure Sync Sets

Enable/Disable Sync Manager

1. Select Enable/Disable Sync Manager tab from the Configure Sync Manager menu.
2. A message appears showing the current Sync Manager mode whether Enabled/Disabled.
3. Click Yes to confirm or No to abort.
 - If Yes, Operation Status – Sync Manager status is changed, click OK.

Generate SSH Authentication Keys

1. Select Generate SSH Authentication Keys tab from the Configure Sync Manager menu.
2. Click Yes to generate new keys or No to abort.

NOTE: New keys will overwrite any existing keys in /mnt/datalog/SSHKeys/SyncMgr?!

- If No.
RESULT; No New keys are generated.

- If Yes.

Result:

- o Generating SSH Public/Private key pair
- o Removing old keys, if any.
- o Key location is /mnt/datalog/SSHKeys/SyncMgr/id_rsa
- o New keys are generated.

- Click OK.

Configure Sync Sets

1. Select Configure Sync Sets tab from Configure Sync Manager menu.

2. Select Display Sync sets tab.
3. A list appears showing the syncset ID, server, IP Address and username.

SIno:	Syncset ID	Server	IPAddress	User name
1	1	rsync	0.0.0.0	admin
2	2	rsync	0.0.0.0	admin
3	3	rsync	0.0.0.0	admin

Back
Syncset ID-1
Syncset ID-2
Syncset ID-3

4. Select any of the Syncset ID to view detailed information:

5. Navigate back to Configure Sync Sets and select Add Sync set tab.
6. Select Configure Server type:
- rsync
 - ftp
 - sftp
7. Enter Destination IP Address and click Confirm.
8. Enter Destination Username and click Confirm.
9. Enter Password credentials (shown only for ftp) and click Confirm.
10. Enter Forced sync Interval (60 to 86400 or 0 seconds) and click Confirm.
11. Enter Check and sync Interval (60 to 86400 or 0 seconds) and click Confirm.
12. Enter Source Path Name and click confirm
13. Enter Destination Path Name and click Confirm.
- Result:** Operation Status – Complete, click OK.
14. Select Edit Sync sets tab from Configure Sync Sets menu.
15. A list appears showing the syncset ID, server, IP Address and username. Select one of the Syncset ID which needs to be Edited.

16. A list appears showing the Syncset ID credentials, click on the respective tab to edit it.

SyncsetId	: 4
Server	: ftp
IP address	: 172.12.222.222
Username	: admin
Forced sync interval	: 120
check and sync Interval	: 120
Source Path	: /mnt/datalog/
Destination Path	: mnt

Back
Edit Server
Edit IP
Edit Username
Edit Forced sync interval
Edit check and sync Interval
Edit Source Path
Edit Destination Path
Edit Password

17. Select Edit Server to modify the existing server and select:

- rsync
- ftp
- sftp

18. Select Edit IP and enter Destination IP Address and click Confirm.

19. Select Edit Username and enter Destination Username and click Confirm.

20. Select Edit Forced sync Interval and enter Forced sync Interval (60 to 86400 or 0 seconds) and click Confirm.

21. Select Edit check and sync Interval and enter Check and sync Interval (60 to 86400 or 0 seconds) and click Confirm.

22. Select Edit Source Path and enter Source Path Name and click confirm

23. Select Edit Destination Path and enter Destination Path Name and click Confirm.

24. Navigate back to Configure Sync Sets and select Delete Sync set.

25. Select the Syncset ID which needs to be removed from the list and click Confirm to delete Syncset or cancel to abort.

Redundancy

1. Select Redundancy tab from the Main menu.

2. The function is used to perform the following actions:
 - Current Configuration
 - Enable/Disable Redundancy
 - Heart Beat Configuration
 - Configure IP Address of PEER Gateway
 - Configure Time Sync with Standby
 - Configure Enable/Disable DTAs in Standby
 - Configure Gateway A/B Designation
 - Setup Public Key Authentication with PEER Gateway
 - Configure Switch Panel Type

- Enable/Disable Non-Sync mode

Note: Any operation in this need a Device Reboot.

Current Configuration

1. Select Current Configuration to view Current Redundancy Configuration:

2. Click OK.

Enable/Disable Redundancy

1. Select Enable/Disable Redundancy to view the current Redundancy status and to switch to different modes:

- Enable/Disable
 - o A message appears showing the current Enabled Redundancy Type: Hot/Warm Standby/Hot-Hot. Click Yes to Disable Redundancy.
Result: Deleting all active HMI Sessions, changes saved successfully.
 - o Click OK.
- Enable - Warm Standby
 - o Click Confirm.
Result:
 - Deleting all active HMI sessions.
 - Redundancy is Enabled, generating SSH Public/Private key pair.
 - Removing old Public/Private keys, if any.
 - Key location is /mnt/datalog/SSHKeys/id_rsa
 - o Click OK.

- Enable - Hot Standby
 - o The following list of applications are disabled/not supported in Hot Standby Configuration:
 - IEC 60870-101 DCA
 - IEC 60870-104 DCA
 - IEC 60870-103 DCA
 - SEL Binary DCA
 - Generic ASCII DCA
 - D.20 DCA
 - IEC 60870-101 DPA
 - IEC 60870-104 DPA
 - Modbus Serial DPA
 - Modbus Network DPA

- Data Logger DTA
- Load Shed Curtailment
- D.20 DCA
- Automated Record Retrieval Manager
- Analog Reports (not available after and including MCP V2.60)

o Click Confirm.

Result:

- Deleting all active HMI Sessions.
- Redundancy is Enabled, generating SSH Public/Private key pair.
- Removing old Public/Private keys, if any.
- Key location is /mnt/datalog/SSHKeys/id_rsa

o Click OK.

Enable/Disable Redundancy

Redundancy is currently **disabled**.

☐ Disable
 ☐ Enable - Warm Standby
 ☒ Enable - Hot Standby
 ☐ Enable - Hot-Hot

Current Redundancy configured is Hot Standby

The following list of applications are disabled/not supported in Hot Standby Configuration.

Any points from these applications mapped to server or automation applications will be offline

IEC60870-101 DCA, IEC60870-104 DCA, IEC60670-103 DCA, SEL Binary DCA, Hydran DCA, Generic ASCII DCA, IEC60870-101 DPA, IEC60870-104 DPA, Modbus Serial DPA, Modbus Network DPA, Data Logger DTA, Load Shed Curtailment, Automated Record Retrieval Manager, D.20 DCA[Not Supported], Analog Reports

Confirm Cancel

- Enable - Hot-Hot

o Click Confirm.

Result:

- Deleting all active HMI sessions.
- Redundancy is Enabled, generating SSH Public/Private key pair.
- Removing old Public/Private keys, if any.
- Key location is /mnt/datalog/SSHKeys/id_rsa

Enable/Disable Redundancy

Redundancy is currently **disabled**.

☐ Disable
 ☐ Enable - Warm Standby
 ☒ Enable - Hot Standby
 ☐ Enable - Hot-Hot

Current Redundancy configured is Hot-Hot

Confirm

Cancel

Heart Beat Configuration

1. Select Heart Beat Configuration tab from Redundancy menu.

NOTE:

- A very low Heart Beat timeout should not be used for a network-based Heart Beat Communication Mechanism.
 - If you are not using serial Heart Beat Communication Mechanism, then Heart Beat Timeout and Heart Beat Retries parameters should not be less than 300ms and 3 respectively (default).
2. The function is used to perform the following actions:
 - Configure Heart Beat Timeout
 - Configure Heart Beat Retries
 - Configure Heart Beat Communication Mechanism
 3. Select Configure Heart Beat Timeout tab from Heart Beat Configuration menu.
 4. Enter Heart Beat timeout in Milliseconds [100 to 1000] is which the interval before which the Gateway Redundancy Manager expects at least one message or Heart Beat from the other Gateway. Click Confirm.
 5. Click Yes to save the settings or No to abort.
 6. Select Configure Heart Beat Retries tab from Heart Beat Configuration menu.
 7. Enter Heart Beat retries [1 to 10] is which the number of retries Gateway Redundancy Manager transmits Heart Beat message before assuming that the other Gateway has failed. Click Confirm.
 8. Click Yes to save the settings or No to abort.
 9. Select Configuration Heart Beat Communication Mechanism tab from Heart Beat Configuration menu.

Home > Redundancy > Heart Beat Configuration > Configure Heart Beat Communication Mechanism

Back
Serial Only
Single LAN
LAN1 and LAN2
LAN and Serial
LAN1, LAN2 and Serial

10. Select any of the Heart Beat Communication Mechanism from the list and click Yes to confirm.

Result: Settings have been saved, click OK.

Configure IP Address of PEER Gateway

1. Navigate back to Redundancy menu and select Configure IP Address of PEER Gateway tab.

2. Select Configure/Update PEER IP Address tab.
 - Enter new Primary IP Address and click Confirm.
 - Enter new Secondary IP Address and click Confirm.
 - NOTE: Firewall does not allow Redundancy LAN Communication on External zones
 - Click Yes to confirm changes to take effect or No to abort.

Result: Saving PEER IP Address, click OK.
3. Select Delete PEER IP Address tab.
4. The current Primary IP and current Secondary IP are displayed on the window:

5. Select Delete Secondary IP to delete it and click OK.
6. Select Delete Both Primary and Secondary IPs to delete both and click OK.
7. Select Advance Secure Tunnel Configuration tab.
8. Current Primary Secure Tunnel and current Secondary Secure Tunnel are displayed on the window.
 - Enter the new Primary Secure Tunnel address and click Confirm.
 - Enter new Secondary Secure Tunnel address and click Confirm.
 - NOTE: Firewall does not allow Redundancy LAN Communication on External zones
 - Click Yes to confirm changes to take effect or No to abort.

Result: Saving PEER IP Address, click OK.

Configure Time Sync with Standby

1. Select Configure Time Sync with Standby tab from Redundancy menu.
 - If enabled, click Yes to disable Time Synchronization between Active and Standby Gateway.

Result: Disabled Time Synchronization between Active and Standby. Click OK.
 - If disabled, click Yes to Enable Time Sync Gateway or No to abort.
 - o Current Time Synchronization between Active and Standby Gateway is displayed.

NOTE: This option should be enabled only if Standby Gateway does not have a non-SCADA time synchronization mechanism (IRIG-B or NTP).

Result: Enabled Time Synchronization between Active and Standby. Click OK.

Configure Enable/Disable DTAs in Standby

1. Select Configure Enable/Disable DTAs in Standby tab from Redundancy menu.

NOTE:

- This parameter is only applicable to hot standby mode. In case of warm standby or Hot-Hot mode, this parameter is ignored or not-applicable.
- DTA's (LOGICLINX, Calculator and Enhanced Automation applications) on Standby Gateway are Enabled.
 - o If Enabled, these DTAs will run normally on the standby Gateway.
 - o If Disabled, these DTAs will suspend processing on standby Gateway.
- Click Yes to Confirm.

Result: Enabled/Disabled DTA's on Standby Gateway. Click OK.

Configure Gateway A/B Designation

1. Select Configure Gateway A/B Designation tab from Redundancy menu.
2. A message showing the current Gateway Designation status is displayed.

NOTE: Gateway A/B Designation:

- This parameter is only applicable if Switch Panel is optional.
 - o If Switch panel is not configured, this parameter is used.
 - o If Switch Panel is configured, Gateway A/B Designation is read from the switch panel.

3. Select Gateway_A or Gateway_B.

Result: Gateway A/B Designation changed to selected Gateway. Click OK.

Setup Public Key Authentication with PEER Gateway

1. Select Setup Public Key Authentication with PEER Gateway tab from Redundancy menu.
2. Click Yes to copy public key of this Gateway to PEER Gateway.

A confirmation dialog box titled "Confirm". It displays the current IP addresses: "Current Primary IP is: 172.12.236.113" and "Current Secondary IP is: None". Below this, it asks the question "Do you want to copy public key of this Gateway to PEER Gateway?". At the bottom right, there are two buttons: "Yes" (highlighted in blue) and "No" (greyed out).

3. Enter PEER username.

A dialog box titled "Trying to connect to PEER Gateway on primary IP Address...". It contains a label "Enter Peer UserName:" followed by a text input field. The input field contains the text "admin". At the bottom right, there are two buttons: "Confirm" (highlighted in blue) and "Cancel" (greyed out).

4. A public key generated was displayed on the window, click Yes to continue connecting.

Confirm

Enter password of admin@172.12.236.113 when prompted:

The authenticity of host '172.12.236.113 (172.12.236.113)' can't be established.

ED25519 key fingerprint is
SHA256:FaweTCy1allwBdikmnQpXne8h7YGaYVAxcd8yuiW9jc.

Are you sure you want to continue connecting

5. Enter device user password and click Confirm.

Public Key Authentication Password

Warning: Permanently added 'g500' (ED25519) to the list of known hosts.

UNAUTHORIZED ACCESS TO THIS DEVICE IS PROHIBITED

You must have explicit permission to access or configure this device. All activities may be logged. Violations of policy governing this device may result in disciplinary action and may be reported to law enforcement. There is no right to privacy in accessing this device.

root@g500's password:

☒

Result:

- Successfully setup public Key Authentication with PEER Gateway.
 - You need to perform this operation on PEER Gateway as well
 - Click OK.
6. Select Configure Switch Panel Type tab from Redundancy menu.
 7. Select switch panel type:
 - MASTER
 - SLAVE

Result: Switch Panel Type changed to selected. Click OK.

Enable/Disable Non-Sync mode

1. Select Enable/Disable Non-Sync mode tab from Redundancy menu.

Confirm

Warning! This parameter is applicable to Hot standby Or Hot-Hot Only. Incase of Warm standby, this parameter will be ignored.

Non-Sync mode is currently enabled.

Note: Non-Sync mode is enabled: Standby Gateway goes to Non-Sync state at startup, if code or configuration are not same on both Gateways.

Are you sure you want to Disable Non-Sync mode?

NOTE:

- This parameter is applicable to hot standby or Hot-Hot. In case of warm standby, this parameter will be ignored.
- Non-Sync mode is enabled
 - o Standby Gateway goes to Non-Sync state at startup, if code or configuration are not same on both Gateways.
- Non-Sync mode is disabled
 - o Standby Gateway does not go to Non-Sync state at startup, if code or configuration are not same on both Gateways.
- Click Yes to Enable/Disable Non-Sync mode.

ARRM

1. Select ARRM tab from the main menu.

Delete Records

The function is used to perform the following actions:

- Delete all Records
- Delete Storage Directory Specific Records
- Delete Station Specific Records
- Delete Device Specific Records
- Delete Temp
- Delete Cache

Delete all Records

1. Select Delete all Records tab.

NOTE: A WARNING message appears stating that the "Directory Delta records will not be retrieved again once deleted. Delete Cache Files to retrieve the old records.

2. Select Confirm to continue or Back to navigate back to Delete Records menu.
 - Select No to abort or
 - Select Yes to continue.

Result: Restarts ARRM application. Details of files deleted are updated in log file.

Delete Storage Directory Specific Records

1. Select Delete Storage Directory Specific Records tab.

NOTE: Directory Delta records will not be retrieved again once deleted. Delete Cache Files to retrieve the old records.

2. Click on the files that need to be deleted and click Yes to confirm or No to abort.

NOTE: Deleting these files will restart ARRM application.

Delete Station Specific Records

1. Select Delete Station Specific Records tab.

NOTE: Directory Delta records will not be retrieved again once deleted. Delete Cache Files to retrieve the old records.

2. Click on the files that need to be deleted and click Yes to confirm or No to abort.

NOTE: Deleting these files will restart ARRM application.

Delete Device Specific Records

1. Select Delete Device Specific Records tab.

NOTE: Directory Delta records will not be retrieved again once deleted. Delete Cache Files to retrieve the old records.

2. Click on the files that need to be deleted and click Yes to confirm or No to abort.

NOTE: Deleting these files will restart ARRM application.

Delete Temp

1. Select Delete Temp tab and select Confirm.
2. Select Yes to confirm or No to abort.

Result: ARRM application will be restarted and the details of Files deleted are updated in log file. Click OK.

Delete Cache

1. Select Delete Cache tab to:

- Delete All Cache Files
- Delete Station Specific Cache Files
- Delete Device Specific Cache Files

2. Select Delete All Cache Files tab and click Yes to confirm or No to abort.

If Yes, **RESULT:** Restarts ARRM application.

3. Select Delete Station Specific Cache Files tab and click Yes to confirm or No to abort.

- If Yes, enter Station Name and click Confirm.

Result: ARRM application will be restarted and the details of Files deleted are updated in log file. Click OK.

4. Select Delete Device Specific Cache Files tab and click Yes to confirm or No to abort.
 - If Yes, enter Station Name and click Confirm.
 - Enter Device name and click Confirm.
Result: ARRM application will be restarted and the details of Files deleted are updated in log file. Click OK.

Suppress Forced Qualities To Masters

1. Select Suppress Forced Qualities To Masters tab from the Main menu.

2. When Enabled for a Master:

- For a configured duration, values with Forced/Substituted Flags are communicated to Master as value changes only.
 - o No Forced/Substituted Flags are seen.
 - o All other flags will still be communicated normally.

NOTE:

- o On expiration of configured suppression time or on disabling this mode, normal processing will be resumed.
- o Currently this feature implies only for IEC101-104 masters.

3. This function is used to perform the following actions:

- Suppression Mode Timer Stats
- Enable/Disable Mode for all Masters
- Enable/Disable Mode for only specified Masters

Suppression Mode Timer Stats

1. Select Suppression Mode Timer Stats tab.

NOTE: At any point of time this stat shows the remaining time for which the qualities will be suppressed to IEC101-104 master.

2. Select Serial IEC-60870-101 Master or Network IEC-60870-104 Master tab from Suppression Mode Timer Stats menu to view Suppressed Values Summary.

Enable/Disable Mode for all Masters

1. Select Enable/Disable Mode for all Masters tab from Suppress Forced Qualities to Masters menu.

2. Click Yes to change the Quality Suppression Mode and enter the Quality suppression period in hours [1-120].

Result: Restarting all applications for changes to take into effect, click OK.

Enable/Disable Mode for only specified Masters

1. Select Enable/Disable Mode for only Specified Masters tab from Suppress Forced Qualities to Masters menu.

- Serial IEC-60870-101 Master
- Network IEC-60870-104 Master

2. Select Serial IEC-60870-101 Master tab and select any of the configured Serial port number of IEC Master and click on the toggle switch at the bottom of the window to change the mode and click Yes to configure suppression mode for any other masters before restarting all applications.

3. Select Network IEC-60870-104 Master tab and select any of the configured Network Instance number of IEC Master and click on the toggle switch at the bottom of the window to change the mode and click Yes to configure suppression mode for any other masters before restarting all applications.

Emulate D20 RTU IEC101 DPA Unbalanced Mode Functionality

Note: This setting has been moved to offline editor Systemwide tab.

Configure IEC101+104 DPA Startup Quality Event Suppress Interval

Note: This setting has been moved to offline editor Systemwide tab.

Configure Serial Port Modes (RS-232/485)

1. Select Configure Serial Ports tab from Main menu.

2. Select the desired port, mode and its termination if applicable (Disabled/Enabled). Click Apply.

Configure D.20 Port Settings

1. Select Configure D.20 Port Settings tab from Main menu.

2. The below message appears if no D.20 HDLC cards installed.

3. If the D.20 HDLC card is installed, proceed to set the parameters as needed and click Apply if changed.

PCIE Slot	Channel	D.20 Port B Connection	End of Link Termination
3	1	Disabled	Enabled
3	2	Disabled	Enabled

Apply Close

EdgeOS Host

1. Select EdgeOS Host from Main menu.

Configure Authentication
Configure Network Settings
Configure Network Interfaces
Configure Secure Access
Configure Firewall
Configure Host Names
Configure Time & Time Sync
Reset System Logs
Reset Database Tables
Reset File Persistence Data
Local HMI
Configure Sync Manager
Redundancy
ARRM
Suppress Forced Qualities To Masters
Configure Serial Ports
Configure D.20 Port Settings
EdgeOS Host
Clear Chassis Intrusion State
Restore Clone Snapshot
Restore Factory Default
Reboot Device

2. The function is used to perform the following actions:
 - Host Net Info (in G100 is Net1, in G500 is Net0)
 - Host Version Info
 - Change Host Shell Idle Timeout
 - Host Logoff
 - Reset PETC Login User Credentials

Host Net Info (Net1 for G100 & Net0 for G500)

1. Select Host Net Info tab to view Method, IP and Gateway information. Click OK.

Host Version Info

1. Select Host Version Info tab to view EdgeOS Host release information. Click OK.

Change Host Shell Idle Timeout

1. Select Change Host Shell Idle Timeout tab.
 - Current host shell idle timeout is displayed in seconds, click Yes to continue and enter the timeout in seconds [60 to 1800]. Click OK.

```
=====
Gateway Settings Menu
EdgeOS Host - Change Host Shell Idle Timeout
=====

Current host shell timeout is 900 seconds

Do you want to continue[Y/N]: y

Enter the timeout in seconds [900]: 600

Host shell idle timeout has been changed to 600.

Press ENTER Key to continue....
```

Host Logoff

1. Select Host Logoff tab.

Result:

Reset PETC Login User Credentials

Once confirmed, the following message shall be prompted:

Please login to PETC to change the default credentials as soon as possible.

When the user wants to reset the credentials, type **y**.

After successful reset, the following operations are performed:

1. Any users created in PETC shall be deleted.
2. The default PETC password and username shall be enabled for login.
3. The user shall be required to enter a new password upon logging into PETC.

```
=====
Gateway Settings Menu
EdgeOS Host - Reset PETC Login User Credentials
=====

PETC Login user credentials will be reset.

Are you sure you want to continue?[Y/N]: y

Please login to PETC to change the default credentials as soon as possible.

Press ENTER Key to continue....
```

4. When the user doesn't want to reset the credentials, type n.

```
=====
Gateway Settings Menu
EdgeOS Host - Reset PETC Login User Credentials
=====

PETC Login user credentials will be reset.

Are you sure you want to continue?[Y/N]: n

Aborted,PETC Login user credentials reset operation.

Press ENTER Key to continue....
```

Clear Chassis Intrusion State

1. Select Clear Chassis Intrusion State tab from Main menu.

2. Click Yes to confirm or No to abort.

Result:

- If No, no action performed.
- If Yes, successfully cleared Chassis Intrusion State. Click OK.

Restore Clone Snapshot

Precondition: In order to perform this operation, user needs to connect a FAT32 formatted USB device containing clone snapshot file(s) with extension *. MCPClonesnapshot.DS7zip (taken using DSAS).

GE Vernova doesn't recommend using more than one USB connected at a time for this operation.

NOTE:Automatic reboot of the device takes place to make the changes effective.

1. Select Restore Clone Snapshot tab from Main menu.

2. Select Yes to Restore Clone Snapshot or No to abort.

3. Select Yes to Auto Mount the USB or No to abort.

Confirm

USB not mounted. Insert USB device and select Yes to initiate auto-mounting?

If more than one USB is connected to device, then the list of USBs will be displayed, and the User need to select the USB from which the Clone snapshot need to be restored.

4. If Single USB is connected to device, then the list of clone snapshot snapshots will be displayed. Select the Clone Snapshot to be restored to the device or Cancel to abort.

Available USB Snapshots

Enter Your Choice

106_CloneSnapshot.MCPCloneSnapshot.DS7zip

G500A_V110_106_v200.MCPCloneSnapshot.DS7zip

LDAP_GroupMapping_Build90.MCPCloneSnapshot.DS7zip

TIMESYNC.MCPCloneSnapshot.DS7zip

5. If the selected Clone Snapshot is a password protected, then enter the password in the confirm password window and press **Confirm** for button to save the snapshot or **Cancel** to abort the operation.

Confirm Password

Password

***** ✓

Re-enter password

***** ✓

Note: Only 3 attempts are provided to provide correct password, failing will display message 'Error: Unable to extract with the password provided. Retry entering valid Password. Error: Max retries reached.' OK to return to main Menu.

6. On Selection of Confirm

- a. If the Clone snapshot schema version match with device schema version, then snapshot copy is successful with message 'Snapshot will be applied after Reboot'.
- b. If snapshot folder already contains snapshot, the Confirm operation popups to delete old clone snapshot and copy the new one. Yes, to overwrite and proceed to save the snapshot- 'Snapshot will be applied after Reboot 'or No to abort replace the operation.

- c. If the Clone snapshot schema version doesn't match with device schema version, then snapshot will fail with message 'Snapshot's schema version:(XX) does not match firmware's schema version (XX)'.

7. Automatic reboot of the device takes place to make the changes effective.

Restore to Factory Default

User can restore a MCP to the factory default (or "clean") configuration.

When restored to default factory settings, all user configuration files, and system settings will be lost.

In case all root / administrator user credentials have been lost, and the MCP cannot be accessed with these roles – the MCP can be restored to a clean and defaulted state using an external USB workflow; for detailed steps, refer to the technical note (*GE Vernova Part Number TN0116*) MCP Firmware Upgrade and Restore to Defaults Workflows.

1. Select Restore Factory Default tab from Main menu.

2. Click Yes to restore to Factory Default or No to abort.
NOTE: Ensure you have a full snapshot of the current configuration.
3. If Yes,
NOTE: When restored to default factory settings, all user configuration files, and system settings will be lost. All System Databases will also be deleted.
4. Click Yes to confirm.

Reboot Device

1. Select Reboot tab from Main menu.

2. Click Yes to reboot the device or No to abort.

Chapter 6 - MCP Configuration

This chapter consists of the following sections:

Steps to Configure MCP

- Online Editor workflow
- Offline Editor workflow
- Create a new MCP device in DSAS
- Configuration file format

Configure System Wide Options

- Systemwide tab
- AI Text Enumeration tab

Build Client Map Files

- GPIO Configuration Steps
- D.20 Peripheral Client
- Client Map
- DNP3 Client
- Modbus Client
- SEL Binary Client
- IEC 60870-5-103 Client
- IEC 60870-5-101+104 Client
- Generic ASCII Client
- SNMP Client Properties
- IEC 61850 Client

MCP Redundancy

- About Redundancy
- Redundancy Summary
- Operational States
- MCP Redundancy Configuration Combinations
- Configure the MCP for Redundancy
- System Points
- Non-Sync Mode
- Validating the Redundant Connections
- Changeover or Failover during Standby Start-up
- Data Synchronization
- Ethernet Connections
- Sync Config Operation
- HMI User Access Privileges on Redundant System
- Redundancy Setup Checklist
- Error Messages and Troubleshooting

Communications

- Connection
- Configure Serial Communications
- Configure Network Communications
- Configure D.20

Configuring Client Applications

- Client Configuration Overview
- DNP3 Multi-drop
- DNP IED Block
- IEC 60870-5-101 Multi-drop
- IEC 60870-5-103 Multi-drop
- IEC 60870-5-104 IED Block
- Modbus Multi-drop
- Modbus TCP or TCP/SSH IED Block
- Generic ASCII
- SEL Binary
- LogicLinx Device
- SNMP Block

Configure to acquire files (ARRM)

- Automated Record Retrieval Manager Overview
- ARRM Configuration
- ARRM Viewer
- Enterprise Synchronization
- Applications - ARRM
- File Set Template - Standard
- File Set Template – Sel ASCII
- About Oscillography files and IEEE File
- Connection Polling
- ARRM FTP Directory Delta Support for Different ftp Is Formats
- Sample File Set Templates for Relay Models
- ARRM ASCII Directory Delta Support

Configure Automation Features

- Configuration Overview
- System Point Manager
- Accumulator Freeze
- Alarm
- Calculator
- Load Shed and Curtailment
- Remote Logging (Rsyslog)
- Syslog Client

Configure Datalogger

- Report Types
- Storage Allocation
- Save Report
- Load Report
- Manage Reports
- Select Points
- Change Scaling

HAMA - Hardware Asset Management Application

- Analog Inputs
- Digital Inputs
- Accumulator Points
- Text Points

Build Server Map Files

- Server Maps
- DNP3 Server
- MODBUS Server
- IEC 60870-5-101+104 Server
- Tejas V Server

Configuring Server Applications

- Server Configuration Overview
- DNP3 Serial Master Stations
- IEC 60870-5-101 Master Station
- Modbus Serial Master Station
- Tejas V Master Stations
- DNP3 Network Master Stations
- IEC 60870-5-104 Master Station
- Modbus TCP Master

Build HMI One-Line Diagrams

- One-Line Viewer
- View One-Line Diagrams
- Executing One-Line Diagram Commands

Create Analog Reports

- Analog Report Generation - Overview
- Analog Report - Viewing
- Analog Report Generation - Configuration

Configure System Security

- Security Features
- System Security
- Password Complexity
- Connection Security
- User Accounts and Authentication
- Setting Up a User Account
- Secure Access
- Software Licensing Tools for MCP
- Software Licensing Tools for D2x
- Firewall Settings
- Automatic logout

System Utilities

- Utilities
- Utilities Log In
- Certificate Import
- Certificate Management
- Export Database
- Generate Gateway Key Pair
- Exporting VPN Client Configuration File
- Upload SSL server Certificate/Server Key

Miscellaneous Utilities

- Utilities Overview
- Setting up a Terminal Session
- Pass-Through Connections
- Direct Connect (mcpconnect)
- MCP Configuration Manager

DS Agile Studio MCP Configuration steps

Once basic settings are configured using MCP Gateway Local Configuration Utility settings (mcpcfg) or MCP Settings GUI, use DS Agile MCP studio's online & offline configuration tool to configure the MCP's gateway/SCADA configuration. DSAS is an abbreviation for DS Agile Studio.

The typical sequence of steps involved in configuring MCP with DS Agile MCP Studio are as follows:

Online Editor workflow

The MCP Online Editor is not available if the MCP device Function is “D” (only D2x).

1. Create the configuration of MCP device using an administrator level user or supervisor level user. For more details, refer to the DS Agile MCP Studio's Online Help or User Manual.
2. Use “Sync From” option from the DS Agile MCP Studio's offline editor/configuration tool and get the current configuration from the MCP device into an offline MCP device in a DSAS Project. This would need connecting to MCP once through the IP Address of the MCP.
3. Once the MCP's device configuration is synced to DS Agile MCP Studio, use the offline editor and configure the MCP further.
4. Go to [Step 5](#) in “Offline Editor workflow”.

Offline Editor workflow

The MCP Offline Editor is not available if the MCP device Function is “D” (only D2x).

1. In a DS Agile MCP Studio Project – create a new MCP device from “Device Templates”.
2. Enter the Name, IP address, Edit the Model Number, Version (and Function “S” in v4.0 and later) and Select the Licenses – according to your needs.
3. Close the dialog, the offline MCP device is created.
4. Configure the MCP Device Redundancy if MCPs need to be configured for redundancy or else skip this step.
5. Create and edit Client (device) maps.
6. Set up device serial and network connections, including protocol-specific parameters.
7. If IEC61850 client needs to be configured, then using Loader utility in the DS Agile Studio and configure the IEC61850 client configuration.
8. If Automatic Record Retrieval Manager (ARRM) needs to be configured, then use the ARRM configuration from the offline configuration utility and configure ARRM to acquire files from the IEDs.
9. If Passthrough, Terminal Server, Secure Scada or OpenVPN needs to be configured then configure the same from the offline configuration tool. Note that OpenVPN configuration is configured using administrator level users only.
10. Configure Automation applications, including the Digital Event Management (alarms), Calculator, Logictinx and the System Point Manager etc. using the offline configuration tool.
11. Configure Datalogger.
12. Configure Analog Reports (not available after and including MCP V2.60).
13. Create and edit Server (master station) map.
14. Set up master station connections, including protocol-specific parameters.

15. Create substation one-line diagrams using the One-Line Designer utility from the offline configuration tool.
16. Configure System Security settings (e.g., creation of HMI users, HMI Auto Login settings, importing/installing of certificates, exporting of Open VPN client configuration files etc.) using online editor/configuration utility of DS Agile MCP Studio.
17. Save the configuration file by applying commit changes button from the online configuration utility DS Agile MCP Studio.
18. Apply “Sync To” from the DS Agile MCP Studio’s offline editor/configuration utility to transfer that applies configuration changes to the MCP.

The DS Agile MCP Studio configuration tool validates the changes and reports any errors. Once a configuration is validated and committed to MCP through “Sync To” option in the Offline configuration tool, the previous configuration files are replaced with the new file and all the MCP applications are re-started to reflect with the new configuration changes.

Starting with MCP V4.00: the MCP device will restart after “Sync To” operation if the MCP Function changed (S, D, C) or if the ports allocation between MCP and D2x changed (Serial, LAN).

The Help section in the DS Agile MCP Studio Offline Configuration Tool describes how to configure the MCP for various substation applications.

Create a new MCP device in DS Agile MCP Studio

This section shows the high level steps to create and initialize the MCP device and its function within a DS Agile MCP Studio Project. For step by step detailed workflows please refer to the “*DS Agile MCP Studio (DSAS) Online Help*”.

Instantiate MCP device

Start with the Device Templates (can be User defined too if one exists), by selecting MCP and drag into the Project workspace:

In the resulting dialog:

The screenshot shows the 'MCP Properties' dialog box. The 'Properties' tab is selected. The 'Name' field is highlighted with a red box. The 'Description' field is below it. The 'Asset Identifier' field is below that. The 'Communications' section contains the 'IP Address' field, which is highlighted with a red box. Below it is a checkbox for 'Use secure connections on port 443'. At the bottom, there is a 'Model Number' field with an information icon and an 'Edit' button, both highlighted with red boxes. A 'Read Firmware' button is also present. The right side of the dialog has a large 'Notes' text area. At the bottom are 'OK' and 'Cancel' buttons.

Enter the Device **Name**.

Enter **IP address** to communicate with the device (if not confirmed can be anything, as it may be updated later).

Edit Model Number and select the Function

Click to open and Edit the Model Number.

In the resulting dialog select the Product Type and Application Version.

Starting with MCP v4.00 there is a new added option to select which function is enabled when the Product Type is G500 (MCP, D2x, Both), see (1) below:

The screenshot shows the 'MCP Model Editor' window. At the top, the 'Model Number' is 'G500-BHU8-UUUUUU-BUUU-UUU-UUU-S-CAD0094-UUUUUUU'. Red numbers 3 and 4 point to the 'S' and the last seven 'U's respectively. Below this, the 'Product Type' is set to 'G500'. The 'Application Version' is 'D0 - v4.0', with a red number 2 pointing to it. To the right, the 'Function' dropdown menu is open, showing options: 'MCP' (selected), 'MCP', 'D2x', and 'MCP/D2x' (with a red number 5 pointing to it). Below the dropdown is a 'Product Option' section with fields for CPU, Primary Power Supply, Redundant Power Supply, and Serial Ports.

The label and new added list (1) shows as selectable (not grayed) only when Application Version (2) is 4.0 or higher and only for G500. For all other versions and for G100 is always “MCP” and is grayed out.

The new added list has the default “MCP”.

Starting with DSAS 4.00 the “as configured” Model Number is displayed in the upper area of MCP Device Properties, to show the user changes in values when various features or licenses are being selected or de-selected.

Selected Function is “MCP”

- This makes the device operate as MCP only.
- In G500 sets the digit (3) to “S” (as in Single MCP) and the last set of digits (4) to “UUUUUUU”.
- The resulting G500 model number is same as previous versions of G500.
- All Serial Ports are allocated to the MCP function.
- D.20 HDLC (if present) is allocated to the MCP function.
- All LAN ports are allocated to the MCP function.
- All offline configuration follows MCP workflows.

For Functions **D2x** and **MCP/D2x** - please see [Chapter 7 – D2x Configuration and Operation](#).

Select Licenses

Starting with DS Agile MCP Studio 4.00 – the licenses are selected only in the “Licensing” tab.

Select Redundancy

Go to the “Redundancy” tab and select the desired operating mode.

See section [MCPv4 Redundancy](#) in this document for detailed available options, depending on which function is selected (MCP or D2x or combined MCP/D2x).

Finish Create Device workflow

Click OK to close the Device Properties dialog.

The device shown in the project canvass will display in the lower right corner a new added string only if the selected function is not MCP alone:

When only MCP
is selected

When only D2x
is selected

When MCP/D2x
is selected

When hovering the mouse over device icons in the project canvass – a tooltip shows main information about the device.

Configuration file format

All Gateway/SCADA Configuration information for an individual MCP is stored as a set of configuration files. The configuration files are saved into the Solid-State Drive on the MCP. The configuration files are stored as XML files.

The configuration files contain the following information:

- Device and master point maps
- Application settings
- HMI settings

Configuration information for each application, is also contained in the individual configuration files which includes configuration settings, default application settings and saved or custom user settings.

All MCP Device specific and System configuration information that is modified using the MCP's Gateway Local configuration utility (mcpcfg) or MCP Settings GUI is stored in separate set of configuration files on the MCP. These configuration files are updated each time changes are made through mcpcfg. The configuration file is stored in non-XML files.

Point Reference and Point Description rules

Each device, master, and application mapfiles contain the point reference and point description fields as described below: **Point Reference** : A short identifier for the points in the map file. It can support up to 66 ASCII characters other than for IEC61850 client that supports up to 255 ASCII characters.

Below is the list of characters (separated by COMMA for readability) supported in Point Reference field.

A-Z, a-z, 0-9, !, ^, *, (,), -, _, +, <, >, {, },], [, ?, ., ~, SPACE

Point Description : A detailed and localized description for the point in the map file. It can support up to 128 Unicode characters other than for IEC61850 client that supports up to 255 Unicode characters.

All Unicode characters are supported in the Point Description field except “|” and “;”.

Configure System Wide Options

This chapter contains the following sections and sub-sections:

Systemwide tab

- Point Groups
- Security
- Email configuration
- Storage
- RTDB Configuration
- Event Logger
- Locale
- Access Manager
- Runtime GUI

User Management

- Overview
 - Add a User
 - Change a User Account
 - Delete a User
- Configure User HMI Home Page
- Auto Login

AI Text Enumeration

- Enumeration Values
- Analog Input Mappings

Systemwide tab

The **Systemwide** tab in the **DSAS MCP Studio Configuration Tool** provides access to a wide range of options for the general operation of the MCP, including:

- System
 - [Point Groups](#)
 - [Security](#)
 - [Email](#)
 - [Storage](#)
 - [IEC 101/104 Server](#)
- [Real-time Database \(RTDB\)](#)
- [Event Logger](#)
- HMI
 - [Locale](#)
- [Access Manager](#)
 - [System access settings](#)
 - [Auto Login](#)
- [Runtime GUI](#)
 - [Global](#)

To access any of these configuration areas, select the appropriate item from the left pane.

Point Groups

The **Point Groups** option under the **Systemwide** tab → System allows you to configure the names of point groups to appear on the **Point Summary** pages.

» To modify the point groups:

1. Open the DSAS MCP Studio Configuration Tool.
2. Click the **Systemwide** tab.
3. In the left pane, click **System > Point Groups** and modify the settings, if desired.
 - Click **Add** to create a new group. Double-click a field to modify the settings.
 - Select a row and click **Delete** to remove an application from the list.
4. Click **Save** to save your changes.
5. Click **Commit Changes** to apply the changes to the MCP.

NOTE: The point group assigned to ID number 0 will be used as the default point group. Newly created points are automatically assigned to this group. You should not delete this point group.

Security

The **Security** options on the **Systemwide** tab → system allows you to configure the general security features of the MCP.

» To change security settings:

1. Open the DSAS MCP Studio Configuration tool.
2. Click the **Systemwide** tab.

3. In the left pane, click **System > Security** and change the security settings, if desired.
4. Click **Save** to save your changes.
5. Click **Commit Changes** to apply the changes to the MCP.

Security Settings

Table 6-1: Security Settings

Point Name	Description
Pass-through Access	If set to From command line only , you must initiate connections to devices manually from the MCP command line using the <i>mcpconnect</i> utility. Note that only SEL Binary and Generic ASCII clients support command line access. If set to Allow network connections , the MCP makes the pass-through connections accessible over the network on port <i><8000 plus the configured com port number></i> . For more information on the <i>mcpconnect</i> utility and pass-through connections, refer to Direct Connect . Default is From command line only .
Passthrough Idle Timeout	Specify the time duration that Pass Through enabled DCA/Terminal Server waits for the data to be available from the user in SSH Secure Tunnel Mode before closing the connection. This parameter is not applicable to Telnet or TLS Security Types.
Local Commands Only	If set to true, only commands issued from the Local HMI (accessed from the USB KVM card) are accepted. If set to false, both local and remote commands are accepted. Applies to controls, set points, local force, inhibits and tagging commands. Default is false.
SSH Security Banner	A block of text that appears on the local HMI command prompt/Login with Secure Terminal Emulator from DS Agile MCP Studio.
Login Security Banner	A message appears on the login page of the MCP local HMI or remote HMI.
CRL Check Interval (Hours)	The interval that the Secure SCADA module checks whether certificates currently in use have been revoked. If the value of CRL Check Interval is 0, the Secure SCADA module will not perform a periodic check of whether certificates currently in used have been revoked. The range is from 0 to 720.

Email Functionality

The MCP can send logs produced by the Digital Event Manager by email to a defined distribution list to notify users of configured system exceptions (SOE, Alarms).

These logs are in the form of text files attached to the sent email message, with the attachment filename in the form shown below (where n is an incremented number in case multiple files and messages need to be sent at the same time):

- *dem_soe_email_filen.txt* when SOE reporting via email is enabled
- *dem_alarm_email_filen.txt* when Alarm reporting via email is enabled

Please refer to the SOE and Alarm Notification Method in Table 6-144: Alarm Settings - Global.

The sent email message body for SOE looks like this:

```
From: <sender email address>
Sent: <date time>
To: <recipient 1 email address>;<recipient 2 email address>;etc.
```

Subject: HOSTNAME = <configured host name, e.g.: G500> : Number of SOE = <number of attached SOE>

HOSTNAME = G500 : Number of SOE = 5

The attached file for SOE looks like this, for e.g:

```
*****
EVENT_TIME          SEQID REC_TYPE      REFERENCE          VAL  STATE  GROUP_NAMES
*****
2025-01-01 12:25:23.245[LOCAL] 791   SINGLE POINT          0    OFF
                        [LOCAL] 792   SINGLE POINT          1    ON
                        [LOCAL] 793   SINGLE POINT          1    ON
                        [LOCAL] 794   SINGLE POINT          1    ON
                        [LOCAL] 795   SINGLE POINT          0    OFF
```

The sent email message body for ALARMS looks like this:

From: <sender email address>

Sent: <date time>

To: <recipient 1 email address>;<recipient 2 email address>;etc.

Subject: HOSTNAME = <configured host name, e.g.: G500> : Number of ALARMS = <number of attached Alarms>

HOSTNAME = G500 : Number of ALARMS = 2

The attached file for ALARMS looks like this, for e.g:

```
*****
EVENT_TIME          SEQID REC_TYPE      REFERENCE          VAL  STATE  GROUP_NAMES

Email Configuration

Using the **Server** settings on the **Systemwide** tab → **System**, you can update the email server information and email address list. The MCP supports network and dial-up (PPP) connections to email servers.

» To set up email Server

1. Open the DSAS MCP Studio Configuration tool.
2. Click the **Systemwide** tab.
3. In the left pane, click **System** > **Server** and enter the settings for the email server.
4. In the left pane, click **System** > **Recipients** and add the email recipients.
 - Click **Add** to create a new entry. Double-click a field to modify the settings.
 - Select a row and click **Delete** to remove an email address from the list.
5. Click **Save** to save your changes.

Email Server Settings

Table 6-2: Email Server Settings

Field	Description
Enable Dial Out	Select to enable PPP dial-up: True or False .
Dial Out Username	Enter a username, if required by the email server.
Dial Out Password	Enter a password, if required by the email server.
Server Type	Select the type of authentication protocol (handshaking) configured on the PPP server: Script based , PAP/CHAP or NT Based MSCHAP .
Primary Phone # (dial-up only)	Enter the phone number.
Secondary Phone # (dial-up only)	Enter a phone number if the Primary phone line is unavailable.
Idle Time Before Hanging Up (dial-up only)	Enter the amount of time (in seconds) the MCP waits before closing an idle connection. Range is 0 to 240.
Enable Log Session	Select to activate a session log of the PPP dialer: True or False . The messages are stored in the MCP system log.
Email Server Address	Enter the IP Address of the email server in ipv4 format (123.x.y.z) or the fully qualified domain name. To disable email notification, set to 127.0.0.1. Note: you must use a fixed email server IP address, the MCP cannot resolve DNS names. The email server must support SMTP on port 25, no TLS. The MCP email client doesn't support SMTPS (port 587) or STARTTLS.
Email Server Username	Enter the username for the email server account. Default value is temp.
Email Server Password	Password to be used when accessing the email server account. Default password is temp123\$.
Sender Email Address	Enter the email address of the SMTP account. Default is gateway@ge.com.

Email Recipient Settings

Table 6-3: Email Recipient Settings

Field	Description
Send Email	Select to include the recipient on the email distribution list.
Email	Enter the recipient's email address in the format <i>name@domain.tld</i> .
Name	Enter the name of the email recipient.

Storage

Using the storage option, you will be able to allocate storage areas for the various subsystems, and this will be done exclusively with the sliders as shown:

» To change storage settings:

1. Open the **DSAS MCP Studio Configuration Tool**.
2. Click the **Systemwide** tab.
3. In the left pane, click **System > Storage** and change the storage settings, if desired.
4. Click **Save** to save your changes.
5. Click **Commit Changes** to apply the changes to the MCP.

Figure 6-1: Storage

The following subsystems storage space is allocated with this storage option

- ARRM
- Data Logger
- Analog Reports (not available after and including MCP V2.60)

The maximum number of SOE, active alarms and historical alarms that can be present in the MCP database are configurable and this configuration is done from **storage** option on the **Systemwide** tab.

IEC 101/104 Server

Using the IEC 101/104 Server option, you will be able to update Global IEC 101/104 Server settings:

» To change IEC 101/104 Server settings:

1. Open the **DSAS MCP Studio Configuration Tool**.
2. Click the **Systemwide** tab.
3. In the left pane, click **System > IEC 101/104 Server** and change the IEC 101/104 Server settings, if desired.
4. Click **Save** to save your changes.
5. Click **Commit Changes** to apply the changes to the MCP.

Figure 6-2: IEC 101/104 Server

The following settings can be configured with this option:

- **Emulate D20 RTU IEC 101 DPA Unbalanced Mode Functionality**
 - o Set Emulate D20 RTU IEC101 DPA Unbalanced Mode Functionality to TRUE/FALSE, click Yes to confirm.
 - o **Result:** Emulate D20 RTU IEC101 DPA Unbalanced Mode Functionality is set to selected., Click OK.
- **Startup Quality Event Suppress Interval (seconds)**
 - o Current Value of Startup Quality Event Suppress Interval (in seconds) is displayed.
 - o **NOTE:** Set the value of startup quality event suppress interval to 0 seconds to disable this functionality.
 - o Enter Startup Quality Event Suppress Interval in Seconds [0 to 600] and click Confirm.

RTDB Configuration

Using the **RTDB** option on the **Systemwide** tab you can change general settings for how data is handled by the [real-time database](#) (RTDB).

» To change RTDB settings:

1. Open the **DSAS MCP Studio Configuration** tool.
2. Click the **Systemwide** tab.
3. In the left pane, click **RTDB** and change the settings, if desired.
4. Click **Save** to save your changes.
5. Click **Commit Changes** to apply the changes to the MCP.

RTDB Settings

Table 6-4: RTDB Settings

Field	Description
AI Persistence	Select the type of analog input persistence: RAM . The default value is RAM.
AO Persistence	Select the type of analog output persistence: RAM . The default value is RAM.
DI Persistence	Select the type of digital input persistence: RAM . The default value is RAM.
DO Persistence	Select the type of digital output persistence: RAM . The default value is RAM.
ACC Persistence	Select the type of accumulator persistence: RAM . The default value is RAM.
Text Persistence	Select the type of text persistence: RAM . The default value is RAM.
Output Command Time To Live	Enter the amount of time, in seconds, that passes before a control request is cancelled. Range is 0 to 65535. Default is 5.
Max Startup Sync	Enter the maximum start-up synchronization period (in seconds) for MCP applications to register all events generated at start-up. If set to 0, there is no limit on the duration. Range is 0 to 65535. Default is 540 secs
Event Queue Full Action	Select how events are handled if the event queue is full: Do not lose events or Lose newest events . Default is Do not lose events .
Event Distribution Priority	Select the distribution priority of events: High or Normal .
HMI Status Queue	Enter the directory path and file name where the command status queue is stored. This field is not editable.
Global Control Disable Home Directory	Indicates the directory path and name of the application that owns the Global Controls Disable point. This field is not editable.
Global Control Disable PointName	Indicates the Global Controls Disable point reference ID number. This field is not editable. NOTE: This point is owned by System Status Manager and is available for display in the System Status Manager Point Details page.
Reject Control Request on Offline Points	Select to reject control requests for data points that are currently marked offline: Yes or No . If set to No, control requests are sent to the device. Default is Yes. This setting takes effect only after closing and reopening the Point Details window.
Report Offline Points if Comm Lost	Report IED data points as OFFLINE if COMM LOST quality attribute is set. Default is Yes.
Display 61850 Object Reference	The 61850 Object Reference is displayed if attribute is set to Yes. Default is Yes.

Event Logger

Using the **Event Logger** option on the **Systemwide** tab you can change general settings for how data is handled by the Event Logger.

» To change Event Logger settings:

1. Open **DSAS MCP Studio Configuration Tool**.
2. Click the **Systemwide** tab.
3. In the left pane, click **Event Logger** and change the settings, if desired.
4. Click **Save** to save your changes.

Event Logger Settings

Table 6-5: Event Logger Settings

Field	Description
PRF NVRAM Size	Enter the amount of space to allocate for the table containing the protective relay fault (PRF) records. Default value is 1000 and is not editable.
Quality NVRAM Size	Enter the amount of space to allocate for the table containing the quality records. Range is 1000 to 10000, default is 1000.
NVRAM	Select whether event records are stored in NVRAM: Default value is false and is not editable.
Number of PRF Records	Enter the maximum number of protective relay fault (PRF) records to store in the real-time database. Range is 1000 to 10000, default is 5000.
Number of Quality Force Records	Enter the maximum number of quality records to store in the real-time database. Range is 1000 to 10000, default is 5000.
Notification Delay	Enter the amount of time (in seconds) the Event Logger waits to buffer additional events before sending a notification. Range is 30 to 3600. Default is 30.
Notification Threshold	Enter the number of events that are buffered before a notification is sent. Range is 0 to 65535. Default is 100.
PRF Notification	Select the method to report PRF events. Range is Not Used , Email . Default is Not Used.

Locale

The MCP HMI can be localized to reflect regional languages, number formats, and date/time formats. Any changes on the **Locale** page require a restart of your browser to take effect.

» To set up your locale:

1. Open **DSAS MCP studio configuration Tool**.
2. Click the **Systemwide** tab.
3. In the left pane, click **Locale** and edit the fields as required.
4. Click **Save** to save your changes.
5. Click **Commit Changes** to apply the changes to the MCP.

NOTE: Your changes do not take effect until you log out of the MCP HMI.

Table 6-6: Locale

Field	Description																										
HMI Language	A list of languages available based on the language packs that have been installed on your device.																										
Decimal Separator	Select whether to use a comma or period to denote a decimal place. Selecting Locale Symbol reverts to the default defined in the selected HMI Language.																										
Grouping Separator	Select whether to use a comma, period, or space to denote hundreds of groupings. If None is selected, no grouping is shown. Selecting Locale Separator reverts to the default defined in the selected HMI Language.																										
Date Format	Select the format to use when showing dates. Refer to the table below for an explanation of string values. Selecting Locale Format reverts to the default defined in the selected HMI Language.																										
Time Format	Select the format to use when showing times. Refer to the table below for an explanation of string values. Selecting Locale Format reverts to the default defined in the selected HMI Language. <table border="1"> <thead> <tr> <th>String</th><th>Definition</th></tr> </thead> <tbody> <tr> <td>dd</td><td>Day of the month with leading zero</td></tr> <tr> <td>MM</td><td>Month of the year with leading zero</td></tr> <tr> <td>yy</td><td>Date of the year truncated to the last 2 digits</td></tr> <tr> <td>yyyy</td><td>Date of the year</td></tr> <tr> <td>h</td><td>Hour of the day in 12-hour format without leading zero</td></tr> <tr> <td>hh</td><td>Hour of the day in 12-hour format with leading zero</td></tr> <tr> <td>H</td><td>Hour of the day in 24-hour format without leading zero</td></tr> <tr> <td>HH</td><td>Hour of the day in 24-hour format with leading zero</td></tr> <tr> <td>mm</td><td>Minute of the hour with leading zero</td></tr> <tr> <td>ss</td><td>Second of the hour with leading zero</td></tr> <tr> <td>SSS</td><td>Microseconds of the hour with leading zeros</td></tr> <tr> <td>a</td><td>AM/PM in the format <i>a</i> or <i>p</i></td></tr> </tbody> </table>	String	Definition	dd	Day of the month with leading zero	MM	Month of the year with leading zero	yy	Date of the year truncated to the last 2 digits	yyyy	Date of the year	h	Hour of the day in 12-hour format without leading zero	hh	Hour of the day in 12-hour format with leading zero	H	Hour of the day in 24-hour format without leading zero	HH	Hour of the day in 24-hour format with leading zero	mm	Minute of the hour with leading zero	ss	Second of the hour with leading zero	SSS	Microseconds of the hour with leading zeros	a	AM/PM in the format <i>a</i> or <i>p</i>
String	Definition																										
dd	Day of the month with leading zero																										
MM	Month of the year with leading zero																										
yy	Date of the year truncated to the last 2 digits																										
yyyy	Date of the year																										
h	Hour of the day in 12-hour format without leading zero																										
hh	Hour of the day in 12-hour format with leading zero																										
H	Hour of the day in 24-hour format without leading zero																										
HH	Hour of the day in 24-hour format with leading zero																										
mm	Minute of the hour with leading zero																										
ss	Second of the hour with leading zero																										
SSS	Microseconds of the hour with leading zeros																										
a	AM/PM in the format <i>a</i> or <i>p</i>																										
Time Zone	Select the time zone mode that should be used when the HMI displays time values. Selecting Local Timezone displays events using the timezone that is configured on your computer. Selecting UTC displays event timestamps as they have been recorded in the MCP without modification.																										

Access Manager

The **Access Manager** is a utility in the MCP that controls access, authentication, and authorization to the MCP. It allows or denies users access to specific features of the system at the point of log in, authentication or log out.

» To change system access settings:

1. Open **DSAS MCP studio configuration Tool**.
2. Click the **Systemwide** tab.
3. In the left pane, click **Access Manager**.
4. Modify the settings as required.

5. Click **Save** to save your changes.
6. Click **Commit Changes** to apply the changes to the MCP (if this button becomes active after **Save**).

System Access Settings

Table 6-7: System Access Settings

Field	Description
Max. Simultaneous Observers	Enter the maximum number of Observer-level users who can be logged in concurrently. Range is 0 to 255. Default is 8.
Max. Simultaneous Operators	Enter the maximum number of Operator-level users who can be logged in concurrently. Range is 0 to 255. Default is 4.
Max. Simultaneous Supervisors	Enter the maximum number of Supervisor-level users who can be logged in concurrently. Range is 1 to 255. Default is 1.
Inactivity Timeout for Local HMI	Enter the amount of time (in minutes) that the MCP waits before automatically logging out an inactive user logged in locally. Range is 0 to 1440. Lower number offers more security while higher number offers more convenience. Default is 15. A value of 0 disables auto logoff. NOTE: It is required to logoff all Local HMI sessions and re-login again for this parameter to take effect.
Inactivity Timeout for Remote HMI	Enter the amount of time (in minutes) that the MCP waits before automatically logging out an inactive user logged in remotely. Range is 0 to 1440. Lower number offers more security while higher number offers more convenience. Default is 15. A value of 0 disables auto logoff. NOTE: It is required to logoff all Remote HMI sessions and re-login again for this parameter to take effect.
Inactivity Timeout for command line operations	Enter the amount of time (in minutes) that the MCP waits before automatically logging out an inactive user when using the command line utility. This setting applies to TELNET, SSH, and serial sessions. Range is 10 to 60. Lower number offers more security while higher number offers more convenience. Default is 15.
Lockout Count	Enter the number of times a password can be incorrectly entered before the user account is locked out. Range is 1 to 32. Default is 3.
Lockout Duration	Enter the amount of time (in minutes) that a user must wait before attempting to log in after being locked out. Range is 1 to 30. Default is 1.
Remote Desktop Functionality	If set to enabled Remote Desktop connections are allowed. Available only in MCP v3.00 and v3.10.
Remote Desktop Inactivity Timeout	Enter the amount of idle time (in minutes) that the Gateway waits before automatically closing a Remote Desktop session. Range is 10 to 60. Default is 15. Available only in MCP v3.00 and v3.10.

Auto Login

Automatic Login' related settings can be configured from HMI, Settings → Automatic Login tab, as shown below:

Table 6-8: Auto Login

Field	Description
Local UI Automatic Login	Select to skip the Local HMI log in when a user logs into the MCP through the local substation computer setup (KVM card) and go directly to the Local HMI main page (home page). Default is False. NOTE: This feature is disabled for Cisco TACACS+, and LDAP Remote Authentication. Note: Starting with MCP V520, Cisco® TACACS+ is no longer available. SECURITY NOTICE: If Local UI Auto Login is set to true, the Local HMI will perform an automatic login using the selected user privilege level and name, without additional human authentication required. It is up to the system's Engineer / Operations to assess the effect and application of this behavior at runtime.
Local UI Automatic Login Wait Time	This parameter can only be configured if "Local UI Automatic Login" is set to true. The Local UI Automatic Login Wait Time parameter represents the wait time (in seconds) that is available for the user to interrupt the system from entering the Local Graphical UI's Main Page from the Command Line Interface.
Local Automatic Login Privilege Level	This parameter can only be configured if the Local UI Automatic Login parameter is set to true. The Local Automatic Login Privilege Level parameter provides the user with the option to configure the Default Privilege Level when navigating to the Local Graphical UI.
Local Automatic Login User	This parameter can only be configured if the Local UI Automatic Login parameter is set to true. The Local Automatic Login User parameter allows the user to choose the default user from the list of users configured under each Privilege Level (Supervisor/Operator/Observer).

Field	Description
Remote UI Automatic Login	Select to skip the Remote HMI log in when a user logs into the MCP through the Remote substation computer and go directly to the Remote HMI main page (home page). Default is False. NOTE: This feature is disabled for Cisco TACACS+, and LDAP Remote Authentication. Note: Starting with MCP V520, Cisco® TACACS+ is no longer available. SECURITY NOTICE: If Remote UI Auto Login is set to true, the Remote HMI will perform an automatic login using the selected user privilege level and name, without additional human authentication required. It is up to the system's Engineer / Operations to assess the effect and application of this behavior at runtime.
Remote UI Automatic Login Wait Time	This parameter can only be configured if "Remote UI Automatic Login" is set to true. The Remote UI Automatic Login Wait Time parameter represents the wait time (in seconds) that is available for the user to interrupt the system from entering the Remote UI's Main Page from the Command Line Interface.
Remote Automatic Login Privilege Level	This parameter can only be configured if the Remote UI Automatic Login parameter is set to true. The Remote Automatic Login Privilege Level parameter provides the user with the option to configure the Default Privilege Level when navigating to the Remote Graphical UI.
Remote Automatic Login User	This parameter can only be configured if the Remote UI Automatic Login parameter is set to true. The Remote Automatic Login User parameter allows the user to choose the default user from the list of users configured under each Privilege Level (Supervisor/Operator/Observer).

GUI (Runtime GUI)

Using the **Global** option on the **Systemwide** tab, you can change general settings for how commands and data appear in the HMI.

» To change global settings:

1. Open **DSAS MCP studio configuration** Tool.
2. Click the **Systemwide** tab.
3. In the left pane, click **Runtime GUI > Global** and modify the settings, if desired.
4. Click **Save** to save your changes.
5. Click **Commit Changes** to apply the changes to the MCP.

Global Configuration Settings

Table 6-9: Global Configuration Settings

Field	Description
Device Identity	This parameter is used to identify the current device. It appears on HMI Power bar. NOTE: • If not specified, the hostname appears on the HMI Power bar by default. • It is necessary to re-login to the HMI to view the new identity on the HMI Power bar after the device identity has been changed. If a device is running in Redundant mode, the suffix '-A' or '-B' is appended to the end of specified value on the HMI Power bar; for example: if the specified text is 'This is my device', the text 'This is my device-A' appears on the HMI Power bar when connecting to Gateway_A. The appended suffix '-A' or '-B' is determined by the device configured as Gateway_A or Gateway_B in the mcpcfg.
Tag/Inhibit Interface Inactivity Timeout	Enter the amount of time, in seconds, that a tag/inhibit interface window remains open before it automatically closes and cancels the operation. Range is 10 to 65535.
Local Force Interface Inactivity Timeout	Enter the amount of time, in seconds, that a local force interface window remains open before it automatically closes and cancels the operation. Range is 10 to 65535.
Execute Control Interface Inactivity Timeout	Enter the amount of time, in seconds, that an execute control interface window remains open before it automatically closes and cancels the operation. Range is 10 to 65535.
Confirmation Inactivity Timeout	Enter the amount of time, in seconds, that a confirmation window remains open before it automatically closes and cancels the operation. Range is 10 to 65535.
Normal Quality Foreground Color	Select the text color to be used when showing normal power quality records. Color choices available in Color palette window.
Normal Quality Background Color	Select the background color to be used when showing normal power quality records. Color choices available in Color palette window.
Invalid Quality Foreground Color	Select the text color to be used when showing invalid power quality records. Color choices available in Color palette window.
Invalid Quality Background Color	Select the background color to be used when showing invalid power quality records. Color choices available in Color palette window.
Questionable Quality Foreground Color	Select the text color to be used when showing questionable power quality records. Color choices available in Color palette window.
Questionable Quality Background Color	Select the background color to be used when showing questionable power quality records. Color choices available in Color palette window.
Engaged Quality Foreground Color	Select the text color to be used when showing engaged power quality records. Color choices available in Color palette window.
Engaged Quality Background Color	Select the background color to be used when showing engaged power quality records. Color choices available in Color palette window.
Zombie Quality Foreground Color	Select the text color to be used when showing zombie power quality records. Color choices available in Color palette window.
Zombie Quality Background Color	Select the background color to be used when showing zombie power quality records. Color choices available in Color palette window.

Field	Description
Conditional Formatting Text Color for Errors	Select the text color to be used when showing errors (Conditional formatting). Color choices available in Color palette window.
Conditional Formatting Background Color for Errors	Select the background color to be used when showing errors (Conditional formatting). Color choices available in Color palette window.
Conditional Formatting Text Color for Unavailable items	Select the text color to be used when showing Unavailable items (Conditional formatting). Color choices available in Color palette window.
Conditional Formatting Background Color for Unavailable items	Select the background color to be used when showing Unavailable items (Conditional formatting). Color choices available in Color palette window.
Conditional Formatting Font Style for Unavailable items	Select the Font style to be used when showing Unavailable items (Conditional formatting). Color choices available in Color palette window.
Record Block Size	Enter the number of rows that appear per page on the Point Details and Point Groups pages. Range is 10 to 100. Default is 20.
Viewer Initial Drawing	Enter the filename of the default drawing to display in the One-Line Viewer . Drawings are created and saved using the One-Line Designer . Default is <i>main.dra</i> .
Local UI Main Page	Select a home page from the dropdown list to display after login to the Local HMI. This parameter is applicable for Local HMI when Redundancy is not configured.
Local UI Main Page for this GatewayA	This parameter is only applicable when Redundancy (Warm Redundancy/Hot Redundancy) is configured. Select a home page from the dropdown list to display after login to the Local HMI of the MCP with the designation Gateway_A.
Local UI Main Page for this GatewayB	This parameter is only applicable when Redundancy (Warm Redundancy/Hot Redundancy) is configured. Select a home page from the dropdown list to display after login to the Local HMI of the MCP with the designation Gateway_B.
Remote UI Main Page	Select a home page from the dropdown list to display after login to the Remote HMI. This parameter is applicable to the Remote HMI, both when Redundancy is not configured or not configured.
CGI request time-to-live	Enter the amount of time, in seconds, that passes before a CGI request is cancelled. Range is 0 to 65535. Default is 5.
Local UI heartbeat timeout	Enter the amount of time, in seconds, between Local UI heartbeats. Range is 1 to 60. Default is 2.
Local UI heartbeat retries	Enter the number of consecutive heartbeat timeout retries after which the Local UI has the user logged off. Range is 1 to 10. Default is 2.

Field	Description
Remote UI heartbeat timeout	Enter the amount of time, in seconds, between Remote UI heartbeats. Range is 1 to 60. Default is 2.
Remote UI heartbeat retries	Enter the number of consecutive heartbeat timeout retries after which the Remote UI has the user logged off. Range is 1 to 10. Default is 2.

AI Text Enumeration tab

The **AI Text Enumeration** feature allows you to assign text strings to integer values of analog input points. This can be used to provide user-friendly definitions to SNMP codes. Though the underlying data reported remains intact (that is, the actual reported integer value of the point is still recorded in the database), the point details page shows the associated text enumeration to users.

Enumeration Values

An **Enumeration** is a set of value/text pairs that can be used by one or more analog input mappings. Your first step in configuring AI Text Enumeration is to create one or more enumerations.

NOTE:

There are predefined enumerations which cannot be changed by users.

Click the **Add** button to insert a new row in the table. Select one or more rows and click **Delete** to remove them.

Table 6-10: Enumeration Values

Value Name	Description
Name	A unique ASCII text description of the enumeration.
Invalid Value Text	If an analog input value is not defined in the enumeration, this text string is shown to users.
Value	The analog value returned by the analog input. You can enter any signed 32-bit integer.
Text	The text string associated with the selected value. Valid range is up to 64 Unicode characters.

Analog Input Mappings

Point Selection Area

You can select system points using the system point tree. Click the checkbox to the left of a point or group name to add a point or a group of points to the group. Points included in the group are shown at the right-hand side of the point selection area. To remove a point, uncheck the appropriate box in the system point tree or highlight the point and click the **Delete** button. Click the **Delete NE** to remove any points that are not valid (that is, points that have been deleted from the system database after they were included in analog input mappings list).

Enumeration

Select one of the available enumerations to be associated with the analog input.

Build Client Map Files

This chapter contains the following sections and sub-sections:

GPIO Configuration steps (G100 only)

D.20 Peripheral Client

Client Map

DNP3 Client

Modbus Client

SEL Binary Client

IEC 60870-5-103 Client

IEC 60870-5-101+104

SNMP Client Properties

IEC 61850 Client

GPIO Configuration Steps (G100 only)

G100 device has a built in **General Purpose IO module (GPIO)** providing 8xDI, 4x DC AI and 4x DO. For additional details about GPIO refer to *G100 Instruction Manual (GE Vernova Part Number 994-0155)*.

The DO operation types on the internal G100 relays are PULSE, LATCH_ON and LATCH_OFF. At runtime, commands received as CLOSE are translated to LATCH_ON, and commands received as TRIP are translated to LATCH_OFF. The PULSE command types are executed as PULSE, according to their associated repeat and duration parameters.

Use DS Agile MCP studio's Online & Offline configuration tool to configure the G100 GPIO configuration. The typical sequence of steps involved in configuring G100 GPIO from DS Agile MCP Studio are as follows:

1. Access the Online or Offline editor for the G100 device:
 - Online Editor – Accessed via the option 'Connect' under the 'Communications' ribbon menu category, or 'Communications' via right-click menu on the G100 device
 - o Login to Online Editor using administrative credentials
 - Offline Editor – Accessed via the option 'Editor' under the 'Configuration' ribbon menu category, or 'Configuration' via right-click menu on the G100 device.
2. Left click on 'GPIO Block' located under 'Local IO Connections' in the 'Connections' tree.

- The block settings window on the right will display the default Line ID / Bay ID / Device ID for the GPIO, along with the default 'gpio_template.xml'.

Block Settings

Configuration Parameters

☒ Auto Start-Up

Please specify the GPIO IED you would like to connect

Line ID	Bay ID	Device ID	Map File ▲
Line 0	Bay 0	Device 0	gpio_template.xml

- The 'Auto Start-Up' checkbox is enabled by default, this setting automatically starts the GPIO application (Local/Remote HMI indicates the application is running under Connections/Point Details), otherwise the application must be manually started.
- The **Line/Bay/Device ID** fields can be populated with unique names, the constraints on naming convention are the same as existing applications in DSAS.
- The 'Map File' column shows the default 'gpio_template.xml', which can be edited, detailed below in step #7.
- Select 'Edit' the 'Edit – gpio_template.xml' window will be displayed; the window contains three tabs for editing (Analog Input / Digital Input / Digital Output).

- Analog Input**

- o **Point ID** cannot be modified and indicates the internal point ID for the respective Analog Input
- o **Point Reference/Description** shows default values, the columns can be populated with unique names, the constraints on naming convention are the same as existing applications in DSAS
- o **Multiplier** default value of '1', the injected current/voltage on the specific Analog Input value is multiplied by the configured multiplier amount, and represented accordingly in the local/remote HMI
- o **Offset** default value of '0', the offset configured for the specific Analog Input will be added to the injected current/voltage on the respective Analog Input, and represented accordingly in the local/remote HMI
- o **Range Selection** default setting '+/- 5V' can be set to '20mA', the local/remote HMI displays the value according to the range selected
 - **Note:** To obtain proper values, there are internal jumpers on the MCP that need to be set to configure each Analog Input individually as a current or voltage input. Refer to the G100 Instruction Manual (*GE Vernova Part Number 994-0155*)
- o **Report Deadband** default value of '0.1', in % of FS. Can be set to a maximum value of '100', and is used to define the reporting threshold for the individual Analog Inputs
 - Voltage Input Deadband calculation = $5 * \text{configured_deadband_value} / 100$ (in V)
 - Current Input Deadband calculation = $20 * \text{configured_deadband_value} / 100$ (in mA)
- o **Point Group** default value of 'PVal' can be used to set the point group for the individual Analog Inputs, adding a new group can be completed via Systemwide → Point Groups tab

- **Digital Input**

- o **Point ID** cannot be modified and indicates the internal point ID for the respective Digital Input
- o **Point Reference/Description** shows default values, the columns can be populated with unique names, the constraints on naming convention are the same as existing applications in DSAS
- o **Debounce Filter** (ms) default value of '0', can be set to a maximum value of '1000', the filter is used to eliminate unwanted noise on the Digital Input; indicating the signal on the Digital Input must be valid for 0-1000ms before the Digital Input value is changed/reported
- o **ON State** represents the unique name which is displayed in the local/remote HMI when the respective Digital Input is in the ON state, the constraints on naming convention are the same as existing applications in DSAS
- o **OFF State** represents the unique name which is displayed in the local/remote HMI when the respective Digital Input is in the OFF state, the constraints on naming convention are the same as existing applications in DSAS
- o **Point Group** default value of 'PVal' can be used to set the point group for the individual Digital Inputs, adding a new group can be completed via Systemwide → Point Groups tab

- **Digital Output**

- o **Point ID** cannot be modified and indicates the internal point ID for the respective Digital Output
- o **Point Reference/Description** shows default values, the columns can be populated with unique names, the constraints on naming convention are the same as existing applications in DSAS
- o **OFF State** represents the unique name which is displayed in the local/remote HMI when the respective Digital Output is in the OFF state, the constraints on naming convention are the same as existing applications in DSAS
- o **ON State** represents the unique name which is displayed in the local/remote HMI when the respective Digital Output is in the ON state, the constraints on naming convention are the same as existing applications in DSAS
- o **Pulse Count** default value '1', can be set to a maximum of '100,000', the amount configured determines how many operations are applied on the respective Digital Output when a PULSE control type is operated
 - The 'Pulse Count' is overwritten by the value entered in the 'Digital Output Interface' window when operating controls using local/remote HMI
- o **Pulse On Duration** (ms) default value '1,000', can be set to a maximum of '100,000', the amount configured determines the duration the relay remains in the 'On' position for the respective Digital Output when a PULSE control is operated
 - The 'Pulse On Duration (ms)' is overwritten by the value entered in the 'Digital Output Interface' window when operating controls using local/remote HMI
- o **Pulse Off Duration** (ms) default value '1,000', can be set to a maximum of '100,000', the amount configured determines the duration the relay remains in the 'Off' position for the respective Digital Output when a PULSE control is operated

- The 'Pulse Off Duration (ms)' is overwritten by the value entered in the 'Digital Output Interface' window when operating controls using local/remote HMI
 - o **Point Group** default value of 'PVal' can be used to set the point group for the individual Digital Outputs, adding a new group can be completed via Systemwide → Point Groups tab
- 8. Once changes to the default 'gpio_template.xml' have been performed, the changes need to be synchronized to the MCP.
 - Using the Online Editor, simply select 'Save', enter a new name for the template, select 'Save' again, followed by 'Commit Changes'
 - Using the Offline Editor, select 'Save', enter a new name for the template, select 'Save' again, followed by 'Commit Changes', then 'Save Session', finally selecting 'Sync to Device'

NOTE: The default 'gpio_template.xml' can be modified but not deleted, in the case an edited template has been saved; the dropdown menu allows using the default template again along with any modified templates

D.20 Peripheral Client

D.20 Peripheral Mapfiles

About the D.20 Peripheral Mapfiles

The D.20 Peripheral map defines how the MCP is configured to poll the data from D.20 peripherals. The MCP supports communications to D.20 peripherals over a standard D.20 link using the D.20 Peripheral Link Client application.

On the **Client Map** tab on the **Configuration** page you configure point maps for the D20 peripheral modules you are connecting to.

The D.20 Peripheral Link Client polls for and retrieves information from peripheral modules according to a client map file. The map file contains information on how polling is scheduled for a device based on the device's capabilities, frequency of polling, selected data points, etc.

To facilitate the collection of data, the MCP comes pre-loaded with map files for all D.20 peripheral modules. Once you create a client map file, it becomes available to select on the Configuration page when assigning device connections.

NOTE: Additional D.20 client configuration settings are available for device communications when configuring D.20 connections on the **D.20 Connection** tab.

D.20 Client Peripheral Properties

The Client map settings are available on the **Client Map** tab when a D.20 protocol device type is selected. The below table lists the poll-specific settings for the D.20 peripherals.

The MCP supports the following configurable D.20 data types:

D.20 data types	Supported by card	Description
Analog inputs	D20 – A, C1, C2	Measured or computed values by the device
Analog outputs	D20 – C2	Physical or computed analog quantities
Digital inputs	D20 – C0, C1, C2, S	States of physical or logical Boolean devices
Digital outputs	D20 – K, C0, C1, C2	Physical or logical ON-OFF, raise-lower, and trip-close points

Types of D.20 Peripherals

Below table lists the D.20 Peripherals and its supported Point Types and count of points in each Type.

Peripheral Board Type	Available Point Type(s) on Board	
D20 A (analog Input board)	32 analog input points	
D20 S (digital input or status board)	64 digital (status) inputs up to 64 Form A counters up to 32 Form C counters up to 32 Double points	
D20 K (digital output or control board)	32 digital (control) outputs (always configured in groups of 8, e.g.:8 raise/lower and 24 trip/close, 16 raise/lower and 16 trip/close, etc.)	
D20 C (combination boards) D20 C0 D20 C1 D20 C2	C0	16 digital (status) inputs 8 digital (control) outputs (always configured in groups of 2)
	C1	16 digital (status) inputs 8 digital (control) outputs (always configured in groups of 2) 16 analog inputs
	C2	16 digital (status) inputs 8 digital (control) outputs (always configured in groups of 2) 8 analog inputs 8 analog outputs

Configuring Peripheral Map files

This section describes how to configure D.20 peripheral map files for D.20 application.

For each peripheral configured following option are available in DSAS.

Configure a D20 A Peripheral (Analog Input Points)

A D20 A peripheral board, also known as the analog board, has 32 analog input points, and can be terminated by a D20 A or a D20 AD termination board.

For D20 A card there are certain sets of fields supported and are given below:

Table 6-11: D20 A card - Peripheral level

Parameter	Description	Range	Default
Termination Board	D20 A Analog Input Peripheral (32 AI)	WESTERM D20 A WESTERM D20 AD WESTERM D20 0AD WESTERM D20 AZ WESTERM D20 AB WESTERM D20 AX WESTERM D10 A	WESTERM D20 A
Description	D20 A Analog Input Peripheral (32 AI), It supports up to 32 ASCII user defined characters	N/A	N/A
Reference Check	Specifies how often the board software updates the on-board analog input references, in terms of analog input scans. Valid only for peripherals that have analog inputs.	20 to 255	100
Reference Dead band	Difference between the running references and EPROM references before the peripheral shuts down. Valid only for peripherals that have analog inputs.	0 to 32767	256

Parameter	Description	Range	Default
Input Settling Time (microseconds)	Length of time the application allows for an analog input signal to settle before the application takes a sample. Valid only for peripherals that have analog inputs (in microseconds).	0 to 32767	500
Line Frequency (Hz)	Frequency of the system being monitored by the device.	50 and 60	60

For each point, fill in the fields as outlined in the table below:

Table 6-12: D20 A card – Point level

Parameter	Description	Default	Action required
Point Reference	Some general information about the point. This information will be displayed in MCP Point Details.	N/A	Type a brief description of the point. Maximum length 64 ASCII Characters
Point Description	Some general information about the point. This information will be displayed in MCP Point Details.	N/A	Type a brief description of the point. Maximum length 64 ASCII Characters
Point Group	Refence for defined point group	Pval	Pval/Demand/Peak Demand
Scan Enable	Enables or disables a point from being scanned and having its value returned to the RTU.	YES	Select either YES or NO.
Range Select	The maximum positive and negative full-scale voltage to be applied to the input point. NOTE: The appropriate input adapter module must be present on the termination board.	0±5 volts	Select either 0±1 volt, 0±5 volts, or 0±10 volts.
Report Deadband	The least significant bits of the analog value that must change before the application reports the value to the system point database. Use this option to control the number of data change events generated.	4	Type in a suitable value for your system.
Client High Scale	The maximum value that is to be returned to the system point database, as a percentage of 32767.	100 %	Use 100% unless you have non-standard analog input scaling modules.
Client Low Scale	The minimum value that is to be returned to the system point database, as a percentage of 32767.	-100 %	Use -100% unless you have non-standard analog input scaling modules.
Peripheral High Scale	The maximum value that is expected from the analog input peripheral, as a percentage of 32767.	100 %	Use 100% unless you have non-standard analog input scaling modules.
Peripheral Low Scale	The minimum value that is expected from the analog input peripheral, as a percentage of 32767.	-100 %	Use -100% unless you have non-standard analog input scaling modules.

Configure a D20 S Peripheral (Digital Input Points)

A D20 S peripheral board, also known as the status (or digital input) peripheral, has 64 digital input points, up to 64 Form A counters, or up to 32 Form C counters and 32 Double points.

Digital inputs monitor and report changes of state, either ON or OFF.

If they are accumulator input points (known as single-point or double point accumulators), they **count** those changes.

For D20 S card there are certain sets of fields supported and are given below:

Table 6-13: D20 S card - Peripheral Level

Parameter	Description	Range	Default
Termination Board	D20 S Digital Input Peripheral (64 DI)	WESTERM D20 S WESTERM D20 SD WESTERM D20 OSD WESTERM D20 SZ WESTERM D20 SZ2 WESTERM D20 SB WESTERM D20 SI WESTERM D20 SX WESTERM D20 SDI WESTERM D10 SI	WESTERM D20 S
Description	D20 S Digital Input Peripheral (64 DI), Supports max 32 ASCII Characters	N/A	N/A
Filter Period (ms)	Length of time used as the sample time window for chatter filtering.	100 to 65535	0

For each point, fill in the fields as outlined in the table below:

Table 6-14: D20 S card - Point Level

Parameter	Description	Default	Action required
Point Reference	Some general information about the point	N/A	Type a brief point reference of the point. Maximum length 64 ASCII Characters
Point Description	Some general information about the point. This information will be displayed in MCP Point Details	Spare	Type a brief description of the point. Maximum length 64 ASCII Characters
Point Group	Refence for defined point group	Pval	Pval/Demand/Peak Demand
Point Type	The type of point.	Status Input	Select from <i>Single-point State</i> , <i>Double-point state</i> , <i>Form A Counter</i> , or <i>Form C Counter</i> .
Report Limit	Specify the size of change in the new counter value from the previous value before the application reports the new value to the system point database. This is only valid if the user has selected "Transition Counter" or "Form C Counter" as the point type.	0 times	Type in the maximum number of counts that can occur before being reported to the MCP. 0 to 255
Tolerant Phase	A period of time during which contact bounce is "acceptable." Having a tolerant period allows you to monitor and time-stamp the initial state of change, while ignoring any subsequent contact bounce.	0 ms	Type in a value between 0 and 255 milliseconds.
Intolerant Phase	A period of time following the tolerant phase during which contact bounce is not "acceptable." It ensures that contact bounce is not mistaken for a valid change of state.	6 ms	Type in a value between 0 and 255 milliseconds.

Parameter	Description	Default	Action required
Valid Period	For a single-point state/Form A counter: Defines the period of time (in 256 ms increments) during which the point state must be ON. For a double-point state/Form C counter: Defines the period of time (in multiples of 10 ms) during which both points must be in a "valid" state (i.e., either 1-0 or 0-1).	0	Type in a value between 0 and 255 increments.
Invalid Period	For a single-point state/Form A counter: Defines the period of time (in 256 ms increments) during which the point state must be OFF. For a double-point state/Form C counter: Defines the period of time (in multiples of 256 ms) during which both points must be in an "invalid" state (i.e., either 0-0 or 1-1).	0	Type in a value between 0 and 255 increments.
Chatter Transitions	The maximum allowable number of state transitions that can occur within a filter base period. If the number of state transitions during a filter period equals or exceeds the maximum allowable number of state transitions, the chatter filter will turn ON, and any further transitions will be ignored for the duration of the "lock-out" period.	0 transitions	Type in a value between 0 and 255 transitions. If the transition value is 0 (zero), the chatter filter is disabled for the associated digital input.
Lock-out Period	If one, the minimum number of filter base periods during which the chatter filter will remain ON. The chatter filter can proceed from ON to OFF only if no state transitions are detected for an entire lock-out period. If zero, the chatter filter can proceed from ON to OFF only if there are less transitions than the maximum expected number of transitions.	0 filter base periods	Type in a value between 0 and 65535 filter base periods.

Configure a D20 K Peripheral (Digital Output Points)

A D20 K peripheral board, also known as the digital output (or control) peripheral, has 32 digital (control) output points, or 16 raise/lower pairs, or a combination of these. It can be terminated by a D20 K or D20 KR termination board. In addition, interposer relay (or KI) expansion boards can be used to provide additional functionality.

For D20 K card there are certain sets of fields supported and are given below:

Table 6-15: D20 K card - Peripheral Level

Parameter	Description	Range	Default
Termination Board	WESTERM D20 K	WESTERM D20 K WESTERM D20 KR WESTERM D20 0KR WESTERM D20 K4Z WESTERM D20 KX WESTERM D10 K WESTERM D10 KR	WESTERM D20 K

Parameter	Description	Range	Default
Description	User defined string to identify peripheral, Supports up to 32 ASCII User Defined characters	N/A	N/A
Select Time (ms)	Length of time the select relay operates before the master relay.	1 to 255	10
Clear time (ms)	Length of time select relay continues operating after master relay.	1 to 255	10
Control arm Time-outs (ms)	Length of time between the arm and executes request for a digital output point before the control is disarmed.	100 to 255	100
Retry time (s)	Length of time peripherals wait to start after shutting down.	1 to 255	10
Retry attempts	Number of times peripheral board tries to restart itself after it fails.	0 to 255	0
Comm fail time out (ms)	Length of time peripheral waits for communication on HDLC link before shutting down all relays.	0 to 65535	0

For each point to be modified, fill in the fields as outlined in the table below:

Table 6-16: D20 K card - Point Level

Parameter	Description	Default	Action required
Point Reference	Some general information about the point This information will be displayed in Point details for individual point.		Type a brief point reference of the point. Maximum length 64 ASCII Characters
Point Description	Some general information about the point. This information will be displayed in Point details for individual point.	Spare	Some general information about the point. Maximum length 64 ASCII Characters
Point Group	Refence for defined point group	Pval	Pval/Demand/Peak Demand
Termination Type	Defines the configuration of the termination board, i.e., the way each group of 8 outputs are configured according to jumper settings.	Trip / Close	WESTERM K-board: select either: Trip/Close, Raise/Lower, Form C outputs, or Open Collector. WESTERM KR-board: select Trip/Close or Raise/Lower.
Reset on Startup	Determines if a latched relay is automatically reset when the MCP starts up.	No	Set "Yes" to reset the relay to a known (clear) state at startup of MCP.

Configure a D20 C Peripheral (Combination of Points)

There are three types of D20 C peripheral boards.

Each one has a different combination of point types shown below. C1 and C2 peripherals have a module also support analog functionality.

Details of each C type peripherals and the input/output support is given below.

Peripheral Board Type	Available Point Type(s) on Board	
D20 C (combination boards) D20 C0	C0	16 digital (status) inputs 8 digital (control) outputs (always configured in groups of 2)

Peripheral Board Type	Available Point Type(s) on Board	
D20 C1 D20 C2	C1	16 digital (status) inputs 8 digital (control) outputs (always configured in groups of 2) 16 analog inputs
	C2	16 digital (status) inputs 8 digital (control) outputs (always configured in groups of 2) 8 analog inputs 8 analog outputs

For D20 C0 card there are certain sets of fields supported and are given below:

Table 6-17: D20 C card - Peripheral Level

Parameter	Description	Range	Default
Termination Board	Standard combo termination board	WESTERM D20 C WESTERM D20 CD WESTERM D20 C4Z WESTERM D20 C4Z2 WESTERM D20 CB WESTERM D20 CDI WESTERM D20 C (DB25) WESTERM D20 CX WESTERM D10 C	WESTERM D20 C
Description	User defined string to identify peripheral. Supports up to 32 ASCII User Defined characters	N/A	N/A
Filter Period (ms)	Length of time used as the sample time window for chatter filtering.	100 to 65535	0
Select Time (ms)	Length of time the select relay operates before the master relay.	1 to 255	10
Clear time (ms)	Length of time select relay continues operating after master relay.	1 to 255	10
Control arm Time-outs (ms)	Length of time between the arm and executes request for a digital output point before the control is disarmed.	100 to 255	100
Retry time (s)	Length of time peripherals wait to start after shutting down.	1 to 255	10
Retry attempts	Number of times peripheral board tries to restart itself after it fails.	0 to 255	0
Comm fail time out (ms)	Length of time peripheral waits for communication on HDLC link before shutting down all relays.	0 to 65535	0

For each point to be modified, fill in the fields as outlined in the table below.

Configure D20 C Digital Input Points

To configure digital input points on D20 C0, C1, or C2 peripheral boards:

- Click points (near the top of the window).
For each point to be modified, fill in the fields as shown in the table in [Configure a D20 S Peripheral \(Digital Input Points\)](#) earlier in this chapter.
- If you enter a value that is out of range, DSAS will show a warning and automatically insert the lowest or highest value that it can accept, as appropriate.

Configure D20 C Digital Output Points

To configure digital output (control) points for D20 C0, D20 C1, or D20 C2 peripheral boards:

1. For each point to be modified, fill in the fields as outlined in the table in [Configure a D20 K Peripheral \(Digital Output Points\)](#) earlier in this chapter.
2. If you enter a value that is out of range, DSAS will show a warning and automatically insert the lowest or highest value that it can accept, as appropriate.

Configure D20 C Analog Input Points

To configure analog input points for D20 C1 or D20 C2 peripheral boards:

1. For each point to be modified, fill in the fields as outlined in the table in [Configure a D20 A Peripheral \(Analog Input Points\)](#) earlier in this chapter.
2. If you enter a value that is out of range, DSAS will show a warning and automatically insert the lowest or highest value that it can accept, as appropriate.

Configure D20 C Analog Output Points

Parameter	Description	Default	Action required
Point Reference	Some general information about the point. This information will be displayed with each point in MCP Point Details.	Spare	Type a brief description of the Point Reference. Maximum length Supports up to 32 ASCII characters.
Point Description	Some general information about the point. This information will be displayed with each point in MCP Point Details.	Spare	Type a brief description of the point. Maximum length Supports up to 32 ASCII characters.
Initial Value	The initial voltage/current setting (in counts) for the device wired to the analog output. The range of this point is -4095 to 4095	Zero (0).	If you are in unipolar current mode and the range of the device reading the outputs is 4-20 mA, it is very important to set the initial value to 819. In all other modes (or in unipolar current mode when device range is 0-20 mA), the default value of zero (0) is fine.
Output Mode	The polarity of the output.	Unipolar 5V	Choose mode range setting for each analog output point from the available choices: Bipolar 5V, Bipolar 10V, Unipolar 5V, Unipolar 10V, Unipolar current.

Client Map

The client map file is based on a specific protocol. Each Client Map specifies what information or data to be gathered from a device. The MCP polls for and retrieves information from a device according to a client map file. The map file contains information on how polling is scheduled for a device based on the device's capabilities, frequency of polling, selected data points, etc.

The MCP has the following default client maps:

- [DNP3](#)
- [SEL Binary](#)
- [Modbus](#)

You can use these default client maps or customize them for your system requirements. Once you create a client map file, it becomes available to select on the Configuration page when assigning device connections.

NOTE: If you are running a LogicLinux program on your MCP and you change the point mapping, you must synchronize the configuration within MCP Utilities to ensure that your LogicLinux mappings are still valid.

The MCP communicates with devices connected to your power network. These devices monitor and record several types of information. The information can be generally classified in the following point groups, defined by default in the MCP:

- Present values (PVal) that reflect the current state of the power system at an instance in time.
- Peak demand that reflects the minimum and maximum power flow conditions encountered.
- Demand

Point groups can be modified on the **Systemwide** tab in the MCP Online Configuration Tool.

The devices store all the information in a “map”. Refer to the device manufacturer’s manual for a list and description of all the data points available from a device.

Creating Client Maps

» To create or edit a client map:

1. On the **Configuration** page, select the **Client Map** tab.
2. Click **New** to create a new client map or **Open** to edit an existing client map.
3. Select the device protocol type and then create or select the device map file.
4. Edit the data type and device protocol settings as desired.
5. Click **Save** and enter a name for your map file.

Tips:

- To add points to the point map, in the **Number of rows to insert** box, type the number of rows you want to add and click **Insert**.
- To delete a point from the point map, select the row and click **Delete**.
- Keep the default map files as basic templates. To create custom templates, modify the default map files, click **Save** and then enter a new template name.

Device properties

Device properties are available on the **Device Properties** pane of **Client Map** tab on the **Configuration** page. These settings shown vary based on the protocol selected.

The **Device Properties** pane allows you to view and modify the protocol settings for a specific client application. These protocol specific settings of a device will also store in the client map file.

» To configure device properties:

1. On the **Client Map** tab, open a map file.
2. In the **Device Properties** pane, to modify a parameter, double-click the associated value and enter a new value or select from the drop-down list.
3. Click **Save** to save your changes.

Protocols

You can create map files for devices using the following protocols.

- [D.20 Peripheral Client](#)
- [DNP3 Client](#)
- [Modbus Client](#)
- [SEL Binary Client](#)
- [IEC 60870-5-103 Client](#)
- [IEC 60870-5-101+104 Client](#)
- [Generic ASCII Client](#)
- [IEC 61850 Client](#)
- [Genascii Client](#)
- [SNMP](#)

DNP3 Client

About the DNP3 Client

The DNP3 Client map defines how the MCP is configured to poll data from DNP3 devices. The MCP supports the following configurable DNP3 data types:

- [Analog inputs](#) - measured or computed values by the device
- [Analog outputs](#) - physical or computed analog quantities
- [Digital inputs](#) - states of physical or logical Boolean devices
- [Double-Bit Digital inputs](#) - double-bit states of physical or logical Boolean devices
- [Digital outputs](#) - physical or logical ON-OFF, raise-lower, and trip-close points
- [Accumulators](#) - counter values
- [Device properties](#) – device-level settings

The DNP3 Client map settings are available on the **Client Map** tab when a DNP3 protocol device type is selected.

NOTE: Additional DNP3 client configuration settings are available for device communications when configuring DNP3 serial connections on the **Serial** tab.

DNP3 Client Device Properties

Settings are available in the **Device Properties** pane on the **Client Map** tab. The following table lists the poll-specific settings for the DNP3 device.

DNP3 Device Properties

Table 6-18: DNP3 Device Properties

Setting	Description	Range	Default
Request Data Link Confirm	Enables request Data Link Confirmations from the device.	True False	False
Request Data Link Confirm for Direct Operate Controls	Enables request Data Link confirms for direct operate control (no SBO controls)	True False	False
Data Link Retry	How many times to retry a failed data link layer message before giving up. Increase the value for unreliable connections, noisy environment, modem communication, etc.	0 to 300	1
Data Link Timeout	Time (in milliseconds) to wait for a data link layer response before deciding it has failed. Set the value much higher for a modem connection, i.e., 600000.	1 to 3600000	1000 (i.e., 1 second)
Enable Unsolicited	True: Send Enable Unsolicited at startup, and in response to a NULL UR. False: Never send Enable Unsolicited.	True False	False
Disable Unsolicited	True: Send Disable Unsolicited at startup, and in response to ANY UR. False: Never send Disable Unsolicited.	True False	False
Local IIN Feedback Poll AO	When the LOCAL IIN bit is asserted in the device, poll for Analog Outputs.	True False	False
Local IIN Feedback Poll DO	When the LOCAL IIN bit is asserted in the device, poll for Digital Outputs.	True False	True
Local IIN Feedback Poll Events	When the LOCAL IIN bit is asserted in the device, poll for Class 1, 2, 3 data.	True False	False
Override Control Type	When an Override is configured, ignore the Control Type propagated by the system point database. That is, always send the control type configured for this setting.	None Direct Operate Direct Operate No ACK SBO	None
Remote Accumulators	True: Send Accumulator commands to the device. False: Perform accumulator operations in the system point database.	True False	True
Connection Check Enable	True: Periodically send Link Status messages to the device to check connection.	True False	True
Connection Check Timeout	If Connection Check is enabled, send a Link Status message to the device after this time out interval (in seconds) has elapsed since a message was last received from the device	30 to 36000	30
Enable Extended Feedback Polling	True: Send the Extended Digital/Analog Feedback poll to the device when a Digital/Analog control is sent to the device.	True False	True
Feedback Poll Delay	Interval to wait (in seconds) after the control is requested, before issuing the Feedback Poll.	1 to 3600	1

Setting	Description	Range	Default
Counter Feedback Poll Delay	Interval to wait (in seconds) after the counter command is requested before issuing the counter poll.	1 to 3600	1
IED Persists Counters	True: Device retains counters across restarts. False: Device clears counters on startup. This setting affects accumulator processing.	True False	True
Freeze Command	Freeze command used by the application: Freeze (and Clear) Running Counters or Freeze (and Clear) Frozen Counters.	Running Counters Frozen Counters	Running Counters
Integrity Poll	The MCP requests integrity poll data at this interval (in seconds). If set to 0, the request is never transmitted.	0 to 360000	300
Class 1 Poll	The MCP requests class 1 data at this interval (in seconds). If set to 0, the request is never transmitted.	0 to 36000	1
Class 2 Poll	The MCP requests class 2 data at this interval (in seconds). If set to 0, the request is never transmitted.	0 to 36000	1
Class 3 Poll	The MCP requests class 3 data at this interval (in seconds). If set to 0, the request is never transmitted.	0 to 36000	1
DI Poll	The MCP requests digital input data at this interval (in seconds). If set to 0, the request is never transmitted.	0 to 36000	0
DI Change Poll	The MCP requests digital input event data at this interval (in seconds). If set to 0, the request is never transmitted.	0 to 36000	0
Double-Bit DI Poll	The MCP requests double-bit digital input data at this interval (in seconds). If set to 0, the request is never transmitted.	0 to 36000	0
Double-Bit DI Change Poll	The MCP requests double-bit digital input event data at this interval (in seconds). If set to 0, the request is never transmitted.	0 to 36000	0
DO Poll	The MCP requests digital output data at this interval (in seconds). If set to 0, the request is never transmitted.	0 to 36000	0
AI Poll	The MCP requests analog input data at this interval (in seconds). If set to 0, the request is never transmitted.	0 to 36000	0
AI Change Poll	The MCP requests analog input event data at this interval (in seconds). If set to 0, the request is never transmitted.	0 to 36000	0
Frozen AI Poll	The MCP requests single-precision frozen analog input with flag at this interval (in seconds). If set to 0, the request is never transmitted.	0 to 36000	0
Frozen AI Change Poll	The MCP requests frozen analog input data at this interval (in seconds). If set to 0, the request is never transmitted.	0 to 36000	0

Setting	Description	Range	Default
Bit-16 AI Poll	The MCP requests 16-bit analog input with flag data at this interval (in seconds). If set to 0, the request is never transmitted.	0 to 36000	0
Bit-32 AI Poll	The MCP requests 32-bit analog input with flag data at this interval (in seconds). If set to 0, the request is never transmitted.	0 to 36000	0
Float AI Poll	The MCP requests single-precision analog input with flag at this interval (in seconds). If set to 0, the request is never transmitted.	0 to 36000	0
AO Poll	The MCP requests analog output status data at this interval (in seconds). If set to 0, the request is never transmitted.	0 to 36000	0
Bit-16 AO Poll	The MCP requests 16-bit analog output status data at this interval (in seconds). If set to 0, the request is never transmitted.	0 to 36000	0
Bit-32 AO Poll	The MCP requests 32-bit analog output status data at this interval (in seconds). If set to 0, the request is never transmitted.	0 to 36000	0
Acc Poll	The MCP requests static counter data at this interval (in seconds). If set to 0, the request is never transmitted.	0 to 36000	0
Acc Change Poll	The MCP requests counter event data at this interval (in seconds). If set to 0, the request is never transmitted.	0 to 36000	0
Frozen Acc Poll	The MCP requests frozen counter data at this interval (in seconds). If set to 0, the request is never transmitted.	0 to 36000	0
Frozen Acc Change Poll	The MCP requests frozen counter event data at this interval (in seconds). If set to 0, the request is never transmitted.	0 to 36000	0
Freeze Acc Poll	Freeze the MCP Accumulator poll	0 to 36000	0
AlternateChannelHealthCheckInterval	The frequency (in seconds) at which the DCA schedules a health check message to the IED. A value of zero disables the health check message.	0 to 3600	60
Device Disable Logic Type	When set to "true", DO=1 to disable device. When set to "false", DO=0 to disable device.	True False	True
Polling Disable Logic Type	When set to "true", DO=1 to disable scheduled polls. When set to "false", DO=0 to disable scheduled polls.	True False	True
Device Disable Sets Remote Force and Offline	When set to "true", Remote Force and Offline quality flags are set when device is disabled at runtime. When set to "false", Remote Force is not set and Offline is set when device is disabled at runtime. This setting operates in conjunction with the DNP Server parameter "Report Remote Forced and Offline Points".	True False	False

DNP3 Client Analog Inputs

Settings are available on the **Analog Input** tab on the **Client Map** tab. The MCP provides the mapping settings for analog inputs as shown below.

Analog Input Mapping Settings

Table 6-19: Analog Input Mapping Settings

Setting	Description	Range	Default
Address	Number of the point in the device Analog Input Map.	0 to 65535	Incremented from 0
Point Reference	A short identifier for the point in the map file.	Up to 66 ASCII characters	AI X
Point Description	A detailed and localized description for the point in the map file.	Up to 128 Unicode characters	Analog Input X
Multiplier	Scale factor of the point (m of formula mx +b).	Full range of 64-bit Float	1.0
Offset	Scale factor of the point (b of formula mx +b).	Full range of 64-bit Float	0.0
Point Group	Point group to which the point belongs.	List of defined point groups	Group assigned to ID number 0

DNP3 Client Analog Outputs

Settings are available on the **Analog Output** tab on the **Client Map** tab. The MCP provides the mapping settings for analog outputs as shown below.

Analog Output Mapping Settings

Table 6-20: Analog Output Mapping Settings

Setting	Description	Range	Default
Address	Number of the point in the Analog Output Map.	0 to 65535	Incremented from 0
Point Reference	A short identifier for the point in the map file.	Up to 66 ASCII characters	AO X
Point Description	A detailed and localized description for the point in the map file.	Up to 128 Unicode characters	Analog Output X
Multiplier	Scale Factor of a point (m of formula mx +b).	Full range of 64-bit Float	1.0
Offset	Scale Factor of a point (b of formula mx +b).	Full range of 64-bit Float	0.0
AO Variation	How the point values should be reported.	16-bit, 32-bit	16-bit
Point Group	Point group to which the point belongs.	List of defined point groups	Group assigned to ID number 0

DNP3 Client Digital Inputs

Settings are available on the **Digital Input** tab on the **Client Map** tab. The MCP provides the mapping settings for digital inputs as shown below.

Digital Input Mapping Settings

Table 6-21: Digital Input Mapping Settings

Setting	Description	Range	Default
Address	The DNP3 Point Index of this point as reported from the device.	0 to 65535	Incremented from 0
Point Reference	A short identifier for the point in the map file.	Up to 66 ASCII characters	DI X
Point Description	A detailed and localized description for the point in the map file.	Up to 128 Unicode characters	Digital Input X
ON State	Text description of the 1 state.	Up to 32 Unicode characters	ON
OFF State	Text description of the 0 state.	Up to 32 Unicode characters	OFF
Point Group	Point group to which the point belongs.	List of defined point groups	Group assigned to ID number 0

DNP3 Client Double-Bit Digital Inputs

Settings are available on the **Double-Bit Digital Input** tab on the **Client Map** tab. The MCP provides the mapping settings for double-bit digital inputs as shown below.

Double-Bit Digital Input Mapping Settings

Table 6-22: Double-Bit Digital Input Mapping Settings

Setting	Description	Range	Default
Address	The DNP3 Point Index of this point as reported from the device.	0 to 65535	Incremented from 0
Off Point Ref	A short identifier for the Off point in the map file.	Up to 66 ASCII characters	DBDI XA
Off Point Desc	A detailed and localized description for the Off point in the map file.	Up to 128 Unicode characters	Double-Bit Digital Input XA
Off Point ON State	Off Point Text description of the 1 state.	Up to 32 Unicode characters	ON
Off Point OFF State	Off Point Text description of the 0 state.	Up to 32 Unicode characters	OFF
On Point Ref	A short identifier for the On point in the map file.	Up to 66 ASCII characters	DBDI XB
On Point Desc	A detailed and localized description for the On point in the map file.	Up to 128 Unicode characters	Double-Bit Digital Input XB
On Point ON State	On Point Text description of the 1 state.	Up to 32 Unicode characters	ON
On Point OFF State	On Point Text description of the 0 state.	Up to 32 Unicode characters	OFF

Setting	Description	Range	Default
Point Group	Point group to which the On and Off points belong.	List of defined point groups	Group assigned to ID number 0

Note:

Off Point is the digital input point representing the least significant bit of a DNP3 Double-Bit Binary Input object.

On Point is the digital input point representing the most significant bit of a DNP3 Double-Bit Binary Input object.

DNP3 Client Digital Outputs

Settings are available on the **Digital Output** tab on the **Client Map** tab. The MCP provides the mapping settings for digital outputs as shown below.

Digital Output Mapping Settings

Table 6-23: Digital Output Mapping Settings

Setting	Description	Range	Default
Address	Number of the point in the Digital Output Map.	0 to 65535	Incremented
Point Reference	A short identifier for the point in the map file.	Up to 66 ASCII characters	DO X
Point Description	A detailed and localized description for the point in the map file.	Up to 128 Unicode characters	Digital Output X
ON State	Text description of the 1 state.	Up to 32 Unicode characters	OFF
OFF State	Text description of the 0 state.	Up to 32 Unicode characters	ON
Point Group	Point group to which the point belongs.	List of defined point groups	Group assigned to ID number 0

DNP3 Client Accumulators

Settings are available on the **Accumulators** tab on the **Client Map** tab. The MCP provides the mapping settings for accumulators as shown below.

Accumulator Mapping Settings

Table 6-24: Accumulator Mapping Settings

Setting	Description	Range	Default
Address	Number of the point in the Accumulator Map.	0 to 65535	Incremented from 0
Point Reference	A short identifier for the point in the map file.	Up to 66 ASCII characters	ACC X
Point Description	A detailed and localized description for the point in the map file.	Up to 128 Unicode characters	Accumulator X
Point Group	Point group to which the point belongs.	List of defined point groups	Group assigned to ID number 0

Modbus Client

The Modbus Client map defines how the MCP is configured to poll data from Modbus devices. The MCP supports the following configurable Modbus data types:

- [Read Coil Status](#) – status of coils
- [Read Input Status](#) – digital input data
- [Read Holding Register](#) – holding registers of the device
- [Read Input Register](#) – input registers of the device
- [Write Single Coil](#) – set a single output to either ON or OFF in the device
- [Write Single Register 6A](#) – set a single holding register in the device (value required)
- [Write Single Register 6B](#) – set a single holding register in the device (value optional)
- [Device properties](#)

Modbus Client map settings are available on the **Client Map** tab when a Modbus protocol device type is selected.

Common Table

Supported Poll Types for Modbus Client

Table 6-25: Supported Poll Types for Modbus Client

Poll Type	Description
Fast	The application schedules requests to retrieve the values of Registers/Coils as quickly as possible, subject to the configured Inter-Poll Delay.
Slow	The application schedules requests to retrieve the values of Registers/Coils at a slower rate; requests occur once a Fast Poll Cycle Count cycle has been completed.
Once	The application schedules requests to retrieve the values of Registers/Coils once upon startup and subsequently whenever the device returns to an online state after communications failure.

Supported Data Types for Modbus Client Points

Table 6-26: Supported Data Types for Modbus Client Points

Data Type	Description
INT8	8-bit signed integer. Range: -128 to 127.
UINT8	8-bit unsigned integer. Range: 0 to 255.
INT16	16-bit signed integer. Range: -32768 to +32767.
INT16_FC16	16-bit signed integer. Range: -32768 to +32767. (Supports both Big Endian and Little-Endian Formats with function code 16)
UINT16	16-bit unsigned integer. Range: 0 to 65535.
UINT16_FC16	16-bit unsigned integer. Range: 0 to 65535. (Supports both Big Endian and Little-Endian Formats with function code 16)
INT32	32-bit signed integer. Range: -2147483648 to +2147483647.
UINT32	32-bit unsigned integer. Range: 0 to 4294967295.
FLOAT32	IEEE® single-precision floating point value, MSB-LSB or little endian.
FLOAT32_MODICON	Single-precision floating point value, LSB-MSB or big endian.
DATE	Date in the format of DD-MMM-YYYY.
TIME	24-hour time in the format of HH:MM:SS.
ASCII	A string of ASCII data. Range as specified in ASCII Size.
BITSTRING 16	A bitstring of 16-bit binary input data. See the bitstring Mapping Settings table.

Data Type	Description
BITSTRING 32	A bitstring of 32- bit binary input data. See the bitstring Mapping Settings table.

Bitstring Mapping Settings

The Bitstring mapping settings are available for the Data Type BITSTRING 16 and BITSTRING 32 in the Read Holding Registers and Read Input Registers tabs.

Table 6-27: Bitstring Mapping Settings

Setting	Description	Range	Default
Bit Position	Position of the Bit in the Bitstring.	1 to 32	Incremented from 1
Point reference	The short user-defined identifier for the point corresponding to the bit position.	0 to 66 alphanumeric characters plus space, underscore, and dash	DI X
Point description	The user-defined block of text that provides a detailed and localized description of the point corresponding to the bit position.	1 to 128 Unicode characters	Digital input X
ON State	A text string that is associated with the 1 state. This string is recorded in the MCP database and is displayed with the point corresponding to the bit position.	0 to 64 characters	ON
OFF State	A text string that is associated with the 0 state. This string is recorded in the MCP database and is displayed with the point corresponding to the bit position.	0 to 64 characters	OFF

Read Coil Status

Settings are available on the **Read Coil Status** tab on the **Client Map** tab.

Table 6-28: Read Coil Status Settings

Setting	Description	Range	Default
Address	A unique identifying number in the register map	0 to 65535	x
Point Name	A short identifier for the point in the map file.	Up to 66 ASCII characters	Coil X
Point Description	A detailed and localized description for the point in the map file.	Up to 128 Unicode characters	Coil X
OFF State	Text description of the 0 state.	Up to 32 Unicode characters	OFF
ON State	Text description of the 1 state.	Up to 32 Unicode characters	ON
Poll Type	The type of poll to be taken of the point	See Support Poll Types table	Fast
Point Group	Point group to which the point belongs.	List of defined point groups	Group assigned to ID number 0

Read Status Input

Settings are available on the **Read Status Input** tab on the **Client Map** tab.

Table 6-29: Read Status Input Settings

Setting	Description	Range	Default
Address	A unique identifying number in the register map.	0 to 65535	x
Point Name	A short identifier for the point in the map file.	Up to 66 ASCII characters	Input X
Point Description	A detailed and localized description for the point in the map file.	Up to 128 Unicode characters	Input X
OFF State	Text description of the 0 state.	Up to 32 Unicode characters	OFF
ON State	Text description of the 1 state.	Up to 32 Unicode characters	ON
Poll Type	The type of poll to be taken of the point.	See Support Poll Types table	Fast
Point Group	Point group to which the point belongs.	List of defined point groups	Group assigned to ID number 0

Read Holding Register

Settings are available on the **Read Holding Register** tab on the **Client Map** tab.

Table 6-30: Read Holding Register Settings

Setting	Description	Range	Default
Address	A unique identifying number in the register map.	0 to 65535	x
Point Name	A short identifier for the point in the map file.	Up to 66 ASCII characters	Holding Register X
Point Description	A detailed and localized description for the point in the map file.	Up to 128 Unicode characters	Holding Register X
Multiplier	Scale factor of the point (m of formula mx +b).	Full range of 64-bit Float	1.0
Offset	Scale factor of the point (b of formula mx +b).	Full range of 64-bit Float	0.0
Poll Type	The type of poll to be taken of the point.	See Support Poll Types table	Fast
Data Type	The type of data polled.	See Support Data Types table	UINT16
ASCII Size	ASCII size, in bits, when a text string is being retrieved from the device. If this field is set to 0, the register does not contain ASCII data.	0 to 99	0
Point Group	Point group to which the point belongs.	List of defined point groups	Group assigned to ID number 0

Read Input Register

Settings are available on the **Read Input Register** tab on the **Client Map** tab.

Table 6-31: Read Input Register Settings

Setting	Description	Range	Default
Address	A unique identifying number in the register map.	0 to 65535	x
Point Name	A short identifier for the point in the map file.	Up to 66 ASCII characters	Input Register X
Point Description	A detailed and localized description for the point in the map file.	Up to 128 Unicode characters	Input Register X
Multiplier	Scale factor of the point (m of formula mx +b).	Full range of 64-bit Float	1.0
Offset	Scale factor of the point (b of formula mx +b).	Full range of 64-bit Float	0.0
Poll Type	The type of poll to be taken of the point.	See Support Poll Types table	Fast
Data Type	The type of data polled.	See Support Data Types table	UINT16
ASCII Size	ASCII size, in bits, when a text string is being retrieved from the device. If this field is set to 0, the register does not contain ASCII data.	0 to 99	0
Point Group	Point group to which the point belongs.	List of defined point groups	Group assigned to ID number 0

Write Single Coil

Settings are available on the **Write Single Coil** tab on the **Client Map** tab.

Table 6-32: Write Single Coil Settings

Setting	Description	Range	Default
Address	A unique identifying number in the register map.	0 to 65535	x
Point Name	A short identifier for the point in the map file.	Up to 66 ASCII characters	Single Coil X
Point Description	A detailed and localized description for the point in the map file.	Up to 128 Unicode characters	Single Coil X
OFF State	Text description of the 0 state.	Up to 32 Unicode characters	OFF
ON State	Text description of the 1 state.	Up to 32 Unicode characters	ON
Data Value	The value to be written to the point. 0000 is an override to send always OFF, FF00 is an override to send always ON, NONE operates according to the command sent.	0000, FF00, NONE	NONE
Point Group	Point group to which the point belongs.	List of defined point groups	Group assigned to ID number 0

Write Single Register 6A

Settings are available on the **Write Single Register 6A** tab on the **Client Map** tab.

Table 6-33: Write Single Register 6A Settings

Setting	Description	Range	Default
Address	A unique identifying number in the register map.	0 to 65535	x
Point Name	A short identifier for the point in the map file.	Up to 66 ASCII characters	Single 6A Register X
Point Description	A detailed and localized description for the point in the map file.	Up to 128 Unicode characters	Single 6A Register X
OFF State	Text description of the 0 state.	Up to 32 Unicode characters	OFF
ON State	Text description of the 1 state.	Up to 32 Unicode characters	ON
Data Value	The value to be written to the point. 0000 is an override to send always OFF, FF00 is an override to send always ON, NONE operates according to the command sent.	0000, FF00, NONE	NONE
Point Group	Point group to which the point belongs.	List of defined point groups	Group assigned to ID number 0

Write Single Register 6B

Settings are available on the **Write Single Register 6B** tab on the **Client Map** tab.

Table 6-34: Write Single Register 6B Settings

Setting	Description	Range	Default
Address	A unique identifying number in the register map.	0 to 65535	x
Point Name	A short identifier for the point in the map file.	Up to 66 ASCII characters	Single 6B Register X
Point Description	A detailed and localized description for the point in the map file.	Up to 128 Unicode characters	Single 6B Register X
Multiplier	Scale factor of the point (m of formula mx +b).	Full range of 64-bit Float	1.0
Offset	Scale factor of the point (b of formula mx +b).	Full range of 64-bit Float	0.0
Data Type	The type of data polled.	See Support Data Types table	UINT16
Point Group	Point group to which the point belongs.	List of defined point groups	Group assigned to ID number 0

Device Properties

The MCP provides mapping settings for the Modbus Client settings on the right side of the **Client Map** tab.

Table 6-35: Modbus Device Properties

Setting	Description	Range	Default
Inter Poll Delay	Delay, in seconds, between polls.	0 to 60	0.1
Reconnect Interval	Time, in seconds, between attempts by the MCP to bring an offline device online.	1 to 3600	60
Endian Type	Endian data interpretation in the map file.	Little, Big	Big

Setting	Description	Range	Default
Max Block Size	The maximum block size, in bits, of Modbus requests.	8 to 255	255
Request Retry Count	The number of retries for each request.	1 to 255	2
Fast to Slow Poll Cycle Frequency	Number of fast poll cycles before a slow poll cycle is initiated.	0 to 255	10
Fault Reset Time	Time, in seconds, for which the fault parameter pseudo points retain values from the latest fault.	1 to 3600	5
Restrike Interval	Once the first fault has occurred, the time to wait (in seconds) before updating the Fault Pseudo points with information if subsequent faults occur before this interval has elapsed.	1 to 3600	30
PRF Processing Type	The PRF processing type to use.	Pre-defined list of types	None
Response Timeout	Time in seconds after which the request is timed out.	0.1 to 300	2

SEL Binary Client

The SEL Binary Client map defines how the MCP is configured to poll data from SEL Fast Meter devices. The SEL client application uses ASCII messages to extract Protective Relay Fault (PRF) information from the SEL device. The MCP supports the following configurable SEL Binary data types:

- [Fast Meter analog channel](#)
- [Demand analog channel](#)
- [Peak demand analog channel](#)
- [SER digital channel](#)
- [Device Digital Output Channel](#)
- [Device properties](#)

The SEL Binary Client map settings are available on the **Client Map** tab when a SEL Binary protocol device type is selected.

NOTE: Additional SEL Binary configuration settings are available for device communications when configuring SEL serial connections on the **Serial** tab.

[Pseudo points](#) are available for the SEL Binary Client application.

Auto-discovery

Most SEL devices support auto-discovery, also known as self-description. This feature allows you to use point mappings automatically provided by the device rather than creating a custom mapping.

Point mappings provided via auto-discovery always override those specified in the selected map file. However, if the remote device refuses an auto-discovery request, the MCP falls back to the mappings specified in the configured map file.

Please refer to section [SEL DCA Workflow at startup with the Auto Discovery File](#) for a detailed explanation how auto-discovery operates.

Fast Meter Analog Input Channel

Settings available on the **Fast Meter Analog Input** tab on the **Client Map** tab. The MCP provides the mapping settings for fast meter analog outputs (Function code 1) as shown below.

Table 6-36: Fast Meter Analog Input

Setting	Description	Range	Default
Point Reference	Text description of the point in the Fast Meter Analog Channel Map.	Up to 66 ASCII characters	FMAI xxx
Point Description	A detailed and localized description for the point in the map file.	Up to 128 Unicode characters	Fast Meter Analog Input xxx
Point Group	Point group to which the point belongs.	List of defined point groups	Group assigned to ID number 0
Multiplier	Scale factor of the point (m of formula mx +b).	Full range of 64-bit Float	1.0
Offset	Scale factor of the point (b of formula mx +b).	Full range of 64-bit Float	0.0

Demand Analog Input Channel

Settings available on the **Demand Analog Input** tab on the **Client Map** tab. The MCP provides the mapping settings for demand analog inputs (Function code 2) as shown below.

Table 6-37: Demand Analog Input

Setting	Description	Range	Default
Point Reference	Text description of the point in the Demand Analog Channel Map.	Up to 66 ASCII characters	DAI xxx
Point Description	A detailed and localized description for the point in the map file.	Up to 128 Unicode characters	Demand Analog Input xxx
Point Group	Point group to which the point belongs.	List of defined point groups	Group assigned to ID number 0
Multiplier	Scale factor of the point (m of formula mx +b).	Full range of 64-bit Float	1.0
Offset	Scale factor of the point (b of formula mx +b).	Full range of 64-bit Float	0.0

SEL IEDs may provide Demand Types which are not supported in MCP, in which case the point value will be “nan” (not a number).

Peak Demand Analog Input Channel

Settings available on the **Peak Demand Analog Input** tab on the **Client Map** tab. The MCP provides the mapping settings for peak demand analog inputs (Function code 3) as shown below.

Table 6-38: Peak Demand Analog Input

Setting	Description	Range	Default
Point Reference	Text description of the point in the Demand Analog Channel Map.	Up to 66 ASCII characters	PDAI xxx
Point Description	A detailed and localized description for the point in the map file.	Up to 128 Unicode characters	Peak Demand Analog Input xxx
Point Group	Point group to which the point belongs.	List of defined point groups	Group assigned to ID number 0

Setting	Description	Range	Default
Multiplier	Scale factor of the point (m of formula mx +b).	Full range of 64-bit Float	1.0
Offset	Scale factor of the point (b of formula mx +b).	Full range of 64-bit Float	0.0

SEL IEDs may provide Peak Demand Types which are not supported in MCP, in which case the point value will be “nan” (not a number).

SER Digital Input Channel

Settings are available on the **SER Digital Input** tab on the **Client Map** tab. The MCP provides the mapping settings for SER digital inputs (Function code 5) as shown below.

Table 6-39: SER Digital Input

Setting	Description	Range	Default
Point Reference	A short identifier for the point in the map file.	Up to 66 ASCII characters	SDI xxx
Point Description	A detailed and localized description for the point in the map file.	Up to 128 Unicode characters	SER Digital Input xxx
Point Group	Point group to which the point belongs.	List of defined point groups	Group assigned to ID number 0
OFF State	Text description of the 0 state.	Up to 32 characters	OFF
ON State	Text description of the 1 state.	Up to 32 characters	ON

Device Digital Output Channel

Settings are available on the **Digital Output** tab on the **Client Map** tab. The MCP provides the mapping settings for Device Digital outputs as shown below.

Table 6-40: Digital Output

Setting	Description	Range	Default
Point Reference	A short identifier for the point in the map file.	Up to 66 ASCII characters	DO xxx
Point Description	A detailed and localized description for the point in the map file.	Up to 128 Unicode characters	Digital Output xxx
Point Group	Point group to which the point belongs.	List of defined point groups	Group assigned to ID number 0
OFF State	Text description of the 0 state.	Up to 32 characters	OFF
ON State	Text description of the 1 state.	Up to 32 characters	ON

Device Properties

Settings are available in the **Device Properties** pane on the **Client Map** tab. The following table lists the poll-specific settings for the SEL device.

Table 6-41: SEL Device Properties

Setting	Description	Range	Default
No. of Targets	Number of Target Rows returned by the device in the Fast Meter command	0 to 2048	0
No. of Breakers	Number of Breakers supported by the Fast Operate message	0 to 255	0

Setting	Description	Range	Default
No. of Remote Bits	Number of Remote Bits supported by the Fast Operate message	0 to 255	0
Pulse Remote Bits	If Pulsing of remote bits is supported by the Fast Operate message	"Yes" "No"	"No"
No. of Calculation Blocks	Number of Calculation blocks returned by the Fast Meter Definition Block	0 to 4	0
Block1CalculationType	Type of calculations that is defined in Block 1.	"None" "0 - Standard" "1 - 2.5 Delta Power" "2 - Voltages Only" "3 - Currents Only" "4 - Single Phase" "5 - Standard With 2 Current Sets" "6 - 2.5 Delta Power 2 Current Sets"	"None"
Block2CalculationType	Type of calculations that is defined in Block 2.	"None" "0 - Standard" "1 - 2.5 Delta Power" "2 - Voltages Only" "3 - Currents Only" "4 - Single Phase" "5 - Standard With 2 Current Sets" "6 - 2.5 Delta Power 2 Current Sets"	"None"
Block3CalculationType	Type of calculations that is defined in Block 3.	"None" "0 - Standard" "1 - 2.5 Delta Power" "2 - Voltages Only" "3 - Currents Only" "4 - Single Phase" "5 - Standard With 2 Current Sets" "6 - 2.5 Delta Power 2 Current Sets"	"None"

Setting	Description	Range	Default
Block4CalculationType	Type of calculations that is defined in Block 4.	"None" "0 - Standard" "1 - 2.5 Delta Power" "2 - Voltages Only" "3 - Currents Only" "4 - Single Phase" "5 - Standard With 2 Current Sets" "6 - 2.5 Delta Power 2 Current Sets"	"None"

IEC 60870-5-103 Client

IEC 60870-5-103 Client Device Properties

The IEC 60870-5-103 Client map defines how the MCP is configured to poll data from IEC 60870-5-103 compliant devices. Map settings are available on the **Client Map** tab when an IEC 60870-5-103 protocol type is selected.

Settings are available in the **Device Properties** pane. The following table lists the device-specific protocol settings.

Table 6-42: IEC 60870-5-103 Device Properties

Setting	Description	Range	Default
Data Link Confirm	Specifies whether the application requests data link confirmation when transmitting data.	Enabled Disabled	Enabled
General Interrogation Interval	The General Interrogation interval (in minutes). A value of 0.0 disables General Interrogations to the remote device, except on application startup.	0.0 to 1440.0	10.0
General Interrogation Timeout	The time (in seconds) after which a General Interrogation is assumed to have completed if no Termination of General Interrogation message has been received from the remote device.	0.01 to 3600.0	30.0
Command Timeout	The time (in seconds) after which a General Command is assumed to have completed if the appropriate ASDU Type 6 (COT=ACK or NACK) message has not been received from the remote device.	0.01 to 3600.0	10.0
Auto Time Sync	Specifies whether the application performs a time sync to the remote device when the application detects a change in the local system time and at application startup.	Enabled Disabled	Disabled
Time Sync Interval	The time synchronization interval (in minutes). A value of 0.0 disables scheduled Time Synchronizations to the remote device.	0.0 to 1440.0	10.0
Time Sync Timeout	The time (in seconds) after which a time sync is assumed to have completed if the appropriate ASDU Type 6 (COT=Time Sync) message has not been received from the remote device.	0.01 to 3600.0	5.0
IEC 103 Compliant Device	Specifies whether the IED of the client mapfile is compliant to IEC 60870-103 Standard.	True False	True

IEC 60870-5-103 Client Info Objects

An information object consists of a set of data elements. You can create the following types of information objects:

- Input
 - [Measurand Time Tag Relative](#)
 - [Measurand Type 1](#)
 - [Measurand Type 2](#)
 - [Measurand User Defined](#)
 - [Time Tagged Message](#)
- Output
 - [General Command](#)

» To create an Information Object:

1. Click Add Info Object.
2. On the **New Info Object** window, enter values for the fields as described in the table below and click **OK**.
3. Enter the number of rows and click **Add** to create and configure elements within the information object.

Table 6-43: Info Object Settings

Setting	Description	Range
Info Object Type	The type of information object being created.	General Command Measurand Time Tag Relative Measurand Type 1 Measurand Type 2 Measurand User Defined Time Tagged Message
Info Object Name	An identifier used within the configuration interface.	1 to 128 ASCII characters
Function Type	The IEC 60870-5-103 function type corresponding to this information object type reported by the remote device.	0 to 255
Info Number	Starting address for this object.	0 to 255

The table directly below the Info Object type drop-down menu shows the configured Info Object Name and either the Function Type and Info Number or the Default Function Type and Initial Info Number of the selected information object.

When General Command or Time Tagged Message types are selected, the Default Function Type value indicates the default function type that is used when a new information object element is added. The Initial Info Number value is incremented for each new information object element that is added.

NOTE: Additional info-object level settings are available for *Time Tagged Message* objects. These are described in the table below.

For all other info object types, values entered for Function Type and Info Number are used for all information object elements that are created.

General Command

Table 6-44: General Command Element Settings

Setting	Description	Range	Default
Function Type	The IEC 60870-5-103 function type corresponding to this information object type reported by the remote device.	0 to 255	0
Info Number	Address for this object.	0 to 255	Incremented by 1 from starting address
Point Reference	A short identifier for the point in the map file.	Up to 66 ASCII characters	<Info object name> X
Point Description	A detailed and localized description for the point in the map file.	Up to 128 Unicode characters	<Info object name> X
ON State	Text description of the 1 state.	Up to 32 Unicode characters	ON
OFF State	Text description of the 0 state.	Up to 32 Unicode characters	OFF
Point Group	Point group to which the point belongs.	List of defined point groups	Group assigned to ID number 0

Measurand Time Tag Relative Time

Table 6-45: Measurand Time Tag Relative Time Element Settings

Setting	Description	Range	Default
Point Reference	A short identifier for the point in the map file.	Up to 66 ASCII characters	<Info object name> X
Point Description	A detailed and localized description for the point in the map file.	Up to 128 Unicode characters	<Info object name> X
Multiplier	Scale factor of the point (m of formula mx + b).	Full range of 64-bit Float	1.0
Offset	Scale factor of the point (b of formula mx + b).	Full range of 64-bit Float	0.0
Point Group	Point group to which the point belongs.	List of defined point groups	Group assigned to ID number 0

Measurand Type 1

Table 6-46: Measurand Type 1 Element Settings

Setting	Description	Range	Default
Point Reference	A short identifier for the point in the map file.	Up to 66 ASCII characters	<Info object name> X
Point Description	A detailed and localized description for the point in the map file.	Up to 128 Unicode characters	<Info object name> X
Multiplier	Scale factor of the point (m of formula mx + b).	Full range of 64-bit Float	1.0
Offset	Scale factor of the point (b of formula mx + b).	Full range of 64-bit Float	0.0

Setting	Description	Range	Default
Element Name	Specifies the name of each element.	current L2 or I.N, voltage L1-L2 or V.EN, active power P, reactive power Q	current L2 or I.N
Point Group	Point group to which the point belongs.	List of defined point groups	Group assigned to ID number 0

Measurand Type 2

Table 6-47: Measurand Type 2 Element Settings

Setting	Description	Range	Default
Point Reference	A short identifier for the point in the map file.	Up to 66 ASCII characters	<Info object name> X
Point Description	A detailed and localized description for the point in the map file.	Up to 128 Unicode characters	<Info object name> X
Multiplier	Scale factor of the point (m of formula mx +b).	Full range of 64-bit Float	1.0
Offset	Scale factor of the point (b of formula mx +b).	Full range of 64-bit Float	0.0
Element Name	Specifies the name of each element.	current L1 current L2 current L3 voltage L1-E voltage L2-E voltage L3-E active power P reactive power Q frequency f	current L1
Point Group	Point group to which the point belongs.	List of defined point groups	Group assigned to ID number 0

Measurand User Defined

Table 6-48: Measurand Type 1 User Defined Element Settings

Setting	Description	Range	Default
Measurand Position	You can define up to 255 elements within the Measurand 1 User Defined info object type. The Measurand Position setting specifies the element position that this value is assigned to.	1 to 255	Incremented from 1
Point Reference	A short identifier for the point in the map file.	Up to 66 ASCII characters	<Info object name> X
Point Description	A detailed and localized description for the point in the map file.	Up to 128 Unicode characters	<Info object name> X
Multiplier	Scale factor of the point (m of formula mx +b).	Full range of 64-bit Float	1.0
Offset	Scale factor of the point (b of formula mx +b).	Full range of 64-bit Float	0.0
Point Group	Point group to which the point belongs.	List of defined point groups	Group assigned to ID number 0

Table 6-49: Measurand Type 2 User Defined Element Settings

Setting	Description	Range	Default
Measurand Position	You can define up to 255 elements within the Measurand 2 User Defined info object type. The Measurand Position setting specifies the element position that this value is assigned to.	1 to 255	Incremented from 1
Point Reference	A short identifier for the point in the map file.	Up to 66 ASCII characters	<Info object name> X
Point Description	A detailed and localized description for the point in the map file.	Up to 128 Unicode characters	<Info object name> X
Multiplier	Scale factor of the point (m of formula mx +b).	Full range of 64-bit Float	1.0
Offset	Scale factor of the point (b of formula mx +b).	Full range of 64-bit Float	0.0
Point Group	Point group to which the point belongs.	List of defined point groups	Group assigned to ID number 0

Time Tagged Message

Table 6-50: Time Tagged Message Info Object Settings

Setting	Description	Range	Default
Relative Time	Specifies whether the time tagged message is returned using relative times.	Yes No	No
In General Interrogation	Specifies whether the points in this object are returned in response to a General Interrogation.	In General Interrogation Not In General Interrogation	In General Interrogation
Fleeting Points	Specifies whether the points in this object are fleeting points. Update of the Not Fleeting Point database only occurs when the reported value is different from the previous reported value in the database. For Fleeting points, the Fleeting Point Reporting setting determines how fleeting points are sent to the Database.	Fleeting Points Not Fleeting Points	Not Fleeting Points
Fleeting Points Reporting	This setting is only applicable to fleeting point objects. It specifies how fleeting point values are sent to the database. The options are: - The Two Events option sends two successive events to the Database, one with the reported value and one with the opposite value to set the point back to its previous state. - The Send Always option sends the reported value to the RTDB as a data change event even if the value is the same as that already in the database.	Two Events Send Always	Not Applicable

Table 6-51: Time Tagged Message Element Settings

Setting	Description	Range	Default
Function Type	The IEC 60870-5-103 function type corresponding to this information object type reported by the remote device.	0 to 255	From "Default Function Type"
Info Number	Starting address for this object.	0 to 255	Incremented by 1 from "Initial Info Number"
Off Point Ref	A short identifier for the off point in the map file for this double point object.	Up to 66 ASCII characters	See note
Off Point Desc	Text description of the off point in the map file for this double point object.	Up to 128 Unicode characters	See note
Off Point ON State	Text description of the 1 state for the off point.	Up to 32 Unicode characters	ON
Off Point OFF State	Text description of the 0 state for the off point.	Up to 32 Unicode characters	OFF
On Point Ref	A short identifier for the on point in the map file for this double point object.	Up to 66 ASCII characters	See note
On Point Desc	Text description of the on point in the map file for this double point object.	Up to 128 Unicode characters	See note
On Point ON State	Text description of the 1 state for the on point.	Up to 32 Unicode characters	ON
On Point OFF State	Text description of the 0 state for the on point.	Up to 32 Unicode characters	OFF
Point Group	Point group to which both points belong.	List of defined point groups	Group assigned to ID number 0

NOTE: The format for the default value is "<Info Object Name> **X/YZ**", where X is the function type, Y is the info number, and Z is either A for off point or B for on point.

IEC 60870-5-101+104 Client Common Properties

IEC 60870-5-101+104 Client Common Properties

The IEC 60870-5-101+104 Client map defines how the MCP is configured to poll data from IEC 60870-5-101+104 compliant devices. Map settings are available on the **Client Map** tab when an IEC 60870-5-101+104 protocol type is selected.

Settings are available in the **Device Properties** pane of the IEC 60870-5-101+104 protocol type **Client Map** tab. The following table lists the device-specific protocol settings.

Table 6-52: IEC 60870-5-101+104 Client Common Properties

Setting	Description	Range	Default
Buffer Overflow DI	The information object address of the DI point where the ON (1) state indicates that the event buffer on the device has overflowed. A value of 0 disables this feature.	0 to 1	0
Command Timeout	The time (in seconds) after which a Command is assumed to have completed if the Termination message has not been received from the remote device.	0.01 to 3600.0	10.0

Setting	Description	Range	Default
General Interrogation Timeout	The time (in seconds) after which a General Interrogation is assumed to have completed if no Termination of General Interrogation message has been received from the remote device.	0.01 to 3600.0	30.0
Counter Interrogation Timeout	The time (in seconds) after which a Counter Interrogation is assumed to have completed if no Termination of Counter Interrogation message has been received from the remote device.	0.01 to 3600.0	30.0
Time Sync Timeout	The time (in seconds) after which a Delay Acquisition Request or a Time Sync request is assumed to have completed if the ACTCON PDU has not been received from the remote device	0.01 to 3600.0	5.0
ACTCON Expected	Specifies whether an ACTCON PDU is expected from the remote device after the application sends an ACT PDU request.	Yes No	Yes
ACTCON Timeout	The time (in milliseconds) after which an ACTCON PDU is assumed to come back after sending out a request of ACT PDU (only applicable to control requests, general interrogation requests, and counter interrogation requests).	1 to 65535	1000
ACTTERM Expected	Specifies whether an ACTTERM PDU is expected to indicate the completion of a transaction.	Yes No	Yes
Control Override	Specifies whether the application is to override the Control Type sent in an RTDB control request, to use in the actual Binary Output request to the remote device.	None DirectOperate SBO	None
Time Sync Interval	The time synchronization interval (in minutes). A value of 0.0 disables scheduled time synchronization to the remote device.	0.0 to 1440.0	10.0
Global Counter Interrogation Interval	The Global Counter Interrogation interval (in minutes). A value of 0.0 disables Global Counter Interrogations to the remote device, except on application startup.	0.0 to 1440.0	0.0
Group X Counter Interrogation Interval	The Group X Counter Interrogation interval (in minutes). A value of 0.0 disables Group X Counter Interrogations to the remote device, except on application startup.	0.0 to 1440.0	0.0
Global Interrogation Interval	The Global General Interrogation Interval (in minutes). A value of 0.0 disables Global General Interrogations to the device, except on application startup.	0.0 to 1440.0	30.0
Group X Interrogation Interval	The Group X General Interrogation Interval (in minutes). A value of 0.0 disables Group X General Interrogations to the device, except on application startup.	0.0 to 1440.0	0.0

IEC 60870-5-101 Client

Settings are available in the **IEC 60870-5-101** pane. The following table lists the device-specific protocol settings.

Table 6-53: IEC 60870-5-101 Client Properties

Setting	Description	Range	Default
Information Object Address Length	The number of octets used in the information object address field.	1 to 3	1

Setting	Description	Range	Default
Cause of Transmission Length	The number of octets used in the Cause of Transmission field.	1 to 2	1
Data Link Confirm	Specifies whether the application requests data link confirmation when transmitting data	Enabled Disabled	Enabled
TX Delay Acquisition	Specifies whether the application performs a TX Delay Acquisition command to the device prior to performing the Clock Synchronization	Enabled Disabled	Enabled
Default TX Delay	The default transmission delay (in milliseconds) that is used by the application to perform a Clock Sync of the remote device when the TX Delay Acquisition is disabled	0 to 60000	0
Load Tx Delay	Specifies whether or not the DCA shall transmit the acquired transmission delay to the remote device if Tx Delay Acquisition is Enabled.	Enabled Disabled	Enabled

IEC 60870-5-104 Client

Settings are available in the **IEC 60870-5-104** pane. The following table lists the device-specific protocol settings.

Table 6-54: IEC 60870-5-104 Client Properties

Setting	Description	Range	Default
Information Object Address Length	The number of octets used in the information object address field.	Not editable	3
Cause of Transmission Length	The number of octets used in the Cause of Transmission field.	Not editable	2
Default TX Delay	The transmission delay (in milliseconds) that is used by the application to perform a Clock Sync of the remote device.	Not editable	0
Controls with Time Tag	Specify if the application is to include a time tag with control requests.	Enabled Disabled	Disabled
Max TX Frames Before Ack	The maximum number of information frames that the application transmits before it must receive an acknowledgement message (value of w).	1 to 32,767	8
Max RX Frames Before Ack	The maximum number of information frames that the application receives before it must send an acknowledgement message (value of k).	1 to 32,767	12
Connect Timeout	The maximum time (in seconds) that the application waits for the TCP transport layer to establish a connection (value of t0).	1 to 255	30
Send Timeout	The maximum time (in seconds) that the application waits for an acknowledgement after sending a frame (value of t1).	1 to 255	15
No Data Timeout	The maximum time (in seconds) that the application waits before sending a supervisory acknowledgement (S) frame (value of t2).	1 to 255	10
Idle Timeout	The period during which no messages are received, in seconds, that the application allows pass before sending a test frame (value of t3).	1 to 255	20

IEC 60870-5-101+104 Client Info Objects

An information object consists of a set of data elements. You can create the following types of information objects:

- Input
 - Bitstring
 - Double Point
 - Integrated Total
 - Measurand
 - Packed Single Point
 - Single Point
 - Step Position
- Output
 - Double Command
 - Regulating Step Command
 - Setpoint Command
 - Single Command

» To create an Information Object:

1. Click Add Info Object.
2. On the **New Info Object** window, enter values for the fields as described in the below Table 6-55 and click **OK**.
3. Enter the number of rows and click **Add** to create and configure elements within the information object.

Table 6-55: IEC 60870-5-101+104 Client Info Objects

Setting	Description	Range
Info Object Type	The type of information object being created.	Bitstring Double Point Integrated Total Measurand Packed Single Point Single Point Step Position Double Command Regulating Step Command Setpoint Command Single Command
Info Object Name	An identifier used within the configuration interface. This is a view-only field.	1 to 128 ASCII characters
Address	The assigned address for BitString and Packed Single Point types; the starting default address for all other types.	1 to 16777215

The table directly below the Info Object type drop-down menu shows the configured Info Object Name and either the Address or Starting Address of the selected information object. When Bitstring or Packed Single Point types are selected, the Address value indicates the actual information object address. If any other Info Object type is selected, the Starting Address value indicates the default starting address that is used when a new information object element is added.

Bitstring

Table 6-56: Bitstring Element Settings

Setting	Description	Range	Default
Bit Position	The bit position within the DI point	1 to 32	Incremented from 1
Point Reference	A short identifier for the point in the map file.	Up to 66 ASCII characters	<Info object name> X
Point Description	A detailed and localized description for the point in the map file.	Up to 128 Unicode characters	<Info object name> X
ON State	Text description of the 1 state.	Up to 32 characters	ON
OFF State	Text description of the 0 state.	Up to 32 characters	OFF
Point Group	Point group to which the point belongs.	List of defined point groups	Group assigned to ID number 0

Double Command

Table 6-57: Double Command Element Settings

Setting	Description	Range	Default
Address	The address of this information object element	1 to 16777215	Incremented by 1 from starting address
Point Reference	A short identifier for the point in the map file.	Up to 66 ASCII characters	<Info object name> X
Point Description	A detailed and localized description for the point in the map file.	Up to 128 Unicode characters	<Info object name> X
Command Qualifier	An attribute that specifies in greater detail the type of control action requested.	No Additional Definition Short Pulse Duration Long Pulse Duration Persistent	Persistent
ON State	Text description of the 1 state.	Up to 32 characters	ON
OFF State	Text description of the 0 state.	Up to 32 characters	OFF
Point Group	Point group to which the point belongs.	List of defined point groups	Group assigned to ID number 0

Double Point

Table 6-58: Double Point Element Settings

Setting	Description	Range	Default
Address	The address of this information object element	1 to 16777215	Incremented by 1 from starting address
Off Point Ref	A short identifier for the off point in the map file for this double point object.	Up to 66 ASCII characters	DP XA
Off Point Desc	Text description of the off point in the map file for this double point object.	Up to 128 Unicode characters	Double Point XA
Off Point ON State	Text description of the 1 state for the off point.	Up to 32 Unicode characters	ON
Off Point OFF State	Text description of the 0 state for the off point.	Up to 32 Unicode characters	OFF
On Point Ref	A short identifier for the on point in the map file for this double point object.	Up to 66 ASCII characters	DP XB
On Point Desc	Text description of the on point in the map file for this double point object.	Up to 128 Unicode characters	Double Point XB
On Point ON State	Text description of the 1 state for the on point.	Up to 32 Unicode characters	ON
On Point OFF State	Text description of the 0 state for the on point.	Up to 32 Unicode characters	OFF
Point Group	Point group to which both points belong.	List of defined point groups	Group assigned to ID number 0

Integrated Total

Table 6-59: Integrated Total Element Settings

Setting	Description	Range	Default
Address	The address of this information object element	1 to 16777215	Incremented by 1 from starting address
Point Reference	A short identifier for the point in the map file.	Up to 66 ASCII characters	<Info object name> X
Point Description	A detailed and localized description for the point in the map file.	Up to 128 Unicode characters	<Info object name> X
Point Group	Point group to which the point belongs.	List of defined point groups	Group assigned to ID number 0

Measurand

Table 6-60: Measurand Element Settings

Setting	Description	Range	Default
Address	The address of this information object element	1 to 16777215	Incremented by 1 from starting address
Point Reference	Text description of the point in the map file.	Up to 128 characters	M X

Setting	Description	Range	Default
Multiplier	Scale factor of the point (m of formula mx +b).	Full range of 64-bit Float	1.0
Offset	Scale factor of the point (b of formula mx +b).	Full range of 64-bit Float	0.0
Point Group	Point group to which the point belongs.	List of defined point groups	Group assigned to ID number 0

Packed Single Point

Table 6-61: Packed Single Point Element Settings

Setting	Description	Range	Default
Bit Position	The bit position within the DI point	1 to 32	Incremented from 1
Point Reference	A short identifier for the point in the map file.	Up to 66 ASCII characters	<Info object name> X
Point Description	A detailed and localized description for the point in the map file.	Up to 128 Unicode characters	<Info object name> X
ON State	Text description of the 1 state.	Up to 32 characters	ON
OFF State	Text description of the 0 state.	Up to 32 characters	OFF
Point Group	Point group to which the point belongs.	List of defined point groups	Group assigned to ID number 0

Regulating Step Command

Table 6-62: Regulating Step Command Element Settings

Setting	Description	Range	Default
Address	The address of this information object element	1 to 16777215	Incremented by 1 from starting address
Point Reference	A short identifier for the point in the map file.	Up to 66 ASCII characters	<Info object name> X
Point Description	A detailed and localized description for the point in the map file.	Up to 128 Unicode characters	<Info object name> X
Regulating Command State	The relative position that the step controller is commanded to move to.	Lower Higher	Lower
Command Qualifier	An attribute that specifies in greater detail the type of control action requested.	No Additional Definition Short Pulse Duration Long Pulse Duration Persistent	Persistent
ON State	Text description of the 1 state.	Up to 32 characters	ON
OFF State	Text description of the 0 state.	Up to 32 characters	OFF
Point Group	Point group to which the point belongs.	List of defined point groups	Group assigned to ID number 0

Setpoint Command

Table 6-63: Setpoint Command Type 2 Element Settings

Setting	Description	Range	Default
Address	The address of this information object element	1 to 16777215	Incremented by 1 from starting address
Point Reference	A short identifier for the point in the map file.	Up to 66 ASCII characters	<Info object name> X
Point Description	A detailed and localized description for the point in the map file.	Up to 128 Unicode characters	<Info object name> X
Conversion	The type of setpoint command. There are 3 possible types: - Normalized - value is between -1 and +1 - 2^{-15} - Scaled - value is scaled using multiplier and offset to -2^{15} to $+2^{15} - 1$ - Short Floating Point - value is a 32-bit floating point.	Normalized Scaled ShortFP	Normalized
Multiplier	Scale factor of the point (m of formula mx + b).	Full range of 64-bit Float	1.0
Offset	Scale factor of the point (b of formula mx + b).	Full range of 64-bit Float	0.0
Point Group	Point group to which the point belongs.	List of defined point groups	Group assigned to ID number 0

Single Command

Table 6-64: Single Command Element Settings

Setting	Description	Range	Default
Address	The address of this information object element	1 to 16777215	Incremented by 1 from starting address
Point Reference	A short identifier for the point in the map file.	Up to 66 ASCII characters	<Info object name> X
Point Description	A detailed and localized description for the point in the map file.	Up to 128 Unicode characters	<Info object name> X
Command Qualifier	An attribute that specifies in greater detail the type of control action requested.	No Additional Definition Short Pulse Duration Long Pulse Duration Persistent	Persistent
ON State	Text description of the 1 state.	Up to 32 characters	ON
OFF State	Text description of the 0 state.	Up to 32 characters	OFF
Point Group	Point group to which the point belongs.	List of defined point groups	Group assigned to ID number 0

Single Point

Table 6-65: Single Point Element Settings

Setting	Description	Range	Default
Address	The address of this information object element	1 to 16777215	Incremented by 1 from starting address
Point Reference	A short identifier for the point in the map file.	Up to 66 ASCII characters	<Info object name> X
Point Description	A detailed and localized description for the point in the map file.	Up to 128 Unicode characters	<Info object name> X
ON State	Text description of the 1 state.	Up to 32 characters	ON
OFF State	Text description of the 0 state.	Up to 32 characters	OFF
Point Group	Point group to which the point belongs.	List of defined point groups	Group assigned to ID number 0

Step Position

Table 6-66: Step Position Element Settings

Setting	Description	Range	Default
Address	The address of this information object element	1 to 16777215	Incremented by 1 from starting address
Point Reference	A short identifier for the point in the map file.	Up to 66 ASCII characters	<Info object name> X
Point Description	A detailed and localized description for the point in the map file.	Up to 128 Unicode characters	<Info object name> X
Multiplier	Scale factor of the point (m of formula mx +b).	Full range of 64-bit Float	1.0
Offset	Scale factor of the point (b of formula mx +b).	Full range of 64-bit Float	0.0
Point Group	Point group to which the point belongs.	List of defined point groups	Group assigned to ID number 0

Generic ASCII Client

About the Generic ASCII Client

The Generic ASCII client can be used to extract data from devices that use an ASCII-based communications protocol over a serial connection. Information that can be collected through this protocol includes:

- Metering data (present values, demand meter data, peak demand data).
- System status and self-test status.
- Status of digital inputs.

There are three configurable components of Generic ASCII client map: [common properties](#), which define device-specific parameters; [parsing policies](#), which define how messages are handled when they are received; and [transactions](#), which define how messages are collected from the remote device.

Generic ASCII Client Common Properties

Settings are available in the pane at the right of the window. The following table lists the device-specific protocol settings.

Table 6-67: Generic ASCII Client Common Properties

Setting	Description	Range	Default
Device family name	The name of the device manufacturer or the product series (for example, SEL or GE DFP).	1 to 65 characters	none
Login required	Specify if a valid username and password is required when accessing the remote device.	True False	True
Enable logging	If set to true, all traffic to and from this device is logged to an IO Traffic window on the MCP HMI.	True False	True
Enable unsolicited processing	If set to <i>true</i> , the MCP accepts unsolicited data from the remote device. If set to <i>false</i> , unsolicited data is ignored.	True False	False
User comments	General comments or information about the client map file.	0 to 1024 characters	none
Fault reset time (sec)	Whenever a fault occurs, the fault information is provided in a pseudo point. After the configured period of time passes, the value of the pseudo point is reset to 0. All faults are recorded in the event log regardless of the amount of time the pseudo point is active.	0 to 3600 seconds	5
Restrike interval (sec)	The amount of time, in seconds, that must pass after a fault is reported before subsequent fault reports are considered valid. If a subsequent fault report occurs within this time period, it is recorded in the event log but is not reported as the value of the pseudo point.	0 to 3600 seconds	30
Login prompt	If login is required, the MCP monitors incoming data from the remote device for the configured login prompt. When encountered, the MCP begins the login sequence. If neither the login prompt or the successful login prompt appears, the MCP sends the configured break sequence.	0 to 64 characters	=
Username	The username to use when logging into the remote device.	0 to 64 characters	ACCESS

Setting	Description	Range	Default
Successful login prompt	The MCP monitors the incoming data from the remote device for the configured successful login prompt. Once detected, the MCP begins the next protocol transactions with the remote device. This parameter is mandatory.	0 to 64 characters	=>
Login retries	The maximum number of times the MCP attempts the login sequence.	0 to 255	0
SOM	The start of message character sequence is defined in hexadecimal format. When this sequence is encountered, the MCP considers it to be the start of the message. If the SOM is not defined, any valid ASCII character received is considered as the SOM. If a multiple character sequence is required as the start of message, use + as a delimiter between each character. For example, to define 123 as the SOM, define these characters as 0x31+0x32+0x33.	0 to 64 characters.	0x02
EOM	The end of message character sequence is defined in hexadecimal format. When this sequence is encountered, the MCP considers the message to be complete. If the EOM is not defined, the message is assumed to be complete when the response timeout passes.	0 to 64 characters	0x03
Break	This character sequence is transmitted to the remote device when the MCP requires a prompt.	0 to 64 characters	0x0D
Stop transmission	This character sequence is transmitted to the remote device by the MCP to request that data transmission be stopped. It is used when the amount of incoming data exceeds the capacity of the MCP to process it.	0 to 64 characters	0x13
Resume transmission	This character sequence is transmitted to the remote device by the MCP to resume a stopped data transmission.	0 to 64 characters	0x11
Default line ends	This character sequence is transmitted to the remote device by the MCP to indicate the end of a command transmission.	0 to 64 characters	Nil (no characters transmitted)
Default retries	The maximum number of times the MCP retries a transaction when it does not receive a response from the remote device.	0 to 300	0
Transaction timeout	The amount of time, in milliseconds, that must pass before the MCP retries a transaction.	20 to 65000 milliseconds	100
Device Response Timeout	The maximum duration in seconds that the DCA is to wait for a response when the Allow Delayed Message Processing property is enabled in application parameters. If the Allow Delayed Message Processing property is disabled, this parameter is not applicable.	0 to 300	5
Reconnect Interval	The Device Offline Reconnect Interval property duration in seconds. Once the MCP detects any device in the offline state, the MCP is to resume polling of transactions only after this Reconnect Interval timer has expired.	10 to 3600	60

Setting	Description	Range	Default
Wait Time Between Polls	The minimum time in seconds to wait between polls; that is by measuring the time between receiving the response of one poll and the beginning of the next poll.	0 to 3600	0.001
Max Offline Fail Count	The number of consecutive failed requests to an IED before the points are marked offline.	1 to 300	2

Generic ASCII Client Parsing Policies

Parsing policies define how incoming generic ASCII messages are processed by the MCP. To add a parsing policy to the client map file, click the **Add Parsing Policy** button and configure the options in the popup window. To remove an existing policy, select it in the drop-down list and click **Remove Parsing Policy**.

The following table lists the options that can be configured for each parsing policy.

Table 6-68: Generic ASCII Client Parsing Policies Options

Setting	Description	Range	Default
Policy name	A user-supplied name to identify the parsing policy.	1 to 64 characters	none
Type of policy	The type of method that the MCP uses to interpret incoming messages. <i>Token</i> : the message is divided into tokens based on a defined separator pattern. <i>Position</i> : The contents of the message are provided in a fixed data position.	Token Position	Token
Invalid Pattern	If this string is returned in response to a request, the MCP assumes that a configuration error has occurred. The data points associated with this message are placed OFFLINE and the Config Errors pseudo point is incremented.	0 to 64 characters	Invalid Command
Separators	The character sequence to be used when tokenizing the incoming message. This field is only applicable when Token is selected as the Type of Policy .	0 to 64 characters	0x09+0x0B+0x0D+0x20
Override line end	If this parsing policy is required to interpret line endings differently than as configured on the common properties pane, it can be defined here. Since a parsing policy may be used by different transactions, you should only apply an override here if it applies to all transactions that are configured to use the policy.	0 to 64 characters	Nil (no characters transmitted)

Generic ASCII Client Transactions

Transactions are used to configure message exchange between the MCP and the remote device.

To add a transaction to the client map file, click the **Add Transaction** button and configure the options in the popup window.

To remove an existing transaction, select it in the drop-down list and click **Remove Transaction**.

Once a transaction has been created, you can define the analog input points, digital input points, and text data points to be made available based on data received from the remote device.

The data points under each transaction are specific to that transaction; that is, the data point values are only updated with the response received during that transaction execution. Even if multiple transactions are defined to provide the same response, the data points are unique for each transaction; that is, the data point values are updated for each specific transaction execution.

Transaction options

The following table lists the options that can be configured for each transaction.

Table 6-69: Generic ASCII Client Transactions Options

Setting	Description	Range	Default
Transaction name	A user-supplied name to identify the transaction.	1 to 64 characters	none
Parsing policy name	Select a parsing policy to be used by this transaction.	List of configured parsing policies	none
Trigger	Select how message requests are made by this transaction: • Cyclic: The remote device is polled for information relative to other transactions based on the number of cycles per poll. • Periodic: The remote device is polled for information at the configured time frequency. NOTE: When multiple transactions are defined, the MCP verifies each transaction for scheduling based on round robin mode. If the cycle time to verify all transactions exceeds the Periodic interval (Msec per poll), the MCP schedules the transaction only when it completes the scan cycle and detects the expiry of the Periodic interval for any transaction. • Unsolicited: The MCP accepts messages from the remote device as they are made available. Support for the Trigger mode setting is available for the SEL family of devices.	Cyclic Periodic Unsolicited	Cyclic
Timestamp parsing	Specifies whether timestamp information should be parsed from information on the transaction level or on the individual point level. Select <i>None</i> if a timestamp should be assigned based on the MCP system clock.	None TransacLevel PointLevel	None
Timestamp definition	Specify how timestamps are to be parsed from incoming messages. Only available if the timestamp parsing field is set to <i>TransacLevel</i> .	See Timestamp Definition .	
Message out	This character sequence is transmitted to the remote device when requesting a message. The MCP supports predefined variable syntax <code>{ADDR\$}</code>. This setting contains the IED Address configured in the Connection page for the respective device. This setting can also be referenced whenever an IED Address is required while configuring the Message out setting. For example: If the required Message Out setting is <code>123<IED Address>,I0<IED Address></code>, then configure the Message Out setting as <code>123\${ADDR\$},I0\${ADDR\$}</code>.	0 to 64 characters	Meter

Setting	Description	Range	Default
Override retries	The maximum number of retry requests for this transaction. If this value is defined, it overrides the default retry limit specified in the common properties pane. Select 0 to use the default retry limit.	0 to 300	0
Override line end	If this transaction is required to interpret line endings differently than as configured on the common properties pane, it can be defined here.	0 to 64 characters	Nil (no characters transmitted)
Msec per poll	The frequency at which the poll request is transmitted to the remote device. If set to 0, the poll is only performed once. This setting is only used if the trigger is set to <i>Periodic</i> .	0 to 86400000	30000
Cycles per poll	The number of times the poll request is transmitted to the remote device per batch. If set to 0, the poll is only performed once. This setting is only used if the trigger is set to <i>Cyclic</i> .	0 to 5000	2
Valid Response Pattern	The valid pattern which is to be available in the received response. When set to Nil, this setting is not applicable and the MCP accepts any response as a valid response. If this setting is defined with a value other than Nil, the MCP assumes the response for Message Out is to contain the valid response string defined and if this valid response string is not available in the response received, the MCP considers the response as an invalid or unrecognized response and discards the response. All the responses received from devices are logged in the global IO traffic window and the valid responses are logged in the respective device IO traffic window.	1 to 255 Printable ASCII Characters	Nil

Valid Response Pattern Definition

For devices which are expected to provide delayed responses, the MCP is configured with a valid response pattern.

Supported characters from MCP HMI comprise all printable ASCII characters. If predefined variables are used, they must match with the syntax definition of predefined variables otherwise they will be considered as regular sub strings in the matching criteria.

Predefined variables supported by the Valid Response Pattern are:

- ADDR – IED Address defined in connection page
- CHKSUM16 – Checksums supported by the device.

The IED Address can be specified using the following pattern: {\$ADDR\$}.

For example: When the response expected from a device is IFF12414F# where the IED Address is 1241 then the valid pattern definition is to be:

- I..{\$ADDR\$}

where I is the starting character

The IED Address defined in Connection Page is available after 2 characters from I.

- I*{\$ADDR\$}

where I is the starting character

The response contains the IED Address defined in the Connection page.

If the predefined variables do not match with the required syntax, the MCP considers this response to be the expected regular string.

For example: When the response is IFF12414F# where IED Address is 1241 and if the valid pattern definition is configured incorrectly as I*{%s\$ADDR@}, the MCP uses {%s\$ADDR@} as one of the substrings it expects in the response which can lead to responses mismatching with any of the configured requests. Consequently, the requests which do not get a matching response are considered as TIMEOUT and are retried based on the configured number of retries.

Examples of incorrect configurations are:

- {ADDR}
- {\$ADDR}
- {ADDR\$}
- {\$addr\$}

An example of a correct configuration is:

- {\$ADDR\$}

If devices support the checksum field in the response, the checksum can be configured using the predefined variables to validate the data received.

The XOR-based 16-bit CHKSUM must be defined using the predefined variable {\$CHKSUM16\$}.

The syntax rules are:

{CHKSUM16\$} or {\$CHKSUM16\$^n} or {\$CHKSUM16\$#n}

Where:

- n specifies the zero-based position of checksum in the response.
- ^ specifies the position from beginning of the response received
- # specifies the position from end of response received

The default definition of {\$CHKSUM16\$} expects the checksum be available in the 2nd and 3rd byte from the end of response.

If there is any misconfiguration of the checksum definition as per the supported syntax checksum definition is considered by the MCP as a regular substring to be used in the matching criteria.

Examples of incorrect configurations are:

- {\$CHKSUM16\$^0}
- {\$CHKSUM16\$^999999999999}
- {\$CHKSUM16@\$^5}

As an example of a correct configuration, consider a response as IFF12414F#; then the valid Pattern Definition is to be:

- I..{\$ADDR\$}{CHKSUM16\$}
- I..{\$ADDR\$}{CHKSUM16\$^7}
- I..{\$ADDR\$}{CHKSUM16\$#2}
- I*{\$ADDR\$}*{\$CHKSUM16\$}
- I*{\$ADDR\$}*{\$CHKSUM16\$^7}
- I*{\$ADDR\$}*{\$CHKSUM16\$#2}

The incorrect configuration of predefined variables can lead to mismatching requests which results in TIMEOUT for the requests.

Timestamp definition

The **Timestamp** window allows you to define a custom timestamp parsing policy for use in a transaction. The following table lists the options that can be configured for each timestamp definition.

Table 6-70: Timestamp Options

Setting	Description	Range	Default
Date format	The format that the remote device reports the date in.	MM/DD/YY MM/DD/YYYY DD/MM/YYYY	MM/DD/YY
Date parsing type	The type of method that the MCP uses to interpret the data to determine the date. <i>Token</i> : the data is divided into tokens based on a defined separator pattern. <i>Position</i> : The contents of the timestamp are provided in a fixed data position.	Token Position	Position
Date parsing start position	The starting position of the date information within the data. <i>Token</i> date parsing type only.	Numeric value	0
Date parsing length	The length of the date information within the data. <i>Token</i> date parsing type only.	Numeric value	0
Date parsing index	The array index that contains the date.	Numeric value	0
Date parsing initial string	If the date token contains a prefix (for example, "Date:") it can be specified here. The MCP removes this string from the token. Enter <i>None</i> to disable parsing.	0 to 20 printable ASCII characters	None
Date Parsing Encoding Format	The encoded data format for the date fields in the received response from the device.	Hex Ascii Binary Packed BCD Decimal	Decimal
Time format	The format that the remote device reports the time in.	hh:mm:ss [AM/PM] hh:mm:ss [24 hour] hh:mm [AM/PM] hh:mm hh:mm:ss.msec [AM/PM] hh:mm:ss.msec [24 hour]	Hh:mm:ss [AM/PM]
Time parsing type	The type of method that the MCP uses to interpret the data to determine the time. <i>Token</i> : the data is divided into tokens based on a defined separator pattern. <i>Position</i> : The contents of the timestamp are provided in a fixed data position.	Token Position	Position
Time parsing start location	The starting position of the time information within the data. <i>Token</i> time parsing type only.	Numeric value	0
Time parsing length	The length of the time information within the data. <i>Token</i> time parsing type only.	Numeric value	0

Setting	Description	Range	Default
Time parsing index	The array index that contains the time.	Numeric value	0
Time parsing initial string	If the time token contains a prefix (for example, “ <i>Time:</i> ”) it can be specified here. The MCP removes this string from the token. Enter <i>None</i> to disable parsing.	0 to 20 printable ASCII characters	None
Time Parsing Encoding Format	The encoded data format for the time fields in the received response from the device.	Hex Ascii Binary Packed BCD Decimal	Decimal

Add Analog Input Points, Digital Input Points and Text Data Points

Once you have created a transaction, you can add Analog Input points, Digital Input points, and Text Data points based on messages received by the MCP. To add one or more points, select the number of points you wish to add and click the **Add** button. To remove points, select them and click the **Delete** button.

The following three tables list the options that can be configured for each point type:

- [Analog Input Points](#)
- [Digital Input Points](#)
- [Text Data Points](#)

Analog Input Points

Table 6-71: Analog Input Points

Setting	Description	Range	Default
Point reference	The short user-defined identifier for the point.	0 to 66 alphanumeric characters plus space, underscore, and dash	none
Point description	The user-defined block of text that provides a detailed and localized description of the point.	1 to 128 Unicode characters	Analog input <i>n</i>
Multiplier	Scale Factor of a point (m of formula mx +b).	Full range of 64-bit Float	1
Offset	Scale Factor of a point (b of formula mx +b).	Full range of 64-bit Float	0
Parsing location	If the type of parsing policy selected in the transaction is <i>Token</i> , you can specify the array index and initial string for this point. If the type of parsing policy is <i>Position</i> , you can specify the length of the data for this point. The starting position is automatically calculated based on the previous configured points.	Index: Numeric value Initial string: 0 to 20 printable ASCII characters Position: Numeric Value	Index: 0 Initial string: None Position: 0

Setting	Description	Range	Default
	Encoding Format: Specify the encoding data format for the Analog Point fields in the response received. The MCP decodes the response packets based on the encoding format selected. If the data is not valid as per the selected encoded format, respective points are put offline and the quality property is set to "Old Data".	Hex Ascii Binary Packed BCD Decimal	Decimal
Timestamp parsing	Specify how timestamps are to be parsed from incoming messages. Only available if the timestamp parsing field is set to <i>PointLevel</i> .	See Timestamp Definition .	
Point Group	Point group to which the point belongs.	List of defined point groups	Group assigned to ID number 0

Digital Input Points

Table 6-72: Digital Input Points

Setting	Description	Range	Default
Point reference	The short user-defined identifier for the point.	0 to 66 alphanumeric characters plus space, underscore, and dash	none
Point description	The user-defined block of text that provides a detailed and localized description of the point.	1 to 128 Unicode characters	Digital input <i>n</i>
ON state	A text string that is associated with the 1 state. This string is recorded in the MCP database and is displayed with the point.	0 to 64 characters	ON
OFF state	A text string that is associated with the 0 state. This string is recorded in the MCP database and is displayed with the point.	0 to 64 characters	OFF
Parsing location	If the type of parsing policy selected in the transaction is <i>Token</i>, you can specify the array index and initial string for this point. If the type of parsing policy is <i>Position</i>, you can specify the length of the data for this point. The starting position is automatically calculated based on the previous configured points.	Index: Numeric value Initial string: 0 to 64 characters Position: Numeric Value	Index: 0 Initial string: None Position: 0
	Encoding Format: Specify the encoding data format for the Digital Point fields in the response received. The MCP decodes the response packets based on the encoding format selected. If the data is not valid as per the selected encoding format selected, respective points are put offline and the quality property is set to "Old Data".	Hex Ascii Binary Decimal	Hex
	Bit Position: This defines the bit position to be considered in the response token for updating the DI Point.	0 to 31	0
Timestamp parsing	Specify how timestamps are to be parsed from incoming messages. Only available if the timestamp parsing field is set to <i>PointLevel</i> .	See Timestamp Definition .	

Setting	Description	Range	Default
Enumeration 0	The string returned by the device that should be interpreted as the 0 state. This parameter is applicable only when the encoding format selected is ASCII. For other encoding formats, the point data is decoded as per the selected encoding format and bit position defined.	0 to 64 characters	0
Enumeration 1	The string returned by the device that should be interpreted as the 1 state. This parameter is applicable only when the encoding format selected is ASCII. For other encoding formats, the point data is decoded as per the selected encoding format and bit position defined	0 to 64 characters	1
Point Group	Point group to which the point belongs.	List of defined point groups	Group assigned to ID number 0

Text Data Points

Table 6-73: Text Data Points

Setting	Description	Range	Default
Point reference	The short user-defined identifier for the point.	0 to 66 alphanumeric characters plus space, underscore, and dash	none
Point description	The user-defined block of text that provides a detailed and localized description of the point.	1 to 128 Unicode characters	Analog input <i>n</i>
Parsing location	If the type of parsing policy selected in the transaction is <i>Token</i> , you can specify the array index and initial string for this point. If the type of parsing policy is <i>Position</i> , you can specify the length of the data for this point. The starting position is automatically calculated based on the previous configured points.	Index: Numeric value Initial string: Position: Numeric Value	Index: 0 Initial string: None Position: 0
	Encoding Format: Specify the encoding data format for the Digital Point fields in the response received. The MCP decodes the response packets based on the encoding format selected. If the data is not valid as per the selected encoding format selected, respective points are put offline and the quality property is set to "Old Data".	Ascii Binary Decimal	Ascii
Timestamp parsing	Specify how timestamps are to be parsed from incoming messages. Only available if the timestamp parsing field is set to <i>PointLevel</i> .	See Timestamp Definition .	
Point Group	Point group to which the point belongs.	List of defined point groups	Group assigned to ID number 0

NOTE: The data points under each transaction are specific to that transaction; that is, the data point values are only updated with the response received during that transaction execution. Even if multiple transactions are defined to provide the same response, the data points are unique for each transaction; that is, the data point values are updated for each specific transaction execution.

Generic ASCII Client Application Settings

Generic ASCII client application settings are available under the Application Parameters field.

Application tab

Table 6-74: Generic ASCII Client Application tab

Setting	Description	Range	Default
Allow Delayed Message Processing	This parameter enables support for processing delayed responses from the devices. With this configuration, distinct "Valid Response Patterns" must be defined for transactions.	Disabled Enabled	Enabled
Passthrough response timeout	This parameter is the same as the pass-through <i>timeout</i> setting, except that it applies to those times when the pass*through connection is idle while awaiting a response from the remote device. In some cases, this time period is configured to be longer than the default timeout below because of the additional time required to process responses to operator commands.	0 to 3600 seconds	10
XON_XOFF flow control	Enable or disable XON/XOFF flow control.	True False	False
RTS_CTS flow control	Enable or disable RTS/CTS flow control.	True False	False
DTR_DSR handshaking	Enable or disable DTR/DSR handshaking.	True False	False
Inter Device Delay	This parameter specifies the delay time in seconds to wait between consecutive device polls. (measured from receiving the response for the last request of one device to the beginning of first poll of next device)	0 to 3600	0.01

SNMP Client Properties

An SNMP client map is used to determine how information is retrieved from SNMP-enabled devices.

Settings are available in the **Device Properties** pane. The following table lists the device-specific protocol settings.

Table 6-75: SNMP Client Common Properties

Setting	Description	Range	Default
Version name	Select the SNMP protocol version to use when communicating with the remote device. The MCP currently supports versions 1 and 2 of the protocol.	V1 V2	V1
Comm name	The name of the community that the SNMP device belongs to. This helps define where information is sent. Default community names are public and private.	2 to 255 ASCII characters	public
Poll frequency	The amount of time, in seconds, that the MCP waits before polling the remote device for new SNMP messages.	5 to 300	60
Session timeout	The amount of time, in seconds, to wait for a response from the remote device before the MCP assumes that a poll has failed.	1 to 10	5

Setting	Description	Range	Default
Retry count	The number of session timeouts that must occur before the MCP attempts to contact the remote device on an alternate port.	0 to 100	3
Reconnect time	The amount of time, in seconds, that the MCP waits before attempting to retry polling a remote device after a session timeout.	10 to 3600	60

Table 6-76: Digital Input Sub-tab

Setting	Description	Range	Default
Point reference	The short user-defined identifier for the point.	0 to 66 alphanumeric characters plus space, underscore, and dash	DI X
Point description	The user-defined block of text that provides a detailed and localized description of the point.	1 to 128 Unicode characters	Digital input X
OID	The identifier of the SNMP object to be retrieved as the point value. You can open the SNMP Agent Browser and enter an IP Address and port number to retrieve a listing of all available OIDs from the remote device.	Valid OID from the remote SNMP device.	None
Poll type	The type of poll to be performed for the point. Selecting: - POLL causes the MCP to periodically check for new SNMP messages at the configured poll interval. - TRAP causes the MCP to wait for unsolicited SNMP messages. - BOTH configures the MCP to both poll and accept unsolicited messages from the remote device.	POLL TRAP BOTH	POLL
ON state	A text string that is associated with the 1 state. This string is recorded in the MCP database and is displayed with the point.	0 to 64 characters	ON
OFF state	A text string that is associated with the 0 state. This string is recorded in the MCP database and is displayed with the point.	0 to 64 characters	OFF
Point Group	Point group to which the point belongs.	List of defined point groups	Group assigned to ID number 0

Table 6-77: Analog Input Sub-tab

Setting	Description	Range	Default
Point reference	The short user-defined identifier for the point.	0 to 66 alphanumeric characters plus space, underscore, and dash	AI X
Point description	The user-defined block of text that provides a detailed and localized description of the point.	1 to 128 Unicode characters	Analog input X

Setting	Description	Range	Default
OID	The identifier of the SNMP object to be retrieved as the point value. You can open the SNMP Agent Browser and enter an IP Address and port number to retrieve a listing of all available OIDs from the remote device.	Valid OID from the remote SNMP device.	None
Poll type	The type of poll to be performed for the point. Selecting: - POLL causes the MCP to periodically check for new SNMP messages at the configured poll interval. - TRAP causes the MCP to wait for unsolicited SNMP messages. - BOTH configures the MCP to both poll and accept unsolicited messages from the remote device.	POLL TRAP BOTH	POLL
Multiplier	Scale factor of the point (m of formula mx +b).	Full range of 64-bit Float	1.0
Offset	Scale factor of the point (b of formula mx +b).	Full range of 64-bit Float	0.0
Point Group	Point group to which the point belongs.	List of defined point groups	Group assigned to ID number 0

Table 6-78: Accumulator and Text Sub-tabs

Setting	Description	Range	Default
Point reference	The short user-defined identifier for the point.	0 to 66 alphanumeric characters plus space, underscore, and dash	ACC X or TEXT X
Point description	The user-defined block of text that provides a detailed and localized description of the point.	1 to 128 Unicode characters	Accumulator X or Text X
OID	The identifier of the SNMP object to be retrieved as the point value. You can open the SNMP Agent Browser and enter an IP Address and port number to retrieve a listing of all available OIDs from the remote device.	Valid OID from the remote SNMP device.	None
Poll type	The type of poll to be performed for the point. Selecting: - POLL causes the MCP to periodically check for new SNMP messages at the configured poll interval. - TRAP causes the MCP to wait for unsolicited SNMP messages. - BOTH configures the MCP to both poll and accept unsolicited messages from the remote device.	POLL TRAP BOTH	POLL
Point Group	Point group to which the point belongs.	List of defined point groups	Group assigned to ID number 0

IEC 61850 Client

The MCP supports communications to IEC 61850 compliant devices using the IEC 61850 client application. The IEC 61850 Loader is used to configure the IEC 61850 client Map file and application for the MCP Substation Gateway. The IEC 61850 client application allows the MCP to act as a master communications device for IEC 61850 compliant server devices. The master device responsibilities include:

- Initiating data exchanges with devices
- Sending control commands to devices, and
- Processing data autonomously reported by devices

The IEC 61850 Loader is integrated into DS Agile MCP Studio™ Utilities. For information on how to configure the MCP for IEC 61850 communications, refer to the DS Agile MCP Studio™ online help.

Note: The IEC 61850 loader application will be launched only if the MCP device is licensed for the IEC61850 client.

IEC61850 Client and Configuration tool (Loader) are compatible to Ed.1 and Ed.2 and support namespace lengths and schema according to associated Conformance Statements.

MCP Redundancy

This chapter consists of the following sections:

[About Redundancy](#)

[Redundancy Summary](#)

[Operational States](#)

[MCP Redundancy Configuration Combinations](#)

[Configure the MCP for Redundancy](#)

[System Points](#)

[Non-Sync Mode](#)

[Sync Config Operation](#)

[HMI User Access Privileges on Redundant System](#)

[Redundancy Setup Checklist](#)

[Error Messages and Troubleshooting](#)

About Redundancy

The MCP redundancy implementation uses two MCPs connected through serial and/or network links.

One MCP is in active mode and the other MCP is in standby mode.

If the active unit fails, the standby unit becomes active and takes over system operation.

If **ALL** communications between the two MCP units fail, the standby unit becomes active. In this situation:

- For systems deployed **with** a switch panel configured as master:
 - o The arbitration of which MCP has to be active can no longer be performed correctly and will result in the standby MCP unit requesting the switch to become active and the previously active unit becoming failed having the switch pulled away without notice.
- For systems deployed **without** a switch panel configured as master:
 - o The arbitration of which MCP has to be active can no longer be performed correctly and will result in both MCP units becoming active.

Because of this is strongly recommended – if possible – to configure redundant and different types of communication links between the two MCP units, to eliminate a single point of failure.

Redundancy in the MCP is enabled and disabled using the mcpcfg Configuration Utility/Settings GUI.

NOTICE

Starting with **MCP V4.00** release, **Warm-Standby** and **Hot-Standby** redundancy modes are no longer available and have been superseded by **Hot-Hot** redundancy mode. **Hot-Hot** redundancy mode has the same functionality as the superseded modes.

Three redundancy modes can be configured:

- **Warm Standby Redundancy**

Two MCP units are connected using network and/or serial communication links.

Only one MCP unit is active at a time.

Connection to an RS232 switch panel is optional.

Data synchronization from active to standby unit is minimal, restricted to:

- Accumulator running values
- ARRM files (Files which MCP extracted from IED's)
- Local commands that have been applied to individual system points (control inhibit, scan inhibit, local force, etc.)

Data is synchronized between the units through the configured inter communication link(s). Initial states are synchronized when the active unit first begins to communicate with the standby unit. Once this initial synchronization is complete, individual events are transferred from the active unit to the standby unit as they occur in real-time.

- **Hot Standby Redundancy**

Two MCP units are connected using network (mandatory) and optional backup serial communication links.

Only one MCP unit is active at a time.

Connection to an RS232 switch panel is optional.

The two MCP units are kept in constant data synchronization with respect to their real-time databases, as long as there is at least one active redundancy network connection between the MCP units.

DNP3 (only) communications to master(s) offer a seamless transition during redundancy switch-over.

Not all applications or communication protocols are available in this mode – see [Table 1-2: MCP Applications - Redundancy](#).

The following data is automatically synchronized from active to standby through the network connection:

- Real time databases
- Events from IEDs
- Alarm and SOE databases
- Local commands that have been applied to individual system points (control inhibit, scan inhibit, local force, etc.)
- Acknowledgements from the Master station to server application, to delete an event from event queues
- Application internal data to start an application from the same state in the event of change-over

- **Hot-Hot Redundancy**

Two MCP units are connected using network (mandatory) and optional backup serial communication links.

Only one MCP unit is active at a time.

Connection to an RS232 switch panel is optional.

The two MCP units are kept in constant data synchronization with respect to their real time databases, as long as there is at least one active redundancy network connection between the MCP units.

Depending on configured parameters at communication protocol and port level, either:

- Each MCP unit communicates independently and simultaneously with the IEDs (assuming IEDs allow this), or
- One MCP unit (active) communicates with the IEDs and then synchronizes its data constantly to the other MCP unit.

DNP3 (only) communications to master(s) offer a seamless transition during redundancy switch-over.

The following data is automatically synchronized from active to standby through the network connection:

- Real time databases
- Events from IEDs
- Alarm and SOE databases
- Local commands that have been applied to individual system points (control inhibit, scan inhibit, local force, etc.)
- Acknowledgements from the Master station to server application, to delete an event from event queues
- Application internal data to start an application from the same state in the event of change-over.

- **Stand-Alone (No Redundancy)**

If No Redundancy is configured, then all configured applications in MCP run independently on each MCP.

Note: In Warm-Standby and Hot-Hot Redundancy modes, if D.20 is configured then there will be a default D.20 Heart-beat link available in addition to the configured Redundancy Heart Beat communications. This option is not available in Hot-Standby Redundancy mode.

Once configured, redundant systems use the [MCP Configuration Manager](#) to synchronize configuration between the two MCP units, ensuring both are configured identically. In addition, the Automated Record Retrieval Manager (ARRM) provides [redundancy support](#).

Serial connections include the redundancy settings listed in the [Redundancy Dedicated Link](#) and [Redundancy Switch Panel](#) sections.

The Redundancy Manager supervises the operational state and state transitions of the MCP units in redundant mode. See the [Operational States](#) and [System Points](#) sections for details.

Hybrid Model for MCP Redundancy

The MCP allows the user to select the system redundancy mode; that is, either:

- Warm Standby
- Hot Standby
- Hot-Hot
- Standalone

When system redundancy is set to Hot Standby mode, the user can only configure and run a smaller set of applications – see [Table 1-2: MCP Applications - Redundancy](#).

The MCP Configuration Tool (mcpcfg/settings GUI) provides an option to select the system redundancy mode as Hot-Hot, Hot Standby, Warm Standby or Standalone.

The DS Agile Studio MCP Configuration tool displays only the available applications according to the selected redundancy mode.

When system redundancy is set to Hot-Hot, Warm Standby, Standalone mode, the user can configure and run all MCP applications.

NOTICE

Not all protocols are supported in **Hot-Standby** Redundancy mode, refer to [Table 1-2: MCP Applications - Redundancy](#).

Carefully review product documentation and configure Redundancy accordingly.

For details, see the following sections:

Redundancy Summary

Table 6-79: Redundancy Summary

Component	Warm Standby Redundancy	Hot Standby or Hot-Hot Redundancy
MCP Redundancy Manager	The MCP Redundancy Manager is responsible for managing communications between the two MCP units and the RS232 Redundancy Switch Panel. It also controls data synchronization and state changes.	The MCP Redundancy Manager is responsible for managing Heart Beat communications between the two MCP units, and the RS232 switch panel. It also controls system state changes. The MCP Redundancy Manager does not perform data synchronization from active unit to standby. Each application on an active unit directly communicates to its standby counterpart for data synchronization.
Redundancy Serial Port Settings	Two serial ports on each MCP are dedicated to redundancy-related communications: Redundancy Dedicated Link - Links the two MCP units together through the ping cable. This is optional in Warm Standby redundancy. Redundancy Switch Panel – Connects each MCP unit to the RS232 switch panel through the watchdog cable. This is optional in Warm Standby redundancy.	Up to two serial ports on each MCP are dedicated to redundancy-related communications: Redundancy Dedicated Link - Links the two MCP units together through the ping cable). This is optional in Hot Standby or Hot-Hot redundancy. Redundancy Switch Panel – Connects each MCP unit to the RS232 switch panel through the watchdog cable. This is optional in the Hot Standby or Hot-Hot redundancy.
MCP Configuration Manager	The MCP Configuration Manager allows you to synchronize configurations between two MCP units. The MCP redundancy application uses this tool to manage the synchronization of configuration files between the active and standby units to ensure both units are configured identically.	
Gateway Configuration Utility – Redundancy	The Gateway Configuration Utility is a tool accessed through the command line/settings GUI of the MCP. The Redundancy section of this utility is used to configure the parameters of the redundancy application.	

Operational States

The MCP Redundancy Manager supervises the operational state and state transitions of the MCP units in redundant mode. The following states are possible:

MCP Redundancy Manager Operational States

Table 6-80: MCP Redundancy Manager Operational States

Field	Description
Active	The unit is active and performing all the standard functions of the MCP.
Standby	The unit is connected to another MCP unit that is in active mode and is ready to assume active mode in the event of a failure of the other MCP unit or a manual change over request.
Non-redundant	The MCP is placed in this mode when redundancy is disabled through the <i>mcpcfg</i> utility/settings GUI or when a configuration error is detected. In this state, the MCP ignores the RS232 switch panel and the other MCP unit. All redundancy related system points and functions are disabled.

Field	Description
Failed	The MCP has entered an unrecoverable state and all software functions have been suspended. The unit must be serviced or restarted to restore functionality.
Service	While in service mode, MCP units do not accept change-over requests. The standby unit enters the Service mode during Sync Config operation and re-initialization.
Non-Sync	If the firmware or configuration of the Standby unit is not the same as that of the active unit, the standby unit enters Non-Sync mode. In non-sync mode, no application is started on the standby unit. The Redundancy Manager on both units maintains communications and responds to user commands initiated on the active unit normally (Configuration Sync, Switch-over, Reboot, etc.). For more details, see Non-Sync Mode .

MCP Redundancy Configuration Combinations

The MCP can be configured to operate in Warm Standby or Hot Standby redundancy mode. The table below summarizes the various configuration combinations that are possible.

Table 6-81: MCP Redundancy Valid Configuration Combinations

Scenario Number	Behavior	Required configurations			
		"mcpcfg" (13>10) /Settings GUI Switch Panel Type	"mcpcfg" (13>3>3) /Settings GUI Heart Beat Mechanism	"Connections" Redundancy Switch Panel	"Connections" Redundancy Serial Dedicated Link ("PING")
1	Switch panel must be present and powered up; it dictates Active/Standby. "PING" link is serial and must be present.	MASTER	Only Serial	YES	YES
2	Switch panel must be present and powered up; it dictates Active/Standby. "PING" link is LAN and must be present.	MASTER	Only LAN	YES	NO
3	Switch panel must be present and powered up; it dictates Active/Standby. "PING" link is serial plus LAN and at least one must be present.	MASTER	Combinations of Serial and LAN	YES	YES

Scenario Number	Behavior	Required configurations			
		"mcpcfg" (13>10) /Settings GUI Switch Panel Type	"mcpcfg" (13>3>3) /Settings GUI Heart Beat Mechanism	"Connections" Redundancy Switch Panel	"Connections" Redundancy Serial Dedicated Link ("PING")
4	Switch panel is present but does NOT dictate Active/Standby and Switch panel button is not operational. Active/Standby is set in software via communications between MCPs. "PING" link is serial and must be present.	SLAVE	Only Serial	YES	YES
5	Switch panel is present but does NOT dictate Active/Standby and Switch panel button is not operational. Active/Standby is set in software via communications between MCPs. "PING" link is LAN and must be present.	SLAVE	Only LAN	YES	NO
6	Switch panel is present but does NOT dictate Active/Standby and Switch panel button is not operational. Active/Standby is set in software via communications between MCPs. "PING" link is serial plus LAN and at least one must be present.	SLAVE	Combinations of Serial and LAN	YES	YES

Scenario Number	Behavior	Required configurations			
		"mcpcfg" (13>10) /Settings GUI Switch Panel Type	"mcpcfg" (13>3>3) /Settings GUI Heart Beat Mechanism	"Connections" Redundancy Switch Panel	"Connections" Redundancy Serial Dedicated Link ("PING")
7	Switch panel is not present. Active / Standby is set in software via communications between MCPs. "PING" link is serial and must be present. Serial IED or Master(s) are not configured, or use RS485 2-wires commonly wired, or use Virtual Serial Ports.	SLAVE	Only Serial	NO	YES
8	Switch panel is not present. Active / Standby is set in software via communications between MCPs. "PING" link is LAN and must be present. Serial IED or Master(s) are not configured, or use RS485 2-wires commonly wired, or use Virtual Serial Ports.	SLAVE	Only LAN	NO	NO
9	Switch panel is not present. Active / Standby is set in software via communications between MCPs. "PING" link is serial plus LAN and at least one must be present. Serial IED or Master(s) are not configured, or use RS485 2-wires commonly wired, or use Virtual Serial Ports.	SLAVE	Combinations of Serial and LAN	NO	YES

Scenario Number	Behavior	Required configurations			
		"mcpcfg" (13>10) /Settings GUI Switch Panel Type	"mcpcfg" (13>3>3) /Settings GUI Heart Beat Mechanism	"Connections" Redundancy Switch Panel	"Connections" Redundancy Serial Dedicated Link ("PING")
10	Switch panel is not present but is configured in Connections. This is an invalid configuration / setup.	SLAVE	Only Serial	YES	YES
11	Switch panel is not present but is configured in Connections. This is an invalid configuration / setup.	SLAVE	Only LAN	YES	NO
12	Switch panel is not present but is configured in Connections. This is an invalid configuration / setup.	SLAVE	Combinations of Serial and LAN	YES	YES

Expected results of above combinations

» For scenarios numbered 1, 2, and 3:

- Removal of the switch panel (with PING communications still valid) leaves the ACTIVE unit as ACTIVE, and the STANDBY unit never becomes ACTIVE (It may go to Fail / Service Mode, but never becomes Active).
- Removal of all PING comms (with switch panel still connected) results in the Standby MCP unit requesting the switch to become Active and the previously Active unit becoming Failed having the switch pulled away without notice.

» For scenarios numbered 4, 5, and 6:

- Removal of the switch panel (with PING communications still valid) does not matter. ACTIVE unit remains as ACTIVE, and the STANDBY unit remains as STANDBY.
- Removal of all PING communications (with switch panel being irrelevant if it is left connected or right connected) leaves the ACTIVE unit as ACTIVE, and the STANDBY unit is in the FAILED state.

NOTE: For scenarios 4, 5, and 6 – the switch panel must be energized and connected at the time of MCP switchover, because the “position” of it may become out of synch if the switch panel is not present while the MCPs are switching.

» **For scenarios numbered 7, 8, and 9:**

- Removal of all PING communications leaves the ACTIVE unit as ACTIVE, and the STANDBY unit becomes ACTIVE as well. This is because in absence of any external ACTIVE/STANDBY arbitrator (that was the Switch Panel in Master Mode in scenarios 1 to 3) and in absence of any communications between them
- The two MCP units are not aware of each other's status and will be ACTIVE for the sake of delivering service.

» **For scenarios numbered 10, 11, and 12:** These configurations / setups are invalid. Cannot have the switch panel configured in Connections but not wired / present.

Adjust the setup to be valid.

NOTE: Users can configure up to 3x PING separate channels, to provide multiple PING link availability; this impacts scenario 6 and 9.

Important Notes

- If a user wants to control ACTIVE/STANDBY from the mechanical toggle button of the switch panel, then the configuration must be 1, 2, 3 (MASTER switch panel in mcpcfg/Settings GUI). And in this case, the arbitration ACTIVE/STANDBY is done by the switch panel.
- When the switch panel is configured as SLAVE, actions performed on the toggle mechanical button on the switch panel do not result in changes. This is because in the case SLAVE Mode either ACTIVE/STANDBY doesn't get any control from the mechanical toggle button on the switch panel and the switch panel in this case should not be used as an arbitrator (SLAVE).
- If switch panel is configured as MASTER it is mandatory to configure the switch panel through the **Configuration > Connection** tab in the DS Agile Studio.
- It is strongly recommended to use redundant Heart Beat links. This means that scenarios 4, 5, 7, 8 are NOT recommended.
- It is strongly recommended that LAN Heart Beat links be configured on the Net interface that is connected to the substation LAN, to eliminate the possibility of duplicated ACTIVE IP addresses in case of both MCP becoming active. This means that a dedicated Net interface for the Heart Beat link is NOT recommended (if this fails and both MCP become active, they will conduct to duplicated ACTIVE IP on the substation LAN). This will ensure that one MCP will be isolated from the substation LAN if the Heart Beat link fails.
- After experiencing both MCP being in active state, and after correcting the Heart Beat communication defects, and if the D.20 IO is configured: it is required to power cycle both MCP devices to clear this state on the D.20 PCIe card.
- In general, after recovering from any redundancy failures there should be comprehensive checks performed to ensure the active device is operating as required, HAMA DI Point "Needs Cold Reboot" is reset (0), D.20 IO (if configured) are online and the standby device shows online in the active device. And then same checks should be performed after a switchover, with the second device being active.

Configure the MCP for Redundancy

The MCP can be configured to operate in Warm Standby, Hot Standby or Hot-Hot redundancy mode.

NOTICE

Do not share the root user's password and do not forget it; this is crucial information.
No method is available to regenerate a lost password.

Prerequisites

To set up two MCPs for redundant operation, the following is required:

- Two MCPs running same Firmware and Production Build

- The two MCP must be pre-connected as per the valid scenarios in *Table 6-81: MCP Redundancy Valid Configuration Combinations*
- Means to change the MCP Settings: Serial Maintenance or SSH client (e.g.: Secure Terminal Emulator from DS Agile MCP Studio), or KVM set connected to the MCPs, or Web based Settings GUI

NOTE: While the workflows below indicate “mcpcfg” usage, the same steps can be achieved using Settings GUI equivalent commands.

Configure Warm-Standby redundancy

» Task 1: Warm standby - Configure the MCPs for operation:

Set up both MCPs for operation. Refer to the G500 Substation Gateway Instruction Manual (*GE Vernova Part Number 994-0152*) or G100 Substation Gateway Instruction Manual (*GE Vernova Part Number 994-0155*).

» Task 2: Warm standby - Connect the MCPs:

1. Connect to the MCPs (Gateway A and Gateway B).
2. Enter the admin login credentials.
3. Login to and start the mcpcfg local MCP configuration utility. You can also use the Local HMI available to login to and start mcpcfg.

» Task 3: Warm standby - Create user accounts:

To configure redundancy, both MCPs are required to have a user account. Skip this task if a user account has already been created.

Tip: In the following procedures, the term “enter” indicates that the menu item number is typed in and then the **Enter** key is pressed.

1. At the MCP#>> prompt, enter **mcpcfg** if you are a root user. Otherwise, enter **sudo mcpcfg** and give login admin user password.

Result: The Gateway Configuration Utility Menu appears.

2. Enter **1. Configure Authentication**.

Result: The Gateway Configuration Utility Menu - Authentication menu appears.

3. Enter **3. Administrator Group Users**.

Result: The Gateway Configuration Utility Menu - Admin Group Users menu appears.

4. Enter **2. Add User**.

Result: The Gateway Configuration Utility Menu - Admin Group Users - Add User in Group command details appear.

5. Enter the desired username.
6. Enter the password, conforming to the password security rules.
7. Repeat this task to add a new user in the second MCP.

» Task 4: Warm standby - Configure the Primary MCP for redundancy:

1. Navigate back to the main mcpcfg menu.

Result: The Gateway Configuration Utility Menu appears.

2. Enter **13. Redundancy**.

Result: The Gateway Configuration Utility Menu - Redundancy menu appears.

3. Enter **1. Current Configuration** to view the Current Redundancy Configuration.

4. Enter **2. Enable/Disable Redundancy**.

- Enter **Y** to enable Redundancy.
Result: You are prompted for the redundancy type.
- Enter **1. Warm Standby** to configure the MCPs in Warm-Standby mode.
- Enter **Y** to confirm your selection.

5. Enter **3. Heart Beat Configuration**.

Result: The Gateway Redundancy Configuration Menu - Heart Beat Configuration Parameters menu appears.

- Enter **1. Configure Heart Beat Timeout**.
 - o Enter a value for the **Heart Beat Timeout** (in milliseconds) within the suggested range (100 to 1000 milliseconds).
 - o Enter **Y**. To save the changes.
- Enter **2. Configure Heart Beat Retries**.
 - o Enter the number of **Heart Beat Retries** within the suggested range (1 to 10).
 - o Enter **Y**. To save the changes.
- Enter **3. Configure Heart Beat Communication Mechanism**.
Result: The Gateway Redundancy Configuration Menu - Heart Beat Mechanism menu appears.
 - o Select the required Heart Beat Mechanism by selecting one of the options from the below menu:
 1. **Serial Only**
 2. **Single LAN**
 3. **LAN1 and LAN2**
 4. **LAN and Serial**
 5. **LAN1, LAN2 and Serial**
 - o If the option is either **1 or 4 or 5**, select the required **Heart Beat Mechanism**, then follow the below steps to configure the Serial Ports:
 1. Navigate to **DS Agile MCP Studio -> Connections -> Serial Connections**.
 2. Add a **New connection**.
 3. Select the **Serial Connection**.
 4. Select the **Redundancy Dedicated Link** type.
 5. Select the **Primary** and **Backup Port** settings.
 6. Enable the **Auto Start** configuration parameters.
 7. **Save and Commit Changes**.
 - o If the option is either **2 or 3 or 4 or 5**, select the required **Heart Beat Mechanism**.
 1. Enter **Y** to save the settings.

6. Navigate back to the Redundancy menu.

7. Enter **4. Configure IP Address of PEER MCP**.

- Enter **1. Configure/Update PEER IP Address**.
 - o Enter the new Primary address of the PEER MCP.
 - o If a Secondary IP for the PEER MCP is available, enter the new Secondary IP Address.

- o Confirm the Primary and Secondary IP Address changes by entering **Y**.
- Enter **2.Delete PEER IP Address**
 - o Enter **1 to Delete Secondary IP**
 - o Enter **2 to Delete Both Primary and Secondary IPs**
- 8. Navigate back to the Gateway Configuration Utility Menu - Redundancy menu.
- 9. Enter **5. Configure Time Sync with Standby**. (Optional)
 - Skip this option if both MCPs are already in time-sync through other means (for example, IRIG-B or NTP).
- 10. Enter **6. Configure Enable/Disable DTAs in Standby**
NOTE:This parameter is not applicable for Warm Stand Redundancy.
- 11. Enter **7. Configure Gateway A/B Designation**.
 - If Switch Panel is configured (master), Gateway A/B Designation is read from the Switch Panel (i.e., user configuration is disabled).
 - If Switch Panel is not configured (slave), enter **1. Gateway_A** to select the Gateway Designation.

Result: Gateway A/B Designation changed to **Gateway_A**.
- 12. Enter **8. Setup Public Key Authentication with PEER MCP**.
NOTE: LAN based Heart Beat Mechanism is not applicable for “**Serial Only**” Heart Beat Mechanism.
 - Enter **Y** to copy the public key of this MCP to PEER the MCP.
 - Enter the password of the user defined in the PEER MCP. This option exchanges the public keys and Redundancy secure tunnel certificates.
- 13. Enter **9. Configure Switch Panel Type**.
NOTE: This option is not applicable if switch panel is not configured.
 - Select Switch Panel Type Configuration:
 - 1. MASTER**
 - 2. SLAVE**
 - Enter **1 or 2**.
 - Navigate to **DS Agile MCP Studio -> Connections -> Serial Connections**.
 - Add a **New connection**.
 - Select the **Serial Connection**.
 - Select the **Redundancy Switch Panel** type.
 - Select the **Primary Port** settings.
 - Enable the **Auto Start** configuration parameters.
 - **Save and Commit Changes**.
- 14. Navigate back to the Gateway Configuration Utility Menu – Redundancy menu.
- 15. Enter **10. Enable/Disable Non-Sync mode**
NOTE:This parameter is not applicable for Warm Stand Redundancy.
- 16. Navigate back to the Gateway Configuration Utility Menu.

17. Enter **24. Reboot Device** and wait for a minute.

Result: This command:

- Restarts all the applications and runs them in Warm-Standby mode.
- Starts the ACTIVE MCP in Warm Standby Mode.

Result: After the first MCP is configured, it enters the Active mode.

18. Login to the PEER MCP and execute **mcpcfg**.
19. Repeat the steps of this task to configure the PEER MCP.

» Task 5: Warm standby - Configure the Secondary MCP for redundancy:

1. Navigate back to the main mcpcfg menu.
Result: The Gateway Configuration Utility Menu appears.
2. Enter **13. Redundancy**.
Result: The Gateway Configuration Utility Menu - Redundancy menu appears.
3. Enter the remaining configuration settings to be identical to the Primary MCP. See [Task 4: Warm standby - Configure the Primary MCP for redundancy](#).
4. Enter **8. Gateway A/B Designation**.
 - If Switch Panel is configured (master), Gateway A/B Designation is read from the Switch Panel (i.e., user configuration is disabled).
 - If Switch Panel is not configured (slave), enter **2. Gateway_B** to select the Gateway Designation.**Result:** Gateway A/B Designation changed to **Gateway_B**.
5. Enter **24. Reboot Device** and wait for a minute.
Result: All the MCP applications are restarted and run in Warm-Standby mode.

This MCP (Gateway_B) communicates to the PEER MCP (Gateway_A) and declares itself to be the Standby MCP since the PEER MCP is already in Active mode.

» Task 6: Warm standby - Verify configuration:

1. At the command prompt of the Primary MCP, enter **mcpcfg**.
2. Enter **13. Redundancy**.
3. Enter **1. Current Configuration**.
4. Repeat the steps of this task for the Secondary MCP.
5. Compare the Primary and Secondary configurations.

» Task 7: Warm standby - Verify redundant MCP operation:

1. Login to MCP remote-HMI and enter credentials.
2. Click **Point Details**  button.
3. Click the **Application** tab.
4. Click **Redundancy Manager Details**.
5. Repeat the steps of this task for the Secondary MCP.
6. Compare the configurations.
7. Confirm that the State of PEER MCP pseudo point is Standby.

Configure Hot-Standby redundancy

Before configuring the MCPs for Hot-Standby redundancy, ensure that the listed Prerequisites on page 510 are on-hand.

» Task 1: Hot standby - Configure the MCPs for operation:

Set up both MCPs for operation. Refer to the G500 Substation Gateway Instruction Manual (*GE Vernova Part Number 994-0152*) or G100 Substation Gateway Instruction Manual (*GE Vernova Part Number 994-0155*).

» Task 2: Hot standby - Connect the MCPs:

1. Connect to the MCPs (Gateway A (MCP) and Gateway B (MCP)) through a secure shell client.
2. Enter the admin login credentials.
3. Login to and start the mcpcfg local MCP configuration utility. You can also use the Local HMI available to login to and start mcpcfg.

» Task 3: Hot standby - Create user accounts:

Creation of user accounts follows the same procedure whether it is for hot-hot, hot standby or warm standby redundancy. See the procedure in section: [Task 3: Warm standby - Create user accounts](#).

» Task 4: Hot standby - Configure the Primary MCP for redundancy:

1. Navigate back to the main mcpcfg menu.
Result: The Gateway Configuration Utility Menu appears.
2. Enter **13. Redundancy**.
Result: The Gateway Configuration Utility Menu - Redundancy menu appears.
3. Enter **1. Current Configuration** to view the Current Redundancy Configuration.
4. Enter **2. Enable/Disable Redundancy**.
 - Enter **Y** to enable Redundancy.
Result: You are prompted for the redundancy type.
 - Enter **2. Hot Standby** to configure the MCPs in Hot-Standby mode.
 - Enter **Y** to confirm your selection.
5. Enter **3. Heart Beat Configuration**.
Result: The Gateway Redundancy Configuration Menu - Heart Beat Configuration Parameters menu appears.
 - Enter **1. Configure Heart Beat Timeout**.
 - o Enter a value for the **Heart Beat Timeout** (in milliseconds) within the suggested range (100 to 1000 milliseconds).
 - o Enter **Y**. To save the changes.
 - Enter **2. Configure Heart Beat Retries**.
 - o Enter the number of **Heart Beat Retries** within the suggested range (1 to 10).
 - o Enter **Y**. To save the changes.
 - Enter **3. Configure Heart Beat Communication Mechanism**.
Result: The Gateway Redundancy Configuration Menu - Heart Beat Mechanism menu appears.

- o Select the required Heart Beat Mechanism by selecting one of the options from the below menu:
 1. **Single LAN**
 2. **LAN1 and LAN2**
 3. **LAN and Serial**
 4. **LAN1, LAN2 and Serial**
- o Enter **1. Single LAN** (the default value).
 1. Enter **Y** to save the settings.
- o If the option is either **3 or 4**, select the required **Heart Beat Mechanism**, then follow the below steps to configure the Serial Ports:
 1. Navigate to **DS Agile MCP Studio -> Connections -> Serial Connections**.
 2. Add a **New connection**.
 3. Select the **Serial Connection**.
 4. Select the **Redundancy Dedicated Link** type.
 5. Select the **Primary** and **Backup Port** settings.
 6. Enable the **Auto Start** configuration parameters.
 7. **Save** and **Commit Changes**.
- 6. Navigate back to the Redundancy menu.
- 7. Enter **4. Configure IP Address of PEER MCP**.
 - Enter **1. Configure/Update PEER IP Address**.
 - o Enter the new Primary IP Address of the PEER MCP.
 - o If a Secondary IP for the PEER MCP is available, enter the new Secondary IP Address.
 - o Confirm the Primary and Secondary IP Address changes by entering **Y**.
- 8. Enter **5. Configure Time Sync with Standby**. (Optional)
 - Skip this option if both MCPs are already in time-sync through other means (for example, IRIG-B or NTP).
- 9. Enter **6. Configure Enable/Disable DTAs in Standby**.
Result: The Gateway Redundancy Configuration Menu - Enable/Disable DTAs on Standby menu appears.
 - If the “Enable/Disable DTAs in Standby” parameter is set to Enabled, the LogicLinX, Calculator and Enhanced Automation DTAs run normally on the standby MCP. If this parameter is set to Disabled, these applications suspend processing on the standby MCP and resume normal operations when the MCP state becomes active.
 - Skip this option if DTA applications (that is, automation applications such as LogicLinX, Calculator, Enhanced Automation) on the Standby MCP are to run (default option).
- 10. Enter **7. Configure Gateway A/B Designation**.
 - If Switch Panel is configured (master), Gateway A/B Designation is read from the Switch Panel (i.e., user configuration is disabled).
 - If Switch Panel is not configured, enter **1. Gateway_A** to select the Gateway Designation.**Result:** Gateway A/B Designation changed to **Gateway_A**.

11. Enter **8**. Setup Public Key Authentication with PEER MCP.
 - Enter **Y** to copy the public key of this MCP to PEER the MCP.
 - Enter the password of the user defined in the PEER MCP. This option exchanges the public key and Redundancy secure tunnel certificates.

12. Enter **9. Configure Switch Panel Type**.

NOTE: This option is not applicable if switch panel is not configured.

- Select Switch Panel Type Configuration:

1. **MASTER**

2. **SLAVE**

- Enter **1 or 2**.
- Navigate to **DS Agile MCP Studio -> Connections -> Serial Connections**.
- Add a **New connection**.
- Select the **Serial Connection**.
- Select the **Redundancy Switch Panel** type.
- Select the **Primary Port** settings.
- Enable the **Auto Start** configuration parameters.
- **Save and Commit Changes**.

13. Enter **10. Enable/Disable Non-Sync mode**.

- Default option: The MCP in Hot-Standby mode runs with Non-Sync Mode Enabled. You can disable this mode.
Enter either:
 - o **Y** to disable Non-Sync Mode.
 - o **N** to continue operation with the default option (Non-Sync mode enabled).

14. Navigate back to the main menu.

15. Enter **24. Reboot Device** and wait for a minute.

- Restarts all the applications and runs them in Hot-Standby mode.
- Starts the ACTIVE MCP in Hot Standby Mode.

Result: After the first MCP is configured, it enters the Active mode.

16. Login to the PEER MCP and execute **mcpcfg**.

17. Repeat the steps of **Task 4: Hot standby - Configure the Primary MCP for redundancy** to configure the PEER MCP.

» **Task 5: Hot standby - Configure the Secondary MCP for redundancy:**

1. Navigate back to the main mcpcfg menu.
Result: The Gateway Configuration Utility Menu appears.
2. Enter **13. Redundancy**.
Result: The Gateway Configuration Utility Menu - Redundancy menu appears.
3. Enter the remainder of the configuration settings identical to the Primary MCP. See **Task 4: Hot standby - Configure the Primary MCP for redundancy**.

4. Enter **7. Gateway A/B Designation**.

- If Switch Panel is configured (master), Gateway A/B Designation is read from the Switch Panel (i.e., user configuration is disabled).
- If Switch Panel is not configured (slave), enter **2. Gateway_B** to select the Gateway Designation.

Result: Gateway A/B Designation changed to **Gateway_B**.

5. Enter **24. Reboot Device** and wait for a minute.

Result: All the MCP applications are restarted and run in Hot-Standby mode.

This MCP (Gateway_B) communicates to the PEER MCP (Gateway_A) and declares itself to be the Standby Gateway since the PEER MCP is already in Active mode.

» **Task 6: Hot standby - Verify configuration:**

1. At the command prompt of the Primary MCP, enter **mcpcfg**.
2. Enter **13. Redundancy**.
3. Enter **1. Current Configuration**.
4. Repeat the steps of this task for the Secondary MCP.
5. Compare the Primary and Secondary configurations.

» **Task 7: Hot standby - Verify redundant MCP operation:**

1. Login to MCP remote-HMI and enter credentials.
2. Click **Point Details**  button.
3. Click the **Application** tab.
4. Click **Redundancy Manager Details**.
5. Repeat the steps of this task for the Secondary MCP.

If the State of PEER MCP point is Non-Sync, then synchronize the configuration by entering the Direct Operate -> Pulse On command on the SyncConfig point.

6. Compare the configurations.
7. Confirm that the State of PEER MCP pseudo point is Standby.

Configure Hot-Hot Redundancy

Before configuring the MCPs for Hot-Hot redundancy, ensure that the listed Prerequisites on page [510](#) are on-hand.

» **Task 1: Hot-Hot - Configure the MCPs for operation:**

Set up both MCPs for operation. Refer to the G500 Substation Gateway Instruction Manual (*GE Vernova Part Number 994-0152*) or G100 Substation Gateway Instruction Manual (*GE Vernova Part Number 994-0155*).

» **Task 2: Hot-Hot - Connect the MCPs:**

1. Connect to the MCPs (Gateway A (MCP) and Gateway B (MCP)) through a secure shell client.
2. Enter the admin login credentials.
3. Login to and start the mcpcfg local MCP configuration utility. You can also use the Local HMI available to login to and start mcpcfg.

» Task 3: Hot-Hot - Create user accounts

Creation of user accounts follows the same procedure whether it is for hot-hot, hot standby or warm standby redundancy. See the procedure in section: [Task 3: Warm standby - Create user accounts](#).

» Task 4: Hot-Hot - Configure the Primary MCP for redundancy

1. Navigate back to the main mcpcfg menu.
Result: The Gateway Configuration Utility Menu appears.
2. Enter **13. Redundancy**.
Result: The Gateway Configuration Utility Menu - Redundancy menu appears.
3. Enter **1. Current Configuration** to view the Current Redundancy Configuration.
4. Enter **2. Enable/Disable Redundancy**.
 - Enter **Y** to enable Redundancy.
Result: You are prompted for the redundancy type.
 - Enter **2. Hot -Hot** to configure the MCPs in Hot-Hot mode.
 - Enter **Y** to confirm your selection.
5. Enter **3. Heart Beat Configuration**.
Result: The Gateway Redundancy Configuration Menu - Heart Beat Configuration Parameters menu appears.
 - Enter **1. Configure Heart Beat Timeout**.
 - o Enter a value for the **Heart Beat Timeout** (in milliseconds) within the suggested range (100 to 1000 milliseconds).
 - o Enter **Y**. To save the changes.
 - Enter **2. Configure Heart Beat Retries**.
 - o Enter the number of **Heart Beat Retries** within the suggested range (1 to 10).
 - o Enter **Y**. To save the changes.
 - Enter **3. Configure Heart Beat Communication Mechanism**.
Result: The Gateway Redundancy Configuration Menu - Heart Beat Mechanism menu appears.
 - o Select the required Heart Beat Mechanism by selecting one of the options from the below menu:
 1. **Single LAN**
 2. **LAN1 and LAN2**
 3. **LAN and Serial**
 4. **LAN1, LAN2 and Serial**
 - o Enter **1. Single LAN** (the default value).
 1. Enter **Y** to save the settings.
 - o If the option is either **3 or 4**, select the required **Heart Beat Mechanism**, then follow the below steps to configure the Serial Ports:
 1. Navigate to **DS Agile MCP Studio -> Connections -> Serial Connections**.
 2. Add a **New connection**.
 3. Select the **Serial Connection**.
 4. Select the **Redundancy Dedicated Link** type.

5. Select the **Primary** and **Backup Port** settings.
 6. Enable the **Auto Start** configuration parameters.
 7. **Save and Commit Changes.**
6. Navigate back to the Redundancy menu.
7. Enter **4. Configure IP Address of PEER MCP.**
 - Enter **1. Configure/Update PEER IP Address.**
 - o Enter the new Primary IP Address of the PEER MCP.
 - o If a Secondary IP for the PEER MCP is available, enter the new Secondary IP Address.
 - o Confirm the Primary and Secondary IP Address changes by entering **Y**.
8. Enter **5. Configure Time Sync with Standby.** (Optional)
 - Skip this option if both MCPs are already in time-sync through other means (for example, IRIG-B or NTP).
9. Enter **6. Configure Enable/Disable DTAs in Standby.**

NOTE: This parameter is not applicable for Warm Stand Redundancy.
10. Enter **7. Configure Gateway A/B Designation.**
 - If Switch Panel is configured (master), Gateway A/B Designation is read from the Switch Panel (i.e., user configuration is disabled).
 - If Switch Panel is not configured, enter **1. Gateway_A** to select the Gateway Designation.

Result: Gateway A/B Designation changed to **Gateway_A**.
11. Enter **8. Setup Public Key Authentication with PEER MCP.**
 - Enter **Y** to copy the public key of this MCP to PEER the MCP.
 - Enter the password of the user defined in the PEER MCP. This option exchanges the public key and Redundancy secure tunnel certificates.
12. Enter **9. Configure Switch Panel Type.**

NOTE: This option is not applicable if switch panel is not configured.

 - Select Switch Panel Type Configuration:
 1. **MASTER**
 2. **SLAVE**
 - Enter **1 or 2.**
 - Navigate to **DS Agile MCP Studio -> Connections -> Serial Connections.**
 - Add a **New connection.**
 - Select the **Serial Connection.**
 - Select the **Redundancy Switch Panel** type.
 - Select the **Primary Port** settings.
 - Enable the **Auto Start** configuration parameters.
 - **Save and Commit Changes.**

13. Enter **10. Enable/Disable Non-Sync mode.**
 - Default option: The MCP in Hot-Hot mode runs with Non-Sync Mode Enabled. You can disable this mode.
Enter either:
 - o **Y** to disable Non-Sync Mode.
 - o **N** to continue operation with the default option (Non-Sync mode enabled).
14. Navigate back to the main menu.
15. Enter **24. Reboot Device** and wait for a minute.
 - Restarts all the applications and runs them in Hot-Hot mode.
 - Starts the ACTIVE MCP in Hot-Hot Mode.

Result: After the first MCP is configured, it enters the Active mode.

16. Login to the PEER MCP and execute **mcpcfg**.
17. Repeat the steps of [Task 4: Hot-Hot - Configure the Primary MCP for redundancy](#) to configure the PEER MCP.

» **Task 5: Hot-Hot - Configure the Secondary MCP for redundancy:**

1. Navigate back to the main mcpcfg menu.
Result: The Gateway Configuration Utility Menu appears.
2. Enter **13. Redundancy.**
Result: The Gateway Configuration Utility Menu - Redundancy menu appears.
3. Enter the remainder of the configuration settings identical to the Primary MCP.
See » [Task 4: Hot-Hot - Configure the Primary MCP for redundancy](#).
4. Enter **7. Gateway A/B Designation.**
 - If Switch Panel is configured (master), Gateway A/B Designation is read from the Switch Panel (i.e., user configuration is disabled).
 - If Switch Panel is not configured (slave), enter **2. Gateway_B** to select the Gateway Designation.
Result: Gateway A/B Designation changed to **Gateway_B**.
5. Enter **24. Reboot Device** and wait for a minute.
Result: All the MCP applications are restarted and run in Hot-Standby mode.

This MCP (Gateway_B) communicates to the PEER MCP (Gateway_A) and declares itself to be the Standby Gateway since the PEER MCP is already in Active mode.

» **Task 6: Hot -Hot- Verify configuration:**

1. At the command prompt of the Primary MCP, enter **mcpcfg**.
2. Enter **13. Redundancy.**
3. Enter **1. Current Configuration.**
4. Repeat the steps of this task for the Secondary MCP.
5. Compare the Primary and Secondary configurations.

» Task 7: Hot-Hot - Verify redundant MCP operation:

1. Login to MCP remote-HMI and enter credentials.
2. Click **Point Details**  button.
3. Click the **Application** tab.
4. Click **Redundancy Manager Details**.
5. Repeat the steps of this task for the Secondary MCP.

If the State of PEER MCP point is Non-Sync, then synchronize the configuration by entering the Direct Operate → Pulse On command on the SyncConfig point.

6. Compare the configurations.
7. Confirm that the State of PEER MCP pseudo point is Standby.

System Points

When running in active mode, the application provides indications through the following digital input system points:

MCP Redundancy Manager Digital Input Points

Table 6-82: MCP Redundancy Manager Digital Input Points

Field	Description
SystemRedundant	TRUE if the MCP is configured to be redundant FALSE if the MCP is not redundant
StandbyGatewayCommFail	TRUE if communications with the redundant MCP unit have failed FALSE if communications with the redundant MCP unit have not failed OFFLINE and INVALID if the MCP is in non-redundant mode
StandbyGatewayinServiceMode	TRUE if the standby MCP is in service mode FALSE if the standby MCP is not in-service mode OFFLINE and INVALID if the MCP is in non-redundant mode
StandbyGatewayNotAvailable	TRUE if the standby MCP is in failed mode or Standby initialization with Active is not completed in Hot-Hot / Hot-Standby modes. False if the standby MCP is not in failed mode or Standby initialization with Active is completed in Hot-Hot / Hot-Standby modes. OFFLINE and INVALID if the MCP is in non-redundant mode
GatewayAActive	TRUE if the MCP has been designated as unit "A" (See note) OFFLINE and INVALID if the MCP is in non-redundant mode
GatewayBActive	TRUE if the MCP has been designated as unit "B" OFFLINE and INVALID if the MCP is in non-redundant mode
Config Sync in Progress	TRUE if configuration synchronization is currently in progress FALSE if configuration synchronization is not currently in progress OFFLINE and INVALID if the MCP is in non-redundant mode

Field	Description
Standby Config Out of Sync	TRUE if the configurations on the active and standby MCPs do not match FALSE if the configurations on the active and standby MCPs do match OFFLINE and INVALID if the MCP is in non-redundant mode, or when: "Redundant with both SERIAL and LAN, and the SERIAL connection recovered while the LAN connection between MCP units is down".
HotstandbyDisabled	TRUE if Hot Standby redundancy is disabled, i.e., Warm Standby / Hot-Hot redundancy is enabled. FALSE if Hot Standby redundancy is enabled OFFLINE and INVALID if the MCP is in non-redundant mode
Standby Code Out of Sync	FALSE when the firmware on the Primary device is the same as that on the backup device TRUE when the firmware on the Primary device is not the same as that on the backup device OFFLINE and INVALID if the MCP is in non-redundant mode, or when: "Redundant with both SERIAL and LAN, and the SERIAL connection recovered while the LAN connection between MCP units is down".

NOTE: If a RS232 switch panel is configured, the MCP is designated as unit A or B depending on the input block it is wired to on the RS232 switch panel. If RS232 switch panel is not configured, designation of both units must be configured using local Gateway Config Utility (See Redundancy).

The state of both units in redundant configuration is provided through the following analog input system points:

MCP Redundancy Manager Analog Input Points

Table 6-83: MCP Redundancy Manager Analog Input Points

Field	Description
State of This Gateway	State of unit where point summary is open. State is one of the Operational States (see Operational States). State is presented in enumerated text.
State of PEER Gateway	State of the other unit. State is one of the Operational States (see Operational States). State is presented in enumerated text.
A/B Designation of the Gateway	Designation of the current Gateway
Redundancy Type	Indicates the redundancy type configured in the MCP

In addition to these indications, the following control points are available as digital outputs:

MCP Redundancy Manager Digital Output Points

Table 6-84: MCP Redundancy Manager Digital Output Points

Field	Description
StartChangeOver	Triggers a change-over – the active MCP moves to standby mode while the standby MCP takes over the active mode. If you are logged into the online GUI of the active MCP when a changeover occurs, the browser window closes, and you are required to log in again. OFFLINE and INVALID if the MCP is in non-redundant mode.

Field	Description
RestartActive	Requests a restart of all software on the active MCP. NOTE: This operation does not cause fail-over. The active MCP comes back as active after restart of all applications.
RestartStandby	Requests a restart of all software on the standby MCP. OFFLINE and INVALID if the MCP is in non-redundant mode.
RebootActive	Requests a reboot of the active MCP. NOTE: This operation causes fail-over. The active MCP comes back as standby after reboot operation.
RebootStandby	Requests a reboot of the standby MCP. OFFLINE and INVALID if the MCP is in non-redundant mode.
SyncConfig	Requests that the configuration of the standby MCP be synchronized with that of the active unit. OFFLINE and INVALID if the MCP is in non-redundant mode. NOTE: This operation automatically restarts software (applications) on the standby MCP to allow applications to take new configuration. If a change to system configuration is synchronized to the standby MCP, a manual reboot of standby unit is required. This operation can be performed using the "RebootStandby" point after SyncConfig operation is over. (see Changeover or Failover during Standby Start-up. Standby takes time to initialize and sync initialized data either during start-up or after changeover. During this time, changeover is not allowed, and a message is logged when a changeover command is issued. Changeover can be issued only after 180 seconds in case of standby start-up. A second changeover can be issued only after 30 seconds of the first changeover.
ShutdownActive	Requests shutdown of active MCP. NOTE: This DO should be used to shutdown active MCP gracefully before powering it off. This prevents data corruption on SSD.
ShutdownStandby	Requests shutdown of standby MCP. OFFLINE and INVALID if the MCP is in non-redundant mode. NOTE: This DO should be used to shutdown standby MCP gracefully before powering it off. This prevents data corruption on SSD.

You may issue any control operation on these points to initiate the request associated with the point. Upon receiving a control operation, the Redundancy Manager momentarily changes the state of the digital output to ON then OFF.

All local commands on indication and control points are rejected.

Non-Sync Mode

If the firmware or configuration of the standby unit is not the same as that of the active unit, the standby unit enters non-sync mode at start up.

Non-Sync Mode is only applicable to Hot-Standby and Hot-Hot Redundancy.

The **Standby Config Out of Sync** digital input point indicates if the configuration on the standby unit does not match with the active unit.

The **Code Out of Sync** digital input point indicates if the firmware on the standby unit does not match with the active unit.

In non-sync mode, no application is started on the standby unit. The Redundancy Manager on both units maintains communications and responds to user commands initiated on the active unit normally (Sync Config, Change-over, Reboot Active, Reboot Standby, Restart Active, Restart Standby, Shutdown Active, and Shutdown Standby).

The non-sync mode of standby unit can be disabled using MCP Config Utility (see Enable/Disable Non-Sync mode).

NOTICE If change-over operation is performed while the standby unit is in non-sync mode, the standby unit changes to active, and the active unit enters non-sync mode.

Validating the Redundant Connections

Once you have configured your redundant setup, you should test the system to ensure that redundancy has been properly configured.

» To validate a redundant system:

1. Log into the online HMI of the active MCP unit.
2. Click the  **Point Details** button on the toolbar.
3. Under the **Application** tab, click the **Details** button for **RedunMgr**.
4. Select the **Analog Input** tab and verify that the points are in the following states:

Point Name	Quality	Value
State of This Gateway	Online	Active
State of PEER Gateway	Online	Standby
A/B Designation of the Gateway	Online	Gateway_A

NOTE: If the state of this Gateway is Active Non-Redundant, check diagnostic logs for the “B034” application for any configuration issues.

NOTE: If the state of PEER Gateway is non-sync, see [Non-Sync Mode](#).

5. Select the **Digital Input** tab and verify that the points are in the following states:

Point Name	Quality	Value
SystemRedundant	Online	1 if both MCP's are Redundant 0 if Both MCP's are non Redundant
StandbyGatewayCommFail	Online	0 if Communication between both MCP's is ok 1 if communication between both MCP's is not OK
StandbyGatewayinService Mode	Online	0 Standby MCP is not in service mode 1 Standby MCP is in Service mode
StandbyGatewayNotAvailable	Online	0 Standby MCP Available 1 Standby MCP Failed
GatewayAActive	Online	1 if you are connected to Gateway A (MCP) 0 if you are connected to Gateway B (MCP) (See note)
GatewayBActive	Online	1 if you are connected to Gateway A (MCP) 0 if you are connected to Gateway B (MCP) (See note)
Config Sync in Progress	Online	0 Configuration sync to peer MCP not in Progress 1 Configuration sync to peer MCP is in Progress
Standby Config Out of Sync	Online	0 if both MCPs have the same configuration 1 if both MCPs have a different configuration
Hot Standby Disabled	Online	0 in case of Hot Standby 1 in case of Warm Standby or Hot-Hot
Standby Code Out of Sync	Online	0 if both MCPs have the same code 1 if both MCPs have a different code

NOTE: If a switch panel is used, and if *GatewayAActive* and *GatewayBActive* remain fixed at 0 or 1 regardless of the position of the A/B switch on the RS232 panel, ensure the wiring is correct. Refer to the *G500 Substation Gateway Instruction Manual (GE Vernova Part Number 994-0152)* or *G100 Substation Gateway Instruction Manual (GE Vernova Part Number 994-0155)* for more information.

6. Select the **Digital Output** tab and verify that all points are online and have a value of zero.

Changeover or Failover during Standby Start-up

Standby may take significant time to initialize and sync initialized data either during start-up or after changeover (minutes). During this time, changeover is not allowed, and a message is logged in the diagnostic log of Active MCP device when a changeover command is issued. Once the Standby initialization is completed, the Redundancy Manager in the Active MCP device resets “StandbyGatewayNotAvailable” Digital Input point to ‘0’ (refer to Redundancy Manager in Runtime HMI Point Details) The changeover can be allowed only after the “StandbyGatewayNotAvailable” status goes to ‘0’.

If the Active MCP device fails while Standby MCP is initializing (i.e., “StandbyGatewayNotAvailable” Digital Input point is still at ‘1’ in the Active MCP, when the fail-over happens) - then after fail-over to Standby, all the applications in the Standby are restarted and entered into the Active state. This is because when the fail-over happens, the Standby initialization has not completed yet and hence the applications re-initialize before proceeding to the Active state.

Data Synchronization

Hot -Hot

In Hot-Hot redundancy, two MCP devices are kept in constant synchronization with respect to their real-time databases either two MCP devices communicate simultaneously with the IEDs or one MCP unit communicates with the IEDs but synchronizes the data to the other MCP unit. The following data is synchronized to the standby MCP:

- Events from IEDs
- Local commands that have been applied to individual system points (control inhibit, scan inhibit, local force, etc.)
- Acknowledgements from the Master station to server application, to delete an event from event queues
- Application internal data to start an application from the same state in the event of change-over

This data is synchronized between the units through the network connection.

Hot Standby

In Hot Standby redundancy, two MCP devices are kept in constant synchronization with respect to their real-time databases. The following data is automatically synchronized to the standby MCP:

- Real time databases
- Events from IEDs
- Alarm and SOE databases
- Local commands that have been applied to individual system points (control inhibit, scan inhibit, local force, etc.)
- Acknowledgements from the Master station to server application, to delete an event from event queues
- Application internal data to start an application from the same state in the event of change-over

This data is synchronized between the units through the network connection.

Warm Standby

In Warm standby redundancy, only the following data is automatically synchronized from the active to the standby MCP:

- Accumulator running values

- ARRM files (Files which MCP extracted from IED's)
- Local commands that have been applied to individual system points (control inhibit, scan inhibit, local force, etc.)
- Data is synchronized between the units through the dedicated serial link. Initial states are synchronized when the active unit first begins to communicate with the standby unit. Once this initial synchronization is complete, individual events are transferred from the active unit to the standby unit as they occur in real-time

Ethernet Connections

When you configure a pair of MCPs for redundancy, you need at least 3 IP Addresses for the two MCPs:

- One unique (adapter) IP Address for each MCP.
- One “active” IP Address to be used by the active MCP.
- Optional: One “alias” IP Address to be used as an alternate to active MCP.

The same “active” IP Address is configured in both MCPs. When a MCP is in active mode, it uses the configured “active” IP Address. In any other state, it uses its own unique adapter IP Address. This allows external devices and master stations to use only one IP Address to access the pair of MCPs.

IP Address Combinations

Table 6-85: IP Address Combinations

Gateway A (MCP)		Gateway B (MCP)	
State	IP Address	State	IP Address
Active State	Active	Inactive State	Unique for Gateway B (MCP)
Inactive State	Unique for Gateway A (MCP)	Active State	Active
Inactive State	Unique for Gateway A (MCP)	Inactive State	Unique for Gateway B (MCP)
Active State	Active (See note ¹)	Active State	Active (See note ¹)

NOTE: Having both MCPs active at the same time can only be achieved if the two units are not reachable to each other via configured Heart Beat communication links. In any other scenario, the two units successfully arbitrate so that only one MCP claims the active IP Address.

This scheme requires static IP Address configuration. The MCP Redundancy solution does not support use of a DHCP server to assign dynamic IP Addresses.

If the MCPs have a Secondary Ethernet interface installed, a second set of 3 IP Addresses is assigned to that interface, using the same rules.

The MCP Redundancy services use 51000 and 51001 TCP ports for Heart Beat communication, data and configuration synchronization. If the two MCPs are connected through an external firewall, then inbound and outbound traffic should be allowed for 51000 and 51001 TCP ports in the external firewall.

Sync Config Operation

The active unit indicates if the configuration on the standby unit does not match with itself via the **Standby Config Out of Sync** digital input.

A Sync Config operation can be initiated from the **SyncConfig** digital output point. As part of Sync Config operation, the following configurations are synchronized:

Application configurations (for example, DNP server mappings, LogicLinx programs, etc.).

NOTE: This operation automatically resets software on the standby MCP to allow applications to take new configuration (this is, only a software restart, not a reboot of the entire device).

System configurations: System configuration refers to any configuration done through the Gateway Configuration Utility (mcpcfg/settings GUI) or User Management of online HMI (for example, time sync inputs, user logins and passwords, etc.).

NOTE: If a change to system configuration is synchronized with the standby MCP, a manual reboot of the standby unit is required. This operation can be performed using **RebootStandby** point after the SyncConfig operation is complete.

While a configuration transfer is in process, the standby unit does not accept any commands from the active unit. The active unit indicates via the **Config Sync in Progress** digital input when configuration synchronization is occurring.

During the software reset of the standby MCP, the active unit may briefly indicate that the standby unit has failed. If the standby unit remains in failed mode, or if the **Standby Config Out of Sync** digital input does not turn off after the standby unit completes the restart, then the configuration synchronization has likely failed. Check the system and diagnostic logs in both the active and standby units for details on why the synchronization did not complete.

The following parameters are not synchronized as part of Sync Config operation:

IP Addresses: They must be independently configured for each unit).

Redundancy Configuration: (see [Redundancy](#)).

No other data is synchronized between the two MCPs, including software licenses, or firmware images.

NOTICE

Do not change the configuration of the active MCP while configuration synchronization is in progress. Changing the configuration of the active MCP may result in a configuration mismatch or configuration corruption.

HMI User Access Privileges on Redundant System

Only observer privilege level is granted to any user logging into the standby MCP. When a supervisor, admin or operator user logs into the standby MCP, his privilege level is demoted to observer.

Upon change-over from:

Active to standby, all users are forcefully logged off.

Standby to active, supervisor and operator users are forcefully logged off.

Redundancy Setup Checklist

The following checklists can be used when preparing a redundant MCP system:

[Warm Standby Setup Checklist](#)

[Hot Standby/Hot-Hot Setup Checklist](#)

Warm Standby Setup Checklist

Table 6-86: Warm Standby Setup Checklist

Task	Reference
1. Prepare two MCP units and ensure they are running the same firmware version.	<i>G500 Substation Gateway Instruction Manual</i> (GE Vernova Part no. 994-0152) or <i>G100 Substation Gateway Instruction Manual</i> (GE Vernova Part no. 994-0155)
2. Connect the MCP units to each other and to remote devices as shown in the redundancy wiring diagrams.	
3. Configure Authentication mode, Admin users and adapter IP Address of the MCP units using mcpcfg/Settings GUI. Ensure that the adapter IP Address is reachable over the network. User must reboot MCPs after completing this step.	Configure Authentication <i>Configure Network Interfaces</i>
4. Configure the redundancy settings on both MCP units using mcpcfg/Settings GUI. This includes configuring the Active IP Address for redundancy and type of redundancy, PEER MCP IP Address and PEER MCP username. Ensure that the active IP Address is reachable over the network.	<i>Configure Network Interfaces</i> <i>Redundancy</i>
5. Setup Public Key Authentication with PEER MCP. NOTE: This step must be performed after steps 1 to 4 are completed on both MCPs.	Redundancy > Setup public Key Authentication with PEER MCP
6. Configure the Redundancy Dedicated Link and the Redundancy Switch Panel serial connections on the Connection configuration page of the MCP's online HMI. NOTE: The user must reboot the MCP units after completing steps 1 to 6.	Redundancy Dedicated Link Redundancy Switch Panel
7. Validate the redundant connection to ensure that the system has been fully configured.	To validate a redundant system

Task	Reference
8. If the <i>Standby Config Out of Sync</i> point has a value of 1, initiate configuration sync from the active unit by executing a control command on the <i>SyncConfig</i> pseudo output point of the Redundancy Manager application. After the sync operation, verify that the <i>Standby Config Out of Sync</i> point has a value of 0.	MCP Redundancy Manager Changeover or Failover during Standby Start-up Standby takes time to initialize and sync initialized data either during start-up or after changeover. During this time, changeover is not allowed, and a message is logged when a changeover command is issued. Changeover can be issued only after 180 seconds in case of standby start-up. A second changeover can be issued only after 30 seconds of the first changeover. Sync Config Operation

Hot Standby /Hot-Hot Setup Checklist

Table 6-87: Hot Standby / Hot-Hot Setup Checklist

Task	Reference
1. Prepare two MCP units and ensure they are running the same firmware version.	<i>G500 Substation Gateway Instruction Manual</i> (GE Vernova Part no. 994-0152) or <i>G100 Substation Gateway Instruction Manual</i> (GE Vernova Part no. 994-0155)
2. Connect the MCP units to each other and to remote devices as shown in the redundancy wiring diagrams.	
3. Configure Authentication mode, Admin users and adapter IP Address of the MCP units using mcpcfg/Settings GUI. Ensure that the adapter IP Address is reachable over the network. You must reboot the MCPs after completing this step.	Configure Authentication <i>Configure Network Interfaces</i>
4. Configure the redundancy settings on both MCP units using mcpcfg/Settings GUI. This includes configuring Active IP Address for redundancy and type of redundancy, PEER MCP IP Address and PEER MCP username. Ensure that the active IP Address is reachable over the network.	<i>Configure Network Interfaces</i> Redundancy
5. Configure Heart Beat communication option from the available options. Ensure that both MCP units are connected, based on this parameter.	Redundancy
6. Setup Public Key Authentication with PEER MCP. NOTE: This step must be performed after steps 1 to 4 are completed on both MCPs.	Redundancy > Setup public Key Authentication with PEER MCP
7. If the Heart Beat communication option includes Serial link as well, configure the Redundancy Dedicated Link on the Configuration > Connection page of the DSAS Configuration. The Primary and an optional backup serial links can be configured.	Redundancy Dedicated Link

Task	Reference
8. If a switch panel is configured, configure the Redundancy Switch Panel serial connections on the Configuration > Connection page of the DSAS Configuration. If a switch panel is not configured, designate one MCP as "A", and other as "B" using <i>mcpcfg/Settings GUI</i>. NOTE: The user must reboot the MCP units after completing steps 1 to 8.	Redundancy Switch Panel Redundancy <i>G500 Substation Gateway Instruction Manual</i> (GE Vernova Part no. 994-0152) or <i>G100 Substation Gateway Instruction Manual</i> (GE Vernova Part no. 994-0155) > Configure Gateway A/B Designation
9. Validate the redundant connection to ensure that the system has been fully configured.	To validate a redundant system
10. If the <i>Standby Config Out of Sync</i> point has a value of 1, initiate configuration sync from the active unit by executing a control command on the <i>SyncConfig</i> pseudo output point of the Redundancy Manager application. After the sync operation, verify that the <i>Standby Config Out of Sync</i> point has a value of 0.	MCP Redundancy Manager Changeover or Failover during Standby Start-up Standby takes time to initialize and sync initialized data either during start-up or after changeover. During this time, changeover is not allowed, and a message is logged when a changeover command is issued. Changeover can be issued only after 180 seconds in case of standby start-up. A second changeover can be issued only after 30 seconds of the first changeover. Sync Config Operation

Error Messages and Troubleshooting

The table below describes the possible error messages displayed by the MCP Redundancy Manager. These messages are entered in the diagnostic log of the MCP.

Common Tables

Configuration Manager Error Codes

Table 6-88: Configuration Manager Error Codes

Error Number	Cause
-1	The two MCP units are not already in sync
0	Success
1	Md5sum.txt / tar-zipped file missing in local/tar modes
2	Command line arguments are not proper
3	IP Address or target unit not provided in correct format
4	Validation of transferred configuration files failed
5	Authentication is not set or remote MCP is not accessible
6	Insufficient permissions to read from file
8	Copying of new configuration to /mnt/usr has failed.

Redundancy Manager Reason Codes

Table 6-89: Redundancy Manager Reason Codes

Technical Number	Reason Code	Description
1	B034_NACK_CHECKSUM_ERROR	corrupted message received
2	B034_NACK_HW_ERROR	some hardware problem
3	B034_NACK_SERVICE_MODE	Service mode
4	B034_NACK_SWITCH_PULL_FAIL	Switch panel hardware problem
5	B034_NACK_TOOL_TASK_TIMEOUT	System was busy or software failure
6	B034_NACK_TOOL_TASK_FAILED	Software failure

MCP Redundancy Diagnostic Error Messages

Table 6-90: MCP Redundancy Diagnostic Error Messages

Serial Number	Diagnostic Log Messages	Details
1	b034_active_proc_db_sync failed with error <error code>	Initial mSQL database synchronization failed. Quality or accumulator records may not have been transferred correctly.
2	Active: failed to pull switch towards	The active unit failed to pull the switch. The RS232 switch panel may not be powered correctly or the connection from the switch panel to the MCP may not be correct.
3	Active: Health CHK failed: Terminating Child	A software error in the MCP Redundancy Manager has occurred.
4	[ACTIVE]: Rejecting command <command type #> because other MCP is in Service Mode	The user issued a command that is not valid when the standby is in Service Mode.
5	[ACTIVE]: Rejecting command <command type #> because activity <activity type> is in progress	The user issued a command that was rejected because another activity was already in progress.
6	[ACTIVE]: Rejecting command <command type> because other MCP is not available	The user issued a command that was rejected since the active cannot communicate with the other MCP. The other MCP may have failed or the HB communication link between the two may be disconnected.
7	[ACTIVE]: CONFIG SYNC activity response timeout waiting for response from standby	Configuration synchronization failed because the standby unit failed to respond to the active. The standby unit may have failed or the HB communication link between the two may be disconnected.
8	[ACTIVE]: Standby MCP rejected the Config Sync request with reason <reason code>	Configuration synchronization failed because the standby unit issued an error.

Serial Number	Diagnostic Log Messages	Details
9	[ACTIVE]: Standby MCP failed in Config Sync using network mode	Configuration synchronization in network (Ethernet) mode has failed. The network connection between the MCPs may be disconnected, or the public/private authentication keys may not be correctly configured.
10	[ACTIVE]: Tool task failed with error = <error code>	Configuration synchronization failed because the standby unit issued an error. Review the <error code> in the table of Configuration Manager error codes .
11	[ACTIVE]: CONFIG SYNC failed due to tool task timeout	Configuration synchronization failed because the Configuration Manager software failed to respond.
12	[ACTIVE]: Standby MCP rejected the DB Sync start request with reason <reason code>	The standby unit rejected a request to synchronize either quality or accumulator data. The <reason code> is identified by a technical number. See Redundancy Manager Reason Codes for the technical number (reason code) descriptions. The most common cause is that the standby unit is in service mode or has failed.
13	[ACTIVE]: Standby MCP failed in DB sync in network mode	Synchronization of either quality or accumulator tables failed to complete. The most common cause is that either communications with the standby unit have been interrupted, or the standby is in service mode or has failed.
14	[ACTIVE]: Response timeout for activity <activity type> subactivity <subactivity type>	The standby unit failed to send a response to the active unit. The numeric codes define the activity that timed out. This is a diagnostic message that only needs to be considered if there are messages indicating that something has failed.
15	Configuration read failed: Entering Active Non-Redundant mode	Check Redundancy serial ports or switch panel are not configured in the connection configuration of the MCP.
16	Redundancy is DISABLED: Entering Active Non-Redundant mode	Diagnostic message only. Redundancy is disabled in the configuration.
17	Failed to open switch panel port: Entering Active Non-Redundant mode	This message indicates a software failure of the MCP. Either the configuration files of the MCP have been corrupted or the MCP has not started properly.
18	Failed to open Heart Beat port: Entering Active Non-Redundant mode	This message indicates a software failure of the MCP. Either the configuration files of the MCP have been corrupted or the MCP has not started properly.
19	Error in reading switch panel: Entering Active Non-Redundant mode	This message indicates a software failure of the MCP. Either the configuration files of the MCP have been corrupted or the MCP has not started properly.
20	Failed to receive initial HB from PEER MCP: Entering Active mode	The active MCP never sent a Heart Beat message to the standby, causing the standby unit to become active. Check that the active unit is functional and that the HB communication link between the two units is properly installed.

Serial Number	Diagnostic Log Messages	Details
21	STATE CONFLICT: This MCP = ACTIVE and A, PEER MCP = ACTIVE and A Failing this MCP	Check the wiring of the MCP units to the switch panel
22	STATE CONFLICT: This MCP = ACTIVE and A, PEER MCP = ACTIVE and B PEER MCP should fail	Check the wiring of the MCP units to the switch panel
23	STATE CONFLICT: This MCP = ACTIVE and B, PEER MCP = ACTIVE Failing this (B) MCP	Check the wiring of the MCP units to the switch panel
24	STATE CONFLICT: This MCP = STANDBY and A, PEER MCP = STANDBY and A Failing this (B) MCP	Check the wiring of the MCP units to the switch panel
25	STATE CONFLICT: This MCP = STANDBY and B, PEER MCP = STANDBY Failing this (B) MCP	Check the wiring of the MCP units to the switch panel. This could also be loss of power to the switch panel, as a powered-down switch panel reads as "standby" and "B" to the MCP.
26	[STANDBY]: Failed to pull the switch, Rejecting Change Over request	The MCP could not pull the switch. Check the wiring of the MCP units to the switch panel. This could also be loss of power to the switch panel.
27	[STANDBY]: Config Sync failed in network mode while copying configuration to /mnt/usr/	The standby MCP unit failed to commit its transferred configuration into the flash card. The flash card may be full, or someone may have changed the write permissions on the card. The standby configuration may be partially copied and unusable.
28	[STANDBY]: Config Sync failed in local mode due to tool task failure	Configuration synchronization failed while transferring configuration data. The standby unit uses its original configuration.
29	[STANDBY]: Config Sync failed in local mode while copying configuration to /mnt/usr/	The standby MCP unit failed to commit its transferred configuration into the flash card. The flash card may be full, or someone may have changed the write permissions on the card. The standby configuration may be partially copied and unusable.
30	[STANDBY]: CONFIG SYNC Activity: Tool task timeout in mode <tool task mode>	Configuration synchronization failed while transferring configuration data. The standby unit uses its original configuration.

Serial Number	Diagnostic Log Messages	Details
31	[STANDBY]: CONFIG SYNC Activity: Response timeout	The active unit failed to send a response during configuration sync activity. The active unit may be experiencing problems, or the communication link between the two units may be disconnected. The standby configuration may be partially copied and unusable.
32	Response timeout in DB SYNC Activity	The standby unit failed to send a response while synchronizing quality or accumulator data. The data on the standby unit may not be up to date. The standby unit may be experiencing problems or the communication link between the two units may be disconnected.
33	[ACTIVE]: Config check completed: Configuration is same	The configuration is the same on both active and standby units.
34	[STANDBY]: Response timeout for activity <activity type> subactivity <subactivity type>	The standby unit failed to send a response to the active unit. The numeric codes define the activity that timed out. This is a diagnostic message that only needs to be considered if there are messages indicating that something has failed.
35	[ACTIVE]: Switch pulled away: PEER MCP is failed, Failing this MCP	Switch pulled manually when the standby unit is not available. The standby unit may have failed or the communication link between the two units may be disconnected.
36	[ACTIVE]: Switch pulled away: Rejecting CHANGE OVER since Other MCP is in Service Mode	Switch pulled manually when the standby unit is in service mode. The active unit rejects the command to switch over.
37	[ACTIVE]: RACE Condition for switch: Failing this (B) MCP	Switch was pulled in the last 1000 ms.
38	[ACTIVE]: Standby MCP rejected the code config request with reason <reason code>	The standby unit rejected a request to update code and config check values. The <reason code> is identified by a technical number. See the Redundancy_Manager_Reason_Codes for the technical number (reason code) descriptions. The most common cause is that the standby unit is in service mode or has failed.
39	[ACTIVE]: No Change Over Event Resp from <no of applications> applications. Change Over Timeout	The active redundancy manager does not receive a change-over event response from the indicated number of applications.
40	failed to open code_config_check file	A MCP has failed due to a software failure. Either the ssh keys are not synced, or the MCP has not started properly.
41	failed to read code_config_check file	A MCP has failed due to a software failure. The MCP has not started properly.
42	failed to update code config info <file name>	A MCP has failed due to a software failure. The MCP has not started properly.

Serial Number	Diagnostic Log Messages	Details
43	redun manager update fifo creation failed with reason <error code>	A MCP has failed due to a software failure. The MCP has not started properly.
44	Failed to write active->standby trigger message to main thread fifo	A MCP has failed due to a software failure. The MCP has not started properly.
45	Failed to read message from redun manager update FIFO	A MCP has failed due to a software failure. The MCP has not started properly.
46	[ACTIVE] Failed to read state of switch panel (master), Failing MCP	Check the: ☐ Switch panel port configuration. ☐ Wiring of the MCP units to the switch panel. ☐ Availability of power to the switch panel.
47	[Active] Failed to read state of switch panel (slave), Ignoring error	Check the: ☐ Switch panel port configuration. ☐ Wiring of the MCP units to the switch panel. ☐ Availability of power to the switch panel.
48	[Active] failed to pull master switch panel towards itself, Failing MCP	Check the: ☐ Switch panel port configuration. ☐ Wiring of the MCP units to the switch panel. ☐ Availability of power to the switch panel.
49	[Active] failed to pull slave switch panel towards itself, Ignoring	Check the: ☐ Switch panel port configuration. ☐ Wiring of the MCP units to the switch panel. ☐ Availability of power to the switch panel.
50	[PRP] Failed to rcv msg from PEER MCP on Channel <channel no>	Possibly a partial message has been received on channel <channel no>
51	Failed to write standby->active trigger message to main thread fifo	A MCP has failed due to a software failure. The MCP has not started properly.
52	bind () call failed. Error [<error code>], Restarting applications on this MCP	There could be more than one instance of Redundancy manager running at the same time.
53	MCP DESIGNATION CONFLICT. BOTH MCPs are <gateway name>. Failing this MCP.	Both MCPs have either Gateway_A or Gateway_B designation. Check mcpcfg for the MCP designation or switch panel configuration on both MCPs.

Serial Number	Diagnostic Log Messages	Details
54	STATE CONFLICT. BOTH MCPs are ACTIVE	Both MCPs are in the active state. This could be due to either: ☐ Heart beat communication link is available after a brief failure or ☐ Switch panel configuration mismatch
55	STATE CONFLICT. BOTH MCPs are ACTIVE. Restarting this MCP	Both MCPs are in the active state. This could be due to either: ☐ Heart beat communication link is available after a brief failure or ☐ Switch panel configuration mismatch
56	STATE CONFLICT. BOTH MCPs are STANDBY. Restarting this MCP	Both MCPs are in the active state. This could be due to a switch panel configuration mismatch.
57	TCP client connection from <IP Address> is not matching with configured PEER IP. Rejecting connection	This indicates a third MCP or another device, which is not configured as PEER, is attempting to connect to this MCP. Subsequently, the connection is closed. Check the configuration using mcpcfg/Settings GUI configuration tool.
58	Failed to get pseudo points from pseudo map file Err:- 98	The RTDB Pseudo points file became corrupted. To recover from this situation, issue the following command from the MCP console and then reboot: <pre>'cp /home/Configure/SystemConfig/RTDBPseudoPoints.xml.default /home/Configure/SystemConfig/RTDBPseudoPoints.xml'</pre>

The following table describes the possible system event messages displayed by the MCP Redundancy Manager. These messages are entered in the system event log of the MCP. These are notifications of significant events, not necessarily errors. If it indicates an error or failure, consult the diagnostic log for details.

MCP Redundancy System Log Messages

Table 6-91: MCP Redundancy System Log Messages

Serial Number	System Event Log Messages	Details
1	MCP Started in Active Mode	
2	Switching to standby mode	The change-over operation is initiated - switching to standby mode.
3	Switching to Non-sync mode	There is a mismatch between the firmware code and/or configuration on two MCPs entering non-sync mode.
4	Sent message to SWWatchdog to restart all apps	
5	Sent message to SWWatchdog to stop all apps	The MCP is being placed in failed mode.
6	Received HB from standby	A lost connection with the standby has been restored.

Serial Number	System Event Log Messages	Details
7	Child starts	Redundancy Manager child started
8	Appl starts	Redundancy Manager application started
9	MCP Started in Non-Redundant Mode	
10	Heart Beat(s) missed from Standby system: Declaring PEER MCP as Failed	The standby MCP has stopped responding to communications.
11	Heart Beat(s) missed from Active system: Declaring PEER MCP as Failed	The active MCP has stopped responding to communications.
12	MCP Started in Standby Mode	
13	Switching to Active mode	The change-over operation is initiated - switching to active mode.

The table below describes the possible diagnostic log messages that can come during initialization, configuration parsing, startup, runtime operations when applications are running in Hot Standby/Hot-Hot Redundancy modes, by using services of MCP Synchronization Service Library.

MCP Hot Standby /Hot-Hot Synchronization Service Diagnostic Log Messages

Table 6-92: MCP Hot Standby / Hot-Hot Synchronization Service Diagnostic Log Messages

Serial Number	System Event Log Messages	Details
1	ERROR: Config Parsing Failed	MCP Sync Service Configuration file parsing failed. Applications run with default parameters.
2	HotStandbySleep Failed with RetVal: (errorCode)	Error in identifying System State.
3	State Returned is neither Active/Standby: (SystemState), Waiting for State from RM	Redundancy Manager System State was not identified or an Invalid System State Received message occurred.
4	ERROR: State Returned is ActiveNonRedundant, Not Starting SyncService Thread	Hot Redundancy is configured but System State is ActiveNonRedundant. Sync operation with standby unit is not performed.
5	Shared Memory Creation Failed with Error (errorCode)	A software failure has occurred on the MCP. Either the MCP is running out of memory or the MCP has not started properly.
6	Shared Memory Registration Failed with Error (errorCode)	A software failure has occurred on the MCP. Either the MCP is running out of memory or the MCP has not started properly.

Serial Number	System Event Log Messages	Details
7	RingBuffer Creation Failed	A software failure has occurred on the MCP. Either the MCP is running out of memory or the MCP has not started properly.
8	SyncService RingBuffer OverFlow, Setting OverFlow Flag	The application buffer has overflowed. The Standby unit may lose some events.
9	Detected RingBuffer OverFlow, Starting Complete Init	Starting Initial Synchronization with Standby unit.
10	DeleteDataPacket: Invalid EntryID passed: (Packet entryID)	Duplicate data has been received from Standby MCP. This can occur during channel switching or change-over. Does not affect normal operation.
11	Starting UDS Server Channel Failed with RetVal: (errorCode)	A software failure has occurred on the MCP. Either the MCP is running out of memory or the MCP has not started properly.
12	Connection Timeout, Closing Current Active Channel: (activeChannel)	The Heart Beat is missing from the Active MCP. Check the TCP communication between the MCPs.
13	Applications Restart on Active/Standby, Doing Complete INIT newPPID: (standby parent process ID), oldPPID: (Standby Old parent process ID)	Applications start on Active/Standby. Starting initial synchronization with Standby unit.
14	Child Restart on Standby	Standby Application child was restarted.
15	No OverFlow: Skipping INIT upon channel reconnection, Last acked EntryID: (entryID)	Channel Reconnection, no buffer overflow observed on Active unit. Does not affect normal operation.
16	ERROR: StartFileTransfer: File Stat Failed	A software failure has occurred on the MCP. Either the MCP is running out of memory or the MCP has not started properly.

Communications

This chapter contains the following sections and sub-sections:

Connection

Configure Serial Communications

- Types of Serial Connections
- Add a Serial Connection
- Modify a Serial Connection
- Delete a Serial Connection
- Connection Application Parameters
- Port Settings
- Physical Serial Ports
- Virtual Serial Ports
- Connection Security
- Redundancy Dedicated Link
- Redundancy Switch Panels
- Terminal Server

Configure Network Communications

- Types of Network Connections
- Add a Network Connection
- Modify a Network Connection
- Delete a Network Connection
- Connection Application Parameters
- Modbus TCP/SSH Tunnel
- Secure Connection Relay
- VPN Server

Configure D.20

- D.20 Peripheral Mapfiles
- Configuring Peripheral Map files

Connection

You can configure [serial](#) and [network](#) communication connections in the MCP on the **Connection** tab of the **Configuration** page.

The following related actions can be performed:

- [Add a serial connection](#)
- [Modify a serial connection](#)
- [Delete a serial connection](#)
- [Add a network connection](#)
- [Modify a network connection](#)
- [Delete a network connection](#)

Configure Serial Communications

Serial Maintenance Port

MCP devices have a dedicated serial port reserved for settings and maintenance operations.

For G500 this is the front USB type B port [see *G500 Substation Gateway Instruction Manual (994-0152)*]. This serial port cannot be used for other purposes in G500.

For G100, this is by default serial port # 4, enabled in the default configuration. When enabled, serial port #4 cannot be used for other purposes in G100. The serial maintenance port in G100 can be disabled and made available to other applications using the MCP Studio Editor (online or offline). When enabled, this is always serial port #4.

The G100 device must be restarted after changing the Port 4 Maintenance state (enabled/disabled).

Figure 6-3: G100 Serial Maintenance Port control

Types of Serial Connections

Refer to the G500 Substation Gateway Instruction Manual (*GE Vernova Part Number 994-0152*) or G100 Substation Gateway Instruction Manual (*GE Vernova Part Number 994-0155*) for more details about the serial port modes and characteristics. Each serial port can be assigned a single host protocol (server application) for master station communications using a standard serial connection. Each serial port can be assigned ONLY a single device protocol (client application) for device communications.

The MCP supports the following types of serial connections:

- Point-to-point
- Multi-drop
- Serial master station

Redundant Communications

Communications that take place over a serial connection can be configured for redundancy by setting up two serial ports – a Primary port and a Secondary (back up) port. Communications normally take place over the Primary port. In the event of a loss of communication with the device over the Primary port, the MCP tries to re-establish communication over the Secondary port. If the MCP cannot re-establish communication over the backup port it reports the device status as offline.

Multi-Drop

Some devices support a daisy-chain connection in which multiple devices are wired together from one to the other. A multi-drop configuration requires additional configuration to set up each individual device on a multi-drop connection.

SCADA Communications

The MCP supports serial connections to SCADA masters through up to eight serial ports. Each serial port can be assigned a single SCADA protocol (server application) for master station communications. The MCP currently supports serial master communications using the following server protocols:

- DNP server
- Modbus
- IEC 60870-5-101
- Tejas V – this application requires additional license “Tejas V Server” (for more details, see [Software Licensing Tools](#)).

Protocols

Serial connections can be configured using the following protocols.

- [DNP3 Master Stations](#)
- [DNP3 Multi-drop](#)
- [IEC 60870-5-101 Master Station](#)
- [IEC 60870-5-101 Multi-drop](#)
- [IEC 60870-5-103 Multi-drop](#)
- [LogicLinx Device](#)
- [Modbus Serial Master Stations](#)
- [Modbus Multi-drop](#)
- [Redundancy Dedicated Link](#)
- [Redundancy Switch Panel](#)
- [Generic ASCII](#)
- [SEL Binary \(MCP as Master\)](#)
- [Tejas V Master Stations](#)
- [Terminal Server](#)

Add a Serial Connection

You manage the serial connections on the MCP on the **Connection** tab on the **Configuration** page.

A client map file must be available in the MCP before a protocol type is available for configuration. The MCP includes several default client maps. If you require a custom map, create it first before setting up the serial connection. See [Client Maps](#).

» To add a serial connection:

1. On the Connections tab, click Add Connection (+).
2. On the New Connection window, select Serial Connection and select the Serial Configuration Type from the list. A new serial connection sub-item is added.
3. Modify the settings for the new connection. Double-click a cell, to modify a value.
4. The fields under Configuration Settings are specific to the connection type. (See the [protocols](#) listed below.)
5. Click Save Configuration to save your changes.

Each row under the **Serial** heading of the Connections pane represents one connection through a serial port.

The serial ports are indicated by numbers or combination of letters and numbers, as below:

- Ports 1 to 4 apply to G100 and G500, and correspond to the numbered physical ports on each device
- Ports 5 to 8 apply to G500, and correspond to the numbered physical ports on the G500 device
- Ports A1 to A4 apply to G500, and correspond to serial ports 1-4 installed in the PCIe slot #1
- Ports B1 to B4 apply to G500, and correspond to serial ports 1-4 installed in the PCIe slot #2
- Ports C1 to C4 apply to G500, and correspond to serial ports 1-4 installed in the PCIe slot #3

Depending on the configured model in the order code in MCP Studio / Device Properties – the ports which are not available in the order code are shown grayed out. They are still available to configure, to allow porting configurations across differently serial ports equipped devices, and without causing configuration errors. However, please note that in absence of the serial port in hardware, configured ports will naturally not operate.

When converting G500 configurations to G100 configurations – the port assignments will be retained, as the system cannot automatically determine what to do with the extra serial ports. Because this conversion is from a device with more serial ports, this operation will require user decision and re-assignment of serial ports in the lesser equipped G100.

The mode of each serial port (RS-232/RS-422/RS-485 2w/RS-485 4w) is configured using online [MCP Local Configuration Utility \(mcpcfg\)](#) or [MCP Settings GUI \(default is RS-232\)](#).

Each serial connection can be configured for device (client) or master station (server) communications using a selected protocol. The type of connection and the protocol you select determine the client or server application and related settings that are used for the communications on that serial port. See the [Port Settings](#) section.

Modify a Serial Connection

» To modify a connection:

1. Select the connection in the **Connections** pane.
2. Double-click or select a configuration parameter field
3. Enter a new value in the parameter field.
4. Click **Save Configuration** to save your changes.

NOTE: If you select a different map file for an existing IED connection in the dropdown list, or when you save it as a different filename when opened from within the Connections > Map File Edit button, you will be prompted with the following dialog:

- If you choose **Retain**, it will apply the new map file. The home directory and point mappings related to the connection are kept unchanged for the points inside the mapfile which were left with same point ID. It is your responsibility to ensure the signals (i.e., point ID meanings) defined by the previous map file are identical to the signals defined in the new map file.
- If you choose **Break**, it will apply the new map file. This will change the home directory which results in invalidating all the existing point mappings that includes points selected within applications like the Calculator, the Alarms configuration page and the System Point Manager. Mappings affected by this are referred to as being “non-existent”.
- Choose **Cancel** if you want to abandon and revert to what was selected before.

Delete a Serial Connection

» To delete a connection:

1. Select the connection you wish to delete in the **Connections** pane.
2. Click **Delete Connection**.
3. Click **Yes** to confirm deletion.
Result: The item is removed from the connections list.
4. Click **Save Configuration** to save your changes.

Connection Application Parameters

The **Application Parameters** window allows you to view and modify the protocol settings for a specific client or server connection. Application parameters are available on the **Connection** tab on the **Configuration** page. The settings shown vary based on the connection type and protocol selected.

» To create a custom application parameter profile:

1. On the **Connection** tab, select or add a connection.
2. Under **Application Parameters**, select **Use Custom** and click **Create**. The **Application Parameters** window opens.
3. To modify a parameter, double-click the associated value and enter a new value or select from the drop-down list. More advanced parameters may be available on the **Advanced** sub-tab.
4. When you are done, click **Save**.
5. On the **Save As** window, enter a filename and click **Save**.
6. Click **Save Configuration** to save your changes.

» To modify application parameters:

1. On the **Connection** tab, select or add a connection.
2. Under **Application Parameters**, select **Use Custom** and click **Edit**.
Result: Either the **Application Parameters** window opens (go to step 4), or the **Choose Version** popup appears (if you created a profile and have not committed it yet).
3. Select the version of the application parameters profile to be edited from the **Choose Version** popup:
 - **COMMITTED:** The most recently committed version.
 - **UNCOMMITTED:** The version created, but not committed yet.
4. Click **OK**.
Result: The **Application Parameters** window opens.
5. To modify a parameter, double-click the associated value and enter a new value or select from the drop-down list. More advanced parameters may be available on the **Advanced** sub-tab.
6. When you are done, click **Save**.
7. On the **Save As** window, enter a filename and click **Save**.
8. Click **Save Configuration** to save your changes.

» To view application parameters:

1. Go to the **Connection** tab.
2. Under **Application Parameters**, select **Use Default** and then click **Show**.
Result: The **Application Parameters** window opens.

Port Settings

The following settings are required for each connection; they define how the MCP communicates over the serial link. Some settings may not be available for all connection types.

Table 6-93: Port Settings

Setting	Description	Range	Default
Primary Port	For G500: Primary serial port for device communications with the MCP. Ports 1-8, A1-A4, B1-B4 and C1-C4 refer to Physical Serial Ports and ports VP1 through VP150 refer to Virtual Serial Ports. For G100: Primary serial port for device communications with the G100. Ports 1-4 refer to Physical Serial Ports and ports VP1 through VP150 refer to Virtual Serial Ports.	For G500: 1-8, A1-A4, B1-B4 and C1-C4 Physical Serial Ports VP1 -VP150 – Virtual Serial Ports For G100: 1-4 - Physical Serial Ports VP1 - VP150 – Virtual Serial Ports	Increment from 1 – Physical Serial Ports Incremented from VP1 – Virtual Serial Ports

Setting	Description	Range	Default
Backup Port	For G500: Secondary port for device communications if the Primary port fails. The Backup port automatically takes on the settings of the associated Primary port. Ports 1-8, A1-A4, B1-B4 and C1-C4 refer to Physical Serial Ports and ports VP1 through VP150 refer to Virtual Serial Ports. For G100: Secondary port for device communications if the Primary port fails. The Backup port automatically takes on the settings of the associated Primary port. Ports 1-4 refer to Physical Serial Ports and ports VP1 through VP150 refer to Virtual Serial Ports.	For G500: 1-8, A1-A4, B1-B4 and C1-C4 Physical Serial Ports VP1 -VP150 – Virtual Serial Ports For G100: 1-4 - Physical Serial Ports VP1 - VP150 – Virtual Serial Ports	NA
Baud Rate	The speed of information being transmitted across the serial connection, in bits per second (bps).	List of baud rates (200 to 115200)	9600
Parity	A bit added to a group of bits to detect the presence of an error.	Even None Odd	None
Data Bits	Number of bits used for each character.	7, 8	8
Stop Bits	Number of bits used to indicate the end of each character as it is transmitted.	1, 2	1

RTS, CTS and DCD Values

Some protocols may require these parameters to be configured.

RTS must be enabled when the serial port is configured to use the internal transceiver in RS485-2w mode.

When the serial port is configured for RS485-4w, modem control handshaking signals (RTS,CTS and DCD) generally do not apply. The exception is with the DNP Server where the RTS Pre-Trans Delay can be used to slow down the server response. This is sometimes necessary in 2-wire setups to prevent the DNP Server from responding while the master is still driving the line.

Table 6-94: RTS Values

Setting	Description	Range	Default
Flow Control	Specifies whether or not RTS Flow Control is enabled	Enabled Disabled	Disabled
Pre-Trans Delay	Specifies the time (in milliseconds) that RTS is asserted before data is transmitted. Also known as the RTS preamble.	1 to 65535	15
Post-Trans Delay	Specifies the time (in milliseconds) after data is transmitted that RTS is held asserted. Also known as the RTS postamble.	1 to 65535	15

Table 6-95: CTS Values

Setting	Description	Range	Default
Flow Control	Specifies whether or not CTS Flow Control is enabled	Enabled Disabled	Disabled

Table 6-96: DCD Values

Setting	Description	Range	Default
Flow Control	Specifies whether or not DCD Flow Control is enabled	Enabled Disabled	Disabled
Receive Inhibit Delay	Specifies the Receive Inhibit Delay, in milliseconds.	1 to 65535	15

Dial-up Modem Settings

The following settings are required when configuring a Dial-up Modem link.

Table 6-97: Dial-up Modem Settings

Setting	Description	Range	Default
Init String	The data string sent to the modem when the application starts.	1 to 64 ASCII characters, no spaces	ATZ*
Attention String	The data string sent to the modem to place it into command mode.	1 to 32 ASCII characters, no spaces	+++
Hang Up String	The data string sent to the modem to cause it to hang up the phone connection.	1 to 32 ASCII characters, no spaces	ATH
Retry Count	How many times to retry a failed connection before giving up. Increase the value for unreliable connections.	0 to 30	3
Retry Delay (sec)	The amount of time to wait (in seconds) between retry attempts.	0 to 3600	3 (Client) 30 (Server)
Idle Wait Time (sec)	The amount of time (in seconds) that must elapse without data transmission before the connection is terminated.	0 to 3600	10 (Client) 15 (Server)
Auto Answer	Enable the modem to automatically answer incoming calls.	Enabled Disabled	Enabled

***NOTE:** Init String depends on Modem make.

Physical Serial Ports

Table identifies the port names used to identify physical serial ports.

Port Range	Physical Serial Ports
1 to 4	Base Serial Ports on G100 and G500
5 to 8	G500 only: Base Serial Ports
A1 to A4	G500 only: Port 1 to 4 on Serial Expansion card in PCIe slot 1
B1 to B4	G500 only: Port 1 to 4 on Serial Expansion card in PCIe slot 2
C1 to C4	G500 only: Port 1 to 4 on Serial Expansion card in PCIe slot 3

Virtual Serial Ports

The Virtual Serial Ports feature allows you to communicate with devices through an Ethernet connection even though they appear to be connected through a physical serial port. You can use virtual serial ports for any connection except for system redundancy and modem links, and you can create up to 150 virtual ports.

The [Terminal Server](#) and [Pass-Through Connections](#) features provide additional options for connecting to devices through the MCP.

» To create a virtual serial port:

1. Access the **Connections** tab of the **Configuration** page. If there are no serial connections on this page, you must create one.
2. Click the **Virtual Serial Ports** tab. This tab is available on all serial connections.
3. Click the **Add** button and configure the newly created row.
4. You can now select this virtual serial port as the Primary or backup port on the **Serial Connection** tab.

Table 6-98: Virtual Serial Port Settings

Setting	Description	Range	Default
Virtual Serial Port #	The port number assigned to the virtual serial port. VP1 to VP150 are reserved for virtual serial ports	VP1 – VP150	Lowest unused virtual port number. Default VP1.
IP Address	The IP Address to use to connect to the device.	Valid IPV4 address	127.0.0.1
Network Port	The network port to connect to on the remote IP Address	0 to 65535	10000 plus the pre-assigned virtual serial port number

NOTE: Do not configure any hardware handshaking options on serial connections that use virtual serial ports. Doing this prevents the virtual serial port from initializing and the server or client application configured for the port fail to start.

Connection Security

For more details, refer to [Configure System Security](#).

Redundancy Dedicated Link

The following settings are required to be used when configuring MCP system redundancy with Serial Heart Beat enabled (see [mcpcfg Redundancy](#) or [Settings GUI Redundancy](#)).

The configured Primary and Backup ports for this serial Redundancy Dedicated Link must match the ping cable(s) connection(s).

In Warm Standby redundancy: only the Primary serial port may be used.

In Hot Standby redundancy or Hot-Hot redundancy: an optional Backup serial port may also be configured.

Table 6-99: Redundancy Dedicated Link Settings

Setting	Description	Range	Default
Device Name	Text description to identify the redundancy connection.	1 to 32 ASCII characters	RLINKx
Auto Start	Not Used.	NA	NA

In a redundant setup, the [MCP Configuration Manager](#) synchronizes configurations between the MCP units; this setting is lost if there is a difference between the two configurations.

Redundancy Switch Panels

The following settings are required to be used when configuring MCP system redundancy with a Switch Panel wired / present. The Port selection must match the RS232 serial port where the Switch Panel cable is connected.

Do not configure this is if a Switch Panel is not wired / not present.

Table 6-100: Redundancy Switch Panel Settings

Setting	Description	Range	Default
Device Name	Text description to identify the redundancy connection.	1 to 32 ASCII characters	RSWITCH
Auto Start	Not used.	NA	NA

Ensure that both MCP units in the redundant setup have connected the watchdog cable to the same serial port number. In a redundant setup, the MCP Configuration Manager synchronizes configurations between the MCP units and this setting are lost if there is a difference between the two.

Terminal Server

The MCP can be configured to provide transparent access (also known as pass-through) to connected devices using vendor-supplied PC programs. This is done by configuring the port the device is connected to as a Terminal Server.

Refer to the [Pass-Through Connections](#) for more information.

The following settings are used when configuring a Terminal Server.

Table 6-101: Terminal Server Settings

Setting	Description	Range	Default
Device Name	Text description to identify the terminal server.	1 to 32 ASCII characters	N/A
Auto Start	Indicates if the client application automatically starts when the configuration is changed and reloaded or when the MCP re-boots.	Disabled Enabled	Disabled
Secure Type	Select a security feature to be enabled on the connection. For more information, refer to Connection Security .	Disabled Telnet TLS Security SSH Secure Tunnel	Disabled
TLS port	Enter the port number that can be used to access the secure connection.	1 to 65535	50000 + X
File	Select the security parameters defining this connection. After a configuration can be created, it can be saved and reused on other connections. Refer to the Secure Application Parameters .	List of saved security settings	N/A

Terminal Server Application Parameters

Terminal Server application settings are available under the **Application Parameters** field.

Terminal Server Application Parameters

Table 6-102: Terminal Server Application Parameters

Setting	Description	Range	Default
Base network port	By default, the terminal server listens for incoming connections on port 8000. However, a custom port can be specified instead	Use Default Use Custom	Use Default
Custom network port	The network port where the terminal server listens for incoming connections	0 to 65535	Not enabled
Password authentication	If set to Yes, the terminal server application requires a valid username and password before a connection is opened. See note below.	Yes No	Yes
Minimum privilege level	The minimum user privilege level required for the user account providing login credentials.	Supervisor Operator	Supervisor

NOTE: If you configure one MCP to act as a terminal server for another MCP that is using virtual serial ports, the password authentication option must be disabled on the terminal server port.

Configure Network Communications

Types of Network Connections

The MCP supports network connections to up to 8 master stations. Each network interface can be assigned a single host protocol (server application) for master station communications.

Network connections to the MCP are shown as sub-items under the **Network Connections** heading of the **Connections** pane. Each network connection can be configured for either:

- Master station (server) communications using a selected protocol.
- IEDs (client) communications using a selected protocol.

Network Blocks

To improve the efficiency of communications, the MCP supports network capable device and master connections using “blocks” that can process communications concurrently. Each network block is an instance of a designated protocol (client or server application).

Each network block can be configured for the number of device (client) or master station (server) connections and instance-specific protocol settings that are used for the network communications. Network blocks appear under the **Network Connections** heading of the **Connection** tab as *<Protocol Name> Blocks*.

Tip: Each additional instance uses additional system resources yet increases system throughput.

Network Devices

Network capable devices can be connected to one or more data collection blocks and polled according to the instance-specific protocol settings.

Master Connections

The MCP can support communications to multiple (up to eight) master stations. The data presented to each master station may be identical or unique as defined by a server map. Although the MCP accepts data requests from only one master station at a time, it can support requests from any master station. A single Master block defines the master station connections.

The **Master Block** tab on the **Network** tab includes a tab for each configured server application. Each row on the **Master Connection** page represents one master connection.

A master station represents a single instance of a server application. Each configured master station application is shown as a sub-item underneath the **Network Master Stations** item on the **Connection** tab.

Protocols

You can configure network connections using the following protocols:

- DNP IED Block
- DNP3 Master
- IEC 60870-5-104 IED Block
- IEC 60870-5-104 Master Station
- Modbus TCP or TCP/SSH IED Block
- Modbus TCP Master
- Secure connection relay
- SNMP Block
- VPN Server

NOTE: IEC 61850 device connections are available for viewing only and cannot be edited on the Network page. To change the IEC 61850 client configuration, you must use the IEC 61850 Loader tool and re-load the configuration into the MCP. Refer to the IEC 61850 Loader online Help for more information.

Add a Network Connection

You manage the network connections on the MCP on the **Connection** tab on the **Configuration** page.

A map file must be available in the MCP before a protocol type can be added. The MCP includes several default maps. If you require a custom map, create it first before setting up the network connection. See [Client Maps](#) or [Server Maps](#).

» To add a network connection:

1. On the Connection tab, click Add Connection.
2. On the New Connection window, select Network Connection and select the configuration type.
Result: A new network connection item or master station sub-item is added.
3. Modify the settings for the new connection. Double-click a cell to modify a value.
4. Select whether the server application automatically starts (Auto-Start) when the configuration is loaded and when the MCP re-boots. Range is Automatic and Disabled.
5. Enter the fields under Configuration Settings are specific to the connection type. (See the [protocols](#) listed below.)
6. Click Save Configuration to save your changes.

Modify a Network Connection

» To modify a connection:

1. Select the connection in the **Connections** pane.
2. Double-click or select a configuration parameter field and enter a new value.
3. Click **Save Configuration** to save your changes.

NOTE: If you select a different map file for an existing IED connection in the dropdown list, or when you save it as a different filename when opened from within the Connections > Map File Edit button, you will be prompted with the following dialog:

- If you choose **Retain**, it will apply the new map file. The home directory and point mappings related to the connection are kept unchanged for the points inside the mapfile which were left with same point ID. It is your responsibility to ensure the signals (i.e., point ID meanings) defined by the previous map file are identical to the signals defined in the new map file.
- If you choose **Break**, it will apply the new map file. This will change the home directory which results in invalidating all the existing point mappings that includes points selected within applications like the Calculator, the Alarms configuration page and the System Point Manager. Mappings affected by this are referred to as being “non-existent”.
- Choose **Cancel** if you want to abandon and revert to what was selected before.

Delete a Network Connection

» To delete a connection:

1. Select the connection you wish to delete in the **Connections** pane.
2. Click **Delete Connection**.
3. Click **Yes** to confirm deletion.
Result: The item is removed from the connections list.
4. Click **Save Configuration** to save your changes.

Connection Application Parameters

The **Application Parameters** window allows you to view and modify the protocol settings for a specific client or server connection. Application parameters are available on the **Connection** tab on the **Configuration** page. The settings shown vary based on the connection type and protocol selected.

» To create a custom application parameter profile:

1. On the **Connection** tab, select or add a connection.
2. Under **Application Parameters**, select **Use Custom** and click **Create**. The **Application Parameters** window opens.
3. To modify a parameter, double-click the associated value and enter a new value or select from the drop-down list. More advanced parameters may be available on the **Advanced** sub-tab.
4. When you are done, click **Save**.
5. On the **Save As** window, enter a filename and click **Save**.
6. Click **Save Configuration** to save your changes.

» To modify application parameters:

1. On the **Connection** tab, select or add a connection.
2. Under **Application Parameters**, select **Use Custom** and click **Edit**.
Result: Either the **Application Parameters** window opens (go to step 4), or the **Choose Version** popup appears (if you created a profile and have not committed it yet).
3. Select the version of the application parameters profile to be edited from the **Choose Version** popup:
 - **COMMITTED:** The most recently committed version.
 - **UNCOMMITTED:** The version created, but not committed yet.
4. Click **OK**.
Result: The **Application Parameters** window opens.
5. To modify a parameter, double-click the associated value and enter a new value or select from the drop-down list. More advanced parameters may be available on the **Advanced** sub-tab.
6. When you are done, click **Save**.
7. On the **Save As** window, enter a filename and click **Save**.
8. Click **Save Configuration** to save your changes.

» To view application parameters:

1. Go to the **Connection** tab.
2. Under **Application Parameters**, select **Use Default** and then click **Show**.
Result: The **Application Parameters** window opens.

Modbus TCP/SSH Tunnel

The following settings are used when configuring a Modbus IED block with TCP/SSH Protocol.

Modbus TCP/SSH Tunnel Configuration Parameters

Table 6-103: SSH TCP Tunnel Configuration Parameters

Setting	Description	Range	Default
SSH Server Port	The port number on which Modbus TCP/SSH is to communicate with the IED.	0 to 65535	22
M2M User Name	Name of the User to authenticate for TCP/SSH communication.	Not Available	m2m_user
SSH Key Rotation Period(days)	Key Rotation Period in days after which new SSH keys are generated, transferred to IED and then the session will be reestablished with new SSH Keys.	0 to 365	1

Secure Connection Relay

A secure connection relay can be used to apply security features to any existing Ethernet connection.

NOTICE

- SECURITY NOTICE

It is strongly recommended that the user employ TLS tunnels to protect the following services:

- [DNP3 Master](#)
- [IEC 60870-5-104 Master Station](#)
- [Modbus TCP Master](#)

The user assumes all responsibility for associated security risks when enabling unsecured services onto an unprotected network.

The following settings are used when configuring a secure connection relay.

Table 6-104: Secure Connection Relay settings

Setting	Description	Range	Default
Secure Relay Name	Text description to identify the connection.	1 to 32 ASCII characters	N/A
Auto Start	Indicates if the application automatically starts when the configuration is changed and reloaded or when the MCP re-boots.	Disabled Enabled	Enabled
Remote IP Address	The IP Address of the remote device that the secure connection is established with.	Valid IPv4 address	0.0.0.0
LAN port	The IP port number to use when connecting to the remote device.	1 to 65535	20001
TLS port	Enter the port number that can be used to access the secure connection.	1 to 65535	50000 + X
Max Conn	The maximum number of concurrent connections permitted to access the secure connection relay at one time.	1 to 32768	1
File	Select the security parameters defining this connection. After a configuration can be created, it can be saved and reused on other connections. Refer to the Secure Application Parameters .	List of saved security settings	N/A

VPN Server

The following settings are used when configuring a VPN Server through DS Agile MCP Studio.

NOTE: Refer to the Integration of MCP with open VPN (Virtual Private Network) Client - Configuration Guide (*GE Vernova Part Number SWM0103*) for the detailed procedures used to:

- Implement a simple Certification Authority using XCA Certification Authority (Open Source tool)
- Install certificates on the MCP and Windows PC running open VPN client
- Configure open VPN client to communicate to the MCP over virtual private network

Table 6-105: VPN Server settings

Setting	Description	Range	Default
Name	Unique name for the VPN Server.	Text string 32 characters are allowed	VPN Server
Auto Start	Indicates if the application automatically starts when the configuration is changed and reloaded or when the MCP re-boots.	Disabled Enabled	Enabled
Network IP Address	IP Address of the device. Must be unique from other configured devices.	Valid IPv4 address	10.200.0.0/24
Port	The port number on which the device communicates.	0 to 65535	1,194
Concurrent Connections	The number of allowed concurrent connections.	1, 2, 3	1

Setting	Description	Range	Default
Transport Layer	The transport layer protocol; either: - Transmission Control Protocol (TCP), or - User Datagram Protocol (UDP)	TCP UDP	UDP
Encryption Algorithm	Mathematical formula used in encryption and decryption of the VPN communication.	List of encryption algorithms. AES-256-CBC AES-256-CFB1 AES-256-CFB8 AES-256-OFB AES-192-CBC AES-192-CFB1 AES-192-CFB8 AES-192-OFB CAMELLIA-256-CBC CAMELLIA-256-CFB CAMELLIA-256-CFB1 CAMELLIA-256-CFB8 CAMELLIA-256-OFB CAMELLIA-192-CBC CAMELLIA-192-CFB CAMELLIA-192-CFB1 CAMELLIA-192-CFB8 CAMELLIA-192-OFB	AES-256-CBC
Authentication Algorithm	Authentication is the process of verifying the encrypted data was sent by the sender and was not altered.	List of authentication algorithms. SHA1-160 RIPEMD160-160 SHA-224 SHA-256 SHA-384 SHA-512	SHA-256

Setting	Description	Range	Default
Custom Option	Enter any options to be added to the VPN Server Configuration. Custom options that overlap the standard options take precedence. All options appear in this field, separated by semicolons. For example: reneg-sec 900; keepalive 90 To edit this field: 1. Click the Edit button. Result: The Configure Custom Option window appears. 2. Click the Add button. Result: A line appears as a Custom Option. 3. Type in the option text. 4. Click Save. NOTICE Custom Options are advanced options and take precedence over the standard configuration options. The standard options are secure by default. Implementing custom options can impact the security strength (e.g., using weak ciphers such as DES*, RC2*, and BF-*). The customer assumes risk of weakened security when implementing custom options. Consult the online OpenVPN literature for guidance.	Text string For example: • reneg-sec 900 • tun-mtu 1500; mssfix 1300 • fragment 1400; • mssfix • tls-cipher TLS-DHE-RSA-WITH-CAMELLIA-256-CBC-SHA • socket-flags TCP_NODELAY • push "socket-flags TCP_NODELAY"	blank

NOTE: VPN Client Configuration (Client Name, Routing and White List) needs to be done by VPN Client.

Configure D.20

The D.20 Subsystem is responsible for:

- Monitor and maintain the code and configuration of every D.20 peripheral in the connected network.
- Present all hardware inputs and outputs provided by the D.20 peripherals as discrete system points of the appropriate data type in the Real Time Database (RTDB) of MCP.
- Send output commands on analog and digital output system points received via the RTDB to the peripheral output associated with the affect system point.
- Monitor the health of each D.20 peripheral in the network and report any issues to the user.

Add a D.20 Peripheral

You manage the D.20 Peripheral connections on the MCP on the **Connection** tab on the **Configuration** page.

D.20 client can use the default peripheral map files or can create the custom peripherals. The MCP includes all supported peripherals default client maps. If you require a custom mapfile, create it first before setting up the connection. See [Client Maps](#).

» To add a D.20 peripheral:

1. On the Connections tab, select D.20 peripheral Block A under D20 connections.

2. Select **Add** option from right button corner of the window to add peripherals, the fields under block settings.
3. Type in the number of peripherals to be connected.
4. Click **Add** to create the new D.20 peripheral connections.
Result: A new peripheral connection appears as a row in the table at the bottom of the pane.
5. In the **D20 Address Hex** column, select the peripheral address.
Result: The peripheral's D.20 Number is computed based on the selected peripheral address with parity setting (see D20 Address settings).
6. In The peripheral type column select the peripheral type.
7. In the **Map File** column, select the appropriate Map File for that peripheral.
Result: The selected Map File is assigned to that peripheral.
8. Update the **Line ID**, **Device ID**, **Cabinet No**, and **Rack Position** as required. Use a unique identifier for the Line ID.
9. Click **Save**.
Result: The changes are saved. Before continuing, wait for the dialog box announcing that the configuration has been saved.
10. Click **Commit Changes**.
Result: The changes are applied to the MCP device.

Modify Peripheral Connections

On the **Connections** tab in the **Configuration** pane you can modify the settings of configured peripheral connections.

» To modify a peripheral connection

1. Select a connection row in the peripheral connections table.
2. Double-click or select a peripheral connection table field and enter a new value.
3. Click **Save**.
Result: The changes are saved.
4. Click **Commit Changes**.
Result: The changes are applied to your MCP device.

Delete Peripheral Connections

On the **Connections** tab in the **Configuration** pane you can delete configured peripheral connections.

» To delete a peripheral connection

1. Select a connection row in the peripheral connections table.
2. Click **Delete**.
Result: The item is removed from the connections table.
3. Click **Save**.
Result: The changes are saved.
4. Click **Commit Changes**.
Result: The changes are applied to your MCP device.

Import D20 Peripheral Link

The D.20 IO (B003) part of a D20/200/MX RTU configuration of can be automatically imported into the MCP. This process will configure the entire D.20 Client with identical parameters as the D20 RTU (D.20 communication settings, IO points and associated settings).

Only one instance of D.20 (B003) can be imported to MCP in this release.

Pre-requisites:

Computer with DSAS and both MCP Studio and D2X Studio installed.

D20 RTU archive / device configuration.

1. Enable D2X Studio if launched DSAS MCP.
2. Ensure the D20 RTU configuration is present in the DSAS repository, in same computer as the one used to configure the MCP (can be different project).
3. Perform a Generate Configuration on the D20 RTU (this is required to identify and correct potential errors). If this cannot be done because the RTU configuration is considered to be “master” – then please make a copy of it and generate the copy.
4. Open MCP offline editor, in Connections, select the D.20 branch on the left side and then click on the button “Import D.20 Peripheral Link” on the right:

5. Follow the prompts and select the D20 RTU from Step 3. Click Next, and on next page click Finish.
Result: the D.20 configuration has been copied into the MCP.
6. Click Save / Commit. The MCP device can now talk to the D.20 IO modules same as the D20 RTU was able to do.

Note:

The imported data will be automatically named based on the source D20 RTU configuration, as following:

Line ID	Bay ID	Device ID	Peripheral Number	D.20 Address Hex	Peripheral Type	Map File	Cabinet Number	Rack Position
{RTU_Name} (Processor#)	PCle 3	D.20 IO (# from D20 RTU)	1	0x03 (0000 0011)	WesdacD20C1	Block_A/D20C1_P1_x03.xml	{From D20RTU}	{From D20RTU}

Line ID is composed of:

- {RTU_Name} = name of the D20 RTU device in Step 3
- {Processor #} = number of the processor (for single node D20 is always “Proc1”)

Bay ID is always the PCIe slot of the MCP, cannot be changed

Device ID is the D.20 IO # coming from the D20 RTU

Peripheral Number comes from the D20 RTU

Peripheral Address comes from the D20 RTU

Peripheral Type comes from the D20 RTU

Cabinet Number comes from the D20 RTU

Rack Position comes from the D20 RTU

Each imported D.20 IO module will have its own D.20 client map file, automatically named based on the following naming convention, to be easily cross referenced with the original D20 RTU IO configuration, based on imported data from D20 RTU:

Block_A is always present and associates with the D20 block of IO imported in the MCP; this is a.

{type}_Peripheral #}_{Peripheral Hex Address}

Map File
Block_A/D20C1_P1_x03.xml
Block_A/D20C1_P2_x05.xml
Block_A/D20S_P3_x06.xml

Application Parameters

The **Application Parameters** tab allows you to view and modify the protocol settings for a specific client connection. Application parameters are available on the **Connection** tab on the **Configuration** page.

» To create a custom application parameter profile

1. On the **Connection** tab, select D.20 Peripheral BlockA under D.20 Connections
2. Under **Application Parameters**, select **Use Custom** and click **Create**. The **Application Parameters** window opens.
3. To modify a parameter, double-click the associated value and enter a new value or select from the drop-down list.
4. When you are done, click **Save**.
5. On the **Save As** window, enter a filename and click **Save**.
6. Click **Save Configuration** to save your changes.

» To modify application parameters

1. On the **Connection** tab, select D.20 Peripheral BlockA under D.20 Connections
2. Under **Application Parameters**, select **Use Custom** and click **Edit**.
3. Change the required settings and click **OK**
Result: The **Application Parameters** window opens.
4. To modify a parameter, double-click the associated value and enter a new value or select from the drop-down list.
5. When you are done, click **Save**.
6. On the **Save As** window, enter a filename and click **Save**.
7. Click **Save Configuration** to save your changes.

» To view application parameters

1. Go to the **Connection** tab, select D.20 Peripheral BlockA under D.20 Connections.
2. Under **Application Parameters**, select **Use Default** and then click **Show**.
Result: The **Application Parameters** window opens.

Configuration Parameters

Setting	Description	Range	Default
Auto Start	Indicates if the client application automatically starts when the configuration is changed and reloaded or when the MCP re-boots.	Disabled Enabled	Disabled
Redundancy	This option differs in the way the peripherals are connected physically to MCP.	"Single Link" "Redundant Links"	Single Link
Address Parity	The automatically generated peripheral address, which is based upon the jumpers settings on peripherals, where the top jumper setting is for the parity bit and can be configured based on the	Even / Odd	Even

Setting	Description	Range	Default
	DSAS address configuration. The address is equal to the peripheral number with the parity bit appended as the least significant bit. (for example, the address of peripheral 3 is 00000110 (0x06) with even parity, or 00000111 (0x07) with odd parity).		
Import D.20 Peripheral Link	This feature allows user to import existing D.20 configurations from D20MX projects into MCP. Refer Import D20 Peripheral Link .	N/A	N/A

Peripheral connection parameters table

Parameter	Description	Range	Default
Line ID	Text description to identify the electrical transmission line associated with this peripheral.	1 to 64 ASCII characters	Line ID
Device ID	Text description to identify the device associated with this peripheral.	1 to 63 ASCII characters	Device ID
D20 Address	The automatically generated peripheral address which is based upon the peripheral number and the configured address parity. The address is equal to the peripheral number with the parity bit appended as the least significant bit (for example, the address of peripheral 3 is 00000110 (0x06) with even parity, or 00000111 (0x07) with odd parity).	0x3 (0000 0011) to 0xF0 (1111 0000)	Not applicable
Peripheral Type	Select the type of peripheral to be configure	WesdacD20A, WesdacD20S, WesdacD20K, WesdacD20C0, WesdacD20C1, WesdacD20C2,	Not applicable
Map File	Either a standard or custom-created client map file defining the points available from the peripheral.	Select the Mapfile	WesdacD 20S_template
Cabinet Number	Text description to identify the cabinet associated with this peripheral. This parameter is provided for informational purposes only and may be used in a report-generation capability in a future release.	1 to 32 ASCII characters	Cabinet ID
Rack Position	The customer or manufacturing reference number for the location of the peripheral in the rack.	1 to 32 ASCII characters	Rack ID

D.20 Application Configuration parameters

The D.20 Client map defines how the MCP is configured to poll data from D.20 peripherals. D.20 application supports two types of configuration parameters options.

Table 6-106: D.20 Link Configuration parameters

Parameter	Description	Range	Default
Global Delay	Length of time between the transmission of a global message and the polling of the first peripherals (milliseconds)	0 to 65535	10ms
Wait Time	Length of time the D.20 Peripheral Link Client waits before trying to communicate with the peripheral board after a serious error (milliseconds)	0 to 65535	5
Network Retries	Maximum number of times the D.20 Peripheral Link Client tries to consecutively poll the peripheral after it detects a failure.	0 to 65535	3
Scan Interval	How often the D.20 Peripheral Link Client will scan all the D.20 Peripherals for data (milliseconds)	10 to 1000	50
Analog Input Scan Rate	Rate that the D.20 peripheral link client polls the peripherals for analog input information. The integrity scan interleaving option overrides the analog input scan rate (milliseconds)	1 to 65535	4000
Analog Ref Scan Rate	Rate that the D.20 Peripherals Link Client performs the scheduled scan of the peripheral for the on-board analog input reference. The integrity scan interleaving option overrides the analog reference scan rate (milliseconds)	1 to 65535	60000
Binary Scan Rate	Rate that the D.20 peripheral link client polls the peripherals for digital input information. The integrity scan interleaving option overrides the digital input scan rate (milliseconds)	1 to 65535	2000
SOE Buffer size	The maximum number of SOE events that a peripheral can report at one time. Typically, 10.	1 to 255	10
Control Output Pattern Generation	Enable or Disable the capability of the client to operate several control points simultaneously.	Enable/Disable	Enabled
Integrity Scan Type	Selected interleaved or scheduled integrity scan	Scheduled/Interleaved	Interleaved
Standby Accumulator	Specify if the standby device in a warm redundant system maintains the current accumulator counts for the peripherals. In a hot standby redundant system, the standby device always maintains the current accumulator counts.	Yes/No	Yes
Max Polls	Specify the number of consecutive successful polls to turn the health pseudo point on D.20 communication parameter. Advanced max polls.	1 to 65535	1
Max Retries	Specify the number of consecutive retried polls to turn the health pseudo point OFF. Advanced max polls.	5 to 65535	5

Additional configuration feature

DSAS supports easy way of configuration for each and every point detail in client map files. With this feature user can copy point details of client map file into Excel and after modification all points will be pasted back to the client map file.

Use the Copy and Paste  options to copy the point details into the Excel sheet.

In the Offline Editor user selects the point type tab which needs to be copied and clicks copy  icon and paste into the Excel sheet. The entire range will be copied.

User modifies as needed the point details in the Excel sheet and copies them as the whole range from the Excel sheet and click paste  icon to import the point details content into the same point type tab of the Offline Editor.

NOTES:

If a value in Excel is out of range, *DSAS* will show a warning and automatically insert the lowest or highest value that it can accept as appropriate.

Do not change the order of the Columns in Excel.

Starting with DSAS V5.40 and MCP V5.40: the first column in Excel indicates the uniquely assigned Point IDs for this client map file (it is unique across all point types in a given client map file). This column is not visible in the Offline Editor (except D.20) but is used internally to retain instantiated database links. Do not change existing Point ID values in Excel if you want to retain the same data links. New added points in Excel should be left with their Point IDs blank and the Offline Editor will automatically assign sequential values as would normally occur when working only in the Offline Editor. Data which contains duplicated values of already present Point IDs cannot be pasted into the Offline Editor and user needs to eliminate such duplicates in Excel. Caution to not delete accidentally all previous Point IDs because this will conduct to lost links in the database after pasting them into the Offline Editor, because they will be automatically assigned new values.

Configuring Client Applications

This chapter contains the following sections and sub-sections:

Overview

Configure Serial Applications

[DNP3 Multi-drop](#)

[IEC 60870-5-101 Multi-drop](#)

[IEC 60870-5-103 Multi-drop](#)

[Modbus Multi-drop](#)

[Generic ASCII Client](#)

[SEL Binary](#)

[LogicLinx Device](#)

Configure Network Clients

[DNP IED Block](#)

[IEC 60870-5-104 IED Block](#)

[Modbus TCP or TCP/SSH IED Block](#)

[SNMP Block](#)

Note: IEC61850 Client Configuration will be done using IEC61850 Loader in the DS Agile MCP Studio.

Client Configuration Overview

You can customize the MCP to poll, receive and store the necessary data from connected Intelligent Electronic Devices (IEDs). Client applications in the MCP allow the MCP to collect event and/or static data from devices through different communication protocols and store the data in the system point database.

The MCP configuration tool supports configuration of protocol-specific object references, scaling factors, and user-defined names for various objects configured for collection. Where applicable, you can also configure additional device-level settings (for the same protocol) at the same time.

» To configure the MCP to communicate with devices, perform the following typical tasks:

1. Create MCP client map file for each device and protocol type.
2. Define the data points list and set point properties.
3. Set protocol-specific properties.
4. Set up serial and network device connections.
5. Configure protocol-specific settings for each device connection.
6. Save the configuration file.
7. Run the configuration file in the MCP by committing the changes.

DNP3 Multi-drop

The following settings are used when configuring a DNP3 Multi-drop connection. If a Modem connection is used, refer to the additional settings defined in [Dial-up Modem Settings](#).

DNP3 Multi-Drop Settings

Table 6-107: DNP3 Multi-Drop Settings

Setting	Description	Range	Default
Auto Start	Indicates if the client application automatically starts when the configuration is changed and reloaded or when the MCP re-boots.	Disabled Enabled	Disabled
Line ID	Text description to identify the electrical transmission line associated with this serial connection.	1 to 64 ASCII characters	Line X
Device ID	Text description to identify the device associated with this serial connection.	1 to 63 ASCII characters	Device X
Bay ID	Text description to identify the bay area associated with this serial connection.	1 to 256 ASCII characters	Bay X
IED Address	Protocol address of the device (i.e., DNP3 device address). This parameter is applicable for Standalone/Warm-Standby/Hot-Standby devices.	0 to 65519	X
IED Address A	Protocol address of the device A (i.e., DNP3 device A address) devices. This parameter is applicable only for Hot-Hot devices.	0 to 65519	X
IED Address B	Protocol address of the device B (i.e., DNP3 device B address) This parameter is applicable only for Hot-Hot devices.	0 to 65519	X
Map File	Name of the Client map file to be used with the specific device.	List of users configured client map files.	N/A
Enable on Start Up	Indicates if communication to the device automatically starts when the configuration is changed and reloaded or when the MCP re-boots.	Disabled Enabled	Disabled
Hot-Hot Communication	This parameter is available only if Hot-Hot redundancy is system level redundancy is enabled. If this parameter is enabled both the MCP units communicate to the IEDs simultaneously. If Hot-Hot is enabled, then IED Address A /Master Address A – Communication from MCP A IED Address B/Master Address B - Communication from MCP B And, if Hot-Hot is disabled, then	Disabled Enabled	Disabled

Setting	Description	Range	Default
	Both MCP units in the redundancy communicate from the Active MCP unit only and use IED Address/Master Address.		

DNP3 Client Application Parameters

DNP3 client settings are available under the **Application Parameters** field and these settings will apply to all multi-dropped devices in a connection.

Tip: If the configured number of DNP IEDs is more than 80, then it is recommended to use higher values for the settings:

- Response Timeout, such as 5 seconds
- Max Offline Fail Count, such as 3

DNP3 Client Application Settings

Table 6-108: DNP3 Client Application Settings

Setting	Description	Range	Default
Master Address	Address of the DNP3 client application. Must be different from all configured devices on this port. This parameter is applicable for Standalone/Warm-Standby/Hot-Standby devices.	0 to 65519	100
Master Address A	Address of the DNP3 client application in MCP A. Must be different from all configured devices on this port. This parameter is applicable for Hot-Hot devices only.	0 to 65519	100
Master Address B	Address of the DNP3 client application in MCP B. Must be different from all configured devices on this port. This parameter is applicable for Hot-Hot devices only.	0 to 65519	100
IIN Class 1 Action	True: Master polls Class 1 data when IIN Class 1 available data is received. False: Ignore "Class 1" IIN. Class 1 Data events are typically very important and should be retrieved from the target device as soon as the indication is received	True False	True
IIN Class 2 Action	True: Master polls Class 2 data when IIN Class 2 available data is received. False: Ignore "Class 2" IIN. Class 2 Data events are typically very reasonably important and should be retrieved from target device as soon as the indication is received	True False	True
IIN Class 3 Action	True: Master polls Class 3 data when IIN Class 3 available data is received. False: Ignore "Class 3" IIN. Some target devices generate large numbers of insignificant Class 3 events. To minimize I/O traffic, set to False.	True False	True

Setting	Description	Range	Default
IIN Time Sync Action	True: Master performs time sync when IIN Time Synchronization Required message is received. False: Ignore IIN Time Synchronization Required message. If a target device requests a time sync, it should be given one, unless the target device has access to another clock than the MCP	True False	True
Time Sync Every Integrity Poll	True: Send out a "Time Sync" message to a target device each time an "Integrity Poll" message is sent to that device. False: Do not send out a "Time Sync" message to a target device each time an "Integrity Poll" message is sent to that device. In general, if a target device needs a time sync, it requests one. This setting should be used only if there is a known problem with the target device's clock.	True False	True
Enable Stagger Integrity Poll	Specifies whether Staggered Integrity polling is enabled or not. True: The DNP3 client ignores the Integrity Poll Interval configured for the devices and utilizes an internal scheduling mechanism to determine when the next integrity poll should be transmitted. False: Do not enable staggered integrity polling. Use the configured settings.	True False	False
Stagger Integrity Interval	If Staggered Integrity polling is enabled, the DNP3 client schedules Integrity polls to devices based on the interval (in seconds) specified here.	30 to 36000	600
Max Switch Fail Count	Maximum number of consecutive failed requests the DNP3 client must see before it attempts to establish communications on the Backup Port.	1 to 300	1
Max Offline Fail Count	Maximum number of consecutive failed requests to a device before the RTDB points is marked offline.	1 to 300	2
Wait Between Messages	Time (in seconds) to wait between two consecutive messages sent on the serial port	0 to 60	0.0
Confirmation Delay	Time in seconds to delay application layer acknowledgment on single fragment solicited or unsolicited responses.	0 to 2	2
Response Timeout	Time (in seconds) to wait for an application layer response before deciding it has failed. Set the value higher for a dial-up modem connection, i.e., 40.	0 to 60	2.0
Time Zone	This option allows you to configure a custom time zone offset which is applied to messages received through this application. By default, the timestamps of messages received through the DNPDPDA are in UTC time.	One of listed Time Zones and geographic locations	GMT
Delay First Request Post TCP Connection	This feature is enabled or Disabled per DNPDCAs instance and is applicable to TCP-based DNP IEDs. Use this command to enable or disable the first DNP poll request after TCP connection since the configured DNPDCAs instance is delayed by data link time-out.	True False	False

Setting	Description	Range	Default
Class Order	The order of class objects in an integrity poll or multiple class poll.	Class3210 Class1230	Class3210

DNP IED Block

The following settings are used when configuring a DNP3 IED block.

NOTE: It is recommended that the total number of IEDs configured in one IED block be limited to 10 IEDs. If more than 10 IEDs are configured in a single multi-drop connection, data connection performance degrades.

DNP3 IED Block connection settings

Table 6-109: DNP3 IED Block connection settings

Setting	Description	Range	Default
Auto Start	Indicates if the application automatically starts when the configuration is changed and reloaded or when the MCP re-boots.	Disabled Enabled	Disabled
Enable Dual Endpoint	Enable or disable TCP dual end point. A dual end point enables the MCP to listen for connection requests from remote devices. If enabled, either side may initiate the connection; the master to send controls, integrity polls, and so on, and the remote device to report unsolicited data. If a remote device establishes a connection, the connection is closed after the period of time specified in the Auto-Disconnect setting. If both sides simultaneously initiate the connection, the connection initiated by the MCP is maintained while the other is dropped. This feature is not supported for devices using the UDP transport layer.	Disabled Enabled	Disabled
Port	The MCP port configured to receive data from remote devices.	1 to 65535	N/A
Auto Disconnect	The amount of time, in seconds, that the MCP allows to pass with no received transmissions before the connection to the remote device is closed. If set to 0, auto disconnect is disabled.	0 to 65535	10
Application Parameters	Select the application parameters defining this connection. The default parameters can be used, or a custom configuration can be created. Refer to DNP3 Application Parameters .	Use Default Use Custom	Use Default
Line ID	Text description to identify the electrical transmission line associated with this connection.	1 to 64 ASCII characters	Line X
Device ID	Text description to identify the device associated with this connection.	1 to 63 ASCII characters	Device X
Bay ID	Text description to identify the bay area associated with this connection.	1 to 256 ASCII characters	Bay X
IED Address	DNP3 address of the device. This parameter is applicable for Standalone/Warm-Standby/Hot-Standby devices.	0 to 65519	N/A

Setting	Description	Range	Default
IED Address A	DNP3 address of the device A. This parameter is applicable only for Hot-Hot devices.	0 to 65519	X
IED Address B	DNP3 address of the device B. This parameter is applicable only for Hot-Hot devices.	0 to 65519	X
Map File	Name of the client map file to be used with the specific device.	List of users configured map files.	N/A
IP Address	IP Address of the device. Must be unique from other configured devices.	Valid IPv4 address	0.0.0.0
Backup IP Address	Redundant backup IP Address of the device.	Valid IPv4 address	0.0.0.0
Network Port Number	The port number on which the device communicates. This parameter is applicable for Standalone/Warm-Standby/Hot-Standby devices.	0 to 65535	20000
Network Port Number A	The port number on which the device A communicates. This parameter is applicable only for Hot-Hot devices.	0 to 65535	20000
Network Port Number B	The port number on which the device B communicates. This parameter is applicable only for Hot-Hot devices.	0 to 65535	20000
Transport Layer	Transport mode for IED communication.	TCP or UDP	TCP
Enable on Start Up	Indicates if communication to the device automatically starts when the configuration is changed and reloaded or when the MCP re-boots.	Enabled Disabled	Disabled
Hot-Hot Communication	This parameter is available only if Hot-Hot redundancy is system level redundancy is enabled. If this parameter is enabled both the MCP units communicate to the IEDs simultaneously. If Hot-Hot is enabled, then IED Address A /Network Port A/Master Address A – Communication from MCP A. IED Address B/Network Port B/Master Address B - Communication from MCP B. And, if Hot-Hot is disabled, then Both MCP units in the redundancy communicate from the Active MCP unit only and use IED Address/Master Address.	Disabled Enabled	Disabled

DNP3 application specific settings are available under the **Application Parameters** field.

DNP3 Application Parameters

Tip: If the configured number of DNP IEDs is more than 80, then it is recommended to use higher values for the settings:

- Response Timeout, such as 5 seconds
- Max Offline Fail Count, such as 3

Table 6-110: DNP3 Application Parameters

Setting	Description	Range	Default
Master Address	DNP3 address of the MCP. Must be different from all configured devices on this port.	0 to 65519	100

Setting	Description	Range	Default
Master Address A	Address of the DNP3 client application in MCP A. Must be different from all configured devices on this port. This parameter is applicable for Hot-Hot devices only.	0 to 65519	100
Master Address B	Address of the DNP3 client application in MCP B. Must be different from all configured devices on this port. This parameter is applicable for Hot-Hot devices only.	0 to 65519	100
IIN React Class1	True: Respond to "Class 1" IIN in a message by requesting class 1 event data. False: Ignore "Class1" IIN Class 1 Data events are typically very important and should be retrieved from the target device as soon as the indication is received	True False	True
IIN React Class2	True: Respond to "Class 2" IIN in a message by requesting class 2 event data. False: Ignore "Class2" IIN Class 2 Data events are typically very reasonably important and should be retrieved from target device as soon as the indication is received	True False	True
IIN React Class3	True: Respond to "Class 3" IIN in a message by requesting class 3 event data. False: Ignore "Class3" IIN Some target devices generate large numbers of insignificant Class 3 events. To minimize I/O traffic, set to False.	True False	True
IIN React Time Sync	True: Respond to "Need Time Sync" IIN in a message by sending a "Time Sync" message. False: Ignore "Need Time Sync" message If a target device requests a time sync, it should be given one, unless the target device has access to another clock than the MCP	True False	True
Integrity Time Sync	True: Send out a "Time Sync" message to a target device each time an "Integrity Poll" message is sent to that device. False: Do not send out a "Time Sync" message to a target device each time an "Integrity Poll" message is sent to that device. In general, if a target device needs a time sync, it requests one. This setting should be used only if there is a known problem with the target device's clock.	True False	False
Stagger Integrity Enable	Specifies whether Staggered Integrity polling is enabled or not. True: The DNP3 client ignores the Integrity Poll Interval configured for the devices and utilizes an internal scheduling mechanism to determine when the next integrity poll should be transmitted. False: Do not enable staggered integrity polling. Use the configured settings.	True False	False
Stagger Integrity Interval	If Staggered Integrity polling is enabled, the DNP3 client schedules Integrity polls to devices based on the interval (in seconds) specified here.	30 to 36000	600

Setting	Description	Range	Default
Max Switch Fail Count	Maximum number of consecutive failed requests the DNP3 client must see before it attempts to establish communications on the Backup Port.	1 to 300	1
Device Offline Fail Count	Number of consecutive failed requests to a device before the RTDB points is marked offline.	1 to 300	2
Wait Between Messages	Time (in seconds) to wait between two consecutive messages sent on the serial port or network connection.	0 to 60	0.0
Confirmation Delay	Time in seconds to delay application layer acknowledgment on single fragment solicited or unsolicited responses.	0 to 2	0
Response Timeout	Time (in seconds) to wait for an application layer response before deciding it has failed.	0 to 60	2.0
Time Zone	This option allows you to configure a custom time zone offset which is applied to messages received through this application. By default, the timestamps of messages received through the DNPDA are in UTC time.	One of listed Time Zones and geographic locations	GMT
Delay First Request Post TCP Connection	This feature is enabled or Disabled per DNPDA instance and is applicable to TCP-based DNP IEDs. Use this command to enable or disable the first DNP poll request after TCP connection since the configured DNPDA instance is delayed by data link time out.	false or true	false
Class Order	The order of class objects in an integrity poll or multiple class poll.	Class3210 Class1230	Class3210

IEC 60870-5-101 Multi-drop

The following settings are used when configuring an IEC 60870-5-101 Multi-drop connection.

IEC 60870-5-101 Multi-drop Settings

Table 6-111: IEC 60870-5-101 Multi-drop Settings

Setting	Description	Range	Default
Link Address Size	The number of octets used for the link address of the device.	1 or 2	1
Auto Start	Indicates if the client application automatically starts when the configuration is changed and reloaded or when the MCP re-boots.	Disabled Enabled	Disabled
Application Parameters	Select the application parameters defining this connection. The default parameters can be used, or a custom configuration can be created. Refer to IEC 60870-5-101 Multi-drop Application Settings .	Use Default Use Custom	Use Default
Line ID	Text description to identify the electrical transmission line associated with this serial connection.	1 to 64 ASCII characters	Line X
Device ID	Text description to identify the device associated with this serial connection.	1 to 63 ASCII characters	Device X
Bay ID	Text description to identify the bay area associated with this serial connection.	1 to 256 ASCII characters	Bay X
Common Address of ASDU	The device's common address of ASDU.	1 to 65534	1

Setting	Description	Range	Default
Link Address	The link address of the device.	0 to 65535	1
Map File	Name of the Client map file to be used with the specific device.	List of users configured client map files.	N/A
Enable on Start Up	Indicates if communication to the device automatically starts when the configuration is changed and reloaded or when the MCP re-boots.	Disabled Enabled	Disabled

IEC 60870-5-101 Multi-drop Application

IEC 60870-5-101 client specific settings are available under the **Application Parameters** field.

Table 6-112: IEC 60870-5-101 Multi-drop Application Settings

Setting	Description	Range	Default
<i>Application tab</i>			
Number of Message Buffers	The number of message buffers allocated by the application used to receive messages and to transmit requests to the remote devices.	1 to 65535	5
Device Restart Delay	The delay (in seconds) between each device restart sequence at application start-up.	0.0 to 3600.0	0.0
Stagger General Interrogation	Specifies whether or not GI polls performed by the application are staggered.	Enabled Disabled	Disabled
GI Qualifier	The Qualifier to use for the General Interrogation poll.	Global, Group 1 through Group 16	Global
GI Stagger Interval	The staggered GI poll interval (in minutes).	0.0 to 1440.0	30.0
Time Zone	The Time Zone of the timestamps exchanged between this instance of the Client and all IEDs it communicates with. NOTE: If a different time zone is required for an IED, you need to create a new instance of the Client.	One of listed Time Zones and geographic locations	UTC
Backoff Time	The time (in seconds) to wait before the application tries to re-contact a device after a communication failure.	0 to 65535	30
Minimum Inter Poll Delay	The minimum time delay (in minutes) between any two consecutive application level polls.	0.0 to 1440.0	0.0
Ignore Unrequested GI Data	Specifies if the DCA will ignore data reported with a cause of transmission of one of the interrogation types (i.e., 20-36) when there is no GI pending.	Enabled or Disabled	Disabled
Max ADSU Frame Length	The maximum value for the length (in octets) of non-background messages (excluding framing overhead).	24 to 255	255
Extra Frame Timeout	The time (in milliseconds) that the application adds to the frame timeout calculation.	0 to 65535	150
Max Confirm Idle Time	The maximum communication idle time (in milliseconds) before the application must receive a confirm message.	1 to 65535	100
Max Respond Idle Time	The maximum communication idle time (in milliseconds) before the application must receive a respond message.	1 to 65535	100

Setting	Description	Range	Default
Max Transmit Retries	The maximum number of transmissions retries before declaring that communication with a remote device has failed.	1 to 255	1
Wait Between Messages	The minimum time (in seconds) to wait between polls (measured from receiving the response of one poll to the beginning of the next poll).	0.0 to 60.0	0.0
Link Transmission Mode	The link transmission mode used by the application. NOTE: Backup ports are not supported on <i>Balanced</i> mode.	Unbalanced Balanced	Unbalanced
<i>Unbalanced Serial Link tab</i>			
Background Polling Interval	The interval (in seconds) of background autonomous polling that happens at the data link layer.	0.0 to 86400.0	3.0
Reply Poll Count	The Maximum number of times to poll a device for Class 2 and 1 data, after receiving a positive acknowledgement at the link layer (CONFIRM:ACK), in response to a "SEND/CONF user data" request at the link layer, that was sent due to an application level request.	0 to 255	10
