Max Poll Count	The maximum number of times to poll a device for Class 1 data before changing to poll the next device, while performing background autonomous polling.	1 to 255	3
<i>Balanced Serial Link tab</i>			
Extra Response Timeout	The time (in milliseconds) to add to the frame timeout calculation.	0 to 65535	200
Inter Frame Gap	The minimum idle time (in milliseconds) between frames transmitted by the application.	0 to 1000	0
Single Char Acknowledgement	Specifies if the application replies to the remote device with a single character acknowledgement.	Enabled Disabled	Disabled

IEC 60870-5-103 Multi-drop

The following settings are used when configuring an IEC 60870-5-103 Multi-drop connection.

Table 6-113: IEC 60870-5-103 Multi-drop Settings

Setting	Description	Range	Default
Auto Start	Indicates if the client application automatically starts when the configuration is changed and reloaded or when the MCP re-boots.	Disabled Enabled	Disabled
Secure Type	Select a security feature to be enabled on the connection. For more information, refer to Connection Security .	Disabled Telnet TLS Security SSH Secure Tunnel	Disabled
TLS port	Enter the port number that can be used to access the secure connection.	1 to 65535	50000 + X
File	Select the security parameters defining this connection. After a configuration can be created, it can be saved and reused on other connections. Refer to Secure Application Parameters .	List of saved security settings	N/A

Setting	Description	Range	Default
Application Parameters	Select the application parameters defining this connection. The default parameters can be used, or a custom configuration can be created. Refer to IEC 60870-5-103 Multi-drop Application Settings .	Use Default Use Custom	Use Default
Line ID	Text description to identify the electrical transmission line associated with this serial connection.	1 to 64 ASCII characters	Line X
Device ID	Text description to identify the device associated with this serial connection.	1 to 63 ASCII characters	Device X
Bay ID	Text description to identify the bay area associated with this serial connection.	1 to 256 ASCII characters	Bay X
Common Address of ASDU	The device's common address of ASDU.	0 to 254	1
Link Address	The link address of the device.	0 to 254	1
Map File	Name of the Client map file to be used with the specific device.	List of users configured client map files.	N/A
Enable on Start Up	Indicates if communication to the device automatically starts when the configuration is changed and reloaded or when the MCP re-boots.	Disabled Enabled	Disabled

IEC 60870-5-103 Multi-drop Application Settings

IEC 60870-5-103 settings are available under the **Application Parameters** field.

Tip: It is recommended to configure both the Max Confirm Time and Max Response Time values to be less than the configured Back off Time value.

Table 6-114: IEC 60870-5-103 Application Parameters

Setting	Description	Range	Default
Number of Message Buffers	The number of message buffers allocated by the application used to receive messages and to transmit requests to the remote devices.	1 to 65535	1000
TCP Pass Through Port	The TCP port number used by the application to listen for a pass-through service connection from an IED vendor PC program. A port number of 0 disables the Pass-Through connection service.	0 to 65535	0
Passthrough Response Timeout	The duration (in seconds) of silence on the serial interface before the application closes the pass-through connection	1.00 to 300.00	120.0
Max Confirm Idle Time	The maximum communication idle time (in milliseconds) before the application must receive a confirm message.	1 to 65535	500
Max Respond Idle Time	The maximum communication idle time (in milliseconds) before the application must receive a respond message.	1 to 65535	1000
Max Transmit Retries	The maximum number of transmission retries before declaring that communication with a remote device has failed.	1 to 255	1

Setting	Description	Range	Default
Backoff Time	The time (in seconds) to wait before the application tries to re-contact a device after a communication failure.	0 to 65535	30
Background Polling Interval	The interval (in seconds) of background autonomous polling that happens at the data link layer.	0.0 to 86400.0	0.5
Wait Between Messages	The minimum time (in seconds) to wait between polls (measured from receiving the response of one poll to the beginning of the next poll).	0.0 to 60.0	0.0
Quick Check	Specifies whether or not quick check is performed between standard polling for class data	Enabled Disabled	Disabled
Reply Poll Count	The Maximum number of times to poll a device for Class 2 and 1 data, after receiving a positive acknowledgement at the link layer (CONFIRM:ACK), in response to a "SEND/CONF user data" request at the link layer, that was sent due to an application level request.	0 to 255	10
Max Poll Count	The maximum number of times to poll a device for Class 1 data before changing to poll the next device, while performing background autonomous polling.	1 to 255	3
Reset Link Function Code	The function code for the reset link request	RESET_CU RESET_FCB	RESET_FCB
Time Zone	The time zone for this instance of the DCA or DPA.	One of listed Time Zones and geographic locations	UTC

IEC 60870-5-104 IED Block

The following settings are used when configuring an IEC 60870-5-104 IED block.

Table 6-115: IEC 60870-5-104 IED Block

Setting	Description	Range	Default
Auto Start	Indicates if the client application automatically starts when the configuration is changed and reloaded or when the MCP re-boots.	Disabled Enabled	Disabled
Application Parameters	Select the application parameters defining this connection. The default parameters can be used, or a custom configuration can be created. Refer to IEC 60870-5-104 IED Block Application Settings .	Use Default Use Custom	Use Default
Line ID	Text description to identify the electrical transmission line associated with this serial connection.	1 to 64 Unicode characters	Line X
Device ID	Text description to identify the device associated with this serial connection.	1 to 63 Unicode characters	Device X
Bay ID	Text description to identify the bay area associated with this serial connection.	1 to 256 Unicode characters	Bay X
Common Address of ASDU	The device's common address of ASDU.	0 to 254	1

Setting	Description	Range	Default
Map File	Name of the Client map file to be used with the specific device.	List of users configured client map files.	N/A
IP Address	IP Address of the device.	Single IP Address	0.0.0.0
Backup IP Address	Redundant backup IP Address of the device.	Single IP Address	Blank
Network Port #	The port number on which the device communicates.	0 to 65535	2404
Transport Layer	Whether to use TCP or UDP network protocol.	Non-editable	TCP
Enable on Start Up	Indicates if communication to the device automatically starts when the configuration is changed and reloaded or when the MCP re-boots.	Enabled Disabled	Disabled

IEC 60870-5-104 IED Block Application Settings

IEC 60870-5-104 settings are available under the Application Parameters field.

Table 6-116: IEC 60870-5-104 IED Block Application Parameters

Setting	Description	Range	Default
<i>Application tab</i>			
Number of Message Buffers	The number of message buffers allocated by the application used to receive messages and to transmit requests to the remote devices.	1 to 65535	5
Device Restart Delay	The delay (in seconds) between each device restart sequence at application start-up.	0.0 to 3600.0	0.0
Stagger General Interrogation	Specifies whether or not General Interrogation (GI) polls performed by the application are staggered.	Enabled Disabled	Disabled
GI Qualifier	The Qualifier to use for the General Interrogation poll.	Not editable	Blank
GI Stagger Interval	The staggered General Interrogation poll interval (in minutes).	Not editable	Blank
Time Zone	The Time Zone of the timestamps exchanged between this instance of the Client and all IEDs it communicates with. NOTE: If a different time zone is required for an IED, you need to create a new instance of the Client.	One of listed Time Zones and geographic locations	UTC
Backoff Time	The time (in seconds) to wait before the application tries to re-contact a device after a communication failure.	0 to 65535	30
Minimum Inter Poll Delay	The minimum time delay (in minutes) between any two consecutive application level polls.	0.0 to 1440.0	0.0
<i>Network tab</i>			
Max Length APDU Frame	The maximum length (in octets) of APDU frames.	253	Not editable

Modbus Multi-drop

The following settings are used when configuring a Modbus Multi-drop connection.

Table 6-117: Modbus Multi-drop Settings

Setting	Description	Range	Default
Auto Start	Indicates if the client application automatically starts when the configuration is changed and reloaded or when the MCP re-boots.	Disabled Enabled	Disabled
Secure Type	Select a security feature to be enabled on the connection. For more information, refer to Connection Security .	Disabled Telnet TLS Security SSH Secure Tunnel	Disabled
TLS port	Enter the port number that can be used to access the secure connection.	1 to 65535	50000 + X
File	Select the security parameters defining this connection. After a configuration can be created, it can be saved and reused on other connections. Refer to Secure Application Parameters .	List of saved security settings	N/A
Line ID	Text description to identify the electrical transmission line associated with this serial connection.	1 to 64 ASCII characters	Line X
Device ID	Text description to identify the device associated with this serial connection.	1 to 63 ASCII characters	Device X
Bay ID	Text description to identify the bay area associated with this serial connection.	1 to 256 ASCII characters	Bay X
IED Address	Protocol address of the device (i.e., Modbus device address) This parameter is applicable for Standalone/Warm-Standby/Hot-Standby devices.	1 to 254	X
IED Address A	Protocol address of the device A (i.e., Modbus device A address). This parameter is applicable only for Hot-Hot devices.	1 to 254	X
IED Address B	Protocol address of the device B (i.e., Modbus device B address). This parameter is applicable only for Hot-Hot devices.	1 to 254	X
Map File	Name of the Client map file to be used with the specific device.	List of users configured client map files.	N/A
Enable on Start Up	Indicates if communication to the device automatically starts when the configuration is changed and reloaded or when the MCP re-boots.	Disabled Enabled	Disabled

Setting	Description	Range	Default
Hot-Hot Communication	This parameter is available only if Hot-Hot redundancy is system level redundancy is enabled. If this parameter is enabled both the MCP units communicate to the IEDs simultaneously. If Hot-Hot is enabled, then IED Address A – Communication from MCP A IED Address B - Communication from MCP B And, if Hot-Hot is disabled, then Both MCP units in the redundancy communicate from the Active MCP unit only and use IED Address/Master Address.	Disabled Enabled	Disabled

Modbus TCP or TCP/SSH IED Block

The following settings are used when configuring a Modbus TCP or TCP/SSH IED block.

Table 6-118: Modbus TCP or TCP/SSH IED Block connection settings

Setting	Description	Range	Default
Auto Start	Indicates if the application automatically starts when the configuration is changed and reloaded or when the MCP re-boots.	Disabled Enabled	Disabled
Line ID	Text description to identify the electrical transmission line associated with this connection.	1 to 64 ASCII characters	Line X
Device ID	Text description to identify the device associated with this connection.	1 to 63 ASCII characters	Device X
Bay ID	Text description to identify the bay area associated with this connection.	1 to 256 ASCII characters	Bay X
IED Address	Address of the device. This parameter is applicable for Standalone/Warm-Standby/Hot-Standby devices.	1 to 254	N/A
IED Address A	Address of the device A. This parameter is applicable only for Hot-Hot devices.	1 to 254	N/A
IED Address B	Address of the device B. This parameter is applicable only for Hot-Hot devices.	1 to 254	N/A
Map File	Name of the client map file to be used with the specific device.	List of users configured map files.	N/A
IP Address	IP Address of the device. Must be unique from other configured devices.	Valid IPv4 address	0.0.0.0
Network Port Number	The port number on which the device communicates. This parameter is applicable for Standalone/Warm-Standby/Hot-Standby devices.	0 to 65535	502

Setting	Description	Range	Default
Network Port A Number	The port number on which the device A communicates. This parameter is applicable only for Hot-Hot devices.	0 to 65535	502
Network Port B Number	The port number on which the device B communicates. This parameter is applicable only for Hot-Hot devices.	0 to 65535	502
Protocol	Indicates which protocol (TCP or TCP/SSH) is to be used for Modbus IED Communication. Double click on this field to select TCP or TCP/SSH. Currently this feature is only available for UR IEDs.	TCP or TCP/SSH	TCP
SSH Parameters	Configure the SSH parameters required for this connection if Protocol configured as TCP/SSH; otherwise this field is greyed out. The default parameters can be used, or a custom configuration can be created. Refer to Modbus TCP or TCP/SSH IED Block configuration parameters for more information.	Use Default Use Custom	Use Default
Enable on Start Up	Indicates if communication to the device automatically starts when the configuration is changed and reloaded or when the MCP re-boots.	Enabled Disabled	Disabled
Hot-Hot Communication	This parameter is available only if Hot-Hot redundancy is system level redundancy is enabled. If this parameter is enabled both the MCP units communicate to the IEDs simultaneously. If Hot-Hot is enabled, then IED Address A /Network Port A – Communication from MCP A. IED Address B/Network Port B - Communication from MCP B. And, if Hot-Hot is disabled, then Both MCP units in the redundancy communicate from the Active MCP unit only and use IED Address/Master Address. Note: If the Protocol type is “TCP/SSH” then Hot-Hot Communication is disabled by default.	Disabled Enabled	Disabled

Generic ASCII Client

The Generic ASCII application is designed to extract data from devices using an ASCII-based communications protocol over a serial port. The information collected from these devices is stored in the internal system database of the MCP.

Fault and Event Information is collected from connected devices, as well as Protective Relay Fault Information to facilitate user notification of faults. This support is available for the SEL family of devices.

The Generic ASCII application supports multi-drop device configuration and multi-encoding formats; that is, Hex, Decimal, Binary, Packed BCD and ASCII.

NOTE: The Generic ASCII application does not support operation of controls on external devices.

The following settings are used when configuring a Generic ASCII connection.

Table 6-119: Generic ASCII Settings

Setting	Description	Range	Default
Auto Start	Indicates if the client application automatically starts when the configuration is changed and reloaded or when the MCP re-boots.	Disabled Enabled	Disabled
Support Multi-Drop	Indicates if the client application supports Multi-Drop serial devices. If selected, you can add multiple ASCII IED blocks in the client application.	Disabled Enabled	Enabled
Application Parameters	Select the application parameters defining this connection. The default parameters can be used, or a custom configuration can be created. Refer to Generic ASCII Client Application Settings .	Use Default Use Custom	Use Default
Secure Type	Select a security feature to be enabled on the connection. For more information, refer to Connection Security .	Disabled Telnet TLS Security SSH Secure Tunnel	Disabled
TLS port	Enter the port number that can be used to access the secure connection.	1 to 65535	50000 + X
File	Select the security parameters defining this connection. After a configuration can be created, it can be saved and reused on other connections. Refer to Secure Application Parameters .	List of saved security settings	N/A
Line ID	Text description to identify the electrical transmission line associated with this serial connection.	1 to 64 ASCII characters	Line X
Device ID	Text description to identify the device associated with this serial connection.	1 to 63 ASCII characters	Device X
Bay ID	Text description to identify the bay area associated with this serial connection.	1 to 256 ASCII characters	Bay X
Map File	Name of the Client map file to be used with the specific device.	List of users configured client map files.	N/A

Setting	Description	Range	Default
IED Address	Address to identify the specific device in the multi-drop device configuration. The IED Address defined can be referenced during a Transaction definition in the Client Map File using variable {\$ADDR\$}. Refer to IED Address Configuration .	0 to 99999	X
Enable on Start Up	Indicates if communication to the device automatically starts when the configuration is changed and reloaded or when the MCP re-boots.	Disabled Enabled	Disabled
Password	For devices that require a password to access information. The provided password will be stored in encrypted format.	1 to 32 ASCII characters	N/A

IED Address Configuration

The IED Address identifies the specific device in the multi-drop device configuration.

The IED Address defined in the Connection page is available as a variable {\$ADDR\$} for further use while configuring Transaction Messages and Valid Response Pattern parameters in the Client Map File.

For example:

To define a Transaction Message to be sent to a device which contains the IED Address:

```
Device 1   :   IED Address: 1241
              Transaction Message: 1231241,I01241

Device 2   :   IED Address: 1242
              Transaction Message: 1231242,I01242
```

The required Transaction Message is to be configured using one of the following methods:

- Method 1 : Define a single Client Map file for both the devices with Message Out as 123{\$ADDR\$},I0{\$ADDR\$} and assign the same Client Map File for both devices in the Connection page.
- At runtime, the MCP frames the required Transaction Message as 1231241,I01241 for Device 1 and 1231242,I01242 for Device 2.
- Method 2 : Define multiple Client Map files with Message Out as 1231241,I01241 and the other file with Message Out as 1231242,I01242 and assign respective Client Map File for both the devices in the Connection page.
- Refer to the [Time Sequence Diagrams and Sample Configuration](#) for a more detailed explanation.

SEL Binary

The Schweitzer Engineering Laboratories (SEL) Binary protocol supports the exchange of information with SEL Fast Meter metering and relay devices over a serial link. It also supports pass through connection to the device.

SEL Binary Client Application Parameters

SEL Binary Client application settings are available under the **Application Parameters** field.

Table 6-120: SEL Binary Client Application Parameters

Setting	Description	Range	Default
Wait Between Messages	Duration, in seconds, to wait to transmit a new message after a response to the previous message has been received	0 to 60.00	0.1
Wait Between Cycles	Duration, in seconds, to wait to begin a new cycle of collecting data points after the previous one was complete	0 to 60.00	0
Response Timeout	Maximum duration, in seconds, to wait for a response from the device	0.100 to 300.00	1
Comm Retries	Number of retries on the communications channel before the device is determined offline	0 to 100	2
Passthrough Response Timeout	Duration, in seconds, for which the device waits on the Serial Interface to obtain a response to a communication message received on the Pass-Through socket	1.00 to 300.00	5
Demand Data Poll Cycle	How many times the Fast Meter Data must be retrieved before Demand Data can be polled. 0 disables Demand Data polling.	0 to 36000	600
Peak Demand Data Poll Cycle	How many times the Fast Meter Data must be retrieved before Peak Demand Data can be polled. 0 disables Peak Demand Data polling.	0 to 36000	600
History Poll Cycle	How many times the Fast Meter Data must be retrieved before the History command can be sent to the SEL device. 0 disables the History command.	0 to 36000	3600
Fault Reset Time	Time, in seconds, for which the fault parameter pseudo points retain values from the latest fault.	0 to 3600	5
Restrike Interval	Once the first fault has occurred, the time to wait (in seconds) before updating the Fault Pseudo points with information if subsequent faults occur before this interval has elapsed.	0 to 3600	30

SEL Binary

The following settings are used when configuring a SEL Binary connection.

Terminal emulation settings should be set to CR (carriage return) for <ENTER>.

For example:

- Secure Terminal Emulator from DS Agile MCP Studio, by default sends/receives LF (linefeed) on <ENTER>
- Secure Terminal Emulator serial mode by default sends/receives CR on <ENTER>
- Hyper Terminal, by default sends/receives LF on <ENTER>

Table 6-121: SEL Binary Settings

Setting	Description	Range	Default
Auto Start	Indicates if the client application automatically starts when the configuration is changed and reloaded or when the MCP re-boots.	Disabled Enabled	Disabled
Secure Type	Select a security feature to be enabled on the connection. For more information, refer to Connection Security .	Disabled Telnet TLS Security SSH Secure Tunnel	Disabled
TLS port	Enter the port number that can be used to access the secure connection.	1 to 65535	50000 + X
File	Select the security parameters defining this connection. After a configuration can be created, it can be saved and reused on other connections. Refer to Secure Application Parameters .	List of saved security settings	N/A
Line ID	Text description to identify the electrical transmission line associated with this serial connection.	1 to 64 ASCII characters	Line X
Device ID	Text description to identify the device associated with this serial connection.	1 to 63 ASCII characters	Device X
Bay ID	Text description to identify the bay area associated with this serial connection.	1 to 256 ASCII characters	Bay X
Map File	Name of the Client map file to be used with the specific device.	List of users configured client map files.	N/A
Enable on Start Up	Indicates if communication to the device automatically starts when the configuration is changed and reloaded or when the MCP re-boots.	Disabled Enabled	Disabled
Password	For devices that require a password to access information.	1 to 32 ASCII characters	N/A

SEL DCA Workflow at startup with the Auto Discovery File

- Go to DSAS offline editor/online editor and add a SEL binary client connection under 'Connections → New Connection' tab.
- Select any existing SEL relay mapfile e.g., SEL-351.xml from the drop down list of mapfiles.
 - Choose a mapfile from the list which matches to the type of the relay.
 - Enter the Level 1 and Level 2 passwords , serial port settings, protocol settings as per the SEL relay manuals.
 - If the passwords are not configured properly then SEL binary client still continue to connect to the relay, however the operations that need access to the relay (Level 1 and/or Level 2) will not work properly. This includes:
 - Failed to retrieve auto discovery file from the relay
 - Failed to retrieve EVE/CEV files from the relay, etc.
 - Apply the new configuration into MCP either through DSAS offline or online editor.

3. After applying the configuration to MCP, the SEL binary client application starts and will not retrieve and use the auto discovery file by default to communicate with the relay even though the serial connection is available with the relay; this is to prevent accidental overwriting of data.
4. After applying either of PULSE ON, LATCH ON or CLOSE command on “Retrieve self description file from IED” Digital Output (DO) point, the SEL binary client starts retrieving the auto discovery information from the relay and creates the auto-discovery file.

This file is saved by SEL binary client as:

```
"/mnt/usr/DeviceConfigure/MapFiles/DCA/selbin/
<homedir>_<FID only first 5 groups>_<CID>_<Port Type>_auto.xml",
```

Where:

<homedir> is the Home Directory of this connection instance,

<FID> is the SEL device FID (Factory Identification),

<CID> is the SEL device CID (Configuration Identification),

<Port Type> is “SER” if the SEL binary client application retrieved the file over a serial port or “VP” if the SEL binary client application retrieved the file over a virtual serial port.

An example filename is: “0000002_SEL-387L-R100-V0-Z001001_1234_VP_auto.xml”, where:

“0000002” is the <homedir>,

“SEL-387L-R100-V0-Z001001” is the <FID only first 5 groups> and trimmed to maximum 24 characters,

“1234” is CID, 4 characters,

“VP” is the <Port Type>,

“_auto” indicates is a retrieved file.

Notes:

- The <Port Type> part of the auto-discovery filename is only available in MCP V520 and higher.
 - The <CID> part of the auto-discovery filename is only available in MCP V540 and higher.
5. If PULSE OFF, LATCH OFF or TRIP command is issued on “Retrieve self description file from IED” Digital Output (DO) point then the retrieval of auto-discovery file will not happen.
 6. User can use the retrieved auto discovery file either in the online editor or after a “sync from” from in the offline editor, and then select this file i.e., auto-discovery file as a mapfile in the connections.
 7. User can save this file with a different name relevant to the specific SEL IED model and Firmware version.
 8. User can assign IEC61850 object references for the points in the Client Map File, similar as for other client applications from the offline editor.
 9. Below are some other notes/info related to the auto-discovery file(s).
 - a. When the user chooses this auto discovery file or rename the auto discovery file with a different name, then the home directory of the SEL binary client connection can be retained with the same old value or changed with a new value as per the home directory dialog.
 - b. If the mapfile is created by SEL binary client using auto discovery the addition/deletion of AI/DI/DO points is not possible either by offline or online editor (the size and order of the data is fixed, to match the SEL IED). However, user can edit any point's reference, description, group, multiplier, offset and state description(either from online or offline). User also can use offline editor to add IEC61850 object references.

10. If the user creates a new file either from offline or online editor then addition/deletion of the points are allowed. However, this file will not be useful as SEL binary client detects that the point data from the relay and point data available in the mapfile are different, and hence it will not start the polling with the device i.e., all the points are created from the SEL binary mapfile only, however the field point qualities are offline/invalid.
11. After applying the new configuration into MCP device, SEL binary client will use the new configuration in the SEL connections and starts the communication with the relay.
12. If Redundancy is configured either as Warm Standby or Hot-Hot/Hybrid, then use the Redundancy Manager "Sync Config" Digital Output (DO) point to sync the auto discovery file(s) to the Standby MCP.
13. If user again executes either of PULSE ON, LATCH ON or CLOSE on "Retrieve self description file from IED" DO point, then above steps 5 -10 and/or 5-11 will be repeated.

Types of Points

1. Fast Meter Analog Input
2. Demand Channel Analog Input
3. Peak Demand Channel Analog Input
4. SER Digital Input
5. Device Digital Output
6. Text (not available in GUI)

Notes:

1. Except Text points all the above points are available in the SEL auto-discovery XML created by the SEL binary client.
2. Point IDs are generated created by the SEL binary client automatically. The assignment of the Point IDs is created for each point sequentially as follows.
 - a. Text point - Ph Rotation
 - b. Fast Meter AI points.
 - c. Tar_xxx DI points
 - d. Dynamic field AI points - Depends on Calc Blocks & Calc Block Type. These are basically points created for Voltage(kV), Current(Amps),1-Phase and 3-Phase Power(MW/MVAR) calculations.
 - e. Demand Channel AI points
 - f. Peak Demand Channel AI points.
 - g. Dynamic field DO points - Open/Close Breakers, Set/Reset Remote Bits, Pulse Remote Bit and Target Reset.
 - h. SER DI points
 - i. Other Text points - FID, Device ID and Device Code
3. If at runtime, the Device Online is ON, and Communications with the SEL IED are good, but the Points from the SEL IED are offline - this indicates the assigned Client Map File in the configuration does not match the SEL IED.

Metadata Information

The metadata presented in the SEL client mapfile are read-only if the file is auto-discovery.

- NoOfTargets
- NoOfBreakers
- NoOfRemoteBits
- PulseRemoteBits
- NoOfTargetResetBlocks
- NoOfCalculationBlocks
- Block1 .. 4 CalculationType

Dynamic Field Points

The point names, e.g., IA1 (Present Values) for Fast Meter, IA (Demand Value) for Demand Meter, IA (Peak Demand Value) for Peak Demand Meter, *[Tar0_1] for DI points and FID for Text points come from the relay directly as a part of auto-discovery from the SEL binary client. So, the SEL binary client application uses these details and populates them into the auto-discovery XML file directly.

In addition, the SEL binary client also creates other AI points in the Fast Meter section and DO points in the Device Digital Output section in the auto-discovery xml. These points are "Dynamic" and are created using the above Metadata information received from the relay, i.e., these points are populated into the auto-discovery XML file indirectly by the SEL binary client application.

Dynamic Field Points are shown in the Client Map editor in blue text.

Excluded characters Since the point reference in MCP supports only printable ASCII characters, SEL binary client will remove the below characters from the point references before writing into the auto-discovery XML file.

- Non-Printable characters with ASCII value between 0 and 31 (both are inclusive)
- Extended ASCII characters between 128 and 255 (both are inclusive)

The point description of the points will be same as the point reference.

Limitations/Constraints

1. The SEL binary client compares the count of the points for each of the above types from the relay with the same data in the mapfile and then continues with the creation of RTDB.
2. If the user manipulates the points order by tweaking the XML outside of the MCP Editor behavior of the SEL application is unpredictable.
This is the reason that no points are added or deleted in the auto-discovery XML file.
3. The auto discovery file will be created as a part of Latch On/Pulse On/Close command on "Retrieve self description file from IED" DO point after 30 -50 secs (depends on the type and configuration in the relay). This means that if the user issues a command on this DO point from the HMI, Master or Automation application then the command response is either positive or negative will come only after the auto-discovery file is created.
4. SEL binary client will start the polling, command processing, pass through or file retrieval only after initial evaluation of HIS, EVE and CVE command support with the relay. This is applied to retrieve the auto-discovery XML file when DO command is applied on "Retrieve self description file from IED".
5. The Text point Ph_Rotation (Present Values) with Point ID = 1 will contain the value only when NoOfCalculationBlocks field in the Device Properties is greater than 0; or else it's value will be empty.

LogicLinx Device

A LogicLinx Device connection is used to define a communications link between the LogicLinx application running on the MCP and a PC running the LogicLinx Editor.

Once assigned, the connection appears with port details.

SNMP Block

SNMP, or Simple Network Management Protocol, is primarily used in network management systems to monitor network-attached devices for conditions that warrant administrative attention. The MCP can be configured to receive SNMP messages on a polled or unsolicited basis.

The following settings are used when configuring an SNMP block.

Table 6-122: SNMP Block connection settings

Setting	Description	Range	Default
Auto Start	Indicates if the application automatically starts when the configuration is changed and reloaded or when the MCP re-boots.	Disabled Enabled	Disabled
Line ID	Text description to identify the electrical transmission line associated with this connection.	1 to 64 ASCII characters	Line X
Device ID	Text description to identify the device associated with this connection.	1 to 63 ASCII characters	Device X
Bay ID	Text description to identify the bay area associated with this connection.	1 to 256 ASCII characters	Bay X
Map File	Name of the client map file to be used with the specific device.	List of users configured map files.	N/A
IP Address	IP Address of the device. Must be unique from other configured devices.	Valid IPv4 address	0.0.0.0
Backup IP Address	Redundant backup IP Address of the device.	Valid IPv4 address	0.0.0.0
Enable on Start Up	Indicates if communication to the device automatically starts when the configuration is changed and reloaded or when the MCP re-boots.	Enabled Disabled	Disabled

Configure to acquire files (ARRM)

[ARRM ASCII Directory Delta Support](#)

Automated Record Retrieval Manager Overview

The Automated Record Retrieval Manager retrieves and stores record files from devices connected to your MCP. The [ARRM Viewer](#) can be used to view the status of this application and to initiate manual transfers.

You can retrieve downloaded records from the MCP using any FTP/SCP/SFTP/TFTP/MMS/SEL Binary/Generic ASCII (supports SEL ASCII protocol) client as needed or on a scheduled basis.

You can also configure the MCP to automatically push files to a remote location using the Sync Manager utility. For more information refer to Sync Manager. Also, this application requires additional license (for more details, see [Software Licensing Tools](#)).

ARRM uses the Trivial File Transfer Protocol (TFTP) or File Transfer Protocol (FTP) or Secure File Transfer Protocol (SFTP) or MMS to retrieve the files from the IED to the device over a local area network (LAN). It is not recommended to perform TFTP or MMS file transfers over WAN systems subject to long and variable packet latencies.

Depending on the IED types and schema used, file retrievals are triggered by:

- The transition of the *RcdMade* digital input point from 0 to 1
- A change in the *FaultNumber* analog input or accumulator point
- Operation of the file retrieval pseudo point, or
- Manual activation through the ARRM application.

The ARRM has the following Primary features and functions:

- Automatic, manual, or connection poll-based retrieval of records from devices
- File naming based on configurable parameters or the [IEEE C37.232-2007 File Naming Convention for Time Sequence Data](#)
- File storage organized by device and/or station
- Clearing the file available status on the GE Vernova D25 IED
- Easy to use interface accessible through the Online HMI

- Visual indication of device online/offline status
- A simple configuration interfaces
- [Pseudo points](#) to trigger file retrievals and to view application status
- Support for [MCP system redundancy](#)

ARRM and MCP System Redundancy

In a redundant system setup, the active unit is responsible for retrieving records from devices. Redundancy is supported by mirroring retrieved files on both the active and standby units. The MCP redundancy manager is notified of file or directory changes by the active unit and automatically synchronizes them on the standby unit. This is done as soon as possible but notifications are not made more than every 10 seconds to reduce network traffic.

ARRM Configuration

The Automated Record Retrieval Manager retrieves and stores from devices connected to your MCP. Examples of files are: Oscillography COMTRADE, SOE logs, Events, Generic data, Information about the IED, IEC 61850 SCL files (IID). The **ARRM** configuration page allows you to configure the ARRM application.

The configuration page is split into two tabs: **Applications** (stations, devices, and file sets), and **File Set Template** (parameters for retrieving files from different types of devices).

ARRM Viewer

The **ARRM Viewer** page is divided into several areas.

Screen Areas

The ARRM Viewer window is comprised of several areas.

Table 6-123: ARRM Viewer - Screen Area

Screen Area	Description
Left pane - Tree view	The left pane provides a hierarchical overview of the stations and devices in your network.
Upper right pane - Device view	The upper right pane shows a tabular listing of devices in your network, including device status and file retrieval status. Selecting a station or device in the left pane filters the grid to only show the selected entries.
Lower right pane - Message log	The lower right pane contains a listing of all communication events (transfer attempts, file downloads, error reports) that have occurred since polling was started. Entries are ordered as they are received, and not necessarily chronologically by their timestamp.
Status Icon	The icon in the bottom right of the window indicates the current connection status of the application.

» To perform actions on devices:

1. Select the station containing the desired device. A listing of devices and file sets within the station is shown.
2. Right-click the row containing the desired file set.
3. On the popup menu, select:
 - **Trigger File Set Retrieval** to manually initiate a file set download. If you select this option, the **Status** field changes to show the progress of the transfer. Status definitions are shown on definition for the [Retrieval State pseudo-point](#).
 - **Clear Recorder Memory** to trigger ARRM to operate the configured digital output point that is mapped to the *MemRs* command. In addition, if the control is successful and the file retrieval method is set to *Fault Number*, ARRM clears the last reported fault number.
 - **Download Files** to save retrieved records from the MCP to your local computer.

Enterprise Synchronization

See the following sections for details:

[Automated Record Retrieval Manager Overview](#)

[Configure ARRM](#)

[Configure Applications](#)

[Configure File Set Templates](#)

[ARRM Viewer](#)

[About Oscillography Files and IEEE File](#)

Applications - ARRM

The **Applications** tab of the ARRM configuration window allows you to configure stations, devices, and file sets to be retrieved by the ARRM application.

Click the  button to create...

- A new station when the company is selected.
- A new device when a station is selected.
- A new file set when a device is selected.

Click the  button to delete the selected station, device, or file set.

Company > General sub-tab

Click the highest item in the tree to access **Company** settings.

Table 6-124: ARRM - General Sub-tab

Field	Description
Company Name	The name of the company that is saved to the oscillography data filename. Range is 1 to 32 alphanumeric characters.
MCP Gateway Name	The name of the MCP Gateway that is included in the ARRM Connection Status File. Range is 1 to 32 alphanumeric characters. For more details, refer to the Connection Polling section.
Maximum Num of Concurrent Retrievals	Enter the number of files that can be retrieved at the same time. This setting is useful in reducing the load that ARRM places on poor networks or networks with many devices. Range is 1 to 256, default is 10. NOTE: Queued file retrievals are initiated at the TFTP/FTP/SFTP retry interval. For example, if you have set the TFTP/FTP/SFTP retry interval to five minutes and have set the number of concurrent file retrievals to 10, ARRM attempts to download 10 files every five minutes. Considering that retrieved files will likely not be examined in real time, it is not recommended to exceed 20 concurrent file retrieval sessions to accelerate the transfers.
Default Time Tag Reference	Select whether stations belonging to this company apply a time tag based on first sample or time trigger. Stations can be configured to override this setting on a case-by-case basis.
Create Station Subdirectories	Select whether to create a separate folder within the storage folders for each station. If this setting is not enabled, all device directories are stored within the root folder.
Create Device Subdirectories	Select whether to create a separate folder within the storage folders (and, if selected, the station subfolder) for each device.

NOTE: It is recommended that the creation of Station and Device Subdirectories be enabled when using non-IEEE file naming, to prevent mixing different Substations and IEDs files in the same folder. This is also required for correct file structuring when pushing the files to Enterprise systems.

Company > Global TFTP sub-tab

Table 6-125: ARRM - Global TFTP Sub-tab

Field	Description
Block Size (bytes)	Block size for TFTP communication Default is 2,048
Retries	The number of times ARRM is to retry a file transfer that has timed-out. Valid range is 0 to 10 times. Default is 2 times.
Retry Interval	If there is a network error, ARRM retries the file retrieval at a configured interval. Enter the amount of time, in seconds, that ARRM must wait before retrying a file transfer that has failed. Valid range is 1 to 86400. Default is 5.

 Station
Table 6-126: ARRM - Station

Field	Description
Station Name	The name of the station that is saved to the oscillography data filename. Valid range is a name that is between 1 and 6 characters in length and must be unique from any other configured station name. Default text is in the format "St x" where x is a system-generated number.
Use Default Time Tag Reference	If set to true , the default time tag reference defined on the <i>Company</i> level is used for this station. If set to false , an override can be specified. Default value is true.
Time Tag Reference	Select whether the station applies a time tag based on first sample or time trigger. This field is disabled when <i>Use Default Time Tag Reference</i> is set to <i>true</i> . Default value is disabled.
Default Time Zone	The default time zone for devices within the selected station. Devices can be configured to override this setting on a case-by-case basis. Default value is UTC.
Devices Adjust for DST	Specify whether devices within this station automatically adjust for daylight saving time. Default value is false.
Global Connection Polling Interval	Specify the Global Connection Polling Interval of the Station in minutes. Range is 1 to 1440 minutes. Default value is 5 minutes.

 Device > Device sub-tab
Table 6-127: ARRM - Device Sub-tab

Field	Description
Device Name	The name of the device saved to the oscillography data filename. Valid range is a name that is between 1 and 14 characters in length and must be unique from any other device within the station. Default text is in the format "Device x" where x is a system-generated number. Refer to ARRM FTP Directory Delta Support for Different ftp Is Formats section for the Device Name Suffix.
Use Default Time Zone	Specify if the selected device should use the time zone configured on the station level. Default value is true.
Time Zone	Select the time zone that the device is located in. Disabled when <i>Use Default Time Zone</i> is set to <i>true</i> . <i>Default is disabled.</i>
Device Adjusts for DST	Specify whether the device automatically adjusts for daylight saving time. <i>Default is disabled.</i>
Logical Device Name	The device name that the ARRM application uses to replace the "%s" format specifier in the file set template configuration, during the file set retrieval operation. Valid range is a name that is 32 characters or less in length. Default value is Empty.
Use Global Station Connection Polling Interval	Specify if the Global Connection Polling Interval configured for the station allows for poll-based File set retrieval. Default value is True.

Field	Description
Device Connection Polling Interval	Specify if the Device Level Polling Interval (in minutes) allows for poll-based File set retrieval. This parameter is enabled when <i>Use Global Station Connection Polling Interval</i> is set to False. Range is 1 to 1440 minutes. Default value is 5 minutes.

Device > File Server sub-tab

Table 6-128: ARRM - File Server Sub-tab

Field	Description
Server Type	Select the type of server to use when connecting to the device. MMS is only available if an IEC 61850 configuration is loaded on the MCP and UR/SFTP is only available if Modbus TCP IED is configured with protocol TCP/SSH. Default value is TFTP. NOTE: File Set Templates with File retrieval mode as Directory Delta cannot work when server is configured as TFTP.
Retrieval Retry Interval (seconds)	If there is a communications error, ARRM retries the file retrieval at a configured interval. Enter the amount of time ARRM waits before retrying a file transfer that has failed. Valid range is 1 to 60000, default is 60.
FileSet Trigger Delay (seconds)	The amount of time (in seconds) after which the ARRM application starts processing file set retrieval, after receiving a file set trigger request.
TFTP Primary Server IP Address	The IP Address of the Primary TFTP server. Available if the server type is TFTP. Default value is Empty.
TFTP Secondary Server IP Address	The IP Address of the Secondary TFTP server. Available if the server type is TFTP. Default value is 0.0.0.0.
TFTP Timeout (ms)	The amount of time ARRM waits for each block in a TFTP transfer. Available if server type is TFTP. Valid range is 1 to 60000. Default is 10000.
MMS Device	Select the IEC 61850 device that is used as the file server. Available if server type is MMS.
FTP Primary Server IP Address	The IP Address of the Primary FTP server. Available if server type is FTP. Default value is Empty.
FTP Secondary Server IP Address	The IP Address of the Secondary FTP server. Available if server type is FTP. Default value is 0.0.0.0.
FTP Server TCP Port	FTP Server TCP port. Enabled when FTP is selected as the server type. Available if server type is FTP. Default value is 21.
FTP Timeout (ms)	Timeout for the FTP connection. Available if server type is FTP. Valid range is 1 to 60000, default is 10000.

Field	Description
FTP Allow Anonymous Login	Allow Anonymous Login to FTP Server. Available if server type is FTP. Enabled when FTP is selected as the server type. Default value is false.
FTP Anonymous Login Password	Password for Anonymous Login to FTP Server. Available if server type is FTP. This field is enabled when "FTP Allow Anonymous Login" is set to true. Default value is empty.
FTP Login Name	Login ID for FTP connection. Available if server type is FTP. This field is enabled when "FTP Allow Anonymous Login" is set to false. Default value is empty.
FTP Password	Password for FTP connection. Available if server type is FTP. This field is enabled when the FTP Allow Anonymous Login field is set to false. Default value is empty.
FTP Connection Mode	FTP Data Connection Mode (Active/Passive). Available if server type is FTP. Enabled when FTP is selected as the server type. Default value is Active.
FTP Data Representation Mode	Mode in which data must be retrieved from FTP Server (ASCII/Binary). Available if server type is FTP. Enabled when FTP is selected as the server type. Default value is Binary.
SFTP Primary Server IP Address	The IP Address of the Primary SFTP server. Available if server type is SFTP. Enabled when SFTP is selected as the server type. Default value is empty.
SFTP Secondary Server IP Address	The IP Address of the Secondary SFTP server. Available if server type is SFTP. Enabled when SFTP is selected as the server type. Default value is 0.0.0.0.
SFTP Server TCP Port	SFTP Server TCP port. Available if server type is SFTP. Default value is 22.
SFTP Timeout (ms)	Timeout for the SFTP connection. Available if server type is SFTP. Valid range is 1 to 60000, default is 10000.
SFTP Authentication Mode	Authentication Mode for SFTP Connection (Password/Public Key). The user needs to configure SFTP Login name and Password if Password mode is selected. For Public Key Authentication mode, you need to generate and copy the ssh public key to the location in IED specified by the vendor (click the Utilities power bar button in the MCP HMI to Generate Gateway Key Pair). Available if server type is SFTP.

Field	Description
SFTP Login Name	Login ID for SFTP Connection. Available if server type is SFTP. This field is enabled when “SFTP Authentication Mode” is set to Password. Default is empty.
SFTP Password	Password for SFTP Connection. Available if server type is SFTP. This field is enabled when “SFTP Authentication Mode” is set to Password. Default is empty.
SelBin Device	Select the SelBin device that is used as the file server. Available if server type is SELB.
Generic ASCII Device	The Generic ASCII device connected to the gateway. Available if server type is GENA.
UR/SFTP Device	Select the UR SFTP device that is used as the file server. Available if server type is UR/SFTP.
UR/SFTP Timeout (ms)	Timeout for the UR SFTP connection. Valid range is 1 to 60000, default is 30000. Available if server type is UR/SFTP.

File Set

Table 6-129: ARRM - File Set

Field	Description
File Set Name	A unique identifier for the file set. Range is 1 to 32 ASCII characters. Default value is in the format “File Set x” where x is a system-generated number.
File Set Template	Select one of the available file set templates .
Include in Connection Polling	Specifies whether polling is enabled or disabled. If this parameter is enabled (True), File Set retrieval occurs through connection polling. Default value is False. NOTE: If this parameter is true, it is recommended to use the Overwrite option in the Fileset Template to avoid High Disk Usage. In the case of COMTRADE files, use the “New file with IEEE naming” option. NOTE: Users should include for connection polling only files which are always available in the end device, otherwise the connection poll may result in a failed file transfer, due to the file(s) no longer being available in the end device. NOTE: User shall not be able to configure file sets that have no means to be retrieved i.e., at least one retrieval trigger (RcdMade Mapped DI Point) or Connection Polling must be “True”. NOTE: File Retrieval using Static Name in the File Set Template requires either “Include in Connection Polling” or a mapped “RcdMade Mapped DI Point” configured.
Use File Trigger Event Timestamp	If set to true, event time that triggers file retrieval operation is used as a timestamp for creation of files in New File with Timestamp File Storage method. Otherwise file retrieved time is used. This is only applicable to New File with Timestamp File Storage method. Default value is false.

Field	Description
Recording Made (RcdMade) Enable	If enabled, ARRM monitors a configured digital input point mapped to the <i>Recording Made</i> indication of the device. When a specific File Set Template - Standard is selected, this field is enabled. Default is disabled.
RcdMade Mapped DI Point	If the <i>Recording Made (RcdMade)</i> setting is enabled, select a system point to monitor for RcdMade indications. When the Recording Made (RcdMade) Enable field is set to true, this field is enabled. Default is disabled. NOTE: To avoid duplication, the RcdMade DI point must be in OFF state and turn ON momentarily to signal that a new file is available or remain ON until the file is read by ARRM. This is only required if the File Set Templates File Type is General.
Fault Number Point Enable	If enabled, ARRM monitors a configured analog input or accumulator point mapped to the <i>Fault Number</i> indication of the device. When a specific File Set Template is selected, this field is enabled. Default is disabled.
Fault Number Point	If the <i>Fault Number Point Enable</i> setting is enabled, select a system point to monitor for fault number indications. NOTE: File retrieval using Fault Number requires %u in the “File Set Template→Retrieved file Absolute Path Name” field (eg: Osc%u) and mapping an AI point under “Fault Number Point”, regardless of “Include in Connection Polling” being True or False
Reset Recorder Memory (MemRs) Enable	If enabled, ARRM operates the MemRs command after the file set is retrieved. This command may also be used to clear the file trigger point in D25 devices. Default value is false.
DO MemRs Point	If the <i>Reset Recorder Memory</i> setting is enabled, select a system point to operate after a file retrieval operation is completed.

For a list of pseudo points created for this file set by the ARRM application, refer to [ARRM Pseudo Points](#).

File Set Template - Standard

The **File Set Template** sub-tab of the ARRM configuration window allows you to configure file set templates to be used by ARRM when retrieving records. Several [predefined templates](#) are provided for some popular IED models. Users have the flexibility to create and save new custom templates for other devices by entering specific file types, locations, and naming parameters.

>> To create a new standard File Set Template:

1. Click the  button to create a new file set template.
2. Choose the **Standard** option:

Select this option to support for File Archival using TFTP, MMS, FTP, or SFTP protocol.

3. Click **OK** to create a New Template.
OR click **Cancel** to exit.

>> To delete the selected template:

- Click the  button.

Table 6-130: Delete - File Set Template - Standard

Setting	Description
Template ID	A unique identifier for the file set template.
Storage Directory	This is the location on the MCP that records are stored in. This directory is located within <i>/mnt/datalog/armm/</i>. The "&" character is used as a placeholder in the Storage Directory to specify a Local File Extension for retrieved files. For example, if you want to save retrieved files with extension "abc" then the Storage Directory is to be configured as "xyz&abc", where "xyz" represents Storage Directory and "abc" represents the local extension. This is applicable to files other than the COMTRADE file type. The valid value for Storage Directory has a minimum length of 2 characters (that is, cannot be blank) and must not start or end with special characters.
File Extension	Files with this file extension are retrieved by the ARRM from the IED. The downloaded files are saved with the same file extension if the local file extension is not configured in the Storage Directory setting. This field is not used if the File Type is set to COMTRADE.
Delete Files Automatically	If enabled, ARRM automatically deletes files in the <i>Storage Directory</i> created based on this template when the storage quota is exceeded.
File Type	Select the type of file being downloaded. - For COMTRADE-based Templates, select COMTRADE-format data only - For SELBIN-based Templates: - Select EVE for Event files; e.g., EVE_10009.TXT - Select CEV for Compressed Event Files; e.g., CEV_10009.TXT - Select BOTH for EVE and CEV Event Files

Setting	Description
File Retrieval	Select a value: • Static Name: Select this option if the data to be retrieved is stored in a fixed location on the target device. • Retrieved File Absolute Path: Enter the path to the data file on the remote device. Do not enter a file extension. Add a logical device placeholder into the filename to create dynamic filenames that change based on which Device is using the template. The logical device placeholder "%s" is replaced with the Logical Device Name from the Device that is using this template. For example, /SOE/event%s. • Enable Record Number: If enabled, you can enter a number to be appended to the filename of retrieved records. This can be used for D25 SOE logs which have a record number as part of the filename (for example, enter 1 for A027_DISOE_LOG1.CSV). • Enable FileName to Save: If enabled, the retrieved remote data file is saved locally using the specified file name. • Fault Number: Select this option if a new record is created on the device each time a fault occurs. <i>Retrieved File Absolute Path:</i> Enter the path to the data file on the remote device. Do not enter a file extension. Add placeholders into the filename to create dynamic filenames that change based on which fault number is being retrieved and which Device is using the template. The logical device placeholder "%s" is replaced with the Logical Device Name from the Device that is using this template. The fault number placeholder "%[fw]u" is replaced with the fault number currently being retrieved. In place of [fw], specify either no number or a number between 1 and 20 to give the field width. For example, %3u is replaced with 003 if the retrieved fault number is 3. Specify at least 1 fault number placeholder but no more than 4. Specify 1 or no logical device placeholders. • Max Number of Files: The maximum number of files that can exist in the remote device before older files are deleted to make room for new ones. This setting prevents the MCP from attempting to retrieve files that no longer exist. • Fault Number Rollover: This is the highest fault number that the device uses before the internal fault number counter rolls over specified as "n" in 2ⁿ-1. Range is 8, 16 or 32. Default is 16. • Directory Delta: This option monitors a fixed location on the target device and downloads any new files as they are created. • Directory Name: Enter the path to the data file on the remote device. Do not enter a file extension. • File Retrieval Expression Type: This is a Unix shell-style wildcard that is used to specify the files within a directory that are considered for retrieval. Default is *, which specifies all files in the directory. The specific pattern matching symbols are as follows: * matches everything ? matches any single character [seq] matches any character in seq [!seq] matches any character not in seq

Setting	Description
File Storage	For Standard Templates, select a value: • Append: If the file does not exist, ARRM creates it. If the file exists and it is not larger than the specified maximum size, ARRM appends the contents of the retrieved file to the existing one. ARRM appends an incrementing number to the filename to distinguish between different files (for example, <i>dfr_001.txt</i>). Available for general file type only. <i>Max File Size:</i> Enter the file size, in bytes, that the download is limited to. Range is 1 to $4^{32}-1$, default is 65535. • New file with IEEE naming: A new file is created whenever information is downloaded. The file name is defined using the IEEE naming convention. Available for COMTRADE file type only. <i>User Type:</i> Specify the type of data being retrieved. This information is then appended to the file name using the IEEE naming convention. For example, you can enter <i>DFR, PQ</i>, or <i>ADCP</i>. Range is 1 to 4 ASCII characters. • New file with timestamp: A new file is created whenever information is downloaded. Enter both a file name (to which the timestamp is appended) and a valid extension. For example, <i>adcp_090416082335.txt</i> was created on April 16, 2009, at 08:23:35. Available for general file type only. • Overwrite: When the parameter Include in Connection Polling is set to True, it is recommended to use this option for retrieval of fixed files from IEDs to avoid high disk usage in the MCP due to connection polling of file sets. Available for the GENREAL file type only.

File Set Template – Sel ASCII

The **File Set Template** sub-tab of the ARRM configuration window allows you to configure file set templates to be used by ARRM when retrieving records from SEL IEDs using automated ASCII commands.

You can also create and save new custom templates for other devices by entering specific file type, location and naming parameters.

NOTE: You can determine if the SEL device supports the EVE and CEV commands by observing pseudo points status provided in the GENASCII application's point summary page.

NOTE: Ensure that the options configured in the File Type setting are supported by the SEL relay before configuring the Template. If a configured option is not supported, this is indicated by the Transaction Failure flags on the ARRM viewer.

>> To create a new Sel ASCII File Set Template:

1. Click the  button to create a new file set template.
2. Choose the Sel ASCII option:

Select this option to generate a New File Template to support Sel Binary protocol.

3. Click **OK** to create a New Template.
or
Click **Cancel** to exit.

To delete the selected template:

- Click the  button.

Table 6-131: Delete - File Set Template - Sel ASCII

Setting	Description
SELB Device	Select the SEL Binary device (supports SEL Fast Meter Protocol) that is used as the file server. Not available if TFTP/FTP/SFTP/UR SFTP/MMS/GENA is selected as the server type.
GENA Device	Select the Generic ASCII device (supports SEL ASCII Protocol) that is used as the file server. Not available if TFTP/FTP/SFTP/UR SFTP/MMS/SELB is selected as the server type.
Template ID	A unique identifier for the file set template.
Storage Directory	This is the location on the MCP that records are stored in. This directory is located within /mnt/datalog/arm/. The valid value for Storage Directory has a minimum length of 2 characters (that is, cannot be blank) and must not start or end with special characters.
File Extension	The extension to append to any files downloaded using this template. This field is not used if the File Type is set to COMTRADE.
Delete Files Automatically	If enabled, ARRM automatically deletes files in the Storage Directory created based on this template when the storage quota is exceeded
File Type	Select the Fault file type to be retrieved. ARRM supports file archival of EVE and CEV files from the SEL IEDs. The default value in the “Options” field is None. The “Options” configuration allows you to choose the frequently used command options used with EVE and CEV commands such as C, L and Lyyy. The template also allows you to choose “other” supported command options with EVE and CEV where you can enter the command extensions supported in the Additional Option field.
File Storage	For Selbin Templates, select a value: • FileName with timestamp: A new file is created whenever information is downloaded. This option saves the event files in the format: EVE_YYMMDDHHMMSS_Msec.EVE/CEV_YYMMDDHHMMSS_Msec.CEV. For example, EVE_090416082335_123.EVE will be created for a file that was generated on April(MM) 16(DD), 2009(YYYY), at 08(HH):23(MM):35(SS).123(mSec). • FileName with Event Number: A new file is created whenever information is downloaded. This option saves the event files in the format: EVE_EventNumber.EVE/CEV_EventNumber.CEV. For example, EVE_100009.EVE is created when the end device sends a command response when this specific file is queried.

About Oscillography files and IEEE File

Oscillography files are saved in COMTRADE format. The COMTRADE standard defines a file format that contains transient waveform and event data collected from power systems. Each oscillography file consists of a three-file set. The files have the same file name but different extensions: .hdr, .cfg, and .dat for header, configuration, and data files respectively. ARRM downloads oscillography files directly from IEDs and automatically generates a new file name for each COMTRADE file set based on the IEEE File Naming Convention for Time Sequence Data.

IEEE File Naming Convention for Time Sequence Data

<Start Date>, <Start Time>, <Time Code>, <Station>, <Device>, <Company>, <Type>. <Extension>

Where:

- <Start Date> has the following format: yymmdd
- <Start Time> has the following format: hhmmssmmmmmm, where hh is hours, mm is minutes, ss is seconds, mmm is milliseconds, and mmm is microseconds.
- <Time Code> is the difference between the time used for start time and Universal Time (or Greenwich Mean Time). The time code ends with an "s" if the device always reports standard time, or an "a" if the device adjusts for daylight savings time. If the device is using Universal Time, neither character is appended.
- <Station> is the configured station name
- <Device> is the configured device name
- <Company> is the configured company name
- <Type> is DFR, PQ, or ADCP
- <Extension> is DAT, CFG, or HDR

Connection Polling

The ARRM Connection Polls are required because, in absence of any events, there are no potential ARRM file transfers for days or weeks at a time; consequently, ARRM files will not appear with an up-to-date status.

The file sets configured for polling will be triggered by the Configured Polling interval (either *Global Connection Polling Interval* or *Device Connection Polling Interval*) in addition to their configured event trigger. The ARRM configuration will not impose any restrictions on files to be included in connection polling – none, one, more or all files can be configured for connection polling, as required.

An asterisk (*) is appended to each file set that is supported by periodic polling.

NOTE: In the case of fault number-based file sets which are included in connection polling, ARRM always retrieve files with the last fault number value. Consideration must be given to the files included in connection polling so redundant files are not created un-necessarily.

ARRM Connection Status File

The ARRM Connection Status file is constantly updated whenever ARRM performed and finalized an action on a file, either because of a trigger or by periodic polls.

The name of the ARRM Connection Status file is *ARRM_Conn_Status.txt*, and is stored in the /mnt/datalog/Logs folder in the MCP. In case of Warm Standby Redundancy, this file is mirrored to the standby unit to a temporary location, and whenever the Standby unit becomes Active it is copied to /mnt/datalog/Logs folder.

The file name convention is based on IEEE C37.232 with additional data fields as required for this functionality (i.e., Delimiters, FileSetName, and FileTransferResult).

File Name Format

<Start Date>, <Start Time>, <Time Code>, <Station>, <Device>, <Company>,
<Type>|<FileSetName>:<FileTransferResult>

Table 6-132: File Name Format

File Name Element	Description
Start Date	The Start Date in the first row always shows the value when the "ARRM_Conn_Status" file was last updated, for whatever reason. The date has the format: YYMMDD (6 characters) according to IEEE C37.232 standard. In subsequent rows, it shows the date when the row-specific file was updated.
Start Time	The Start Time in the first row always shows the value when the "ARRM_Conn_Status" file was last updated, for whatever reason. The time has the format HHMMSSMMMMMM (12 characters) according to IEEE C37.232 standard, where "H" = hour, "M" = minute, "S" = seconds and the remaining 6 "M"s refer to milliseconds and micro seconds. In subsequent rows, it shows the time when the row-specific file was updated.
Time Code	The Time Code contains from 1 to 7 formatted characters. The Time code indicates the time zone offset for the start date and time fields. The offset is specified as the offset East of GMT time (e.g., +5h30 for IST). The first character is "+", except if the offset is GMT. If the offset is GMT, then there is no "+" sign character, and the offset appears simply as 0. The character "t" is appended to each offset. NOTE: Enterprise systems should ignore the character "t" while parsing the ARRM Connection Status File All time code (zone) values in this file are driven by the MCP Local Time as configured in mcpcfg (independent from any time zone settings in ARRM). The rationale is the indicated times in this file reflect the moment when the MCP ARRM performed a check; these are not times received from IEDs or other files.
Station	The first line is always set to "ARRM" to reflect a generic / virtual "station name" associated with the MCP Gateway. The station name has no meaning in the first line since this first line represents the collector status, and a single collector (i.e., MCP) can have multiple stations. For remaining lines, this is the configured station name.
Device	For the first row, this is the name of the MCP Gateway executing the ARRM. For all other rows, this is the device name as configured in ARRM.
Company	This is the configured company name.
Type	For this file, the type is always "stat" (status) for the Gateway (i.e., for the first line). The other entries (remaining rows in this file) have the file type: - As configured in ARRM under "User Type" where the file was configured as COMTRADE. - As "genr" (generic) for the files not configured as COMTRADE.
Storage Directory	This setting is not applicable to the first row. For subsequent rows, the identifier is the local "Storage Directory" configured in the ARRM File Set Template.
FileSetName	For the first row, the identifier is always: Application (i.e., the ARRM application). For subsequent rows, the identifier is the "File Set Name" configured in ARRM.

File Name Element	Description
FileTransferResult	The <FileTransferResult> value in the first row is associated with the ARRM application status. This value is always 1, even if all IEDs have their file transfers disabled or offline. The timestamp (START DATE, START TIME and TIMECODE) in the first row is always updated with the latest file retrieval's timestamp. The remaining rows indicate the last known transfer state of those specific files as follows: 0 = FAILED; this is the file transfer result due to manual file trigger/automatic file trigger/connection poll file trigger. 1 = SUCCESSFUL; this is the file transfer result due to manual file trigger/automatic file trigger/periodic poll file trigger. -1 = DISABLED; this is the case when automatic file trigger is disabled. Example: ARRM_Conn_Status File <pre>150529, 161918353582,-7ht, ARRM, MCP_GW, GE, stat Application:1 150529, 161918353582,-7ht, St 1, Device 1, GE, comt,storagedir1 File Set 1:0 150529, 111110414615,-7ht, St 1, Device 2, GE, test,storagedir2 File Set 1:0</pre>

ARRM FTP Directory Delta Support for Different ftp ls Formats

>> To determine the ftp ls format:

1. Log in to the mcpcfg local configuration utility using admin credentials.
2. From mcpcfg, connect to the device using ftp.
3. Log in through ftp.
4. Enter a **ls** command.
5. Observe the format of the response from the device as shown in below screen capture.

```

D400#>> ftp 192.168.4.128
Connected to 192.168.4.128.
220 VxWorks (VxWorks5.5.1) FTP server ready
Name (192.168.4.128:admin): Administrator
331 Password required
Password:
230 User logged in
ftp> ls
200 Port set okay
150 Opening ASCII mode data connection
  size      date      time      name
-----
  2048    Aug-11-2009   09:42:56   boot          <DIR>
  2048    Feb-25-2012   08:07:20   reg           <DIR>
  2048    Aug-11-2009   09:39:24   install       <DIR>

```

The following table lists the ftp **ls** formats which the MCP ARRM supports in directory delta mode. You must provide the suffix listed in the below table for each format in the device name configuration.

Table 6-133: ftp ls formats

S. No.	ftp ls format	Suffix in ARRM device name	Example devices
1	-rwxrwxrwx 1 0 0 3 Dec 30 1969 RAM drwxrwxrwx 2 0 0 0 Jan 1 00:00 code	No suffix required	SEL 451,F650
2	drwxrwxrwx 4 root 4096 Feb 20 00:05 -rw-rw-rw- 1 root 150984 Jun 19 15:22 558433B70004	__LS1	Tesla4000

Sample File Set Templates for Relay Models

The table below provides some sample File Set Templates for popular IED Models.

Table 6-134: Sample File Set Templates for IED Models

Template Name	Use this template to . . .
MULTILIN_UR_OSC_TFTP	Retrieve oscillography files using TFTP from GE Vernova Grid Solutions Multilin Universal Relays.
MULTILIN_UR_OSC_MMS	Retrieve oscillography files using MMS (IEC 61850) from GE Vernova Grid Solutions Multilin Universal Relays.
MULTILIN_F650_OSC_MMS	Retrieve oscillography files using MMS (IEC 61850) from GE Vernova Grid Solutions Multilin F650 relays.
7SJ_DFR	Retrieve oscillography files using MMS (IEC 61850) from Siemens 7SJ64 relay. Though this template was only tested with a Siemens 7SJ64 relay, it will likely work for other Siemens 7SJ models.
ABB_REL_670	Retrieve oscillography files using MMS (IEC 61850) from ABB REL670 relay. Though this template was only tested with an ABB REL670 relay, it can likely work with other ABB relay models in the same family.
MICOM	Retrieve oscillography files using MMS (IEC 61850) from MICOM P143 relay. Though this template was only tested with a MICOM P143 relay, it can likely work with other MICOM relays in the same family.
D25_PQ_MMS	Retrieve power quality oscillography files using MMS (IEC 61850) from GE Vernova Grid Solutions Multilin D25 IEDs.
D25_PQ_TFTP	Retrieve power quality oscillography files using TFTP from GE Vernova Grid Solutions Multilin D25 IEDs.
D25_ACDP_MMS	Retrieve AC Data Profiling oscillography files using MMS (IEC 61850) from GE Vernova Grid Solutions Multilin D25 IEDs.
D25_ACDP_TFTP	Retrieve AC Data Profiling oscillography files using TFTP from GE Vernova Grid Solutions Multilin D25 IEDs.

Template Name	Use this template to . . .
D25_DFR_MMS	Retrieve Digital Fault Recording oscillography files using MMS (IEC 61850) from GE Vernova Grid Solutions Multilin D25 IEDs.
D25_DFR_TFTP	Retrieve Digital Fault Recording oscillography files using TFTP from GE Vernova Grid Solutions Multilin D25 IEDs.
D2X_1_DISOE	Retrieve SOE files for Digital Input Logging Record 1 from GE Vernova Grid Solutions Multilin D2X devices.
D2X_1_AISOE	Retrieve SOE files for Analog Input Logging Record 1 from GE Vernova Grid Solutions Multilin D2X devices.
D2X_2_DISOE	Retrieve SOE files for Digital Input Logging Record 2 from GE Vernova Grid Solutions Multilin D2x devices.
D2X_2_AISOE	Retrieve SOE files for Analog Input Logging Record 2 from GE Vernova Grid Solutions Multilin D2x devices.
MULTILIN_UR_EVT_TFTP	Retrieve Event files using TFTP from GE Vernova Grid Solutions Multilin Universal Relays.
MULTILIN_UR_PRODINFO_TFTP	Retrieve Product Information files using TFTP from GE Vernova Grid Solutions Multilin Universal Relays.
MULTILIN_UR_DATALOGTXT_TFTP	Retrieve Datalog files using TFTP from GE Vernova Grid Solutions Multilin Universal Relays.
MULTILIN_UR_FLTREP_TFTP	Retrieve Fault Report files using TFTP from GE Vernova Grid Solutions Multilin Universal Relays.
MULTILIN_UR_SECEVT_TFTP	Retrieve Security Event files using TFTP from GE Vernova Grid Solutions Multilin Universal Relays (This file will be available for UR Relays having Cybersentry Lvl 1 option).
MULTILIN_UR_DATALOGA_TFTP	Retrieve COMTRADE Datalogger files using TFTP from GE Vernova Grid Solutions Multilin Universal Relays.
MULTILIN_UR_URINFO_TFTP	Retrieve UR Information files using TFTP from GE Vernova Grid Solutions Multilin Universal Relays.
MULTILIN_UR_USER_FLTRESP_TFTP	Retrieve User Fault Report files using TFTP from GE Vernova Grid Solutions Multilin Universal Relays.
MULTILIN_UR_ICD_TFTP	Retrieve ICD files using TFTP from GE Vernova Grid Solutions Multilin Universal Relays.
MULTILIN_UR_CID_TFTP	Retrieve CID files using TFTP from GE Vernova Grid Solutions Multilin Universal Relays.
MULTILIN_UR_IID_TFTP	Retrieve IID files using TFTP from GE Vernova Grid Solutions Multilin Universal Relays.
SEL 451	Retrieve COMTRADE files from SEL 451 Relays. A trigger DI (indicates file generation in relay) must be configured to the file set. If DI is not available, it is recommended that the "Include in Connection Polling" option to be enabled.
8Series_EVT_TFTP	Retrieve Event files using TFTP from 8 series Relays.
URPlus_EVT_TFTP	Retrieve Event files using TFTP from GE Vernova Grid Solutions Multilin UR+ Relays.

ARRM ASCII Directory Delta Support

ARRM provides an interface to the SELBinary DCA and the GENASCII DCA applications to retrieve and archive the Event Log files from the SEL IEDs/numerical relays.

The SELBinary and GENASCII DCA applications use ASCII commands to retrieve two types of fault/event log files:

- EVE (Event Report Files) and
- CEV (Compressed Event Report Files).

The ARRM application automatically tabulates the number of files present in the SEL IEDs and periodically directs the DCA applications connected to the SEL IEDs to retrieve the event files one after another, sequentially.

The ARRM application also provides configurable user-friendly Templates, custom-designed specifically for file archival from SEL relays.

The Template provides you with an option to choose the type of the Fault records/Event log files to retrieve:

- EVE
- CEV
- Both

The event files retrieved by ARRM from SEL relays as can be stored with two different naming formats:

- FileName with Event Number
The FileName with EventName option saves the event files in the format:
EVE_EventNumber.EVE/CEV_EventNumber.CEV
or
- FileName with TimeStamp.
The FileName with TimeStamp option saves the event files in the format
EVE_YYMMDDHHMMSS_Msec.EVE/CEV_YYMMDDHHMMSS_Msec.CEV

» To create a new file set template:

1. Click **File Set Template**.

Result: Two options are available.

2. Select the appropriate option.

Configure Automation Features

This section contains the following sub-sections:

Configuration Overview

System Point Manager

[System Point Manager - Overview](#)

Accumulator Freeze

[Analog Value Selection](#)

[Control Lockout](#)

[Double Point](#)

[Input Point Suppression](#)

[Redundant I/O](#)

[Control In-Progress](#)

Alarm

[Alarm Types](#)

[Configure Alarms](#)

Calculator

[Mapped Points](#)

[Expressions](#)

[Points](#)

[Application Parameters](#)

[Basic Syntax Rules](#)

Load Shed and Curtailment

[Feeders tab](#)

[Zones tab](#)

Remote Logging (Rsyslog)

[Remote Logs](#)

[Receiving Remote System Logs](#)

[Configure UDP- and TCP-based logging](#)

[Configure Hosts-Subnets Filters](#)

Syslog Client

[Types of Logs Supported](#)

[Configure Syslog Client](#)

[Network Connection - Configuration Settings](#)

[Types of Logs and the Default Severity](#)

Configuration Overview

The MCP Automation applications retrieve data from the real-time database, manipulate the data and store the results in the real-time database. The type of data supported by the automation applications varies depending on the application. The MCP currently supports the following automation applications:

- [System Point Manager](#)
- [Accumulator Freeze](#)
- [Alarm](#)
- [Calculator](#)
- [Automated Record Retrieval](#)
- [Data Logger](#)
- [Input Point Suppression](#)
- [Load Shed and Curtailment](#)
- [Remote Logging \(Rsyslog\)](#)
- [Syslog Client](#)

Automation Applications

Some features are implemented through automation applications which retrieve data from the real-time database, manipulate the data and store the results in the real-time database. The type of data supported by the automation applications varies depending on the application.

» **To configure automation applications for use on the MCP you typically:**

1. Select data points.
2. Define application points.
3. Set up the point manipulations and associated settings.
4. Save and run the configuration file by committing the changes.

System Point Manager

System Point Manager – Overview

The **System Point Manager** enables you to configure a variety of advanced automation functions on your device. These functions include:

- [Accumulator Freeze](#): Groups of accumulator points whose values are frozen periodically or on demand.
- [Analog Value Selection](#): Define a group of prioritized analog input points with the highest priority, valid input being reported to a single analog input point.
- [Control Lockout](#): Ensure that only a single master station can access a group of controls at one time and lock out groups of local controls for maintenance purposes.

**WARNING**

The MCP Control Lockout feature is not a replacement or equivalent of LOTO (Lockout – Tagout). Use standard safety procedures to implement Lockout - Tagout and to perform maintenance operations.

- **Double Point:** Associate two digital input points to form a double point indication. Also known as 4-state points.
- **Input Point Suppression:** Suppress reporting of input points while they are unavailable during maintenance.
- **Redundant I/O:** Specify a Secondary data point for any point that is used to report the value and quality when the associated Primary point is invalid or questionable.
- **Control In-Progress:** The Control In-Progress feature of system point manager allows you to trace if a control command on digital output point is in progress or not. This feature also provides the information about the application that has issued the command and the control command type.

Accumulator Freeze

The **Accumulator Freeze** feature of the System Point Manager allows you to create groups of accumulators that are frozen periodically or on demand.

Accumulators in a group may also be frozen as a result of Master requests when mapped to DNP3 and Tejas V.

Table 6-135: Accumulator Freeze

Field	Description
Group Name	A short text description that is assigned to the group. Maximum of 66 ASCII characters comprising alphanumeric characters, space, underscore and dash.
Group ID	Non-editable. A unique reference identifier for the group.
Group Description	A description of the group. Maximum 128 characters.
Freeze Time Acc Name	A user-defined name that can be used for quick indexing and filtering. Maximum 66 characters, ASCII only.
Freeze Time Acc Description	A user-defined block of text that provides a detailed and localized description of the group. Maximum 128 Unicode characters.
Freeze Trigger DO Name	A user-defined name that can be used for referencing the DO that will trigger a freeze action to the group when operated. Maximum 66 characters, ASCII only.
Freeze Trigger DO Description	A user-defined block of text that provides a detailed and localized description of the DO that will trigger a freeze action to the group when operated. Maximum 128 Unicode characters.
Freeze Feedback DI Name	A user-defined name that can be used for referencing the DI that indicates a freeze action of the group. Maximum 66 characters, ASCII only.
Freeze Feedback DI Description	A user-defined block of text that provides a detailed and localized description of the DI that indicates a freeze action of the group. Maximum 128 Unicode characters.

Field	Description
Copy Value Policy	Determines the action performed on all members of the group if an accumulator freeze is triggered. If <i>Absolute</i> is selected, the frozen value of the mapped point is applied to the corresponding frozen value point. If <i>Delta</i> is selected, the value of the frozen value point is updated by the amount of difference between the new frozen value and the previous frozen value. If an accumulator freeze group has "Copy Values" configured as anything other than "None", the System Point Manager creates one pseudo accumulator owned by Accumulator Freeze application, for each accumulator mapped into the group. Note regarding the <i>Delta</i> setting: If the current frozen value is smaller than the previous frozen value, the delta value calculated would be calculated as a rollover number, causing the frozen value accumulator points to be extremely large. For example, if the current frozen value is 3 and the previous frozen value is 258, the resulting frozen value accumulator point is shown as 9.22e+18.
Freeze Interval (min)	Specifies the frequency, in minutes, at which freeze commands are automatically issued to the group. The range is 0 to 14400 minutes (i.e., 10 days). Enter 0 to disable.
Time of Hour Alignment Offset	The time of day to align the freeze interval to. For example, if the alignment offset is set to xx:15, the freeze operation is aligned to begin at 15 minutes past the hour. The freeze interval setting must divide evenly into an hour to facilitate the offset. Disabled if the Freeze Interval is set to 0.
Freeze Trigger Point	Define a system point (digital input) that can be used to trigger freeze commands to the group. The trigger state (ON or OFF) is configurable.
Freeze Report Point	Define a system point (digital output) that is triggered when a freeze operation is initiated to any accumulator points mapped to the group. The control type (close, trip, latch ON, latch OFF, pulse ON, or pulse OFF) and pulse duration (in milliseconds, not available for latch controls) are configurable.
Point Selection Area	You can select system points to add to the accumulator freeze group using the system point tree. System points can be used in multiple accumulator freeze groups. Click the checkbox to the left of a point or group name to add a point or a group of points to the group. Points included in the group are shown at the right-hand side of the point selection area. To remove a point, uncheck the appropriate box in the system point tree or highlight the point and click the Delete button. Click the Delete NE to remove any points that are not valid (that is, points that have been deleted from the system database after they were included in the accumulator freeze group). The <i>Frozen Value Reference</i> and <i>Frozen Value Description</i> fields define the accumulator point that is created for the selected point. The value of this accumulator points changes based on the <i>Copy Value Policy</i> defined above.

Analog Value Selection

The **Analog Value Selection** feature of the System Point Manager allows you to define a group of prioritized analog inputs with lower and upper limits; the highest priority valid input from the group is reported as the value of a configured analog input point.

Table 6-136: Analog Value Selection

Field	Description
Group Name	A short text description that is assigned to the group. Maximum of 66 ASCII characters comprising alphanumeric characters, space, underscore and dash.
Group ID	Non-editable. A unique reference identifier for the group.
Group Description	A description of the group. Maximum 128 Unicode characters.
Configure Group Point...	Opens the Group Point window, which contains the following two fields. The system point created for this group is available under the System Point Manager application. Group Point Reference A user-defined name that can be used for quick indexing and filtering. Maximum 66 characters, ASCII only. Group Point Description A user-defined block of text that provides a detailed and localized description of the group. Maximum 128 Unicode characters.
Lower Limit	The minimum value that must be met by at least one of the points within the group. If this limit is not met by any points in the group, the value and quality of the lowest-priority point is reported as the value and quality for the group. Note that the limit value itself is considered within range (that is, a value of -1000 is considered valid for an analog selection group with a lower limit of -1000). If all the points are below the defined lower limit, the value of the lowest priority point is reported.
Upper Limit	The maximum value that can be reported by any of the points within the group. If this limit is exceeded by all the points in the group, the value and quality of the lowest-priority point is reported as the value and quality for the group. Note that the limit value itself is considered within range (that is, a value of 1000 is considered valid for an analog selection group with an upper limit of 1000). If all the points are above the defined upper limit, the value of the lowest priority point is reported.
Point Selection Area	You can select system points to add to the analog value selection group using the system point tree. Click the checkbox to the left of a point or group name to add a point or a group of points to the group. Points included in the group are shown at the right-hand side of the point selection area. To remove a point, uncheck the appropriate box in the system point tree or highlight the point and click the Delete button. Click the Delete NE to remove any points that are not valid (that is, points that have been deleted from the system database after they were included in the analog value selection group). Priority Use a numeric value to set the priority of each point within the group, with 0 being the lowest priority.

Control Lockout

The **Control Lockout** feature of the System Point Manager allows you to ensure that only a single master station can access a group of controls at one time (**Remote Groups**) and can lock out local groups of controls to allow for safer local maintenance (**Local Groups**). You can create up to 8 remote control groups and up to 10000 local control groups. Any digital output (except for those owned by the System Point Manager application) can be included in one remote and one local group.

The **Control Lockout** feature of the System Point Manager allows users to implement two types of control lockout groups:

- Remote Groups
- Local Groups

WARNING

The MCP Control Lockout feature is not a replacement or equivalent of LOTO (Lockout – Tagout). Use standard safety procedures to implement Lockout - Tagout and to perform maintenance operations.

Remote Groups

Remote Groups ensure that only a single master station can access a group of controls at one time. Up to 8 remote control groups can be created.

For the duration of the control plus 100 milliseconds, no other commands are accepted on controls in the group unless they originate from the application or device that locked the remote group. After this period has passed, the controls are available to all participating (“candidate”) applications and devices again.

Any of the candidate application included in the remote lockout group can be configured to obtain remote group lockout either as:

Automatic Remote Group Ownership

This applies when the Manual Ownership checkbox is **not** selected for the included candidate applications.

In this case a remote group is automatically locked to the included candidate which issued a control on any member point, and remains locked to this candidate until another included candidate locks the remote group. These candidates do not need to explicitly lock the remote group first.

Manual Remote Group Ownership

This applies when the Manual Ownership checkbox **is** selected for the included candidate applications.

In this case each included candidate with the Manual Ownership option selected needs to lockout the group explicitly before being able to operate controls in that remote group.

The lockout of the Remote Group can be done by turning ON (latch) the associated Remote Group Control Lockout DO and unlocked by turning it OFF (latch).

Any of the candidate application(s) included in the remote group can remove the lockout by sending the OFF command through the Remote Control Group Lockout feature. This behavior is different from an equivalent **LOTO** applied lock where only the applicant can remove the lock. The reason for this difference is so the MCP Gateway is not placed into a locked out situation if the lock issuer is no longer available to remove the lock (e.g., a remote Master Station applied the lock manually and for communications reasons is no longer available and the controls must be unlocked and operated from a different candidate with manual ownership, e.g., MCP HMI).

NOTE: Reboot of the MCP resets the locked groups.

NOTICE

Applications **not** included in a remote group (i.e., the box under *included candidates* is **NOT checked**) – are unrestricted. This means that they are not affected by remote group lockouts and can still operate controls on all points even when a remote group lockout is in effect. These applications cannot remove a lockout.

In addition, the application which turned on the remote group lockout (i.e., issued the latch ON for *Group Lockout DO reference*) can still operate controls on all points part of that specific local group, as “owner”, and all other applications which have the *include* and *manual ownership* boxes **checked** are not able to operate the controls in this locked remote group.

The table below shows a summary of Remote Groups operation depending on how candidates are configured:

Include	Manual Ownership	Behavior
No	No	Applications not included can operate any controls, unrestricted.
Yes	No	The included application locks the remote group automatically to itself by operating any control in the remote group.
Yes	Yes	The included application must explicitly lock the remote group to itself before operating any control in the remote group.

Local Groups

Lock out groups of controls to allow for safer local maintenance, or any other applications where a group of controls need to be blocked.

The “Need Ownership” functionality for Local Groups was introduced after V520 (i.e. not included in V520 and all previous ones).

Any of the candidate application included in the Local lockout group can be configured to operate controls in the Local group either as:

Doesn't need Ownership

This applies when the Needs Ownership checkbox is **not** selected for the included candidate applications.

In this case each included candidate application can operate controls in the local group as long as the Local Group is not locked by any other included candidate.

Needs Ownership

This applies when the Needs Ownership checkbox **is** selected for the included candidate applications

In this case each included candidate with the Needs Ownership option selected needs to lockout the group explicitly before being able to operate controls in that local group.

When a Local Group is locked only the included candidate which initiated the lockout can operate controls in that group.

Normally, control lockout is manually initiated by an operator and commands are not accepted until the lockout has been released. Control lockout can also be achieved using applications such as Calculator or LogicLinx to issue the lockout commands.

A local group is locked by turning ON (latch) the associated *Local Group Lockout DO* and is unlocked by turning it OFF (latch).

Any of the candidate application included in the local lockout group can remove the lockout by sending the OFF command through the Local Control Group Lockout feature. This behavior is different from an equivalent **LOTO** applied lock where only the applicant can remove the lock. The reason for this difference is so the MCP Gateway is not placed into a locked out situation if the lock issuer is no longer available to remove the lock (e.g., a remote Master Station applied the lock and for communications reasons is no longer available and the controls must be unlocked and operated from a different candidate, e.g., MCP HMI).

NOTE: Reboot of the MCP resets the locked groups.

NOTICE Applications **not** included in a local group (i.e., the box under *included candidates* is **NOT checked**) – are unrestricted. This means that they are not affected by local group lockouts and can still operate controls on all points even when a local group lockout is in effect. These applications cannot remove a lockout.

In addition, the application which turned on the local group lockout (i.e., issued the latch ON for *Group Lockout DO reference*) can still operate controls on all points part of that specific local group, as “owner”, and all other applications which have the *include* box **checked** are not able to operate the controls in this locked local group.

The table below shows a summary of Local Groups operation depending on how candidates are configured:

Include	Needs Ownership	Behavior
No	No	Applications not included can operate any controls, unrestricted.
Yes	No	If the local group is not locked: the included application can operate any controls in the local group. The Local group is not locked just by operating controls in it. If the local group is locked: only the included application which locked the local group can operate controls in that local group. Any included application can remove the local group lock.
Yes	Yes	The included application with Needs Ownership must explicitly lock the local group to itself before operating any control in the local group. If the local group is locked: only the included application which locked the local group can operate any controls. Any included application can remove the local group lock.

Example of Local Group configuration and operations

Example 1

In this Local Group configuration, the following applications are present and configured as shown below:

Include	Needs Ownership	Application
No	No	Calculator (configured controls expressions in Calculator)
Yes	Yes	HMI (the MCP runtime HMI)
Yes	No	Master1 (a first DNP3 Master)
Yes	No	Master2 (a second DNP3 Master)
No	No	Master3 (a third MODBUS Master)

- In this example we begin at run time when this Local Group is not locked initially.
- Master1, Master2 can operate controls in this local group because the group is not locked.

- Master3 and Calculator can operate controls in this local group because are not an included application.
- HMI cannot operate controls in this local group because the group is not locked by the HMI.

An operator wants to send a command from the MCP runtime HMI. Uses the HMI to lock this local group by turning ON the Local Group Lockout DO, directly from the HMI.

In this moment:

- Master1, Master2 cannot operate controls in this local group because the group is locked by HMI.
- Master3 and Calculator can operate controls in this local group because are not an included application.
- HMI can operate controls in this local group because the group is locked by the HMI.

When finished, the operator uses the HMI to remove the group lockout by turning OFF the Local Group Lockout DO, directly from the HMI. To be noted that Master1 and Master2 can also turn OFF the Local Group Lockout DO because they are included candidates. Master3 or Calculator cannot turn OFF the Local Group Lockout DO because they are not included candidates.

Next, let's assume that Master1 wants to have exclusivity in operating the controls in this local group, and block the other included candidates. Master1 locks this local group by turning ON the Local Group Lockout DO, directly from the Master1 application.

In this moment:

- Master1 can operate controls in this local group because the group is locked by Master1.
- Master2 cannot operate controls in this local group because the group is locked by Master1.
- Master3 and Calculator can operate controls in this local group because are not an included application.
- HMI cannot operate controls in this local group because the group is locked by Master1.

At any point any of the included candidates may reset the local group ownership and set it to self if desired: HMI, Master1, Master2 can turn OFF the Local Group Lockout DO because they are included candidates. Master3 or Calculator cannot turn OFF the Local Group Lockout DO because they are not included candidates.

Example 2

In this Local Group configuration, the following applications are present and configured as shown below:

Include	Needs Ownership	Application
Yes	No	Calculator (configured controls expressions in Calculator)
Yes	No	HMI (the MCP runtime HMI)
Yes	No	Master1 (a first DNP3 Master)
Yes	Yes	Master2 (a second DNP3 Master)
No	No	Master3 (a third MODBUS Master)

Here the system is configured with a *Digital Assignment* calculator expression which controls the *Local Group Lockout DO*, based on simple conversion logic. Assume the HMI has the capability to change the state of the input of this calculator expression; this allows an operator to perform an HMI action which has

the final effect of controlling the *Local Group Lockout DO*, but now indirectly via Calculator (not mapped to this Local Group).

- In this example we begin at run time when this Local Group is not locked initially.
- Calculator, HMI, Master1 can operate controls in this local group because the group is not locked.
- Master2 cannot operate controls in this local group because the group is not locked by Master2.
- Master3 can operate controls in this local group because is not an included application.

The operator uses the HMI to turn ON the calculator input, which in turn locks the local group.

In this moment:

- HMI cannot operate controls in this local group because the HMI was not technically the issuer of the lockout command, but Calculator is the issuer of the lockout command and Calculator is now the current owner of the locked group; this does not allow users to execute any commands from the HMI, even though – from a human operator perspective – the lockout order was done from the HMI.
- Master1, Master2 cannot operate controls in this local group because the group is locked by Calculator.
- Master3 can operate controls in this local group because is not an included application.
- If Calculator has other expressions which are mapped to the DO points in the locked local group, those execute because Calculator is seen as the owner of the group in this moment.

When finished, the operator uses the HMI to remove the group lockout by changing the state of the input calculator expression which controls the group lockout. Turning OFF the *Local Group Lockout DO* directly from the HMI (e.g., Point Details) or by Master1 or Master2 is also possible.

An implementation of this use example is to have a throw switch position acquired via any application as a DI which then is used as calculator input to the assignment expression controlling the group lockout. Multiple local groups can be controlled by the same DI using multiple calculator assignment expressions, or by individual DI points.

Common functionality between Remote and Local Groups

Each defined Remote or Local Group has associated Status and Command Points, which at run time indicate and control the operational state of the group; see [Configure Indication Points](#).

Any digital output (except for those owned by the System Point Manager application) can be included in **one remote** and **one local** group.

Digital output points mapped into a group (remote or local) accept only transient commands at run time; e.g., PULSE, TRIP, CLOSE.

Latched commands (ON, OFF) are rejected because the group allows for only one command at a time and latched requests indefinitely lock the group.

NOTE: For many MCP applications, pseudo (logical) points can still be controlled using CLOSE or PULSE_ON to attain an ON action and respectively – TRIP or PULSE_OFF to attain an OFF action.

Field	Description
Group Name	A short text description that is assigned to the group. Maximum of 66 ASCII characters comprising alphanumeric characters, space, underscore and dash.
Group ID	View-only field: A unique reference identifier for the group.
Group Description	A description of the group. Maximum 128 Unicode characters.

Field	Description
Configure Indication Points...	Opens the Group Status Indication Points window, which contains the following eight fields. The system points created for this group are available under the System Point Manager application. <Point> Reference A user-defined name that can be used for quick indexing and filtering. Maximum 66 characters, ASCII only. <Point> Description A user-defined block of text that provides a detailed and localized description of the point. Maximum 128 characters. Locked DI The digital input point that is ON when the group is locked out. Active DI The digital input point that is ON when a control in the group is in operation. Group Owner AI The analog input that contains the ID number of the application that has locked the group. You can use the AI Text Enumeration feature to display a user-friendly text string instead of the identification number. Group Lockout DO The digital output point that must be operated to initiate the control lockout.
Control Lockout Candidates selection area	Select the applications that are candidates of the lockout group. NOTICE Applications not included in a local group are unrestricted. This means that they are not affected by local control lockouts and can operate controls on all points even when a lockout is in effect.
Point Selection Area	You can select digital output system points to add to the control lockout group using the system point tree. Click the checkbox to the left of a point or group name to add a point or a group of points to the group. Points included in the group are shown at the right-hand side of the point selection area. To remove a point, uncheck the appropriate box in the system point tree or highlight the point and click the Delete button. Click the Delete NE to remove any points that are not valid (that is, points that have been deleted from the system database after they were included in the group).

The flow chart below depicts the Control lockout processing when both Remote and Local Control Groups are configured. See the following figure.

Continued on next page.

NOTES on the flowchart:

Note 1: DPA shall return a negative ack to the master if the result is Reject Command. This applies to both Select and Execute operations.

Note 2: Any candidate can reset the RC DO at any time

Note 3: These are internal lockout events sent to interested consumers. Currently only System Point Manager DTA registers for these events. System Point Manager updates two DIs (group lockout status and group active status) and one AI (App ID of control originator).

Note 4: Group is made inactive by RTDB under the following conditions:

- After producer sends command response and duration of the last pulse request sent by the owner of the group plus 100 ms expires.
- The command response is not received within 500 ms of the last pulse duration expiring.
- If the group is locked out by a select and the select is terminated for any reason (e.g. select timeout expired).

Group Active DI is reset once Group becomes inactive.

The diagram indicates to "Flag" the remote or local group to be active. This flag is checked later on by the "Update Group Active Status" sub-process.

Note 5: Any included candidate can reset the LC DO at any time. Same as for RC, this is to eliminate potential lockouts when a candidate that set it on (e.g. remote master) is no longer available and the system goes into a denial of service at runtime.

Double Point

The **Double Point** feature of the System Point Manager allows you to associate two digital input points to form a double point indication.

» To create a double point:

1. Select a device or application in the left pane. The **Close Point Reference** and the **Open Point Reference** fields must refer to points from the same application or device, so selecting a device or application in this pane limits both fields accordingly.
2. Click the **Add** button at the top right of the screen.
3. Configure the double point using the fields below.
4. Click the **Save** button.

Table 6-137: Double Point

Field	Description
Reference	A user-defined name that can be used for quick indexing and filtering. Maximum 66 characters, ASCII only.
Description	A user-defined block of text that provides a detailed and localized description of the group. Maximum 128 characters.
Close Point Reference	A point selection tree that allows you to choose the point to be used as the Secondary source. Only points of the same data type that have not already been selected as a Primary source are available.
Open Point Reference	A point selection tree that allows you to choose the point to be used as the Secondary source. Only points of the same data type that have not already been selected as a Primary source are available.
State	Text labels to be used for each of the four states of the double point. Maximum 32 characters.
Invalid State Qualification	The amount of time, in milliseconds, that the two source points must remain in the 1 state before the double point is reported as invalid. Range is from 0 to 65535.
Output Type / Output Status	You can specify up to two digital output points that can be used to operate the double point. If you choose <i>Single Output</i> , you can select one point via the Output Status field to receive Trip and Close commands. If you choose <i>Dual Outputs</i> , you can select two points via the Output Status field; one to receive Trip commands and another to receive Close commands. Both the <i>Single Output</i> and <i>Dual Outputs</i> modes allow you to enable or disable inclusion of the status of the output in the double point's quality flag.

NOTE: Double Point functionality is only for Alarms, thereafter it can be used for One Line Data Sources

Input Point Suppression

The **Input Point Suppression** feature of the System Point Manager allows you to disable groups of analog input, digital input and accumulator points by ignoring their actual data and quality changes within selected applications. While points are suppressed, a predefined suppression value, quality, or the last reported value (before applying suppression) and the **Point Suppressed** quality flag are provided instead. This can be useful during maintenance operations to prevent spurious OFFLINE alarms and false readings while devices are powered off or disconnected. Another possible application is to override the actual quality and change the reported quality based on database events.

When input points change their value or quality while suppressed, and the suppression is later removed – the resulting reported event has the timestamp of the removal action.

You can add any number of input points to a point suppression group, but any input may only be included in a maximum of one group at any time. Local commands can be executed on suppressed points; however, you do not see the effects of the local command until suppression is removed.

Please [review this note](#) if you are using input point suppression in conjunction with redundant I/O.

Table 6-138: Input Point Suppression

Field	Description
Group Name	A short text description that is assigned to the group. Maximum of 66 ASCII characters comprising alphanumeric characters, space, underscore and dash.
Group ID	Non-editable. A unique reference identifier for the group.
Group Description	A description of the group. Maximum 128 Unicode characters.
Configure Group Quality Point...	Opens the Group Quality Point window, which contains the following two fields. Point Reference A user-defined name that can be used for quick indexing and filtering. Maximum 66 characters, ASCII only. Point Description A user-defined block of text that provides a detailed and localized description of the group. Maximum 128 characters. This digital output point activates the suppression group upon receipt of a latch ON, close, or pulse ON control. Suppression can be disabled through a latch OFF, trip, or pulse OFF control.
Input suppression candidate selection area	Select the applications that are candidates of the suppression group. The list of candidates is built automatically based on what applications are enabled. When the input point suppression of a given group is active, the applications selected here receive suppressed information from the points in the selected group. Candidate Reference A user-defined name that can be used for quick indexing and filtering. Maximum 66 characters, ASCII only. Candidate Description A user-defined block of text that provides a detailed and localized description of the group. Maximum 128 characters. Point Suffix A unique identifier that is added to the end of the input point suppression pseudo point generated for this point. Maximum 60 characters, ASCII only. NOTE: <u>The applications selected as candidates of the suppression group are common to all groups.</u>

Field	Description
Point Selection Area	You can select system points to add to the input point suppression group using the system point tree. Available point types are analog input, digital input and accumulator. Click the checkbox to the left of a point or group name to add a point or a group of points to the group. Points included in the group are shown at the right-hand side of the point selection area. To remove a point, uncheck the appropriate box in the system point tree or highlight the point and click the Delete button. Click the Delete NE to remove any points that are not valid (that is, points that have been deleted from the system database after they were included in the group). Suppression State Configure the suppression state provided by the application to selected candidates when suppression is enabled: - o Last Reported value, or - o Override Value with a pre-configured value, or - o Override Quality with a pre-configured set of quality types, or - o Override Value and Quality with pre-configured value and set of quality types. Override Value Choose the value to supply to candidate applications when suppression is enabled. ON or OFF for DI points, or a value entry for AI and ACC points. This field is disabled and ignored when Last Reported or Override Quality are selected as the point's suppression state. Override Quality Choose the set of quality flags to supply to candidate applications when suppression is enabled. This field is disabled and ignored when Last Reported or Override Value are selected as the point's suppression state. Note: While this list contains all possible quality flags at configuration time - not all quality flags apply to all applications and candidates at runtime. Please refer to Appendix J – List of supported qualities in MCP applications.
Default Suppression State Area	These are the initial (default) values applied to the points at the time when points are selected in the system point tree. After selection – the points in the group can have their suppression combinations changed on an individual basis.

Redundant I/O

The **Redundant I/O** feature of the System Point Manager allows you to specify a Secondary data source for any point that is used to report the value and quality of the Primary point in the event the Primary point becomes invalid or questionable.

Controls sent to a Primary point while a Secondary data source is in effect automatically routed to the Secondary data source instead. Acknowledgement messages are handled by the MCP to appear as though they were routed from the Primary point. A virtual quality flag, **Secondary Source**, is applied to the Primary point and is visible within certain system applications, however, this flag is not stored as an actual quality flag.

Please [review this note](#) if you are using input point suppression in conjunction with redundant I/O.

Table 6-139: Redundant I/O

Field	Description
Point Selection Area	You can select the system points that you would like to have a Secondary data source. Click the checkbox to the left of a point or group name to add a point or a group of points to the group. Points included in the group are shown at the right-hand side of the point selection area. To remove a point, uncheck the appropriate box in the system point tree or highlight the point and click the Delete button. Click the Delete NE to remove any points that are not valid (that is, points that have been deleted from the system database after they were included in this list).
Secondary Source	A point selection tree that allows you to choose the point to be used as the Secondary source. Only points of the same data type that have not already been selected as a Primary source are available.
IO Group	Opens the Redundant I/O Group window, which contains the following six fields. Redundant I/O groups can be reused for multiple points. Group Name A short text description that is assigned to the group. Maximum of 66 ASCII characters comprising alphanumeric characters, space, underscore and dash. Group Description A user-defined block of text that provides a detailed and localized description of the group. Maximum 128 Unicode characters. Secondary Source DI This digital input point is set to ON if any point within the I/O group is relying on a Secondary source. This field is a user-defined name that can be used for quick indexing and filtering. Maximum 66 characters, ASCII only. Secondary Source DI Description A user-defined block of text that provides a detailed and localized description of the Secondary source DI point. Maximum 128 characters. Secondary Source DO This digital output point transfers all Primary points within the group to their respective Secondary sources upon receipt of a latch ON, close, or pulse ON control. The points can be returned to their own reported values through a latch OFF, trip, or pulse OFF control. This field is a user-defined name that can be used for quick indexing and filtering. Maximum 66 characters, ASCII only. Secondary Source DO Description A user-defined block of text that provides a detailed and localized description of the Secondary source DO point. Maximum 128 characters.

NOTE: Input point suppression and redundant I/O

Redundant I/O processing occurs before input point suppression. Therefore, suppressing the Secondary source of a redundant pair does not cause the suppressed value to appear as the value of the Primary point. Instead, the Primary point continues to receive the live value of the Secondary source. You must suppress the Primary point directly for the suppressed value to appear.

Control In-Progress

The Control In-Progress feature of system point manager allows you to trace if a control command on digital output point is in progress or not. This feature also provides information about the application that has issued the command and the control command type.

You can add any number of digital output points to a control in-progress group, but any digital output point may only be included in a maximum of one group at a time. The Apply and Remove tag and alarm local HMI commands are only supported by points generated by this feature

Table 6-140: Control In-Progress

Field	Description
Group Name	A short text description that is assigned to the group. Maximum of 66 ASCII characters comprising alphanumeric characters, space, underscore and dash.
Group ID	Non-editable. A unique reference identifier for the group.
Group Description	A description of the group. Maximum 128 Unicode characters.
Point Selection Area	You can select system points to add to the control in progress group using the system point tree. Click the checkbox to the left of a point or group name to add a point or a group of points to the group. Points included in the group are shown at the right-hand side of the point selection area. To remove a point, uncheck the appropriate box in the system point tree or highlight the point and click the Delete button. Click the Delete NE to remove any points that are not valid (that is, points that have been deleted from the system database after they were included in the group). In Progress Point Opens the In-Progress Point Details window, which contains the following two fields. Point Reference A user-defined name that can be used for quick indexing and filtering. Maximum 66 characters, ASCII only. Point Description A user-defined block of text that provides a detailed and localized description of the group. Maximum 128 Unicode characters. This digital input point is set when control command on the Digital Output point is in progress and is reset when the control command is complete. Control command is <i>complete</i> either on receiving a command response or expiry of maximum control time. In case of no command response, the maximum time for which the point is in set state depends on type of control command issued. The maximum time is calculated as per the below formulae. Pulse On / Pulse Off: (Pulse-On Duration + Pulse-Off Duration) * Number of Pulses + 100ms Trip / Close: (Pulse-On Duration) * Number of Pulses + 100ms Latch-On / Latch-Off: 100ms Last Issued Control Type Opens the Last Issued Control Point Details widow, which contains following two fields. Point Reference A user-defined name that can be used for quick indexing and filtering. Maximum 66 characters, ASCII only. Point Description

Field	Description
	A user-defined block of text that provides a detailed and localized description of the group. Maximum 128 Unicode characters. This analog input point provides the information about the last control command type that was issued. The possible values of this analog input point are: -1 - Digital Output point is offline 0 - Digital Output Point is online 1 - Last issued control command on Digital Output point is Trip 2 - Last issued control command on Digital Output point is Close 3 - Last issued control command on Digital Output point is Pulse On 4 - Last issued control command on Digital Output point is Pulse Off 5 - Last issued control command on Digital Output point is Latch On 6 - Last issued control command on Digital Output point is Latch Off Last Issued Application Opens the Last Issued Application Point Details widow, which contains following two fields. This analog input point gives the application ID of the application that has issued the command in the digital output point. Point Reference A user-defined name that can be used for quick indexing and filtering. Maximum 66 characters, ASCII only. Point Description A user-defined block of text that provides a detailed and localized description of the group. Maximum 128 Unicode characters. If the control command issuer application is an automation application, then the value is one from the below list. If the application is not an automation application, the application ID is provided as a pseudo point in the issuer application. -1 - HMI -2 - Calculator -3 - Data Logger -4 - LogicLinx -6 - Redundancy Manager -7 - System Status Manager -9 - System Point Manager Control Lockout -10 - System Point Manager Input Point Suppression -11 - System Point Manager Accumulator Freeze -12 - System Point Manager Analog Value Selection -13 - System Point Manager RIO -14 - Load Shed Curtailment -15 - Digital Event Manager -23 - Analog Reports (not available after and including MCP V2.60)

Alarm

In the substation-monitoring environment, alarms are used to indicate the occurrence of an event that requires attention, for example, the opening of a breaker due to an over-current condition.

The Alarm (Digital Event Management) functionality applies to the MCP HMI as well as at database level in form of pseudo points that can be mapped to other applications.

In some applications may be desired to use Alarms only at database level for Automation and reporting to SCADA, but not to be visible in the MCP HMI Active Alarms screen; in such cases the Alarm Groups can be configured as non-visible at runtime.

When the MCP HMI is used to display alarms - it is the end user's responsibility to ensure that OPERATIONAL ALARMS are always assigned to VISIBLE Alarm Groups.

The MCP monitors a given set of digital input points for alarm conditions. Each configured alarm by default has no associated pseudo points. However, if the "individual digital input indications" parameter is set in an alarm group, then a single digital input pseudo point is created for each alarm in the group.

Upon detecting an alarm condition on a source point or a group of points, the MCP creates a record in the database and presents the alarm to the operator on the MCP Active Alarms page for further action. Once an alarm is acknowledged it is archived by moving it from the **Active Alarms** page to the **Historical Alarms** page.

You can:

- View active alarms
- View historical alarms
- Acknowledge an alarm
- Configure alarms, including double-point alarms, alarm points, and alarm settings
- Enable/mute an audible alarm

Alarm Types

The following alarms types are configurable:

- **Deviation Alarms** (2-state): Generates an active alarm when the point state changes from normal to alarmable and archives the alarm only when the point state returns to normal and the alarm is acknowledged.
- **On Update Alarms** (2-state): Generates an active alarm when the alarm state changes from one state to another and archives the alarm when the alarm is acknowledged. In effect, two alarms are created: the first alarm is generated when the source point changes from ON to OFF, and a second alarm is generated when the source point changes from OFF to ON.
- **Double Point Alarms** (4-state): Two alarm types are generated – an **On-Update Alarm** and a **Deviation Alarm**.

NOTE: You can only select [pre-configured double points](#) for this type of alarm.

- An **On Update Alarm** is generated when the double point is in the transit state (both points = 0) or in the invalid state (both points = 1) and the state persists longer than the configured invalid period of time. The On Update alarm is archived when it is acknowledged.
- A **Deviation Alarm** is generated when the double point is in the open state (open point = 1, close point = 0) and is put in the reset state when the double point returns to the close state (open point = 0, close point = 1). The Deviation alarm is archived when the alarm state is reset, *and* it is acknowledged.

NOTE: The Digital Event Manager does not support the “,” (comma) character in the Point, Point State, Alarm and Alarm State field descriptions. If the user has used commas in these field descriptions during configuration, the commas are automatically replaced with spaces during runtime processing.

NOTE: The MCP does not raise alarms on points that are offline.

The Alarm Description is created automatically at point selection time using the Description of the source selected point. This content can be manually edited later. The maximum length of the Alarm Description

is 128 characters. Points originated from IEC61850 Client may have more than 128 characters in their Point Description which would cause issues when selected as alarms. In such case the resulting Alarm Description will be trimmed at the end with the characters `__#trim#` being the last ones, so this situation can be identified for manual Alarm Description correction.

Configure Alarms

On the **Alarm** tab on the **Configuration** page you can configure alarms and modify how alarms are processed and reported by the MCP. The maximum number of SOE, active alarms and historical alarms that can be present in the MCP database are configurable and this configuration is done from **storage** option on the Systemwide tab.

NOTES:

- Alarms must be configured to activate the Active Alarms page in the MCP HMI.
- Digital points must already be configured in map files before they can be selected as alarmable points.
- After deploying a configuration that has Alarms changed – the action of *Reset Database Tables > Delete Digital Event Data* should be performed to avoid mismatch of data between the already stored records and the new configuration. If required by operations – record backups can be taken before performing such changes, using the corresponding Runtime HMI interfaces.

Alarm Points tab

On the **Alarm Points** tab, you configure digital input points for alarm-capable conditions. The MCP supports three alarm types:

- Deviation (2 state)
- On Update (2 state)
- Double Point (4 state)

The **Point Picker** pane lists the digital input points in the database available for configuration as alarm points. Each alarm type tab lists the selected alarm points and the current configuration settings.

NOTES:

- Alarms must be configured to activate the Active Alarms page in the MCP HMI.
- Digital points must already be configured in map files before they can be selected as alarmable points.
- You must select a [pre-configured double point](#) for double point alarms.

» To configure alarm points:

1. Click the **Configuration** Power bar button.
2. Click the **Alarm** tab > **Alarm Points** tab.
3. Click the tab for the type of alarm to be configured: **Deviation Alarms**, **On Update Alarms**, or **Double Point Alarms**.
4. In the tree-view pane, expand the folders and click to select digital input points to add to the alarm list.
5. To modify the default settings for an alarm point, in the alarm list, double-click a setting and enter a new value.
6. Click **Save** to save your changes.

» To configure alarm settings:

1. Click the **Configuration** Power bar button.

2. Click the **Alarm** tab > **Settings** tab.
3. Select **Global Settings** or **Alarm Group Settings**.
4. To modify the default settings, double-click a setting and enter a new value.
5. Click **Save** to save your changes.

Tip: To remove a point from the Alarms list, select the row and click **Delete**. Click **Delete NE** to remove points that have been deleted from the system database after they were selected as alarmable points.

Alarm Points configuration settings

Deviation Alarms

Table 6-141: Deviation Alarms

Setting	Description
Connection	The name of the application or device that the point belongs to. This field is not editable.
Source Point	DI source point selected from the Point Picker. This field is not editable.
Source Description	A detailed and localized description of the point. This field is not editable.
Alarm Reference	A user-defined name that can be used for quick indexing and filtering. Maximum 32 characters, ASCII only.
Alarm Description	A user-defined block of text that provides a detailed and localized description of the group. Maximum 128 characters. Initialized to the source point description when selected, can be edited after.
Text State 0	Enter text to display to represent the point state when the associated digital input point value becomes 0, typically the Normal state. Range is 1 to 32 alphanumeric characters. Initialized to the source point state 0 name when selected, can be edited after.
Text State 1	Enter text to display to represent the point state when the associated digital input point value becomes 1, typically the Alarm state. Range is 1 to 32 alphanumeric characters. Initialized to the source point state 1 name when selected, can be edited after.
Invalid State Description	Select the state to be reported in the event the point is INVALID.
Alarmable State	Select to indicate when the point value is in the alarmable state: OFF (0) or ON (1).
Group	Select the single alarm group to which the point's alarm is to be associated with. All configuration information for the alarm group (for example, color and sound) is applied to every point associated with the alarm group. Alarm groups are configured on the Settings tab.
Originator	Select the specific originators that trigger an alarm. Available for IEC 61850 points only.
Source	Indicates the selected source Home Directory and the Point ID of the Source Point.
Alarm ID	Unique Alarm Identification number which is auto-assigned by the Alarm application for each of the newly configured Alarms.

On Update Alarms

Table 6-142: On Update Alarms

Setting	Description
Connection	The name of the application or device that the point belongs to. This field is not editable.
Source Point	DI source point selected from the Point Picker. This field is not editable.

Setting	Description
Source Description	A detailed and localized description of the point. This field is not editable.
Alarm Reference	A user-defined name that can be used for quick indexing and filtering. Maximum 32 characters, ASCII only.
Alarm Description	A user-defined block of text that provides a detailed and localized description of the group. Maximum 128 characters. Initialized to the source point description when selected, can be edited after.
Text State 0	Enter text to display to represent the point state when the associated digital input point value becomes 0, typically the Normal state. Range is 1 to 32 alphanumeric characters. Initialized to the source point state 0 name when selected, can be edited after.
Text State 1	Enter text to display to represent the point state when the associated digital input point value becomes 1, typically the Alarm state. Range is 1 to 32 alphanumeric characters. Initialized to the source point state 1 name when selected, can be edited after.
Invalid State Description	Select the state to be reported in the event the point is INVALID.
ACK Method	Select the method to acknowledge the alarm: manually by the user or automatically by the MCP when generated (and then immediately archived).
Group	Select the single alarm group to which the point's alarm is to be associated with. All configuration information for the alarm group (for example, color and sound) is applied to every point associated with the alarm group. Alarm groups are configured on the Settings tab.
Originator	Select the specific originator that triggers an alarm. Available for IEC 61850 points only.
Source	Indicates the selected source Home Directory and the Point ID of the Source Point.
Alarm ID	Unique Alarm Identification number which is auto-assigned by the Alarm application for each of the newly configured Alarms.

Double Point Alarms

Applies only to the Double points configured using the [System Point Manager](#), before they can be selected for alarming.

Does not apply to Double Points originated in communication protocols that support this (DNP3, IEC61850).

Table 6-143: Double Point Alarms

Setting	Description
Source Point	DI source point selected from the Point Picker. This field is not editable.
Source Description	A detailed and localized description of the point. This field is not editable.
Alarm Reference	A user-defined name that can be used for quick indexing and filtering. Maximum 32 characters, ASCII only.
Alarm Description	A user-defined block of text that provides a detailed and localized description of the group. Maximum 128 characters.
Text States	Text labels to be used for each of the four states of the double point. Maximum 32 characters.
Invalid ACK Method	Select the method to acknowledge the alarm: manually by the user or automatically by the MCP when generated (and then immediately archived.)
Invalid State Value	Select the state to be reported in the event the point is INVALID.

Setting	Description
Group	Select the single alarm group to which the point's alarm is to be associated with. All configuration information for the alarm group (for example, color and sound) is applied to every point associated with the alarm group. Alarm groups are configured on the Settings tab.
Originator	Select the specific originator that triggers an alarm. Available for IEC 61850 points only.
Alarm ID	Unique Alarm Identification number which is auto-assigned by the Alarm application for each of the newly configured Alarms.

Alarm Settings tab

On the Alarm **Settings** tab, you configure the way that alarms are grouped and presented on the **Active Alarms** page. The MCP supports the configuration of global alarm settings and alarm groups, including the information columns to display on the Active Alarms page.

NOTE: Some changes on the **Alarm Settings** tab require a restart of your browser to take effect.

Global settings

Table 6-144: Alarm Settings - Global

Setting	Description
Alarm On Startup	Set which points generate alarms when the MCP is started or restarted. This value can be set to: - Disable: No points are generated at startup - All Points: All points mapped to alarms are generated at startup. - Only Pseudo Points: Only pseudo points mapped to alarms are generated at startup.
DB Commit Time (sec)	The interval, in seconds, at which data is committed to the database by the digital event manager. Range is 10 to 60, default is 30.
SOE Notification Method	Select the method to report SOE events. Range is None, Email. Default is None.
Alarm Notification Method	Select the method to report Alarms. Range is None, Email. Default is None.
Email Notification Delay	The amount of time, in seconds, that the digital event manager waits to buffer additional events before sending an email notification. Range is 30 to 3600. Default is 30.
Notification Time Format	The timezone to use when printing or sending email notifications. Local time uses the time zone configured on the MCP using mcpcfg and UTC uses the MCP system clock without any modification.
Log All Pseudo Points as SOE	Select whether or not to log all pseudo digital inputs as SOEs. You can override this setting by manually configuring alarms on pseudo digital input points.
Alarm Sound File	The audio file to be played by the MCP HMI when an alarm occurs. If there are Alarm Groups configured as non-visible at runtime the audio file is set to None.
Alarm Blinking Rate	The speed at which the Active Alarms icon in the power bar flashes when acknowledged or unacknowledged alarms are present.
LOCAL HMI Alarm Buzzer ON	The alarm buzzer ON in seconds. The buzzer is disabled when ON=0 If there are Alarm Groups configured as non-visible at runtime the buzzer is disabled (0).
LOCAL HMI Alarm Buzzer OFF	The alarm buzzer OFF in seconds. Continuous steady tone is when OFF=0 and ON>0 If there are Alarm Groups configured as non-visible at runtime the buzzer is disabled (0).

Alarm Groups settings

Click the **Add** button to create a new alarm group. Select a group and click the **Delete** button to remove it. Any alarms assigned to a group that is deleted become unassigned and must be manually re-assigned to a different group.

Table 6-145: Alarm Groups Settings

Setting	Description
Group Reference	A user-defined name that can be used for quick indexing and filtering. Maximum 66 characters, ASCII only.
Group Description	A user-defined block of text that provides a detailed and localized description of the group. Maximum 128 characters.
Individual Alarm Indication	If this setting is enabled, one digital input pseudo point is created for each alarm in the group. The pseudo point for the group is set to ON if the alarm is active. NOTE: Redundant pseudo points are created if alarms are assigned to multiple groups.
Display Scheme	Select a pre-configured alarm display scheme or create a new one. The settings below are configurable for each display scheme.
Display Name	A user-defined name that can be used for quick indexing and filtering. Maximum 66 characters, ASCII only.
Display Description	A user-defined block of text that provides a detailed and localized description of the group. Maximum 128 characters.
In Alarm Blink Rate	The rate at which the active alarm text blinks when it is in the alarm state.
Reset Alarm Blink Rate	The rate at which the active alarm text blinks when it is in the normal alarm state.
Acked Alarm Blink Rate	The rate at which the active alarm text blinks when it is in the acknowledged state.
Foreground Colors (4x)	Select the color of the text that appears when a point belonging to the alarm group is in one of the following alarm conditions: - On Update In Alarm, - Deviation in Alarm, - Deviation Reset, or - Deviation Acked (acknowledged) Click a color Value cell to see the color palette window. The color can be chosen from Swatch, HSV, HSL, RGB, or CMYK palettes.
Background Colors (4x)	Select the background (BG) color of the text that appears when a point belonging to the alarm group is in one of the following alarm conditions: - On Update In Alarm, - Deviation in Alarm, - Deviation Reset, or - Deviation Acked (acknowledged) Click a color Value cell to see the color palette window. The color can be chosen from Swatch, HSV, HSL, RGB, or CMYK palettes.
Display In Alarm Viewer	When selected – alarms assigned to this group are displayed in the Alarm Viewer at runtime. Default value: Selected
Group Alarm Reflash Time (ms)	The amount of time (in milliseconds) that the group alarm re-flash DI point continues to wait to indicate to the master station that a new alarm has occurred.

Setting	Description	
Pseudo Points	Opens the Group Pseudo Point Properties window, which contains the following fields which are available under the System Point Manager application.	
Group Unacknowledged Reference	This point specifies whether there are alarm records for any alarm in this group that are not in the reset or not acknowledged state.	These pseudo points created for this group evaluate to TRUE when any points in the group are in the conditions listed (unacknowledged, in alarm, or acknowledged).
Group Unacknowledged Description	This is a user-defined block of text that provides a description of the Group Unacknowledged Reference point. Maximum 128 characters.	
Group In Alarm Reference	This specifies whether there are alarm records for any alarm in this group that are not in the reset state.	
Group In Alarm Description	This is a user-defined block of text that provides a description of the Group In Alarm Reference point. Maximum 128 characters.	
Acknowledge Group Reference	A latch ON, close, or pulse on operation for this point acknowledges all alarms in this group.	
Acknowledge Group Description	This is a user-defined block of text that provides a description of the Acknowledge Group Reference point. Maximum 128 characters.	
<State> Reference	A user-defined name that can be used for quick indexing and filtering. Maximum 66 characters, ASCII only.	
<State> Description	A user-defined block of text that provides a detailed and localized description of the point. Maximum 128 characters.	
Total Alarms Reference	A user-defined name that can be used for quick indexing and filtering. Maximum 66 characters, ASCII only.	These two pseudo points refer to an analog output point that contains the number of alarms contained within the group.
Total Alarms Description	A user-defined block of text that provides a detailed and localized description of the point. Maximum 128 characters.	
Alarm Indication Point Reference	These DI points are reset whenever one or more of the alarms belonging to the group are active.	
Alarm Indication Point Description	This is the description field for the Alarm Indication Point Reference setting.	
Group In Alarm Reflash Reference	This DI point is momentarily de-asserted and re-asserted after a short duration of time to alert that a new alarm has occurred in a group that is already in an alarmable state.	
Group In Alarm Reflash Description	This is the description field for the Group In Alarm Reflash Point Reference setting.	

Number of SOE and Alarms

The maximum number of SOE's, historical and SOE alarms that can be present in system are configurable. This configuration is present in **Systemwide** tab under **System ->Storage** section. The slider options allow the User to configure maximum under of SOE/PRF, historical and active alarms that can be present in the system.

Table 6-146: Number of SOE and Alarms

Setting	Description
Max Number of SOE/PRF	The Maximum number of SOE/PRF records that can be stored in the Database. Range is 10,000 to 2,00,000, default is 50,000
Max Number of Active Alarms	The Maximum number of Active alarm records that can be stored in the Database. Range is 2000 to 20,000, default is 5,000
Max Number of Historical Alarms	The Maximum number of Historical alarms records that can be stored in the Database. Range is 10,000 to 2,00,000, default is 50,000

Originators

The MCP documents the sources of control commands and reports this information on the Active Alarms, Historical Alarms, and SOE List pages under the **Originator** field.

The Originator is only available for points mapped from IEC 61850 devices that support enhanced security controls, such as the GE Vernova D25 Multifunction IED. It corresponds to the or Cat value in IEC 61850-7-3 Table 8. For all other points, it appears as *not supported*.

Table 6-147: Originators example from D25

Originator	Description
not-supported	The control command did not contain originator information.
bay-control	Operator using a client located at bay level. For example, a graphical display panel on a bay controller.
station-control	MCP web interface or local HMI.
remote-control	Remote operator outside the substation. For example, master station via MCP server applications, like DNP3 or Modbus.
automatic-bay	Automation logic, like Calculator or LogicLinx, through a bay controller.
automatic-station	Automation logic, like Calculator or LogicLinx, on the MCP.
automatic-remote	Automation logic, like Calculator or LogicLinx, through a master station.
maintenance	Actions initiated through the WESMAINT connection.
process	Status change occurred without control action. For example, the trip of a circuit breaker or failure inside the breaker.

Alarms Bulk Editor

Starting with MCP V5.20 users have access to a "Bulk Editor" in the Alarm tab:

Click on the **Bulk Edit** button to open a new window where Alarms can be configured in a more efficient approach, similar to Excel tables (filter, copy/paste, search and replace within ranges, etc.).

Other DSAS workflows and actions are not possible while the Alarm Bulk Editor window is open.

The tabs on the bottom of the Bulk Editor correspond to each Alarm Editor tabs:

Alarm Global Settings are not part of the Bulk Editor.

Display Schemes can be selected in the Bulk Editor. Creation and managing of Display Schemes must be performed in the Alarm Groups tab.

The Ribbon **File** menu on the top allows users to:

Save the changes and still remain in the Bulk Editor. A **Validation** of changed items is also performed when changes are saved.

Save As the tables to an offline Excel file in the PC local storage, which may be later used as a copy of Alarms configuration at the time when was saved as, independent of DSAS.

Delete the selected record(s) / line(s).

Validate the changes and indicate any errors using red text.

Re-synch from Database to update the shown data with the database and client map files values. This will re-synch the following data fields only for what is shown in that moment, i.e. works on each tab separately and is subject to Filters applied before the re-synch action:

- Alarm Reference
- Alarm Description
- Text States

The Ribbon **Home** menu on the top allows users to:

Perform **Copy/Paste/Paste Special** actions (in addition to **CTRL+C** and **CTRL+V**).

The Ribbon **Data** menu on the top allows users to access directly the sort and filter actions:

Sort based on the selected column.

Enable, Clear or Reapply **Filters**.

Calculator

On the **Calculator** tab on the **Configuration** page you configure the Calculator automation application by:

- Selecting data points referenced in expressions (called mapped points)
- Building expressions

The Calculator creates new points in the MCP system point database based on the results of the configured expressions. Once you have defined calculated points, they are available for selection when creating server maps, configuring alarms, and creating additional Calculator expressions. During runtime, calculated point values are presented to the operator on the **Application** tab on the **Point Details** page.

NOTE: Data points must already be configured in the MCP before they can be selected as mapped points in the Calculator.

The Calculator application is typically used in the MCP to carry out the following functions:

- Perform Mathematical, Logical, or Timer based operations on selected system data points
- Automatically operate one or more digital or analog outputs when certain conditions are met

The Calculator creates new points in the MCP system point database based on the results of configured expressions. All Calculator-owned points are referred to in the expressions by a configurable alias name. The values of the data points generated by the Calculator are evaluated each time a change event is received on one of the data points referenced in a defined expression.

The following data types are supported for use in expressions.

- Analog Input (AI)
- Digital (binary) Input (DI)
- Analog Output (AO)

- Digital (binary) Output (DO)
- Accumulators
- Text

The Calculator supports the following types of point calculations:

- Evaluations
- Timers
- Analog Assignments
- Digital Assignments
- Quality conversion
- Type conversion
- Averages
- Output to Input conversions

Once you have defined calculated points; they are available for selection when creating client and server maps and configuring alarms. During runtime, calculated point values are presented to the operator on the **Automation** tab on the **Point Details** page.

Mapped Points

The **Mapped Points** tab on the **Calculator** page is used to select system points to be used as variables within Calculator expressions.

The left pane displays a tree view listing of the data points available in the MCP system point database from which you can select as mapped points. Mapped points are organized under the data type sub-tabs: Analog Input, Analog Output, Digital Input, Digital Output, Accumulator, and Text.

Mapped points that are selected in the tree view are added to the list in the center of the screen. Double-click the **Alias** field within this list to change the Calculator alias for the point (the alias is only used within the Calculator application). The alias field can be 1 to 126 ASCII characters.

To delete a point, select the point and click the **Delete** button. Click the **Delete NE** button to remove all non-existent points that are referenced. Non-existent points may occur if a device containing the referenced data points is deleted from the MCP.

Expressions

The **Expressions** tab on the **Calculator** page is used to create, modify and delete calculated expressions. Up to 10000 Calculator Expressions can be created.

You construct expressions by combining operands and operators to produce a resulting point. You can use any defined reference points in expressions. Operands can include constants, system data points and Quality attributes. Operators include mathematical, logical, and bit-wise operators. The expressions also define the Point Names and Data Types that are used to represent the resulting evaluation.

» To create an expression:

1. Click the  button.
2. On the **New Expression** window, select the type of expression you want to create and click **OK**.
3. The new expression is added to the left pane. Select it to display the configuration window.

» To delete an expression:

1. Select the expression in the left pane.
2. Click the  button. The expression is deleted.

The following related actions can be performed to configure:

- [Evaluations](#)
- [Timers](#)
- [Analog assignments](#)
- [Digital assignments](#)
- [Quality conversions](#)
- [Type conversions](#)
- [Averages](#)
- [Output to Input conversions](#)

Evaluations

Evaluation expressions perform operations on referenced points and store the result in a Calculator-owned input point.

The following operations are supported in evaluation expressions:

- [Math operations](#)
- [Logical operations](#)
- [Bit-wise operations](#)
- [Request Type operations](#)
- [If-Then-Else construct](#)

Evaluation expressions are re-evaluated whenever a data change event is issued on a point referenced by the expression. Quality changes on referenced points only cause re-evaluation if the expression is converting the changed quality flag into a digital input, or if the quality change indicates that the referenced point is coming online or has had communications restored. The Calculator monitors the quality of referenced points for changes in the Questionable and Invalid quality flags. If any referenced point becomes Invalid or Questionable, the resulting point for any expression that includes that referenced point becomes Invalid.

Table 6-148: Evaluation Fields

Field	Description
Name	A system name to describe this expression within the Calculator application. Range is up to 128 alphanumeric characters.
Target Point Type	The type of point that is returned as the output of the expression.
Target Point	The name of the point that is returned as the output of the expression. This name must be unique across all data types.
Target Alias	Enter a short name to reference the output point within Calculator. Must be unique across all data types. Used as point description in Available Points list. Supported characters are: any combination of up to 126 characters using "a" through "z", "0" through "9", "_" (underscore) and "-" (hyphen), followed by a suffix indicating the data type of the referenced point (ai, ao, di, do, acc, or txt). Spaces are not allowed. Suggested format is <a to z><1 to 9999><datatype>. For example, scada43di. Range is up to 126 alphanumeric characters. Default is Xai or Xdi, depending on the Target Point Type, where X is incremented from 1.
Result Point Description	A user-defined description of the expression.
Expression Notes	Internal notes regarding the expression.
Expression	The formula used to calculate the expression. To insert a mapped point, calculator point, or expression, expand the tree menu and double-click the entry.

Example Field Settings**Table 6-149: Field Settings - Example 1**

Field	Example Settings
Name	Evaluation 1
Target Point Type	Analog Input
Target Point	AI 11
Target Alias	11ai
Result Point Description	Analog Input 11
Expression Notes	Sum of AI 1, AI 2 and AI 3.
Expression	1ai + 2ai + 3ai

Table 6-150: Field Settings - Example 2

Field	Example Settings
Name	Evaluation 2
Target Point Type	Analog Input
Target Point	AI 12
Target Alias	12ai
Result Point Description	Analog Input 12
Expression Notes	Multiplication of AI 1 and AI 11.
Expression	1ai * 11ai

Table 6-151: Field Settings - Example 3

Field	Example Settings
Name	Evaluation 3
Target Point Type	Digital Input
Target Point	DI 10
Target Alias	10di
Result Point Description	Digital Input 10
Expression Notes	Logical AND of DI 1 and DI2.
Expression	1di && 2di

Example Expressions

Table 6-152: Expressions - Example

Expression	Description
3di && (4di 5di)	If DI3 is 1 and either DI 4 or DI 5 is 1 then the result of the expression is set to 1. Otherwise, if DI 3 is 0 or both DI 4 and DI 5 are 0 then the result of the expression is set 0. Where, DI 3, DI 4 and DI 5 are the mapped/referenced points.
(RT (10do) == TR)? 0 : 1	When a trip command is received on calculator digital output point DO 10, set the result of the expression to 0. For any other commands, set to 1.
(6di 7di 8di) ? (4ai + 1000) : 0	If any of DI 6, DI 7, or DI 8 are 1, set the result of the expression to (4ai + 1000). If all are zero, set the result of the expression to zero.
(RT (11do) == PU)? 5ai	Whenever a pulse on operation is received on calculator digital output point DO 11, set the result of the expression to 5ai. Otherwise, no operation.
(6ai > 5000)? 1: (RT (12do) == ANY)? 0	If AI 6 is greater than 5000, set the result of the expression to 1. Otherwise, if AI 6 is less than or equal to 5000 and when any command is issued on calculator digital output point DO 12, set the result of the expression to 0.

Math Operations

The Calculator handles mathematical operations as follows:

- A mathematical operation is always evaluated using floating-point arithmetic.

- If binary values are used as operands for a math operation, then TRUE is interpreted as 1 and FALSE as zero.
- Mathematical operators are evaluated left to right only. Order of precedence is not enforced on mathematical expressions unless parentheses are used.

The Calculator supports the following math operators:

Table 6-153: Math Operations

Symbol	Operation	Example
+	Addition	B1 + B2
-	Subtraction	B1 - B2
*	Multiplication	B1 * B2
/	Division	B1 / B2
%	Modulo	B1 % B2
^^	Exponent	B1 ^^ B2
loge	Natural logarithm	loge(B1)
log10	Logarithm base	10 log10(B1)

Logical Operations

The Calculator handles logical operations as follows:

- All operands are evaluated as binary values before performing the logical operation.
- A logical operation evaluates to TRUE or FALSE.
- All non-zero values are interpreted as TRUE and zero values as FALSE.
- If the output is later used in a mathematical operation, TRUE is interpreted as 1 and FALSE as zero.

The Calculator supports the following logical operators:

Table 6-154: Logical Operations

Symbol	Operation	Example
==	Equal	B1 == B2; Result is true if B1 and B2 are equal, false otherwise
>	Greater Than	B1 > B2; Result is true if B1 is greater than B2, false otherwise
<	Less Than	B1 < B2; Result is true if B1 is less than B2, false otherwise
>=	Greater Than or Equal To	B1 >= B2; Result is true if B1 is greater than or equal to B2, false otherwise
<=	Less Than or Equal To	B1 <= B2; Result is true if B1 is less than or equal to B2, false otherwise
!=	Not Equal	B1 != B2
&&	Logical AND	B1 && B2; Result is true if B1 and B2 are true, false otherwise.
	Logical OR	B1 B2; Result is true if either of B1 or B2 is true, false otherwise.
!	Logical NOT	!B1; Result is true if B1 is false and vice versa.

Logical operators and mathematical operators can be combined to create if/then/else-style statements.

For example, the simple construct *if a then b else c*, where a is a logical operation, could be expressed as $((a) * b) + ((!a) * c)$ in the Calculator. Since logical operations always evaluate to 1 or 0, the multiplication effectively 'cancels' the result for the logical operation that is not true.

NOTE: The weakness of this approach is that the "else" case must always be defined. It is not possible to define a simple "if/then" construct with this method.

Bit-Wise Operations

The Calculator handles bit-wise operations as follows:

- The output of a bit-wise operation is always a 32-bit integer value.
- A floating-point value is converted to a 32-bit integer by dropping all data after the decimal before performing a bit-wise operation.
- If the expression stores the final value in a digital input, then a non-zero value is interpreted as TRUE, while a zero value is interpreted as FALSE, unless a specific bit position is specified in the result to be selected as the DI state.

The Calculator supports the following bit-wise operators:

Table 6-155: Bit-Wise Operations

Symbol	Operation	Example
>>	Bit Shift Right	B1 >> 3
<<	Bit Shift Left	B1 << 3
&	AND	B1 & B2
	OR	B1 B2
~	1's complement	~ B1
^	Exclusive OR	B1 ^ B2

Request Type Operations

The Calculator handles request type operations as follows:

- The request type operator references the type of command received by a Calculator-owned digital output point and evaluates to one of the request types listed below. As such, the operator can only be used in conjunction with the logical operators *equal* and *not equal* (for example, *RT (d05) == TR*).
- The syntax *RT(<alias>) == <request type>* is used, where *alias* is the alias of any Calculator-owned digital output point and *request type* is one of the nine request types listed below.
- The operator is only evaluated now a command is received on the Calculator-owned digital output point. At that moment, all expressions that reference the digital output are evaluated. Immediately after all evaluations are complete, the operator evaluates to NO when processing a change in any other point in the expression.

The request type operator evaluates to one of the following values:

Table 6-156: Request Type Operations

Operation	Request Type
Latch On	ON
Latch Off	OFF
Pulse On	PU
Pulse Off	PO
Close	CL
Trip	TR
Don't Care (see note)	ANY
No Operation	NO

NOTE: If the request type is tested against ANY, then any control operation except NO evaluates to 1.

If-Then-Else Construct

The Calculator supports the **If-Then-Else** construct `<condition> ? <value if true> : <value if false>`. The construct evaluates to *value if true* if the *condition* results in a non-zero value, or to *value if false* if the *condition* results in zero.

You may leave either of the value fields empty. If this is done and the *condition* selects the empty value, the construct is considered not to have changed and no further evaluation is carried out. The syntax of the construct is either `<condition> ? <value if true>` or `<condition> ? : <value if false>`

Timers

The Calculator provides timer functionality to a resolution of 1 second. A timer operation is defined by two hold times: rising edge (FALSE to TRUE) and falling edge (TRUE to FALSE). Hold times can be positive or zero. When the result of a binary expression changes, Calculator starts a timer based on the defined hold times. If the value of the binary expression stays constant for the entire timer duration, then the value of the timer expression evaluates to TRUE.

For example, if you want a Calculator digital input to turn ON when digital inputs DI22 and DI54 are the same value for more than 10 seconds, use the following settings:

- Output point type is *Digital Input*
- The timer expression is *(DI22 == DI54)*
- The Rising Edge Time is *10* and the Falling Edge Time is *0*.

Result: The output of Calculator digital input will turn ON after 10 seconds.

Table 6-157: Timer Operations

Field	Example Settings
Name	A system name to describe this expression within the Calculator application. Range is up to 128 alphanumeric characters.
Target Point Type	The type of point that is returned as the output of the expression.
Target Point	The name of the point that is returned as the output of the expression. This name must be unique across all data types.
Target Alias	Enter a short name to reference the output point within Calculator. Must be unique across all data types. Used as point description in Available Points list. Supported characters are: any combination of up to 126 characters using "a" through "z", "0" through "9", "_" (underscore) and "-" (hyphen), followed by a suffix indicating the data type of the referenced point (ai, ao, di, do, acc, or txt). Spaces are not allowed. Suggested format is <a to z><1 to 9999><datatype>. For example, scada43di. Range is up to 126 alphanumeric characters. Default is Xai or Xdi depending on the Target Point Type, where X is incremented from 1.
Result Point Description	A user-defined description of the expression.
Expression Notes	Internal notes regarding the expression.
Rising Edge Time (s)	The amount of time, in seconds, that the expression must remain in the TRUE state before the timer expression evaluates to TRUE.
Falling Edge Time (s)	The amount of time, in seconds, that the expression must remain in the FALSE state before the timer expression evaluates to FALSE.
Expression	The formula used to calculate the expression. To insert a mapped point, calculator point, or expression, expand the tree menu and double-click the entry.

Example Field Settings

Table 6-158: Timer Operations - Example 1

Field	Example Settings
Name	Timer 1
Target Point Type	Digital Input
Target Point	DI 11
Target Alias	11di
Result Point Description	Digital Input 11
Rising Edge Time (s)	10
Falling Edge Time (s)	5
Expression Notes	(DI 7 == DI 8) (T10 L5)
Expression	(7di == 8di)

Table 6-159: Timer Operations - Example 2

Field	Example Settings
Name	Timer 2
Target Point Type	Digital Input
Target Point	DI 12
Target Alias	12di
Result Point Description	Digital Input 12
Rising Edge Time (s)	5
Falling Edge Time (s)	10
Expression Notes	(DI 9 == 1) (T5 L10)
Expression	(9di == 1)

Analog Assignments

Analog Assignment expressions receive commands on Calculator-owned analog output and input points and translate these into operations on [mapped analog data output points](#). Quality changes on the Calculator and referenced points are monitored in case the change in quality impacts the Calculator expression. Assignment expressions support the same syntax as evaluation expressions on the right-hand side of the expression.

Fields

Table 6-160: Analog Assignments

Field	Example Settings
Name	A system name to describe this expression within the Calculator application. Range is up to 128 alphanumeric characters.
Target Point	The source analog output point that receives output command generated by Calculator.
Expression Notes	Internal notes regarding the expression
Expression	The formula used to calculate the expression. To insert a mapped point, calculator point, or expression, expand the tree menu and double-click the entry.

Example Field Settings

Table 6-161: Analog Assignments - Example 1

Field	Example Settings
Name	Analog Assignment 1
Target Point	0ao
Expression Notes	Send the SetPoint command on the mapped point AO 0 if an event comes on the mapped point AI 1.
Expression	1ai

Table 6-162: Analog Assignments - Example 2

Field	Example Settings
Name	Analog Assignment 2
Target Point	1ao
Expression Notes	Route SetPoint command on the mapped point AO1 if a SetPoint command receives on calculator AO 10.
Expression	10ao

Table 6-163: Analog Assignments - Example 3

Field	Example Settings
Name	Analog Assignment 3
Target Point	2ao
Expression Notes	Assign AO 2 with 1234 if TRIP is received on calculator DO 10, OR Assign AO2 with -1234 if CLOSE is received on calculator DO 10.
Expression	(RT (10do) ==TR)? 1234: ((RT (10do) == CL)? (-1234))

NOTE: It is recommended to use braces around negative numbers in the expressions. e.g., (-1234).

Digital Assignments

Digital Assignment expressions receive commands on Calculator-owned digital output and input points and translate these into operations on referenced system digital output points. Quality changes on the Calculator and referenced points are monitored in case the change in quality impacts the Calculator expression. Assignment expressions support the same syntax as evaluation expressions on the right-hand side of the expression.

Control type (specification)

You can declare the parameters of output commands in line with the rest of an assignment expression, instead of (or in addition to) using the control type. If provided, the in-line declaration overrides any configured operation for the point. The digital output parameter syntax is {<command type>, <on duration>, <off duration>, <number of operations>} where:

- *command type* is a [valid request type](#)
- *on duration* is the length of time, in milliseconds, that the control remains in the ON state
- *off duration* is the length of time, in milliseconds, that the control remains in the OFF state
- *number of operations* is a numerical value

The alias of any mapped analog input or Calculator-owned analog output point can be used for the *on duration*, *off duration*, and number of operations variables. If aliases are used, the current value of the point associated with the alias is used as the value of the parameter (refer to the [Example Expressions](#)).

» **To insert a control output parameter:**

- Click the **Ctrl Spec** button on the Expression Builder.

Table 6-164: Digital Assignments - Control Type

Field	Description
Name	A system name to describe this expression within the Calculator application. Range is up to 128 alphanumeric characters.
Control Routing	The possible options are: None: The functionality of the Digital assignment expression types is the same as Analog assignment. So, a command will be issued to the target DO point based on the result of the expression and according to control type and other configuration parameters. On Target Point: Only “ON” type commands are routed to another DO. “OFF” type commands are not routed. Off Target Point: Only “OFF” type commands are routed to another DO. “ON” type commands are not routed. Both Target Points: Both “ON” and “OFF” type commands are routed to different targets. The default value selected for Control Routing is None - i.e., Digital assignment will perform no routing.
Target Point	This point receives all operation commands when the Control Routing parameter is set to None.
ON Target Point (When Control Routing Parameter is set to ON Target Point / Both Target Points)	This receives 'Close/Latch ON/Pulse ON' commands if the result of the Expression is TRUE. No command is received if the result of the Expression is FALSE.
OFF Target Point (When Control Routing Parameter is set to OFF Target Point/Both Target Points)	This point receives 'Trip/Latch OFF/Pulse ON' commands if the result of the Expression is FALSE. No command is received if the result of the Expression is TRUE. Pulse OFF commands can be issued only when Control Routing is not set to None.

Field	Description																																						
Control Type (When Control Routing Parameter is set to None)	Control type is used if your assignment expression: Evaluates to a true or false value In this case, the control type instructs Calculator how to interpret the expression result based on the following criteria:																																						
	<table><tr><th rowspan="2">Control Type</th><th colspan="2">Control Type Issued</th></tr><tr><th>When expression changes to True</th><th>When expression changes to False</th></tr><tr><td>Inverted Latch</td><td>Latch OFF</td><td>Latch ON</td></tr><tr><td>Latch</td><td>Latch ON</td><td>Latch OFF</td></tr><tr><td>Pulse</td><td>Pulse ON</td><td>No operation</td></tr><tr><td>Trip/Close</td><td>Close</td><td>Trip</td></tr></table>	Control Type	Control Type Issued		When expression changes to True	When expression changes to False	Inverted Latch	Latch OFF	Latch ON	Latch	Latch ON	Latch OFF	Pulse	Pulse ON	No operation	Trip/Close	Close	Trip																					
	Control Type		Control Type Issued																																				
		When expression changes to True	When expression changes to False																																				
	Inverted Latch	Latch OFF	Latch ON																																				
	Latch	Latch ON	Latch OFF																																				
	Pulse	Pulse ON	No operation																																				
	Trip/Close	Close	Trip																																				
	The default Control Type is Trip-Close.																																						
	This is meant to translate a control operation from a Calculator-owned digital output into another type and pass it on to a mapped digital output if you aren't using inline control specifications. As noted above, if you use an inline control specification, the command defined inline overrides the configured control type. In this case, the control received on the Calculator is evaluated as being a True or False type of command, and the same logic as above is applied. Control types are evaluated as follows:																																						
- True commands: Latch ON, Pulse ON, Close - False commands: Latch OFF, Pulse OFF, Trip																																							
<table><tr><th rowspan="2">Control Type Received Calculator Owned DO Point</th><th colspan="4">Control Type Issued to Target DO Point</th></tr><tr><th>Control Type is Latch</th><th>Control Type is Pulse</th><th>Control Type is Trip/Close</th><th>Control Type Inverted Latch</th></tr><tr><td>Latch ON</td><td>Latch ON</td><td>Pulse ON</td><td>Close</td><td>Latch OFF</td></tr><tr><td>Pulse ON</td><td>Latch ON</td><td>Pulse ON</td><td>Close</td><td>Latch OFF</td></tr><tr><td>Close</td><td>Latch ON</td><td>Pulse ON</td><td>Close</td><td>Latch OFF</td></tr><tr><td>Latch OFF</td><td>Latch OFF</td><td>Pulse OFF</td><td>Trip</td><td>Latch ON</td></tr><tr><td>Pulse OFF</td><td>Latch OFF</td><td>Pulse OFF</td><td>Trip</td><td>Latch ON</td></tr><tr><td>Trip</td><td>Latch OFF</td><td>Pulse OFF</td><td>Trip</td><td>Latch ON</td></tr></table>	Control Type Received Calculator Owned DO Point	Control Type Issued to Target DO Point				Control Type is Latch	Control Type is Pulse	Control Type is Trip/Close	Control Type Inverted Latch	Latch ON	Latch ON	Pulse ON	Close	Latch OFF	Pulse ON	Latch ON	Pulse ON	Close	Latch OFF	Close	Latch ON	Pulse ON	Close	Latch OFF	Latch OFF	Latch OFF	Pulse OFF	Trip	Latch ON	Pulse OFF	Latch OFF	Pulse OFF	Trip	Latch ON	Trip	Latch OFF	Pulse OFF	Trip	Latch ON

Latch OFF	No operation	No operation	No operation	No operation																																			
Pulse OFF	No operation	No operation	No operation	No operation																																			
Trip	No operation	No operation	No operation	No operation																																			

Field	Description																	
Control Type (When Control Routing Parameter is set to Off Target Point)	Off Target Point Control type is used if: Your assignment expression is meant to translate a control operation from a Calculator-owned digital output into another type and pass it on to a mapped digital output if you aren't using inline control specifications. As noted above, if you use an inline control specification, the command defined inline overrides the configured control type.																	
	The Off-Target Point Control Type instructs Calculator on how to interpret the expression result based on the following criteria:																	
	<table><tr><th rowspan="2">Off Target Point Control Type</th><th colspan="2">Off Target Point Control Type Issued</th></tr><tr><th>When expression changes to True</th><th>When expression changes to False</th></tr><tr><td>Inverted Latch</td><td>No operation</td><td>Latch OFF</td></tr><tr><td>Latch</td><td>No operation</td><td>Latch ON</td></tr><tr><td>Pulse</td><td>No operation</td><td>Pulse ON</td></tr><tr><td>Trip/Close</td><td>No operation</td><td>Trip</td></tr></table>	Off Target Point Control Type	Off Target Point Control Type Issued		When expression changes to True	When expression changes to False	Inverted Latch	No operation	Latch OFF	Latch	No operation	Latch ON	Pulse	No operation	Pulse ON	Trip/Close	No operation	Trip
	Off Target Point Control Type		Off Target Point Control Type Issued															
		When expression changes to True	When expression changes to False															
	Inverted Latch	No operation	Latch OFF															
	Latch	No operation	Latch ON															
	Pulse	No operation	Pulse ON															
	Trip/Close	No operation	Trip															
The default Control Type is Trip-Close.																		
The Off-Target Point Control Types are evaluated as follows:																		

Control Type (When Control Routing Parameter is set to Both Target Points)	Both Target Points Control type is used if your assignment expression: Is meant to translate a control operation from a Calculator-owned digital output into another type and pass it on to two mapped digital outputs (either same DOs or different Dos), if you are not using inline control specifications. As noted above, if you use an inline control specification, the command defined inline overrides the configured control type. The Both Target Points Control Type instructs Calculator on how to interpret the expression result based on the following criteria:				
	On Target Point Control Type	On Target Point Control Type Issued			
		When expression changes to True	When expression changes to False		
	Inverted Latch	Latch OFF	No operation		
	Latch	Latch ON	No operation		
	Pulse	Pulse ON	No operation		
	Trip/Close	Close	No operation		
	Off Target Point Control Type	Off Target Point Control Type Issued			
		When expression changes to True	When expression changes to False		
	Inverted Latch	No operation	Latch OFF		
	Latch	No operation	Latch ON		
	Pulse	No operation	Pulse ON		
	Trip/Close	No operation	Trip		
	The resulting actions will be a combination of configuration On Target Point Control Type and Off Point Target Control Types.				
	Control Type Received for Owned DO Point (i.e., the single mapped in the Expression field)	Control Type Issued to On Target DO Point			
		Control Type is Latch	Control Type is Pulse	Control Type is Trip/Close	Control Type is Inverted Latch
	Latch ON	Latch ON	Pulse ON	Close	Latch OFF
	Pulse ON	Latch ON	Pulse ON	Close	Latch OFF
	Close	Latch ON	Pulse ON	Close	Latch OFF
Latch OFF	No operation	No operation	No operation	No operation	
Pulse OFF	No operation	No operation	No operation	No operation	
Trip	No operation	No operation	No operation	No operation	
Latch ON	No operation	No operation	No operation	No operation	
Pulse ON	No operation	No operation	No operation	No operation	

Field	Description				
	Close	No operation	No operation	No operation	No operation
	Latch OFF	Latch ON	Pulse ON	Trip	Latch OFF
	Pulse OFF	Latch ON	Pulse ON	Trip	Latch OFF
	Trip	Latch ON	Pulse ON	Trip	Latch OFF
	The default type is Trip-Close.				
Expression Notes	Internal notes regarding the expression.				
Expression	The formula used to calculate the expression. To insert a mapped point, calculator point, or expression, expand the tree menu and double-click the entry.				

Example Field Settings

Table 6-165: Digital Assignments - Example 1

Field	Example Settings
Name	Digital Assignment 1
Control Routing	None
Target Point	3do
Control Type	Pulse
Pulse On Duration	1000
Pulse Off Duration	100
Number of Operations	1
Override Operation	None
Expression	(RT(13do) ==PU) ?{CL,1000,0,1} :{TR,100,0,1}
Expression Notes	If a Pulse ON command is received on calculator DO 13, send a 1000ms CLOSE command on mapped point DO 3. Otherwise, send a 100ms TRIP command to DO 3.

Table 6-166: Digital Assignments - Example 2

Field	Example Settings
Name	Digital Assignment 2
Enable Control Routing	Both Target Points
Close/Latch/Pulse ON Target Point	1do
Control Type (ON Target Point)	Pulse
Pulse On Duration (ON Target Point)	1000
Pulse Off Duration (ON Target Point)	100
Number of Operations (ON Target Point)	1
Trip/Latch/Pulse OFF Target Point	2do
Control Type (OFF Target Point)	Trip-Close
Pulse On Duration (OFF Target Point)	1000
Pulse Off Duration (OFF Target Point)	0

Field	Example Settings
Number of Operations (OFF Target Point)	1
Override Operation	Select Before Operate
Expression	(RT(13do) ==PU) ?{CL,1000,0,1} :{TR,100,0,1}
Expression Notes	If a Pulse ON command is received on calculator DO 13, send a 1000ms CLOSE command on mapped point DO 1. Otherwise, send a 100ms TRIP command to DO 2.

Table 6-167: Digital Assignments - Example 3

Field	Example Settings
Name	Digital Assignment 3
Enable Control Routing	On Target Point
Close/Latch/Pulse ON Target	0do
Control Type (ON Target Point)	Trip-Close
Pulse On Duration (ON Target Point)	1000
Pulse Off Duration (ON Target Point)	0
Number of Operations (ON Target Point)	1
Override Operation	None
Expression	0di
Expression Notes	Send the Trip/Close command on DO 0 if an ON event is received on 1di.

Table 6-168: Digital Assignments - Example 4

Field	Example Settings
Name	Digital Assignment 4
Enable Control Routing	OFF Target Point
Trip/Latch/Pulse OFF Target Point	3do
Control Type (OFF Target Point)	Trip-Close
Pulse On Duration (OFF Target Point)	1000
Pulse Off Duration (OFF Target Point)	
Number of Operations (OFF Target Point)	1
Override Operation	None
Expression	3do
Expression Notes	When the 1di value is 0 then the Trip command is sent to 3do. When the 1di value is 1, then no command is sent to 3do.

Example Expressions

Table 6-169: Expressions - Example

Expression	Description
!14do	Any command on the calculator owned point DO 14 is inverted and passed on to the configured mapped DO point according to the control type and other configuration parameters.
(RT (15do) != CL) ? 1 : 0	Any command on the calculator owned point DO 15 except CLOSE is passed through to configured mapped DO point according to the control type and other configuration parameters.
(0di) ? {TR, 100, 0 ,1} : 1di	When DI 0 is true, a 100-millisecond trip command will be sent to the configured mapped DO point. And, when DI 0 is false the value of 1di will be translated according to the control type and other configuration parameters.
(1ai < 1000) ? 16do	When AI 1 is less than 1000, any command calculator owned point DO 16 is passed through to the configured mapped DO point according to the control type and other configuration parameters. And, If AI 1 is greater than or equal to 1000, any command on DO 16 is ignored.
(4di) ? {PU, 1ai, 2ai, 3ai}	When mapped point DI 4 goes from false to true, send a Pulse ON command to configured mapped DO with On Duration equal to the current value of AI 1, an OFF Duration equal to the current value of AI 2, and a number of operations are equal to the current value of AI 3.

Quality Conversions

Converted points are a special class of pseudo points that are created based on an actual system point. Quality conversions take a system point and report a binary TRUE or FALSE based on a certain quality flag within that point. For example, if you create an OFFLINE quality point conversion based on analog point called *AI_000*, whenever *AI_000* is offline, the quality conversion points you created is TRUE. When *AI_000* is online, the quality conversion point is FALSE.

Quality conversion types

The MCP provides the following quality conversion flags:

- ALARM_INHIBIT
- CHATTER
- COMM_LOST
- LOCAL_CONTROL_ACTIVE
- LOCAL_FORCE – Commonly used to test expressions
- OFFLINE
- OLD_DATA
- OUTPUT_INHIBIT
- OVER_RANGE
- OVERFLOW
- QUESTIONABLE - Ceases evaluating the expression while Questionable is asserted
- REF_CHECK
- REMOTE_CONTROL_ACTIVE
- REMOTE_FORCE

- RESTART
- SCAN_INHIBIT – Asserts Questionable and Old Data flags
- SECONDARY_SOURCE
- SECONDARY_SOURCE_OFFLINE
- TAGGED
- TEST
- TIME_SYNC
- ZOMBIE - Asserts when the Zombie quality attribute of the mapped point is set

Table 6-170: Quality Conversions

Field	Description
Name	Enter a text description of the converted point in the Calculator map. Appears as the Point Description on the Point Details page. Range is up to 128 alphanumeric characters.
Quality Attribute	Selected quality flag to which the reference point is forced.
Source Point	The input point for the expression.
Target Point	The name of the point that is returned as the output of the expression. This name must be unique across all data types.
Target Alias	Enter a short name to reference the conversion point in the Calculator expression. Must be unique across all data types. Used as point description in Available Points list. Supported characters are: any combination of up to 126 characters using "a" through "z", "0" through "9", "_" (underscore) and "-" (hyphen), followed by a suffix indicating the data type of the referenced point (ai, ao, di, do, acc, or txt). Spaces are not allowed. Suggested format is <a to z><1 to 9999><datatype>. For example, scada43di. Range is up to 126 alphanumeric characters. Default is Xdi, where X is incremented from 1.
Result Point Description	A user-defined description of the expression.
Expression Notes	Internal notes regarding the expression.

Example Field Settings**Table 6-171: Quality Conversions - Example 1**

Field	Example Settings
Name	Quality Conversion 1
Quality Attribute	OFFLINE
Source Point	0ai
Target Point	DI 13
Target Alias	13di
Result Point Description	Digital Input 13
Expression Notes	Set DI 13 to 1, if the quality of mapped point AI 0 is OFFLINE

Table 6-172: Quality Conversions - Example 2

Field	Example Settings
Name	Quality Conversion 2
Quality Attribute	ALARM_INHIBIT
Source Point	0di
Target Point	DI 14
Target Alias	14di
Result Point Description	Digital Input 14
Expression Notes	Set DI 14 to 1, if the quality of mapped point DI 0 is ALARM_INHIBIT

Type Conversions

Converted points are a special class of pseudo points that are created based on an actual system point. Type conversion points change points from binary to analog format, or from analog to binary. For example, if you create a binary input type conversion from an analog input, a new point is created where the value of the analog input value is converted to a binary TRUE or FALSE. The MCP provides the following type conversions:

Table 6-173: Type Conversions

Field	Description
Analog input to digital input	Floating-point values are truncated to integers. The bit position specifies which resulting integer is used to determine the state of the digital input.
Digital input to analog input	The digital input state is converted to the value 1 (TRUE) or 0 (FALSE)
Analog output to analog input	Value of the analog input reflects the current Set Point Value of the analog output
Digital output to digital input	State of the digital input reflects the current state of the digital output
Accumulator to analog input	The value type of the references point specifies whether the running or frozen value of the accumulator is used in the expression
Accumulator to digital input	The value type of the referenced points specifies whether the running or frozen value of the accumulator is used in the expression. The bit position specifies which resulting integer is used to determine the state of the digital input.
Text to analog input	ASCII text representing a numeric value is converted into a floating-point value. If the text does not contain any valid numeric values (only decimal, scientific, or other valid floating-point formats, no letters, no special characters) that can be converted – the conversion fails and returns `0`, indicating the parsing was unsuccessful.
Name	Enter a text description of the conversion point in the Calculator map. Appears as Point Description on Point Details page. Range is up to 128 alphanumeric characters. Default is tcX, where X is incremented from 1.
Source Point	The input point for the expression.
Target Point Type	The type of point that is returned as the output of the expression.
Target Point	The name of the point that is returned as the output of the expression. This name must be unique across all data types.

Field	Description
Target Alias	Enter a short name to reference the conversion point in the Calculator expression. Must be unique across all data types. Used as point description in Available Points list. Supported characters are: any combination of up to 126 characters using "a" through "z", "0" through "9", "_" (underscore) and "-" (hyphen), followed by a suffix indicating the data type of the referenced point (ai, ao, di, do, acc, or txt). Spaces are not allowed. Suggested format is <a to z><1 to 9999><datatype>. For example, scada43di. Range is up to 126 alphanumeric characters. Default is Xai or Xdi depending on the Target Point Type, where X is incremented from 1.
Value Type (ACC to AI, ACC to DI only)	The type of accumulator points to use in the expression.
Bit Position (AI to DI, ACC to DI only)	The integer within the value returned from the source point used to determine the state of the digital input.
Result Point Description	A user-defined description of the expression.
Expression Notes	Internal notes regarding the expression.

Example Field Settings

Table 6-174: Type Conversions - Example 1

Field	Example Settings
Name	Type Conversion 1
Source Point	1ai
Target Point Type	Digital Input
Target Point	DI 15
Target Alias	15di
Bit Position (AI to DI, ACC to DI only)	0
Result Point Description	Digital Input 15
Expression Notes	AI to DI Conversion

Table 6-175: Type Conversions - Example 2

Field	Example Settings
Name	Type Conversion 2
Source Point	0di
Target Point Type	Analog I Input
Target Point	AI 13
Target Alias	13ai
Result Point Description	Analog Input 13
Expression Notes	DI to AI Conversion

Table 6-176: Type Conversions - Example 3

Field	Example Settings
Name	Type Conversion 3

Field	Example Settings
Source Point	0acc
Target Point Type	Digital Input
Target Point	DI 16
Target Alias	16di
Bit Position (AI to DI, ACC to DI only)	1
Value Type (ACC to AI, ACC to DI only)	RUNNING
Result Point Description	Digital Input 16
Expression Notes	ACC to DI Conversion

Calculator Averages

Calculator supports both standard and time-weighted averaging on selected analog inputs.

Fields

Table 6-177: Calculator Averages

Field	Description
Name	A system name to describe this expression within the Calculator application. Range is up to 128 alphanumeric characters.
Average Type	Select the type of averaging to perform: <i>Block</i> averaging is a basic arithmetic average. <i>Time-Weighted</i> gives an average that considers the amount of time the point stayed at each value. Time-Weighted average is used to reduce the influence of infrequent outliers.
Source Point	The analog input to be averaged.
Target Point	The name of the source point that is created for this expression. This name must be unique across all data types.
Target Alias	Enter a short name to reference the output point within Calculator. Must be unique across all data types. Used as point description in Available Points list. Supported characters are: any combination of up to 126 characters using "a" through "z", "0" through "9", "_ " (underscore) and "-" (hyphen), followed by a suffix indicating the data type of the referenced point (ai). Spaces are not allowed. Suggested format is <a to z><1 to 9999><datatype>. For example, scada43ai. Range is up to 120 alphanumeric characters. Default is Xai, where X is incremented from 1.
Alignment	The time of day to align the period to. Periods are positioned such that a new period begins each day at the alignment time. For example, if the alignment time is set to 12:00 pm, a new period is aligned to begin at this time every day. 
Sub Block Divisor	How many segments to divide the period into. The minimum value is 1. If a value greater than 1 is provided, Calculator averages the analog input over the segment instead of the full averaging period. Calculator reports the average of the last <i>n</i> fractional averages, where <i>n</i> is the sub-block divisor.
Sliding	Select if a sliding window should be used.

Field	Description
	If not selected, Calculator reports the average at every full averaging interval. For example, if you specify an averaging interval of 1 hour and a sub-block divisor of 4, Calculator calculates the average of the analog input every 15 minutes; it reports this average every 15 minutes if a sliding window is used, or every hour if set to use a non-sliding window.
Value Exclusion	An enable/disable flag for excluding or not excluding the range of sample values for the averaging.
Value Exclusion: Min	A Floating-point minimum value for the value exclusion. Default is -0.5.
Value Exclusion: Max	A Floating-point maximum value for the value exclusion. Default is +0.5.
Result Point Description	A user-defined description of the expression.
Period	Enter the size of the averaging interval. The size of the period must divide evenly into the alignment interval, defined above. For example, in the figure above, the period is set to 4 hours. Since the alignment period is 12:00 pm, there are 6 periods in a full day. For this reason, a period size of 5 hours would not be accepted since this would divide into 2.4 periods per day and would not coincide with the <i>Alignment</i> value.
Expression Notes	Internal notes regarding the expression.

Example Field Settings

Table 6-178: Calculator Average - Example 1

Field	Example Settings
Name	Average 1
Average Type	Block
Source Point	0ai
Target Point	AI 14
Target Alias	14ai
Alignment	00:00:00
Sub Block Divisor	1
Sliding	Not Selected
Value Exclusion	Not Selected
Value Exclusion: Min	-0.5
Value Exclusion: Max	0.5
Result Point Description	Analog Input 14
Period: Days	0
Period: Hours	1
Period: Minutes	0
Period: Seconds	0
Expression Notes	Calculate and Report Block Average for every 1 hour.

Table 6-179: Calculator Average - Example 2

Field	Example Settings
Name	Average 2
Average Type	Block
Source Point	0ai
Target Point	AI 15
Target Alias	15ai
Alignment	00:00:00
Sub Block Divisor	4
Sliding	Selected
Value Exclusion	Not Selected
Value Exclusion: Min	-0.5
Value Exclusion: Max	0.5
Result Point Description	Analog Input 15
Period: Days	0
Period: Hours	1
Period: Minutes	0
Period: Seconds	0
Expression Notes	Calculate and Report Block Average for every 15 minutes.

Table 6-180: Calculator Average - Example 3

Field	Example Settings
Name	Average 3
Average Type	Time-Weighted
Source Point	0ai
Target Point	AI 16
Target Alias	16ai
Alignment	00:00:00
Sub Block Divisor	1
Sliding	Not Selected
Value Exclusion	Selected
Value Exclusion: Min	-0.9
Value Exclusion: Max	0.9
Result Point Description	Analog Input 16
Period: Days	0
Period: Hours	0
Period: Minutes	1
Period: Seconds	0
Expression Notes	Calculate and Report Time Weighted Average for every 1 minute (Excluding the samples from -0.9 to +0.9).

Output to Input Conversion

Output to input conversion expressions enable master stations to communicate with each other by converting two types of calculator-owned points:

- digital output to digital input
- analog output to digital input, accumulator, or analog input

This feature replicates the functionality of the Mailbox DTA (B009). To convert inputs belonging to external applications and devices, use calculator's [type conversion](#) feature.

Table 6-181: Output to Input Conversion

Field	Description
Name	Enter a text description of the conversion point in the Calculator map. Appears as Point Description on the Point Details page. Range is up to 128 alphanumeric characters.
Source Point Type	The type of point that is returned as the output of the expression, either Analog Output or Digital Output.
Source Point	A user-defined name that can be used for quick indexing and filtering. Maximum 66 characters, ASCII only. The default value is the next available system point reference.
Source Alias	Enter a short name to reference the conversion point in the Calculator expression. Must be unique across all data types. Used as point description in Available Points list. Supported characters are: any combination of up to 126 characters using "a" through "z", "0" through "9", "_" (underscore) and "-" (hyphen), followed by a suffix indicating the data type of the referenced point (ai or do). Spaces are not allowed. Suggested format is <a to z><1 to 9999><datatype>. For example, scada43do. Range is up to 126 alphanumeric characters. Default is the next available auto-generated alias, Xao or Xdo depending on the selected Source Point Type, where X is incremented from 1.
Source Point Description	A user-defined description of the expression.
Expression Notes	Internal notes regarding the expression.
Target Point Type	The type of point that is used as the input of the expression, <i>Digital Input</i> (if digital output is selected as the result point type) or <i>Accumulator, Analog Input, or Digital Input</i> (if analog output is selected as the result point type).
Target Point	A user-defined name that can be used for quick indexing and filtering. Maximum 66 characters, ASCII only.
Target Alias	The alias of the point that is used as the input of the expression.
Input Point Reference	The input point to be used by the expression.
Bits to Map (AO to DI only)	The number of input points to concatenate as the expression's digital input.
Result Point Description	A user-defined description of the expression.

Example Field Settings

Table 6-182: Output to Input Conversion - Example 1

Field	Example Settings
Name	Output To Input Conversion 1
Source Point Type	Digital Output
Source Point	DO 17
Source Alias	17do
Source Point Description	Digital Output 17
Expression Notes	DO 17 into DI 17 Output to Input Conversion
Target Point Type	Digital Input
Target Point	DI 17
Target Alias	17di
Result Point Description	Digital Input 17

Table 6-183: Output to Input Conversion - Example 2

Field	Example Settings
Name	Output To Input Conversion 2
Source Point Type	Analog Output
Source Point	AO 3
Source Alias	3ao
Source Point Description	Analog Output 3
Expression Notes	AO 3 into DI 18 and DI19 Output to Input Conversion
Target Point Type	Digital Input
Bits Position	0
Target Point	DI 18
Result Point Description	Digital Input 18
Target Alias	18di
Bits Position	1
Target Point	DI 19
Result Point Description	Digital Input 19
Target Alias	19di

Calculator Points

Calculator points can be used to provide input into one or more expressions. Once defined on the **Calculator Points** page, these analog output and digital output points are shown within the point picker tree on the Expression Builder.

Table 6-184: Calculator Points

Field	Description
Analog Output and Digital Output tabs	The type of output point to be made available.
Source Reference	The unique name of the source point. This field is automatically assigned and cannot be edited.
Alias	Enter a short name to reference the output point within Calculator. Must be unique across all data types. Used as point description in Available Points list. Supported characters are: any combination of up to 126 characters using "a" through "z", "0" through "9", "_" (underscore) and "-" (hyphen), followed by a suffix indicating the data type of the referenced point (ai, ao, di, do, acc, or txt). Spaces are not allowed. Suggested format is <a to z><1 to 9999><datatype>. For example, scada43di. Range is up to 126 alphanumeric characters. Default is Xai, Xdi, Xdo, Xacc, Xtxt, where X is incremented from 1.
Source Description	A user-defined description of the expression.

Calculator Application Parameters

The **Application Parameters** tab allows you to change the way that time stamps are recorded by the Calculator application.

Table 6-185: Calculator Application Parameters

Field	Description
Data Change Time Tag	Can be set to: - Use evaluation time When this option is selected, Calculator uses the time stamp of the trigger event to time stamp the resulting point from an expression (if the expression evaluation results in a changed point value). - Use trigger event When this option is selected, Calculator time stamps the resulting point with the time reported by the system clock after the expression has been evaluated. The default setting is <i>Use trigger event</i>.
Allow Controls At Startup	Can be set to: - Only Pseudo Points When this option is selected, Calculator at startup allows the controls to the mapped pseudo points only. - All Points When this option is selected, Calculator at startup allows the controls to all the mapped points. - Disabled When this option is selected, Calculator does not allow the controls at startup. The default value is Only Pseudo Points.

Basic Syntax Rules

To create a valid [expression](#), the following syntax rules of the Calculator must be followed (in addition to the format of the specific operation types).

Order of precedence

No special precedence is enforced on any Calculator expression, except where parentheses have been used. The Calculator evaluates parts of any expression that are within parentheses first, and then evaluate the rest of the expression in a left to right manner. The Calculator allows up to 10 levels of nested parentheses. Evaluation of nested statements occurs in an inward-to-outward manner where the more deeply nested parts of the expression are evaluated first.

For example, in the expression $x =$

Part_1(Part_2)Part_3(Part_4(Part_5(Part_6))Part_7)Part_8((Part_9)Part_10)

the correct order of evaluation is Part_2; Part_6; Part_5; Part_4; Part_7; Part_9; Part_10; Part_1; Part_3; Part_8.

White space

You may insert any number of spaces between operators and operands; the Calculator ignores these spaces.

Load Shed and Curtailment

The **Load Shed** application allows you to configure sets of feeders and load shed zones. Inputs to the MCP can be used to trigger the opening of feeders to shed load on the system. Load shedding can also be referred to as Demand Side Management or Load Management.

You can create up to 50 zones and select up to 100 feeders.

Feeders tab

Table 6-186: Feeder tab

Field	Description
Feeder Name	A user-defined name that can be used for quick indexing and filtering. Maximum 66 characters, ASCII only.
Zone Assignment	The Load Shed zone that the feeder is assigned to. Zones can be created on the Zones sub-tab.
Description	A user-defined block of text that provides a detailed and localized description of the group. Maximum 128 characters.
Point Selection Area	You can select digital output system points to add to the feeder group using the system point tree. Click the checkbox to the left of a point or group name to add a point or a group of points to the group. Points included in the group are shown at the right-hand side of the point selection area. To remove a point, uncheck the appropriate box in the system point tree or highlight the point and click the Delete button. Click the Delete NE to remove any points that are not valid (that is, points that have been deleted from the system database after they were included in the group).

In the event a load shed command is issued to the zone that this feeder is a member of, all the digital outputs selected here receive a TRIP control command.

Zones tab

Table 6-187: Zones tab

Field	Description
Zone Name	A user-defined name that can be used for quick indexing and filtering. Maximum 66 characters, ASCII only.
Zone Description	A user-defined block of text that provides a detailed and localized description of the group. Maximum 128 characters.
Load Shed Trigger Point	A point selection tree that allows you to choose the digital input point to be used as the load shed trigger point. The feeders associated with this group are tripped when this point transitions to the configured Trigger state.
Trigger Point Description	A detailed and localized description of the trigger point. This field is not editable.
Trigger State	The binary state used to trigger the load shed point selected.

Remote Logging (Rsyslog)

Remote Logs

File	RemoteLogs.txt
Location on MCP	/mnt/datalog/Logs
Log Format	<ID> < DATE_SHORT > <TIME_SHORT > < TIMESTAMP> < SOURCE_IP > < SOURCE_NAME> < FACILITY> < FACILITY_NUM> < SEVERITY> < SEVERITY_NUM > < TAG> <MESSAGE >
Delimiter	Pipe
Example Log Format	- 03/03/2020 22:29 March 7 02:01:58 10.1.1.80 localhost local6 22 info 6 HMI_Access_Mngr: HMI_Access_Mngr;2020-5-7 2:2:7:634 UTC;1430964118;634; observer_remote;3.185.89.75;3.185.89.75; observer; Logout of HMI user session for user: observer_remote at 3.185.89.75

To configure Remote System Log through mcpcfg, refer Configure Rsyslog service and from Settings GUI, refer [Configure Rsyslog Service](#).

Receiving Remote System Logs

The MCP can be configured to accept system logs from an IED or any substation equipment that can support the syslog remote logging feature. The MCP supports both TCP- and UDP-based remote connections to the IEDs on the standard port numbers. All the logs received are saved in a default file under a set path. The current version is configured to conform to RFC5424 standard.

Figure 6-4: System Log Retrieval

Configure UDP- and TCP-based logging

Both the UDP- and TCP-based connection ports can be simultaneously opened to listen for the incoming remote syslog messages being pushed from the IEDs or another substation equipment. A dedicated port is opened in listen mode and is classified operate under internal interface (For more details, see [Firewall Settings](#) section).

Configure Hosts-Subnets Filters

By default, the MCP saves all incoming logs being pushed from any of the IEDs connected to the network and configured with the MCP IP Address and syslog port).

The MCP also allows you to configure the:

- **Subnets-based binding filter:** By selecting a subnet from the displayed list or by specifying a subnet from the Custom Filters options, the MCP starts logging messages from IEDs whose IP Addresses fall under the subnet's range)
- **Host-based binding filter:** By Specifying a Host's IP Address, the MCP starts logging messages being pushed from the specified host.

Configuring Subnet address and Host IP Address is beneficial when:

- An IED or substation equipment's IP Address is not under any of the subnets available in the MCP.
- The MCP is in redundant mode and the Standby's Ethernet Interface (Alias IP/Gateways etc.) are configured to be in different subnets from that of the Active's Ethernet Interface.

For details on enabling and editing Rsyslog services, refer to the online help topic: Configure Secure Access.

Syslog Client

The MCP generates internally produced security events in syslog format (i.e., RFC5424) as per specifications of IEC 62351-14. In addition, it also generates internally produced application log events in syslog format (i.e., RFC3164).

The Syslog Client can relay the MCP locally buffered remote IED Syslogs, when the Rsyslog service is enabled in the MCP.

When the Syslog Client application is configured, it enables the G500 to transfer these (security, application & remote IED syslog) events to remote syslog server over **UDP**.

Types of Logs Supported

The Syslog Client application can be configured for transfer each of the below supported logs:

- Remote IED Acquired Syslogs
- User Activity Logs
- Diagnostic Logs
- Control
- Firewall
- System Event
- OpenVPN
- ARRM
- Analog Report (not available after and including MCP V2.60)
- IEC62351-14 (Security Events)

Configure Syslog Client

1. Launch the **DSAS** application.
2. Click **Connect** and enter your login credentials.
3. Go to the **Connections** tab and click the  icon to add a new connection.
4. In the **New Connections** window, choose **Network Connection**. From the **Network Connection Type** dropdown, choose **Syslog Client**.

Figure 6-5: Network Connection Type – Syslog Client

5. Click **OK** and the Syslog Client is successfully added under the Network Connections.

Figure 6-6: Network Connection – Remote/Local

	IEC62351-14	☒	Warning

Note: The Remote Syslog Server shall be accessible via Predix EdgeManager IP. To configure the Edge Manager IP, refer to the **EdgeManager Connectivity Configuration** detailed under the Configure Network Interfaces topic of the [Chapter 5 - MCP Settings GUI](#).

Network Connection - Configuration Settings

To set the Network Connection Configuration Settings, follow the below table.

Table 6-188: Network Connection - Configuration Settings

Field	Description
Enabled	When this checkbox is enabled, the Syslog client application is configured for transfer of syslog events to remote syslog server.
Network Protocol	This parameter defines the supported protocol to transfer the syslog events to remote syslog server (UDP).
Primary Server IP	Supported protocol is UDP. The MCP allows to configure multiple remote syslog server connection details. This parameter defines the primary remote syslog server IP. Note: The remote syslog server IP shall be reachable via EdgeManager IP.
Primary Server Port	This parameter defines the primary remote syslog server Port number.
Secondary Server IP	The MCP allows to configure multiple remote syslog server connection details. This parameter defines the secondary remote syslog server IP. Note: The remote syslog server IP shall be reachable via EdgeManager IP
Secondary Server Port	This parameter defines the secondary remote syslog server Port number.

Types of Logs and the Default Severity

There are two categories of logs supported:

- Remote Logs
- Local Logs

Follow the below tables to understand the logs data transfers and the types of minimum severity.

Remote Logs

Table 6-189: Logs Supported - Remote

Logs Origin	Logs Data	Send to Syslog Server	Types of Minimum Severity
Remote	Remote IED Acquired Syslogs	When this checkbox is enabled, all the Remote IED Acquired syslog events whose severity is same or higher than the Minimum Severity configured, will be transferred to configured remote syslog server.	Supported Values: • Alarm • Error • Warning • Notice • Info The default value is Warning .

Local Logs

Table 6-190: Logs Supported - Local

Logs Origin	Logs Data	Send to Syslog Server	Types of Minimum Severity
Local	User Activity Log	When this checkbox is enabled, all the User Activity application log events whose severity is same or higher than the Minimum Severity configured, will be transferred to configured remote syslog server.	Supported Values: • Info The only value is Info .
	Diagnostic Log	When this checkbox is enabled, all the diagnostic application log events whose severity is same or higher than the Minimum Severity configured, will be transferred to configured remote syslog server.	Supported Values: • Alarm • Error • Warning • Notice • Info The default value is Warning .
	Control	When this checkbox is enabled, all the control application log events whose severity is same or higher than the Minimum Severity configured, will be transferred to configured remote syslog server.	Supported Values: • Info The only value is Info .
	Firewall	When this checkbox is enabled, all the firewall application log events whose severity is same or more than the Minimum Severity configured, will be transferred to configured remote syslog server.	Supported Values: • Info The only value is Info .
	System Event	When this checkbox is enabled, all the system event application log	Supported Values: • Alarm

Logs Origin	Logs Data	Send to Syslog Server	Types of Minimum Severity
		events whose severity is same or more than the Minimum Severity configured, will be transferred to configured remote syslog server.	- Error - Warning - Notice - Info The default value is Warning .
	OpenVPN	When this checkbox is enabled, all the OpenVPN application log events whose severity is same or more than the Minimum Severity configured, will be transferred to configured remote syslog server.	Supported Values: - Alarm - Error - Warning - Notice - Info The default value is Warning .
	ARRM	When this checkbox is enabled, all the ARRM application log events whose severity is same or more than the Minimum Severity configured, will be transferred to configured remote syslog server.	Supported Values: Info The only value is Info .
	Analog Report (not available after and including MCP V2.60)	When this checkbox is enabled, all the Analog Report application log events whose severity is same or more than the Minimum Severity configured, will be transferred to configured remote syslog server.	Supported Values: - Alarm - Error - Warning - Notice - Info The default value is Warning .
	IEC62351-14	When this checkbox is enabled, all the internal security events whose severity is same or more than the Minimum Severity configured, will be transferred to configured remote syslog server.	Supported Values: - Alarm - Error - Warning - Notice - Info The default value is Warning .

Configure Datalogger

This section contains the following sub-sections:

Data Logger

[Configure the Data Logger](#)

[Report Types](#)

[Storage Allocation](#)

[Save Report](#)

[Load Report](#)

[Manage Reports](#)

[Select Points](#)

[Change Scaling](#)

Configure the Data Logger

The Data Logger application allows you to graphically monitor and record data from devices connected to the MCP. You can also save and review historical reports created by the application.

Choose between three different report types:

- [Continuous Reports](#)
- [Periodic Reports](#)
- [Out of Range Reports](#)

Report Types

Continuous Reports

Continuous reports record all events on the selected points.

» To select a point to log:

1. Expand the point tree by clicking the +.
2. Click the checkbox next to the point name. If a folder is selected, all points that fall under that group are added to the report.
3. Enter the deadband setting by double clicking the **Deadband** cell and entering the desired value.

Table 6-191: Continuous Reports

Field	Description
Name	User-defined name to refer to the report.
Log Full Action	When the maximum number of records is reached, define how incoming records are to be handled. <i>Overwrite Oldest Data</i> replaces the oldest entries in the log with the new incoming records; <i>Reject Newest Data</i> ceases recording incoming records until space is made available (through the Manage Reports window of the Data Logger).
Max Number of Records	Enter the maximum number of records that should be recorded within this report. Note that the number of records is divided among the selected points. Refer to Storage Allocation for information on configuring MCP storage space available for reports.
Enable Trigger Point	When selected, the Data Logger monitors a defined digital input point for status changes. When a status change occurs, log recording begins; it ends when the status changes back.
Trigger Point	Select a digital input to trigger recording of the report.
Go State	If <i>Enable Trigger Point</i> is selected, select the state that the point must enter to begin recording.

Periodic Reports

Periodic reports record current value, minimum value, or maximum value for the selected points within a defined interval:

» To select a point to log:

1. Expand the point tree by clicking the +.
2. Click the checkbox next to the point name. If a folder is selected, all points that fall under that group are added to the report.
3. Enter the deadband setting by double clicking the **Deadband** cell and entering the desired value.

Table 6-192: Periodic Reports

Field	Description
Name	User-defined name to refer to the report.
Log Full Action	When the maximum number of records is reached, define how incoming records are handled. <i>Overwrite Oldest Data</i> replaces the oldest entries in the log with the new incoming records; <i>Reject Newest Data</i> ceases recording incoming records until space is made available (through the Manage Reports window of the Data Logger).
Max Number of Records	Enter the maximum number of records that should be recorded within this report. Note that the number of records is divided among the selected points. Refer to Storage Allocation for information on configuring MCP storage space available for reports.
Periodic Value	Select if you would like to record the current, minimum, or maximum values for selected points at each interval.
Log Interval	Select the type of interval. This value is combined with the Alignment value below to define the interval length.
Interval	The length of interval. For example, if the selected log interval is <i>hours</i> and the interval is 2, the length of the interval is 2 hours.

Field	Description
Alignment	The time of day to align the period to. Intervals are positioned to meet at the alignment value. For example, if an <i>Hours</i> interval is selected and the alignment is set to <i>xx:15</i> , a new interval begins at 15 minutes past each hour. If a <i>Days</i> interval is selected and the alignment is set to 8, a new interval begins at 8:00 am each day.
Enable Trigger Point	When selected, the Data Logger monitors a defined digital input point for status changes. When a status change occurs, log recording begins; it ends when the status changes back.
Trigger Point	Select a digital input to trigger recording of the report.
Go State	If <i>Enable Trigger Point</i> is selected, select the state that the point must enter to begin recording.

Out of Range Reports

Out of Range reports record events on the selected points that fall outside of a configured range.

» To select a point to log:

1. Expand the point tree by clicking the +.
2. Click the checkbox next to the point name. If a folder is selected, all points that fall under that group are added to the report.
3. Enter the deadband setting by double clicking the **Deadband** cell and entering the desired value.
4. Enter the validation time. A value of 0 disables this feature. See below for an explanation of this setting.
5. Enter the lower and upper limits of the configured range.

Table 6-193: Out of Range Reports

Field	Description
Name	User-defined name to refer to the report.
Log Full Action	When the maximum number of records is reached, define how incoming records are to be handled. <i>Overwrite Oldest Data</i> replaces the oldest entries in the log with the new incoming records; <i>Reject Newest Data</i> ceases recording incoming records until space is made available (through the Manage Reports window of the Data Logger).
Max Number of Records	Enter the maximum number of records that should be recorded within this report. Note that the number of records is divided among the selected points. Refer to Storage Allocation for information on configuring MCP storage space available for reports.
Enable Trigger Point	When selected, the Data Logger monitors a defined digital input point for status changes. When a status change occurs, log recording begins; it ends when the status changes back.
Trigger Point	Select a digital input to trigger recording of the report.
Go State	If <i>Enable Trigger Point</i> is selected, select the state that the point must enter to begin recording.

Validation Time

Out of range logging allows for an optional validation period. This is used to account for instances where a reading may be incorrect for one scan before the device corrects itself. If this feature is enabled, the following occurs:

1. If a new event is in the *same* reporting range as the previously reported value, the new event is accepted and recorded.
2. If a new event is in a *different* reporting range than the previously reported value, the validation timer is started:
 - a) If the validation timer expires with no new events being reported, the event being validated is accepted and recorded.
 - b) If a new event is reported before the timer expires, and it falls within the same range as the event being validated, both are accepted and recorded, and the validation timer is reset.
 - c) If a new event is reported before the timer expires, and it falls outside the range of the event being validated, the event being validated is discarded, the validation timer is reset, and the new event starts at step 2.

Storage Allocation

Global Memory allocated to Data Logger

The percentage of memory allocated to datalogger is present under Storage section of Systemwide tab. By default, it is divided between 2 applications: ARRM and Data Logger.

» To change the Data Logger storage allocation:

1. On the storage section under Systemwide the storage space allocated to datalogger can be changed.
2. Move the slider left or right to change the allocation. You cannot decrease the amount of storage space to less than that currently allocated to records.
3. Save the selected allocation in system wide storage and these changes will be reflected in Storage section under datalogger tab.

Memory allocated to Data Logger

Tip: Each record uses 0.06 KB of memory space.

Save Report

The **Save Report** window allows you to export a .csv (comma separated values) file from the Data Logger. The CSV file contains point attributes and values for the entire timeframe shown in the Summary Area.

» To save a report:

1. Click Save Report.
2. On the CSV Report Options window, enable or disable saving vertex data in the report. Click OK.
3. Browse to the location you want to store the report file.
4. Enter a file name ending in .csv and click Save.

NOTES:

- Historic records loaded from other reports are not saved within the new report file.
- If no records exist within the selected timeframe, the exported file will contain one entry that shows the first available value before the selected start time.

Vertex Data

When saving reports, Data Logger gives you the option of including or excluding vertex data from the file. Vertex data is the collection of x and y coordinates that comprise a plotted trend. When a report is saved without vertex data, only the properties of the report (configured trends, scales, pen colors, axis settings, etc.) are saved, not the data within the report itself.

Load Report

The **Load Report** window allows you to import a .csv (comma separated values) file previously exported from the Data Logger.

» To load a report:

1. Click Load Report.
2. If vertex data has been saved to the report:
 - a) On the CSV Report Options window, enable or disable loading of vertex data from the report.
 - b) Click OK.
3. Browse to the report file you want to display and click Open.

Vertex Data

When loading reports, Data Logger gives you the option of importing or ignoring vertex data within the file. Vertex data is the collection of x and y coordinates that comprise a plotted trend. When a report is loaded containing vertex data, the trends appear on the chart area as they appeared when the file was saved.

NOTE: When a historic report is loaded, **No End Date** is automatically unchecked, and auto-trending is disabled.

When a report is loaded without vertex data, only the properties of the trend (scales, pen color, axis settings, etc.) are restored that is, not the data within the trend itself. Data Logger attempts to reestablish a connection to the live trends as defined in the report.

Manage Reports

The **Manage Reports** window allows you to view the amount of disk space consumed by report data as well as pause and restart logging.

Manage Reports										
✓ Logging is enabled.										
#	Report ID	Name	Historic?	Active?	Activate	Deactivate	Capacity (MB)	Size (MB)	Size (%)	Empty
1	0		☐	☒	Activate	Deactivate	3235.84	1.21	0.04%	Empty
2	1		☐	☒	Activate	Deactivate	1617.92	0.01	0.00%	Empty
3	2		☐	☒	Activate	Deactivate	3235.84	0.01	0.00%	Empty
4	3		☐	☒	Activate	Deactivate	1617.92	0.01	0.00%	Empty
5	4		☐	☒	Activate	Deactivate	3235.84	1.21	0.04%	Empty
6	5		☐	☒	Activate	Deactivate	1617.92	0.01	0.00%	Empty
7	6		☐	☒	Activate	Deactivate	3235.84	0.01	0.00%	Empty
8	7		☐	☒	Activate	Deactivate	1617.92	0.01	0.00%	Empty
9	8		☐	☒	Activate	Deactivate	3235.84	1.21	0.04%	Empty

✓ OK

Table 6-194: Manage Reports

Field	Description
#	A non-editable row number to identify the trend.
Report ID	The ID number of the report. Non-editable field that can be configured in the Data Logger tab of the Configuration Tool.
Name	The system name of the report. Non-editable field that can be configured in the Data Logger tab of the Configuration Tool.
Historic?	If a report is no longer configured within Data Logger but is loaded from a saved file, the checkbox is selected to indicate this.
Active?	Indicates if logging is currently enabled for the report type. Use the <i>Activate</i> and <i>Deactivate</i> buttons to change this setting.
Activate	Sends a command to the MCP to resume logging for this report type. The <i>Active?</i> field indicates logging status.
Deactivate	Sends a command to the MCP to pause logging for this report type. The <i>Active?</i> field indicates logging status.
Capacity (MB)	The amount of disk space allocated to the report type, in Mbytes. Non-editable field that can be configured in the Data Logger tab of the Configuration Tool.
Size (MB)	The amount of disk space currently consumed by the report, in Mbytes, including cache data.
Size (%)	A percent-representation of the amount of capacity currently being consumed by the report type.
Empty	Sends a command to the MCP to delete all records for this report type. Trend data already cached and displayed within Data Logger is not deleted.

Select Points

The **Select Points for Trending** window lists the points that can be selected for graphing within the Data Logger.

» To select points for graphing:

1. Select the **Start Date** for the graph timeframe. If **Earliest Record** is selected, the timeframe of the graph resizes to show the first recorded point.
2. Select the **End Date** for the graph timeframe. If **No End Date** is selected, Data Logger continually polls the MCP for new data values on a regular basis and extends the graph as new data is received. **No End Date** must be selected to enable Auto-Trend.
3. Select up to 10 points to graph by clicking the  icon. When a point is selected, it is marked by a  icon. The  icon indicates some child points of the item have been selected.
4. Click **OK**.

Result: Data Logger creates a graph of the selected points.

Up to and including MCP version 5.10 maximum 10,000 logged data samples can be retrieved at a time.

Starting with MCP version 5.20:

- units with 8 GB RAM can accommodate maximum 100,000 logged data samples to be retrieved at a time.
- units with 16 GB RAM can accommodate maximum 500,000 logged data samples to be retrieved at a time.

This is not the amount of data being *logged*, which depends on how many reports are configured versus logging frequency and storage space – see the Data Logger → Storage Allocation configuration.

As an example for the 16 GB RAM units: starting with MCP v5.20 this would allow operators to retrieve in one single trends screen either of below combinations (each example equates to about 500k logged data samples):

- Close to 6 days of one pen logged every second, or
- About 23 hours of six pens logged every second, or
- About 17 days of ten pens logged every 30 seconds, or
- About 6 months of one pen logged every 30 seconds.

It is important to note that retrieving such amount of data (500,000 logged data samples in one single screen) may require in excess of 30 seconds to display it. By comparison 10 pens logged every 30 seconds for one day would be retrieved and displayed within 2 seconds.

During this time the Trend display will not show anything and on the bottom left will indicate the message “Connecting to trend data...”:

Once the data has been retrieved – it will be displayed with correct start and date times and on the bottom left will indicate the message “Streaming trend data...”:

From this point on, as long as the trend screen remains open – operators can adjust the vertical bars for start-end of data and “zoom in” to see the details on the upper area – all virtually instant.

Changing focus from the trend screen to another screen and coming back to the trend screen will require again time to retrieve the previous amount of requested data.

(Re) selecting other trend pens will also cause data retrieval.

Operators can look at different other screens at same time, without closing the trend screen – by using **Window > Floating** mode:

Data Logger supports the following record types:

- **Periodic** – Records one or more of the following for the selected analog input:
 - o Current value
 - o Minimum value
 - o Maximum value
- **Continuous** – Records all events on the selected analog input
- **Ranged** – Records events on the selected analog input that fall outside of a configured range

Change Scaling

The **Change Scales and Axes** window allows you to change the way graphs are shown within the Data Logger.

Table 6-195: Change Scaling

Field	Description
#	A non-editable row number to identify the trend.
Color	The color of line used when graphing the trend.
Report	The system name of the report the trend belongs to. Non-editable field that can be configured in the Data Logger tab of the Configuration Tool.
Point	The system name of the point. Non-editable field that can be configured in the Data Logger tab of the Configuration Tool.
Axis Label	The user-configurable name shown when referencing the trend.
Unit	A user-configurable label shown to indicate the type of data being graphed. This field is for display only and does not affect the graphing of the point.
Auto-Range	When enabled, the <i>Min</i> and <i>Max</i> fields are disabled, and the Y-axis on the Summary Area automatically scales vertically to contain the trend's data.
Min	The minimum Y-axis limit to be displayed. Enabling Auto-Range will override this setting.
Max	The maximum Y-axis limit to be displayed. Enabling Auto-Range will override this setting.
Axis	Display or hide the Y-axis scale for the trend. This affects the scales in both the Summary Area and the Viewing Area.
Historic	Shows whether the trend is live or has been loaded from a saved report.
Axis Sets	• Individual: One axis per point in each report. • Per Point Name: One axis per point. Each axis is shared between reports. • Single: One shared axis for all points. This axis is shared between reports.

HAMA - Hardware Asset Management Application

This chapter contains the following sections and sub-sections:

[Hardware Asset Management Application \(HAMA\)](#)

[Analog Inputs](#)

[Digital Inputs](#)

[Accumulator Points](#)

[Text Points](#)

Hardware Asset Management Application (HAMA)

Hardware Asset Management Application (HAMA) is a Data Translation application in MCP. HAMA DTA gathers the live or dynamic data every 10 seconds (e.g., network modes, serial port settings, temperatures, real time utilizations of various resources, etc.) and presents to RTDB by means of Analog/Digital/Accumulator/Text Points but not in the above report.

Below are list of RTDB points supported by HAMA DTA application. All these points present to RTDB as field points (i.e., Point IDs greater than 1).

Analog Inputs

Table 6-196: Analog Inputs

Point ID	Point Reference	Point Description	Values
300	Last Reset Cause	Last Reset Cause	Not supported in G100 Gets the Last Reset Cause of the Main Board. Options (INT from 1 to 9): - Reset Power Other, 1 - Reset Power Main, 2 - Reset Temp Module, 3 - Reset Temp Carrier, 4 - Reset WDT Module, 5 - Reset WDT Carrier, 6 - Reset System, 7 - Reset Carrier, 8 - Reset Power Button, 9 Note: value 0 is present only while initializing.
310	Chassis Intrusion Status	Chassis Intrusion Status	Not supported in G100 Gets the Chassis Intrusion Status of the Board. Options: - Intrusion Safe (1), - Intrusion Unsafe (2), or

Point ID	Point Reference	Point Description	Values
			Intrusion Undefined (-1) Note: value 0 is present only while initializing or point is invalid.
400	Front Display State	Front Display State	Not supported in G100 State of the Display in BIT ENCODED values: Options: - Bit 0 = Display State OFF (bit = 0) / ON (bit = 1) - this is the actual state, is not driven by the saver setting - Bit 1 = Display State OverTemp Warn (bit =1) - Bit 2 = Display State OverTemp Alarm (bit =1)
501	Power Supply 1 (top) Status	Power Supply 1 (top) Status	Not supported in G100 0 = No PSU (not inserted) 1 = HV PSU present but not energized or Not OK 7 = HV PSU present, energized and OK 9 = LV PSU present but not energized or Not OK 15 = LV PSU present, energized and OK
502	Power Supply 2 (bottom) Status	Power Supply 2 (bottom) Status	Not supported in G100 0 = No PSU (not inserted) 1 = HV PSU present but not energized or Not OK 7 = HV PSU present, energized and OK 9 = LV PSU present but not energized or Not OK 15 = LV PSU present, energized and OK
601	Temperature Power Supply 1 (top)	Temperature Power Supply 1 (top) in Deg C	Not supported in G100 Deg C
602	Temperature Power Supply 2 (bottom)	Temperature Power Supply 2 (bottom) in Deg C	Not supported in G100 Deg C
610	Temperature CPU	Temperature CPU in Deg C	Deg C
611	Temperature Memory (RAM)	Temperature Memory (RAM) in Deg C	Not supported in G100 Deg C

Point ID	Point Reference	Point Description	Values
615	Temperature FPGA LAN	Temperature FPGA LAN in Deg C	Not supported in G100 Deg C
621	Temperature storage SSD	Temperature storage (SSD) in Deg C	Not supported in G100 Deg C
624	Slot 1 (UART exten card) Temperature	Slot1(UART exten card) Temperature in Deg C	Not supported in G100 Deg C
625	Slot 2(UART exten card) Temperature	Slot2(UART exten card) Temperature in Deg C	Not supported in G100 Deg C
626	Temperature Display	Temperature Display in Deg C	Not supported in G100 Deg C
1100	ETH1-2 Redundancy Mode	ETH1-ETH2 Redundancy Mode	Not supported in G100 0 = not redundant 1 = redundant same MAC/Same IP 2 = PRP 3 = HSR
1110	ETH1-2 PRP/HSR IreInterfaceStatsIndex	Unique value for each LRE	Not supported in G100 IreInterfaceStatsIndex Unsigned32, This value should always be 1
1111	ETH1-2 PRP/HSR IreCntNodes	number of nodes in the Nodes Table	Not supported in G100 IreCntNodes Integer32,
1112	ETH1-2 PRP/HSR IreCntProxyNodes	number of nodes in the Proxy Node Table. Only applicable to RedBox.	Not supported in G100 IreCntProxyNodes Integer32,
1300	ETH3-4 Redundancy Mode	ETH3-ETH4 Redundancy Mode	Not supported in G100 0 = not redundant 1 = redundant same MAC/Same IP 2 = PRP 3 = HSR
1310	ETH3-4 PRP/HSR IreInterfaceStatsIndex	Unique value for each LRE	Not supported in G100 IreInterfaceStatsIndex Unsigned32, This value should always be 2
1311	ETH3-4 PRP/HSR IreCntNodes	number of nodes in the Nodes Table	Not supported in G100 IreCntNodes Integer32,
1312	ETH3-4 PRP/HSR IreCntProxyNodes	number of nodes in the Proxy Node Table. Only applicable to RedBox.	Not supported in G100 IreCntProxyNodes Integer32,
1500	ETH5-6 Redundancy Mode	ETH5-ETH6 Redundancy Mode	Not supported in G100 0 = not redundant 1 = redundant same MAC/Same IP 2 = PRP

Point ID	Point Reference	Point Description	Values
1510	ETH5-6 PRP/HSR IreInterfaceStatsIndex	Unique value for each LRE	Not supported in G100 IreInterfaceStatsIndex Unsigned32, This value should always be 3
1511	ETH5-6 PRP/HSR IreCntNodes	number of nodes in the Nodes Table	Not supported in G100 IreCntNodes Integer32,
1512	ETH5-6 PRP/HSR IreCntProxyNodes	number of nodes in the Proxy Node Table. Only applicable to RedBox.	Not supported in G100 IreCntProxyNodes Integer32,
1521	PCIe 1 Module type	Integer	Integer: 0 = Not present -1 = Unknown 1 = Serial 4 ports
1522	PCIe 2 Module type	Integer	Not supported in G100 Integer: 0 = Not present -1 = Unknown 1 = Serial 4 ports
1523	PCIe 3 Module type	Integer	Not supported in G100 Integer: 0 = Not present -1 = Unknown 1 = Serial 4 ports 2 = Serial 8 ports (Not supported in MCP) 3 = D.20 HDLC
2010	COM1 Mode	COM1 Mode (RS232,485 2w,485 4w,Term_In,V_Out_OL)	Bit encoded value, an overall value of 0 means not initialized or error: • Bit 0 ON= RS232 • Bit 1 ON = RS422 • Bit 2 ON = RS485 2W • Bit 3 ON = RS485 4W • Bit 4 ON = Termination IN
2020	COM2 Mode	COM2 Mode (RS232,485 2w,485 4w,Term_In,V_Out_OL)	Bit encoded value, an overall value of 0 means not initialized or error: • Bit 0 ON= RS232 • Bit 1 ON = RS422 • Bit 2 ON = RS485 2W • Bit 3 ON = RS485 4W • Bit 4 ON = Termination IN
2030	COM3 Mode	COM3 Mode (RS232,485 2w,485 4w,Term_In,V_Out_OL)	Bit encoded value, an overall value of 0 means not initialized or error: • Bit 0 ON= RS232 • Bit 1 ON = RS422

Point ID	Point Reference	Point Description	Values
			• Bit 2 ON = RS485 2W • Bit 3 ON = RS485 4W • Bit 4 ON = Termination IN
2040	COM4 Mode	COM4 Mode (RS232,485 2w,485 4w,Term_In,V_Out_OL)	Bit encoded value, an overall value of 0 means not initialized or error: • Bit 0 ON= RS232 • Bit 1 ON = RS422 • Bit 2 ON = RS485 2W • Bit 3 ON = RS485 4W • Bit 4 ON = Termination IN
2050	COM5 Mode	COM51 Mode (RS232,485 2w,485 4w,Term_In,V_Out_OL)	Not supported in G100 Bit encoded value, an overall value of 0 means not initialized or error: • Bit 0 ON= RS232 • Bit 1 ON = RS422 • Bit 2 ON = RS485 2W • Bit 3 ON = RS485 4W • Bit 4 ON = Termination IN
2060	COM6 Mode	COM6 Mode (RS232,485 2w,485 4w,Term_In,V_Out_OL)	Not supported in G100 Bit encoded value, an overall value of 0 means not initialized or error: • Bit 0 ON= RS232 • Bit 1 ON = RS422 • Bit 2 ON = RS485 2W • Bit 3 ON = RS485 4W • Bit 4 ON = Termination IN
2070	COM7 Mode	COM7 Mode (RS232,485 2w,485 4w,Term_In,V_Out_OL)	Not supported in G100 Bit encoded value, an overall value of 0 means not initialized or error: • Bit 0 ON= RS232 • Bit 1 ON = RS422 • Bit 2 ON = RS485 2W • Bit 3 ON = RS485 4W • Bit 4 ON = Termination IN
2080	COM8 Mode	COM8 Mode (RS232,485 2w,485 4w,Term_In,V_Out_OL)	Not supported in G100 Bit encoded value, an overall value of 0 means not initialized or error: • Bit 0 ON= RS232 • Bit 1 ON = RS422 • Bit 2 ON = RS485 2W

Point ID	Point Reference	Point Description	Values
			• Bit 3 ON = RS485 4W • Bit 4 ON = Termination IN
2101	PCle A – COM Mode 1	COM8 Mode (RS232,485 2w,485 4w,Term_In,V_Out_OL)	Not supported in G100 Same as COM1
2102	PCle A – COM Mode 2	COM8 Mode (RS232,485 2w,485 4w,Term_In,V_Out_OL)	Not supported in G100 Same as COM1
2103	PCle A – COM Mode 3	COM8 Mode (RS232,485 2w,485 4w,Term_In,V_Out_OL)	Not supported in G100 Same as COM1
2104	PCle A – COM Mode 4	COM8 Mode (RS232,485 2w,485 4w,Term_In,V_Out_OL)	Not supported in G100 Same as COM1
2105	PCle A – COM Mode 5	COM mode is always RS232, indicate with 0 if not installed	Not supported in G100 Forced to Bit 0 ON (RS232) when present
2106	PCle A – COM Mode 6	COM mode is always RS232, indicate with 0 if not installed	Not supported in G100 Forced to Bit 0 ON (RS232) when present
2107	PCle A – COM Mode 7	COM mode is always RS232, indicate with 0 if not installed	Not supported in G100 Forced to Bit 0 ON (RS232) when present
2108	PCle A – COM Mode 8	COM mode is always RS232, indicate with 0 if not installed	Not supported in G100 Forced to Bit 0 ON (RS232) when present
2111	PCle B – COM Mode 1	COM8 Mode (RS232,485 2w,485 4w,Term_In,V_Out_OL)	Not supported in G100 Same as COM1
2112	PCle B – COM Mode 2	COM8 Mode (RS232,485 2w,485 4w,Term_In,V_Out_OL)	Not supported in G100 Same as COM1
2113	PCle B – COM Mode 3	COM8 Mode (RS232,485 2w,485 4w,Term_In,V_Out_OL)	Not supported in G100 Same as COM1
2114	PCle B – COM Mode 4	COM8 Mode (RS232,485 2w,485 4w,Term_In,V_Out_OL)	Not supported in G100 Same as COM1
2115	PCle B – COM Mode 5	COM mode is always RS232, indicate with 0 if not installed	Not supported in G100 Forced to Bit 0 ON (RS232) when present
2116	PCle B – COM Mode 6	COM mode is always RS232, indicate with 0 if not installed	Not supported in G100 Forced to Bit 0 ON (RS232) when present

Point ID	Point Reference	Point Description	Values
2117	PCle B – COM Mode 7	COM mode is always RS232, indicate with 0 if not installed	Not supported in G100 Forced to Bit 0 ON (RS232) when present
2118	PCle B – COM Mode 8	COM mode is always RS232, indicate with 0 if not installed	Not supported in G100 Forced to Bit 0 ON (RS232) when present
2121	PCle C – COM Mode 1	COM8 Mode (RS232,485 2w,485 4w,Term_In,V_Out_OL)	Not supported in G100 Same as COM1
2122	PCle C – COM Mode 2	COM8 Mode (RS232,485 2w,485 4w,Term_In,V_Out_OL)	Not supported in G100 Same as COM1
2123	PCle C – COM Mode 3	COM8 Mode (RS232,485 2w,485 4w,Term_In,V_Out_OL)	Not supported in G100 Same as COM1
2124	PCle C – COM Mode 4	COM8 Mode (RS232,485 2w,485 4w,Term_In,V_Out_OL)	Not supported in G100 Same as COM1
2125	PCle C – COM Mode 5	COM mode is always RS232, indicate with 0 if not installed	Not supported in G100 Forced to Bit 0 ON (RS232) when present
2126	PCle C – COM Mode 6	COM mode is always RS232, indicate with 0 if not installed	Not supported in G100 Forced to Bit 0 ON (RS232) when present
2127	PCle C – COM Mode 7	COM mode is always RS232, indicate with 0 if not installed	Not supported in G100 Forced to Bit 0 ON (RS232) when present
2128	PCle C – COM Mode 8	COM mode is always RS232, indicate with 0 if not installed	Not supported in G100 Forced to Bit 0 ON (RS232) when present
3000	Time Sync Input Source	Time Sync Input Source (None-SCADA, PTP, IRIG-B, NTP, SNTP)	Indicates at runtime the Time Sync Input for the MCP in real time. Values: • Local/Not synch'ed/SCADA, • PTP • IRIG-B • NTP SCADA time synch is set in SSM points because HAMA cannot access this type of information.

Point ID	Point Reference	Point Description	Values
3011	NET1-2 PTP Port State	NET1-2 PTP Port State	Not supported in G100 port state: • PORT_MASTER • PORT_SLAVE • PORT_PASSIVE • PORT_LISTENING • PORT_PRE_MASTER • PORT_UNCALIBRATED • PORT_FAULTY • PORT_DISABLED • PORT_INITIALIZING
3012	NET3-4 PTP Port State	NET3-4 PTP Port State	Not supported in G100 port state: • PORT_MASTER • PORT_SLAVE • PORT_PASSIVE • PORT_LISTENING • PORT_PRE_MASTER • PORT_UNCALIBRATED • PORT_FAULTY • PORT_DISABLED • PORT_INITIALIZING
3013	NET5-6 PTP Port State	NET5-6 PTP Port State	Not supported in G100 Port state: • PORT_MASTER • PORT_SLAVE • PORT_PASSIVE • PORT_LISTENING • PORT_PRE_MASTER • PORT_UNCALIBRATED • PORT_FAULTY • PORT_DISABLED • PORT_INITIALIZING
3021	PTP Clock Class	PTP Clock Class	Not supported in G100 Indicates the grandmaster's clock class if synced. Otherwise, shows its default clock class (187).

Point ID	Point Reference	Point Description	Values
3100	IRIG-B IN Type	IRIG-B IN Type (B002, B006)	Indicates the configured IRIG-B input signal type: • B002 • B006 • Absent
3101	IRIG-B IN Time Zone Offset to UTC	IRIG-B IN Time Zone Offset to UTC	Not currently supported.
3150	NTP Time Offset	NTP Time Offset	NTP Time Offset
3151	NTP IN Server Selected	NTP IN Server Selected	Bit encoded AI to indicate communication with all configured NTP time sources. • Bit 0 = ON for NTP Source 1 • Bit 1 = ON for NTP Source 2
3152	NTP IN Servers Quality	NTP IN Servers Quality	Bit encoded AI to indicate quality with all configured NTP time sources. • Bit 0 = ON for NTP Source 1 good quality • Bit 1 = OK for NTP Source 2 good quality, etc.

Digital Inputs

Table 6-197: Digital Inputs

Point ID	Point Reference	Point Description	Values
311	Chassis Intrusion State	Chassis Intrusion State	Not supported in G100 Gets the Chassis Intrusion State of the Board 1 - Intrusion Unsafe and 0 – Intrusion Safe
333	Needs System Reboot	Needs System Reboot	Not supported in G100 Shows the MCP needs cold reboot 1 - for needs for cold reboot 0 - for otherwise
420	Front Display Always ON	Front Display Always ON	Not supported in G100 1 - Front Display light saver is disabled; display is always on
531	Power Supply 1 (top) Good	Power Supply 1 (top) Good	Not supported in G100 Alarm = 0, for e.g., over temp, bad output (if available in HW) 1 - if all is OK

Point ID	Point Reference	Point Description	Values
532	Power Supply 2 (bottom) Good	Power Supply 2 (bottom) Good	Not supported in G100 Alarm = 0, for e.g., over temp, bad output (if available in HW) 1 - if all is OK
1524	PCIe 1 Card Status	Available if D.20 PCIe Card is present or else it will be Offline/Greyed Out	"0 - if D.20 PCIe Card is Not Healthy (the absence of card is indicated by quality and a value set to 0) 1 - if D.20 PCIe Card is available and healthy (as a card)"
1525	PCIe 2 Card Status	Available if D.20 PCIe Card is present or else it will be Offline/Greyed Out	Not supported in G100 "0 - if D.20 PCIe Card is Not Healthy (the absence of card is indicated by quality and a value set to 0) 1 - if D.20 PCIe Card is available and healthy (as a card)"
1526	PCIe 3 Card Status	Available if D.20 PCIe Card is present or else it will be Offline/Greyed Out	Not supported in G100 "0 - if D.20 PCIe Card is Not Healthy (the absence of card is indicated by quality and a value set to 0) 1 - if D.20 PCIe Card is available and healthy (as a card)"
1600	ETH_FRONT Link Good	NET0/ETH_FRONT Link Good	Not supported in G100 1 - Link is UP / '0' Link is down
1610	ETH1 Link Good	NET1/ETH1 Link Good	Not supported in G100 1 - Link is UP / '0' Link is down
1611	ETH1 SFP IN	NET1/ETH1 SFP IN	Not supported in G100 1 - SFP is IN (present) / '0' SFP is OUT (not present)
1620	ETH2 Link Good	NET2/ETH2 Link Good	Not supported in G100 1 - Link is UP / '0' Link is down
1621	ETH2 SFP IN	NET2/ETH2 SFP IN	Not supported in G100 1 - SFP is IN (present) / '0' SFP is OUT (not present)
1630	ETH3 Link Good	NET3/ETH3 Link Good	Not supported in G100 1 - Link is UP / '0' Link is down
1631	ETH3 SFP IN	NET3/ETH3 SFP IN	Not supported in G100 1 - SFP is IN (present) / '0' SFP is OUT (not present)
1640	ETH4 Link Good	NET4/ETH4 Link Good	Not supported in G100 1 - Link is UP / '0' Link is down

Point ID	Point Reference	Point Description	Values
1641	ETH4 SFP IN	NET4/ETH4 SFP IN	Not supported in G100 1 - SFP is IN (present) / '0' SFP is OUT (not present)
1650	ETH5 Link Good	NET5/ETH5 Link Good	Not supported in G100 1 - Link is UP / '0' Link is down
1651	ETH5 SFP IN	NET5/ETH5 SFP IN	Not supported in G100 1 - SFP is IN (present) / '0' SFP is OUT (not present)
1660	ETH6 Link Good	NET6/ETH6 Link Good	Not supported in G100 1 - Link is UP / '0' Link is down
1661	ETH6 SFP IN	NET6/ETH6 SFP IN	Not supported in G100 1 - SFP is IN (present) / '0' SFP is OUT (not present)
3200	PTP/IRIG-B Clock Synchronized	PTP/IRIG-B Clock Synchronized	Only IRIG-B is supported in G100 Indicates 1 if the MCP is in time sync with the configured PTP or IRIG-B Input. Indicates 0 if the MCP has never synchronized with a PTP or IRIG-B input source. Note: if the configured time source signal exists but its quality has never been good, this DI will be 0.
3210	PTP IN Enabled	PTP IN Enabled	Not supported in G100 Set to – 1, if PTP Client enabled in the configuration. Default is 0.
3211	PTP IN Signal	PTP IN Signal	Not supported in G100 Indicates 1 if PTP time sync communication is established. Indicates 0 if PTP time sync communication is not established.
3212	PTP IN Quality	PTP IN Quality	Not supported in G100 Indicates 1 if PTP time sync communication is established and the grandmaster's clock class is 6 or 7, and its UtcOffsetValid is true. Otherwise, the value will be 0.
3300	IRIG-B Enabled	IRIG-B Enabled	Set to 1 if IRIG-B input is enabled in the configuration. Default is 0.
3301	IRIG-B IN Signal Fail	IRIG-B IN Signal Fail	Set to 0 when IRIG-B signal is present (regardless of quality).

Point ID	Point Reference	Point Description	Values
			Set to 1 if IRIG-B Watchdog period of 2 seconds is expired, meaning the input signal is not present. Inverted compared to other time sources, need to stay inverted for MCP legacy compatibility
3302	IRIG-B IN Quality	IRIG-B IN Quality	Set to 1 if the IRIG-B Input has good quality (this is not about the signal being present). 0 otherwise.
3350	NTP IN Enabled	NTP IN Enabled	Set to 1 if NTP time sync client is enabled in the configuration. Default is 0.
3351	NTP IN Signal	NTP IN Signal	Indicates 1 if NTP time sync communication is established. Indicates 0 if NTP time sync communication is not established.
3352	NTP IN Quality	NTP IN Quality	Offline and not used in current version.
3360	NTP OUT Enabled	NTP OUT Enabled	Set to 1 if NTP time sync server is enabled in the configuration. Default is 0.

Accumulator Points

Table 6-198: Accumulator Points

Point ID	Point Reference	Description
1701	ETH1-2 PRP/HSR IreCntTxA	Not supported in G100 PRP/HSR frames sent over port A
1702	ETH1-2 PRP/HSR IreCntTxB	Not supported in G100 PRP/HSR frames sent over port B
1703	ETH1-2 PRP/HSR IreCntTxC	Not supported in G100 number of frames sent towards the application interface
1704	ETH1-2 PRP/HSR IreCntErrWrongLanA	Not supported in G100 number of frames with the wrong LAN identifier received on port A
1705	ETH1-2 PRP/HSR IreCntErrWrongLanB	Not supported in G100 number of frames with the wrong LAN identifier received on port B
1706	ETH1-2 PRP/HSR IreCntErrWrongLanC	Not supported in G100 number of frames with the wrong LAN identifier received on the RedBox interlink
1707	ETH1-2 PRP/HSR IreCntRxA	Not supported in G100 number of PRP/HSR frames received on port A
1708	ETH1-2 PRP/HSR IreCntRxB	Not supported in G100 number of PRP/HSR frames received on port B

Point ID	Point Reference	Description
1709	ETH1-2 PRP/HSR IreCntRxC	Not supported in G100 number of frames received from the application interface of a DANP or DANH or the number of number of frames received on the interlink of a RedBox
1710	ETH1-2 PRP/HSR IreCntErrorsA	Not supported in G100 number of frames with errors received on port A
1711	ETH1-2 PRP/HSR IreCntErrorsB	Not supported in G100 number of frames with errors received on port B
1712	ETH1-2 PRP/HSR IreCntErrorsC	Not supported in G100 number of frames with errors received on the application interface of a DANP or DANH or on the interlink of a RedBox
1716	ETH1-2 PRP/HSR IreCntDuplicateA	Not supported in G100 number of entries in the duplicate detection mechanism on port A for which one single duplicate was received
1717	ETH1-2 PRP/HSR IreCntDuplicateB	Not supported in G100 number of entries in the duplicate detection mechanism on port B for which one single duplicate was received
1718	ETH1-2 PRP/HSR IreCntDuplicateC	Not supported in G100 number of entries in the duplicate detection mechanism on the application interface of the DAN or the interlink of the RedBox for which one single duplicate was received
1731	ETH3-4 PRP/HSR IreCntTxA	Not supported in G100 PRP/HSR frames sent over port A
1732	ETH3-4 PRP/HSR IreCntTxB	Not supported in G100 PRP/HSR frames sent over port B
1733	ETH3-4 PRP/HSR IreCntTxC	Not supported in G100 number of frames sent towards the application interface
1734	ETH3-4 PRP/HSR IreCntErrWrongLanA	Not supported in G100 number of frames with the wrong LAN identifier received on port A
1735	ETH3-4 PRP/HSR IreCntErrWrongLanB	Not supported in G100 number of frames with the wrong LAN identifier received on port B
1736	ETH3-4 PRP/HSR IreCntErrWrongLanC	Not supported in G100 number of frames with the wrong LAN identifier received on the RedBox interlink
1737	ETH3-4 PRP/HSR IreCntRxA	Not supported in G100 number of PRP/HSR frames received on port A

Point ID	Point Reference	Description
1738	ETH3-4 PRP/HSR IreCntRxB	Not supported in G100 number of PRP/HSR frames received on port B
1739	ETH3-4 PRP/HSR IreCntRxC	Not supported in G100 number of frames received from the application interface of a DANP or DANH or the number of number of frames received on the interlink of a RedBox
1740	ETH3-4 PRP/HSR IreCntErrorsA	Not supported in G100 number of frames with errors received on port A
1741	ETH3-4 PRP/HSR IreCntErrorsB	Not supported in G100 number of frames with errors received on port B
1742	ETH3-4 PRP/HSR IreCntErrorsC	Not supported in G100 number of frames with errors received on the application interface of a DANP or DANH or on the interlink of a RedBox
1746	ETH3-4 PRP/HSR IreCntDuplicateA	Not supported in G100 number of entries in the duplicate detection mechanism on port A for which one single duplicate was received
1747	ETH3-4 PRP/HSR IreCntDuplicateB	Not supported in G100 number of entries in the duplicate detection mechanism on port B for which one single duplicate was received
1748	ETH3-4 PRP/HSR IreCntDuplicateC	Not supported in G100 number of entries in the duplicate detection mechanism on the application interface of the DAN or the interlink of the RedBox for which one single duplicate was received
1761	ETH5-6 PRP/HSR IreCntTxA	Not supported in G100 PRP/HSR frames sent over port A
1762	ETH5-6 PRP/HSR IreCntTxB	Not supported in G100 PRP/HSR frames sent over port B
1763	ETH5-6 PRP/HSR IreCntTxC	Not supported in G100 number of frames sent towards the application interface
1764	ETH5-6 PRP/HSR IreCntErrWrongLanA	Not supported in G100 number of frames with the wrong LAN identifier received on port A
1765	ETH5-6 PRP/HSR IreCntErrWrongLanB	Not supported in G100 number of frames with the wrong LAN identifier received on port B
1766	ETH5-6 PRP/HSR IreCntErrWrongLanC	Not supported in G100 number of frames with the wrong LAN identifier received on the RedBox interlink

Point ID	Point Reference	Description
1767	ETH5-6 PRP/HSR IreCntRxA	Not supported in G100 number of PRP/HSR frames received on port A
1768	ETH5-6 PRP/HSR IreCntRxB	Not supported in G100 number of PRP/HSR frames received on port B
1769	ETH5-6 PRP/HSR IreCntRxC	Not supported in G100 number of frames received from the application interface of a DANP or DANH or the number of number of frames received on the interlink of a RedBox
1770	ETH5-6 PRP/HSR IreCntErrorsA	Not supported in G100 number of frames with errors received on port A
1771	ETH5-6 PRP/HSR IreCntErrorsB	Not supported in G100 number of frames with errors received on port B
1772	ETH5-6 PRP/HSR IreCntErrorsC	Not supported in G100 number of frames with errors received on the application interface of a DANP or DANH or on the interlink of a RedBox
1776	ETH5-6 PRP/HSR IreCntDuplicateA	Not supported in G100 number of entries in the duplicate detection mechanism on port A for which one single duplicate was received
1777	ETH5-6 PRP/HSR IreCntDuplicateB	Not supported in G100 number of entries in the duplicate detection mechanism on port B for which one single duplicate was received
1778	ETH5-6 PRP/HSR IreCntDuplicateC	Not supported in G100 number of entries in the duplicate detection mechanism on the application interface of the DAN or the interlink of the RedBox for which one single duplicate was received

Text Points

Table 6-199: Text Points

Point ID	Point Reference	Point Description
201	PCIe 1 Serial No.	Serial No. of HDLC Card
202	PCIe 1 FPGA Version	FPGA Version of HDLC Card
203	PCIe 2 Serial No.	Not supported in G100 Serial No. of HDLC Card
204	PCIe 2 FPGA Version	Not supported in G100 FPGA Version of HDLC Card
205	PCIe 3 Serial No.	Not supported in G100 Serial No. of HDLC Card
206	PCIe 3 FPGA Version	Not supported in G100

Point ID	Point Reference	Point Description
		FPGA Version of HDLC Card
330	FPGA_VER	Not supported in G100 FPGA Version details
331	CPLD_VER	Not supported in G100 CPLD Version details
332	UEFI_VER	Not supported in G100 UEFI Version details
503	Power Supply 1 (top) Id	Not supported in G100 Power supply 1 (top) ID details
504	Power Supply 2 (Bottom) Id	Not supported in G100 Power Supply 2 (Bottom) ID details
3800	PTP Grand Master clock ID	Not supported in G100 PTP Grand Master clock ID
3801	PTP Master Clock ID	Not supported in G100 PTP Master Clock ID
3802	PTP Output Clock ID	Not supported in G100 PTP Output Clock ID

Build Server Map Files

This chapter contains the following sections and sub-sections:

Server Maps

- Creating Server Maps
- Server Protocol Settings
- Logical Remote Units
- Communication Statistics

DNP3 Server

- About the DNP3 Server
- DNP3 Server Analog Inputs
- DNP3 Server Analog Outputs
- DNP3 Server Digital Inputs
- DNP3 Server Double-Bit Digital Inputs
- DNP3 Server Digital Outputs
- DNP3 Server Accumulators

MODBUS Server

- Modbus Server Coils
- Modbus Server Read Only and Read Write Registers
- Modbus Server Input Status

IEC 60870-5-101+104 Server

- Info Object Settings
- Bitstring Mapping Settings
- Double Command Mapping Settings
- Double Point Mapping Settings
- Integrated Total Mapping Settings
- Measurand Mapping Settings
- Packed Single Point Mapping Settings
- Regulating Command Mapping Settings
- Root Directory Mapping Settings
- Setpoint Command Mapping Settings
- Single Command Mapping Settings
- Single Point Mapping Settings
- Step Position Mapping Settings

Tejas V Server

- Tejas V Server Analog Input
- Tejas V Server Setpoint
- Tejas V Server Status Points (DI)
- Tejas V Server Raise/Lower Control
- Tejas V Server Control
- Tejas V Server Accumulator
- Tejas V Server Special

Server Maps

SCADA master stations monitor many remote terminal units and gateway devices for certain critical information. The MCP forms an integral part of a SCADA system by collecting data from devices and then transmitting selected information to the master station as required. The MCP stores all the desired information for a master station in a “map” that lists and describes the selected data points from selected devices.

The server map file is based on a specific protocol and specifies what information to present to a master. The map file contains information on how and when data is transmitted to a master station.

Once you create a server map file, it becomes available to select on the Configuration page when assigning master connections.

Creating Server Maps

» To create or edit a server map:

1. On the **Configuration** page, select the **Server Map** tab.
2. Click **New** to create a new client map or **Open** to edit an existing server map.
3. Select the SCADA protocol type and then create or select the master map file.
4. Edit the data type and protocol settings as desired.
5. Click **Save** and enter a name for your map file.

Tips

- To create a custom mapping template, create a map file, click "Save" and enter a template name.
- To add a full level of points for a device or point group, select the checkbox in the points tree view.
- To delete a point from the point map, select the row and click **Delete**.
- To create custom templates, create a default map file, click **Save** and then enter a new template name.
- To swap two addresses of points of same type, write the address of one of the points over the other address.
- To re-sort by address, right click on the Address field and select “Reindex” (where available).

Server Protocol Settings

Server applications are available for the following protocols:

- [DNP3 Server](#)
- [Modbus Server](#)
- [IEC 60870-5-101+104 Server](#)
- [Tejas V Server](#)

Logical Remote Units

The MCP can be configured to function as several distinct instances. Each instance is called a Logical Remote Unit (LRU). It appears as a single, physical server to any master station communicating with the LRU.

The MCP can be configured to represent multiple Logical Remote Units (LRUs) to multiple master stations. The data presented to each master station may be identical or unique and can be achieved using multiple protocols simultaneously.

For example, the MCP can maintain a separate event queue for every master station configured in the system. If a data point is configured for presentation to eight master stations, an event on the point causes eight events to be reported – one event to each master station.

Communication Statistics

Server applications maintain communication statistics and other status information in the real-time database as pseudo points.

DNP3 Server

About the DNP3 Server

The DNP3 Server application allows a remote master station to retrieve data from and/or operate commands to the MCP using the DNP3 protocol. Because the DNP3 server application supports device-level addressing, it can access the full range of addresses supported by the protocol. For example, for DNP3, all master station addresses are user configurable per the DNP3 address range of 0 to 65519.

The DNP3 Server map defines how the MCP is configured to present data to DNP3 masters. The MCP supports the following configurable DNP3 data types:

- Analog inputs** - measured or computed values by the device
- Analog outputs** - physical or computed analog quantities
- Digital inputs** - states of physical or logical Boolean devices
- DNP3 Server Double-Bit Digital Inputs** - double-bit states of physical or logical Boolean devices
- Digital outputs** - physical or logical ON-OFF, raise-lower, and trip-close points
- Accumulators** - counter values

The DNP3 Server map settings are available on the **Server Map** tab when a DNP3 SCADA protocol type is selected.

DNP3 Server Analog Inputs

Settings are available on the **Analog Inputs** tab. The default property values are defined in the lower pane. The MCP provides the mapping settings for analog inputs as shown below.

Analog Input Mapping Settings

Table 6-200: Analog Input Mapping Settings

Setting	Description	Range	Default
Index	Point Index (0 Based). Each point index number must be unique.	0 to 65535	Incremented from 0.
Home Directory	Home directory of the IED AI point selected from the Point Picker. Read only.	N/A	System Assigned Identifier
Point Description	Point description of the AI point selected from the Point Picker. Read only.	N/A	System Assigned Identifier.
Point Reference	Point reference of the AI point selected from the Point Picker. Read only	N/A	System Assigned Identifier

Setting	Description	Range	Default
Point ID	Point ID of the AI point selected from the Point Picker. Read only.	N/A	System Assigned Identifier
Multiplier	Scale factor of the point (m of formula mx + b)	Full range of 64-bit Float	1.0
Offset	Scale factor of the point (b of formula mx + b)	Full range of 64-bit Float	0.0
Buffer Events	Specify whether to buffer analog input events.	Buffered Not Buffered	User selected Default
Processing Options	When Buffer Events is set to Not Buffered, this setting determines whether to send the event with the: - Current value and time or - First value and Time, (in the case of multiple changes on the same point before the DPA can report a change)	Current Value and Time First Value and Time	User selected Default
Dead Band	Minimum change in the AI point value that constitutes an event. A value of 0 disables event generation for the point.	0 to 65535	User selected Default
Static Variation	How the point values should be reported.	32-Bit 16-Bit 32-Bit w/o flag 16-Bit w/o flag 32-Bit Float	User selected Default
Event Variation	Indicates how an event on this point should be reported.	32-Bit with Time 32-Bit without Time 16 Bit with Time 16 Bit without Time 32-Bit Float with Time 32-Bit Float without Time	User selected Default
Class	Default Class for change events on the point.	None 3 2 1	User selected Default

Default Settings are available in the lower pane of the **Analog Inputs** tab. The configuration settings defined below are used to configure the default values at the time of mapping for analog input points defined in the DNP3 server map.

Analog Input Properties

Table 6-201: Analog Input Properties

Setting	Description	Range	Default
Default Class	Specifies a default Class for change events on the point.	None 3 2 1	2
Default Static Variation	Indicates how the AI point values should be reported	32-Bit 16-Bit 32-Bit w/o flag 16-Bit w/o flag 32-Bit Float	32-Bit
Default Event Variation	Indicates how an Event on the AI point should be reported	32-Bit with Time 32-Bit without Time 16 Bit with Time 16 Bit without Time 32-Bit Float with Time 32-Bit Float without Time	32-Bit with Time
Default Dead Band	Specifies the minimum change in the AI value to qualify as an event. Configuring a value of -1.0 disables reporting of data changes (quality changes are always reported).	0-65535	5
Default Buffer Events	Indicates whether to buffer analog input events.	Buffered Not Buffered	Buffered
Default Processing Options	Indicates when Buffer Events is set to Not Buffered, this setting determines whether to send the event with the: 1. Current value and time or 2. First value and time (in the case of multiple changes on the same point before the DPA can report a change).	Current Value and Time First Value and Time	Current Value and Time

DNP3 Server Analog Outputs

Settings are available on the **Analog Outputs** tab. The default property values are defined in the lower pane. The MCP provides the mapping settings for analog outputs as shown below.

Analog Output Mapping Settings

Table 6-202: Analog Output Mapping Settings

Setting	Description	Range	Default
Index	Point Index (0 Based). Each point index number must be unique.	0 to 65535	Incremented from 0.
Home Directory	Home Directory of the IED of AO point selected from the Point Picker. Read only.	N/A	System Assigned Identifier
Point Description	Point Description of the AO point selected from the Point Picker. Read only.	N/A	System Assigned Identifier
Point Reference	Point Reference of the AO point selected from the Point Picker. Read only.	N/A	System Assigned Identifier
Point ID	Point ID of the AO point selected from the Point Picker. Read only.	N/A	System Assigned Identifier
Multiplier	Scale factor of the point (m of formula mx + b)	Full range of 64-bit Float	1.0
Offset	Scale factor of the point (b of formula mx + b)	Full range of 64-bit Float	0.0
Static Variation	How the point values should be reported.	32-Bit 16-Bit 32-Bit w/o flag 16-Bit w/o flag 32-Bit Float	User selected Default

Default Settings are available in the lower pane of the **Analog Outputs** tab. The configuration settings defined below are used to configure the default values at the time of mapping for analog output points defined in the DNP3 server map.

Analog Output Properties

Table 6-203: Analog Output Properties

Setting	Description	Range	Default
Default Static Variation	Indicates how the AO point values should be reported.	32-Bit 16-Bit	32-Bit

DNP3 Server Digital Inputs

Settings are available on the **Digital Input** tab. The default property values are defined in the lower pane. The MCP provides the mapping settings for digital inputs as shown below.

Digital Input Mapping Settings

Table 6-204: Digital Input Mapping Settings

Setting	Description	Range	Default
Index	Point Index (0 Based). Each point index number must be unique.	0 to 65535	Incremented from 0.
Point Description	Point description of the DI point selected from the Point Picker. Read only.	N/A	System Assigned Identifier
Point Reference	Point reference of the DI point selected from the Point Picker. Read only.	N/A	System Assigned Identifier
Point ID	Point ID of the DI point selected from the Point Picker. Read only.	N/A	System Assigned Identifier
Home Directory	Home Directory of the IED DI point selected from the Point Picker. Read only.	N/A	System Assigned Identifier
Invert	Select if the value of the mapped points should be inverted.	True or False	User selected Default
Static Variation	How the point values should be reported.	32-Bit 16-Bit 32-Bit w/o flag 16-Bit w/o flag 32-Bit Float	User selected Default
Event Variation	Indicates how an event on this point should be reported.	32-Bit with Time 32-Bit without Time 16 Bit with Time 16 Bit without Time 32-Bit Float with Time 32-Bit Float without Time	User selected Default
Class	Default Class for change events on the point.	None 3 2 1	User selected Default

Default Settings are available in the lower pane of the **Digital Input** tab. The configuration settings defined below are used to configure the default values at the time of mapping for digital input points defined in the DNP3 server map.

Digital Input Properties

Table 6-205: Digital Input Properties

Setting	Description	Range	Default
Default Class	Specifies a default Class for change events on the point.	None 3 2 1	1
Default Invert	Indicates whether a DI point's value should be inverted.	True or False	False
Default Static Variation	Indicates how static data on the DI point should be reported.	WithStatus, w/oStatus	WithStatus
Default Event Variation	Indicates how an Event on the DI point should be reported.	WithTime, w/oTime	WithTime

DNP3 Server Double-Bit Digital Inputs

Settings are available on the **Double-Bit Digital Input** tab. The default property values are defined in the lower pane. The MCP provides the mapping settings for double-bit digital inputs as shown below.

Double-Bit Digital Input Mapping Settings

Table 6-206: Double-Bit Digital Input Mapping Settings

Setting	Description	Range	Default
Index	Point Index (0 Based). Each point index number must be unique.	0 to 65535	Incremented from 0.
Off Point Device	Line ID Device ID Bay ID of the Off point selected from the Point Picker. Read only.	N/A	System Assigned Identifier
Off Point Source	Home directory and Point ID of the Off point selected from the Point Picker. Read only.	N/A	System Assigned Identifier
Off Point Description	Point description of the Off point selected from the Point Picker. Read only.	N/A	System Assigned Identifier
On Point Device	Line ID Device ID Bay ID of the On point selected from the Point Picker. Read only.	N/A	System Assigned Identifier
On Point Source	Home directory and Point ID of the On point selected from the On Point Picker.	Home Directory, Point ID selected via Point Picker	System Assigned Identifier
On Point Description	Point description of the On point selected from the Point Picker. Read only.	N/A	System Assigned Identifier
Invert	Select if the value of DETERMINED_ON (2) and DETERMINED_OFF (1) states should be inverted. INTERMEDIATE (0) and INDETERMINATE (3) states are not impacted by this setting.	True or False	User selected Default

Setting	Description	Range	Default
Valid Time	Specifies the minimum time (in milliseconds) that both digital input points (off point and on point) must be stable in a DETERMINED_ON (2) or DETERMINED_OFF (1) state before is reported.	0, 100 to 65535	User selected Default
Suppress Time	Specifies the minimum time (in milliseconds) that both digital input points (off point and on point) must be stable in an INTERMEDIATE (0) or INDETERMINATE (3) state before is reported.	0, 100 to 65535	User selected Default
Static Variation	How the double-bit DI point values should be reported.	With Status w/o Status	User selected Default
Event Variation	Indicates how an event on this double-bit DI point should be reported.	With Time w/o Time	User selected Default
Class	Default Class for change events on the double-bit DI point.	None 3 2 1	User selected Default

Default Settings are available in the lower pane of the **Double-Bit Digital Inputs** tab. The configuration settings defined below are used to configure the default values at the time of mapping for double-bit digital input points defined in the DNP3 server map.

Double-Bit Digital Input Properties

Table 6-207: Double-Bit Digital Input Properties

Setting	Description	Range	Default
Default Invert	Default for the Invert field, which indicates whether a double-bit digital input point's values should be inverted.	True or False	False
Default Valid Time	Default for Valid Time field, which indicates the minimum time (in milliseconds) that both digital input points must be stable in a DETERMINED_ON (2) or DETERMINED_OFF (1) state before is reported.	0, 100 to 65535	100
Default Suppress Time	Default for Suppress Time field, which indicates the minimum time (in milliseconds) that both digital input points must be stable in an INTERMEDIATE (0) or INDETERMINATE (3) state before is reported.	0, 100 to 65535	1000
Default Class	Specifies a default Class for change events on the point.	None 3 2 1	1
Default Static Variation	Default for the Static Variation field, which indicates how the static value of the double-bit digital input point should be reported.	WithStatus, w/oStatus	WithStatus
Default Event Variation	Default for Event Variation field, which indicates how an Event on the double-bit digital input point should be reported.	WithTime, w/oTime	WithTime

Note 1:

Off Point is the digital input point representing the least significant bit of a DNP3 Double-Bit Binary Input object.

On Point is the digital input point representing the most significant bit of a DNP3 Double-Bit Binary Input object.

When the Off and On points change within “Suppress Time” – a single Double-Bit event is generated, with the timestamp of the earliest point.

When one of the Off / On points changes and the “Suppress Time” expires before the paired point changes – a Double-Bit event will be generated with the timestamp of the point that changed. If subsequently the paired point will also change, a second Double-Bit event will be generated with the timestamp of the paired point.

Note 2:

To assist in the workflow of point selection – when an Off Point is selected from a device in the point picker tree list, then the next point from that device will be automatically selected as On Point. If the database has the lower number as On point use the Invert setting after mapping. This allows also for bulk mapping of all points using the parent checkbox in the Point Picker Tree. Clicking on the parent checkbox when is partially selected (gray) will remove all mappings under that level.

After the initial automated selection the On Point can be changed with any other point from the available devices in the point picker tree list for double points.

If the point selected for the Off point is the last point in the device then the On point will be same as the Off point, this will require manual re-mapping of the On point.

If the application requires to report a single digital input point as DNP3 Double-Bit, then map the same single digital input point as both Off Point and On Point.

DNP3 Server Digital Outputs

Settings are available on the **Digital Outputs** tab. The default property values are defined in the lower pane. The MCP provides the mapping settings for digital outputs as shown below.

Digital Output Mapping Settings

Table 6-208: Digital Output Mapping Settings

Setting	Description	Range	Default
Index	Point Index (0 Based). Each point index number must be unique.	0 to 65535	Incremented from 0.
Home Directory	Home Directory of the IED of DO point selected from the Point Picker. Read only.	N/A	System Assigned Identifier
Point Description	Point Description of the DO point selected from the Point Picker. Read only.	N/A	System Assigned Identifier
Point Reference	Point Reference of the DO point selected from the Point Picker. Read only.	N/A	System Assigned Identifier
Point ID	Point ID of the DO point selected from the Point Picker. Read only.	N/A	System Assigned Identifier
Supported Command	Command the DNP3 server should expect. If the DNP3 server receives a command that is not configured, it rejects the command.	All operations SBO Only	User selected Default

Default Settings are available in the lower pane of the **Digital Outputs** tab. The configuration settings defined below are used to configure the default values at the time of mapping for digital output points defined in the DNP3 server map.

Digital Output Properties

Table 6-209: Digital Output Properties

Setting	Description	Range	Default
Default Command Supported	DNP3 DPA Command type the DPA should expect. If the DPA receives a command type that is not configured, it shall reject the command.	All operations SBO Only	SBO Only

DNP3 Server Accumulators

The accumulators are used for reporting running values, frozen values, and events. This means that the same DNP3 point index is used for both the running and frozen value. The DNP3 server returns the running value when data points for Static Variation (Object 20) are requested by the master station. The DNP3 server returns the frozen value when data points for Static Variation (Object 21) is requested by the Master station. The Threshold configured is used to qualify events for running accumulators only Event Variation (Object22). Frozen accumulator events (Object 23) are generated whenever a configured accumulator is frozen.

Settings are available on the **Accumulators** tab. The default property values are defined in the lower pane. The MCP provides the mapping settings for accumulators (counters) as shown below.

Accumulator Mapping Settings

Table 6-210: Accumulator Mapping Settings

Setting	Description	Range	Default
Index	Point Index (0 Based). Each point index number must be unique.	0 to 65535	Incremented from 0.
Home Directory	Home directory of the IED Accumulator point selected from the Point Picker. Read only.	N/A	System Assigned Identifier
Point Description	Point description of the Accumulator point selected from the Point Picker. Read only.	N/A	System Assigned Identifier
Point Reference	Point reference of the Accumulator point selected from the Point Picker. Read only.	N/A	System Assigned Identifier
Point ID	Point ID of the Accumulator point selected from the Point Picker. Read only.	N/A	System Assigned Identifier
Threshold	Minimum change required in the Running Accumulator count to cause an event to be generated. 0 disables generation of Running Accumulator Events.	0 to 5000	User selected Default
Static Variation	How the point values should be reported. Applies to Running value.	32-Bit 16-Bit	User selected Default
Event Variation	Indicates how an event on this point should be reported. Applies to Running value.	32-Bit with Time 32-Bit without Time 16 Bit with Time 16 Bit without Time	User selected Default

Setting	Description	Range	Default
Frozen Static Variation	How the point values should be reported. Applies to Frozen value.	32-Bit with Time 32-Bit without Time 16 Bit with Time 16 Bit without Time	User selected Default
Frozen Event Variation	Indicates how an event on this point should be reported. Applies to Frozen value.	32-Bit with Time 32-Bit without Time 16 Bit with Time 16 Bit without Time	User selected Default
Class	Default Class for change events on the point.	None 3 2 1	User selected Default

Default Settings available in the lower pane on the **Accumulators** tab. The configuration settings defined below are used to configure the default values at the time of mapping for accumulator points defined in the DNP3 server.

Accumulator Properties

Table 6-211: Accumulator Properties

Setting	Description	Range	Default
Default Class	Specifies a default Class for change events on the point.	None 3 2 1	3
Default Static Variation	Indicates how static data on the ACC point should be reported.	32-Bit 16-Bit	32-Bit
Default Event Variation	Indicates how an Event on the ACC point should be reported.	32-Bit with Time 32-Bit without Time 16-Bit with Time 16-Bit without Time	32-Bit with Time
Default Frozen Static Variation	Indicates how static data on the ACC point should be reported.	32-Bit with Time 32-Bit without Time 16-Bit with Time 16-Bit without Time	32-Bit with Time
Default Frozen Event Variation	Indicates how an Event on the ACC point should be reported.	32-Bit with Time 32-Bit without Time 16-Bit with Time 16-Bit without Time	32-Bit with Time
Default Threshold	Specifies the minimum change required in the Running Accumulator count to cause an event to be generated.	0 to 5000	0

MODBUS Server

About the Modbus Server

The Modbus Server application allows a remote master station to retrieve data from and/or operate commands to the MCP using the Modbus protocol.

The Modbus Server map defines how the MCP is configured to present data to Modbus masters. The MCP supports the following configurable Modbus data types:

- Modbus Server Coils
- Modbus Server Read Only and Read Write Registers
- Modbus Server Input Status

The Modbus Server map settings are available on the **Server Map** tab when a Modbus protocol type is selected.

The MODBUS address is assigned automatically in order of mapping points.

When changing the Data Format size of a mapped point, if the new selection requires a larger size – the next contiguous addresses are incremented automatically. Any address gaps will also be filled. If the new selection requires a smaller size – the user has a choice to decrement the address only for the selected point, or to decrement all next contiguous addresses.

When deselecting a mapped point and then map again a point – the lowest address available in potential gaps will be assigned.

Modbus Server Coils

Mapping settings are available in the upper pane of the **Coils** tab as shown below.

Table 6-212: Coil Mapping Settings

Setting	Description	Range	Default
Address	The Modbus address assigned to the point	0 to 65535	X
Home Directory	Shows the Home Directory of the selected point. Read only.	Not editable	System Assigned Identifier
Point ID	Shows the Point ID of the selected DI point. Read only.	Not editable	System Generated Point Identifier
Point Reference	A short identifier for the selected point. Read Only.	Up to 66 ASCII Characters Not editable	Assigned point name
Point Description	A detailed and localized description of the selected point. Read only.	Up to 128 characters Not editable	Assigned IED point description
Type	The point type. Read only.	Not editable. DI, DO	Assigned type
Control Spec	See the Control Specification Properties table. Only enabled for DO type points.	=	
Feedback Opt	If set to <i>Self</i> , the values of the DO points are returned. If set to <i>Digital Inputs</i> , the value of the Digital Input point is returned. Only enabled for DO type points.	Self DigitalInput	Self

Setting	Description	Range	Default
Feedback Point	If Feedback Opt is set to <i>Digital Input</i> , the point selected is returned.	List of points based on configured DIs	N/A
Invert	Select if the value of the mapped points should be inverted. Only enabled for DI points.	True or False	False

Table 6-213: Control Specification Properties

Setting	Description	Range	Default
Control Code	The control commands that the IED accepts.	Latch ON/OFF Pulse ON/OFF TRIP/CLOSE	Latch ON/OFF
Function Code	The protocol function code to pass as part of the digital control command sent to a device.	Select Before Operate Direct Operate	Select Before Operate
Count	Number of times to consecutively repeat a control code, applying the pulse on and pulse off times to each control pulse repetition (applies only to Control Codes of type Pulse On, Pulse Off, Trip, or Close).	1 to 255	1
On Time	Duration, in milliseconds, of an ON pulse	0 to 65535	0
Off Time	Duration, in milliseconds, of an OFF pulse	0 to 65535	0

Default settings are available in the lower pane of the **Coils** tab. The configuration settings defined in the table below are used to configure the default values for all coils defined in the Modbus server map.

Table 6-214: Coil Default Properties

Setting	Description	Range	Default
Default Control Spec	See the Default Control Specification Properties table.		
Default Feedback Opt	If set to <i>Self</i> , the values of the DO points are returned. If set to <i>Digital Inputs</i> , the value of the Digital Input point is returned.	Self DigitalInput	Self
Default Invert	Select if the value of the mapped points should be inverted by default	True or False	False

Table 6-215: Default Control Specification Properties

Setting	Description	Range	Default
Default Control Code	The control commands that the IED accepts by default.	Latch ON/OFF Pulse ON/OFF TRIP/CLOSE	Latch ON/OFF
Default Function Code	The default protocol function code to pass as part of the digital control command sent to a device.	Select Before Operate Direct Operate	Select Before Operate
Default Count	Number of times to consecutively repeat a control code, applying the pulse on and pulse off times to each control pulse repetition (applies only to Control Codes of type Pulse On, Pulse Off, Trip, or Close).	1 to 255	1
Default On Time	Default duration, in milliseconds, of an ON pulse	0 to 65535	0
Default Off Time	Default duration, in milliseconds, of an OFF pulse	0 to 65535	0

Modbus Server Read Only and Read Write Registers

Mapping settings are available on the **Read Only** and **Read Write Registers** tab as shown below.

Table 6-216: Read Only and Read Write Register Mapping Settings

Setting	Description	Range	Default
Address	The Modbus address assigned to the point	0 to 65535	X
Line ID	Shows the Line ID of the selected point. Read only. Blank for BITSTRING16 or BITSTRING32.	Not editable	System Assigned Identifier
Device ID	Shows the Device ID of the selected point. Read only. Blank for BITSTRING16 or BITSTRING32.	Not editable	System Assigned Identifier
Bay ID	Shows the Bay ID of the selected point. Read only. Blank for BITSTRING16 or BITSTRING32.	Not editable	System Assigned Identifier
Home Directory	Shows the Home Directory of the selected point. Read only. Blank for BITSTRING16 or BITSTRING32.	Not editable	System Assigned Identifier
Point ID	Shows the Point ID of the selected DI point. Read only. Blank for BITSTRING16 or BITSTRING32.	Not editable	System Generated Point Identifier
Point Reference	A short identifier for the selected point. Read Only. Blank for BITSTRING16 or BITSTRING32.	Up to 66 ASCII Characters Not editable	Assigned point name
Point Description	A detailed and localized description of the selected point. Read only. Blank for BITSTRING16 or BITSTRING32.	Up to 128 characters Not editable	Assigned IED point description
Type	The point type. Read only. Blank for BITSTRING16 or BITSTRING32.	Not editable. Read Only Registers: DI, AI, ACC Read Write Registers: DI, AI, AO, ACC	Assigned type
Data Format	The type of data polled.	See Supported Data Types for Modbus Server Read Only and Read Write Registers table.	INT16
Register	This click button is available inside the Data Format column only when Data Format is BITSTRING16 or BITSTRING32. This opens another window which allows users to map individual DI as bits part of the bitstring value.	Bits 0-15 for BITSTRING16. Bits 0-31 for BITSTRING32.	N/A
Point Value to Use	The attribute of the point to be polled. Available options depend on selected Data Format.	Value Frozen Value Date and Time Freeze Date and Time	Value

Setting	Description	Range	Default
Multiplier	Scale factor of the point (m of formula mx + b)	Full range of 64-bit Float	1.0
Offset	Scale factor of the point (b of formula mx + b)	Full range of 64-bit Float	0.0

Default settings are available in the lower pane of the **Read Only** and **Read Write Registers** tab. The configuration settings defined in the table below are used to configure the default values for all read only registers defined in the Modbus server map.

Table 6-217: Read Only and Read Write Register Defaults

Setting	Description	Range	Default
Default Point Value To Use	The attribute of the point that should be polled by default	Value Frozen Value Date and Time Freeze Date and Time	Value
Default Multiplier	Default scale factor of the point (m of formula mx + b)	Full range of 64-bit Float	1.0
Default Offset	Default scale factor of the point (b of formula mx + b)	Full range of 64-bit Float	0.0

Supported Data Types for Modbus Server Read Only and Read Write Registers

Table 6-218: Supported Data Types for Modbus Server Read Only and Read Write Registers

Data Type	Description
UINT16	16-bit unsigned integer. Range: 0 to 65535.
INT16	16-bit signed integer. Range: -32768 to +32767.
UINT32	32-bit unsigned integer. Range: 0 to 4294967295.
INT32	32-bit signed integer. Range: -2147483648 to +2147483647.
FLOAT	IEEE® 754-1985 single-precision floating point value, MSB-LSB or little endian.
DATETIME	Requires 4 consecutive UINT16 Modbus addresses, encoded as: 1. MMDD 2. YYYY 3. hhmm 4. ss.ddd
BITSTRING16	16-bit unsigned integer representing encoded 16- bit binary input data.
BITSTRING32	32-bit unsigned integer representing encoded 32- bit binary input data.

The BITSTRING value is calculated as:

$$\text{Value} = \text{SUM}_{(i=0 \text{ to } n)} (\text{Bit}_i * 2^i)$$

Where:

n=15 for BITSTRING16,

n=31 for BITSTRING32,

Bit_i is the value of Bit i (0 or 1)

Note that in the mapping of each DI that builds the bitstring value – users are able to invert the mapped DI value. Therefore, in the above formula Bit_i is the value of the mapped DI after applying (or not) the inversion.

BITSTRING Register

Selection of DI points part of a BITSTRING value are available as shown below.

Table 6-219: DI points part of BITSTRING

Setting	Description	Range	Default
Bit Position	The associated Bit Position of the mapped DI. Must be unique for a given BITSTRING value. Not all bits need to be assigned. Unassigned bit positions equate as 0 at runtime in the BITSTRING value. NE DI points equate as 0 at runtime in the BITSTRING value. Offline bits equate as 0 at runtime in the BITSTRING value, regardless of the inversion flag. Hint: By duplicating a single mapped DI as two consecutive bit positions – the MODBUS Client can identify if this DI goes offline by reading value “00”. Otherwise, when the DI is online the value will be either “01” or “10”.	0-15 for BITSTRING16. 0-31 for BITSTRING32.	None
Line ID	Shows the Line ID of the selected point. Read only.	Not editable	System Assigned Identifier
Device ID	Shows the Device ID of the selected point. Read only.	Not editable	System Assigned Identifier
Bay ID	Shows the Bay ID of the selected point. Read only.	Not editable	System Assigned Identifier
Home Directory	Shows the Home Directory of the selected point. Read only.	Not editable	System Assigned Identifier
Point ID	Shows the Point ID of the selected DI point. Read only.	Not editable	System Generated Point Identifier
Point Reference	A short identifier for the selected point. Read Only.	Up to 66 ASCII Characters Not editable	Assigned point name
Point Description	A detailed and localized description of the selected point. Read only.	Up to 128 characters Not editable	Assigned IED point description
Invert	Select if the value of the selected point should be inverted	True or False	False

Modbus Server Input Status

Mapping settings are available on the upper pane of the **Input Status** tab as shown below.

Offline DI points equate as 0 at runtime.

Table 6-220: Input Status Mapping Settings

Setting	Description	Range	Default
Address	The Modbus address assigned to the point	0 to 65535	X

Setting	Description	Range	Default
Line ID	Shows the Line ID of the selected point. Read only.	Not editable	System Assigned Identifier
Device ID	Shows the Device ID of the selected point. Read only.	Not editable	System Assigned Identifier
Bay ID	Shows the Bay ID of the selected point. Read only.	Not editable	System Assigned Identifier
Home Directory	Shows the Home Directory of the selected point. Read only.	Not editable	System Assigned Identifier
Point ID	Shows the Point ID of the selected DI point. Read only.	Not editable	System Generated Point Identifier
Point Reference	A short identifier for the selected point. Read Only.	Up to 66 ASCII Characters Not editable	Assigned point name
Point Description	A detailed and localized description of the selected point. Read only.	Up to 128 characters Not editable	Assigned IED point description
Type	The point type. Read only.	Not editable. DI	Assigned type
Invert	Select if the value of the mapped point should be inverted	True or False	False

Default settings are available in the lower pane of the **Input Status Mapping** tab. The configuration settings defined in the table below are used to configure the default values for all read write registers defined in the Modbus server map.

Table 6-221: Input Status Default Properties

Setting	Description	Range	Default
Default Invert	Select if the value of the mapped points should be inverted by default	True or False	False

IEC 60870-5-101+104 Server

The IEC 60870-5-101 and IEC 60870-5-104 Server applications allow remote master stations to retrieve data from and/or operate commands to the MCP using the IEC 60870-5 protocol.

The IEC 60870-5-101+104 Server map defines how the MCP is configured to present data to IEC 60870-5 masters. User can create the following types of information objects:

User can configure the IEC 60870 Server Time Zone offset using the **mcpcfg** command line utility. Refer to [Configure Time Synchronization](#).

» To create an Information Object:

1. Click **Add Info Object**.
2. On the **New Info Object** window, enter values for the fields as described in the table below and click **OK**.
3. Configure each info object and add points to present to the master station.

Info Object Settings

Table 6-222: Info Object Settings

Setting	Description	Range
Info Object Type	The type of information object being created.	Bitstring Double Command Double Point Integrated Total Measurand Packed Single Point Regulating Command Root Directory Setpoint Command Single Command Single Point Step Position
Info Object Name	An identifier used within the configuration interface.	1 to 128 ASCII characters
Starting Info Object Address	Starting address for this object.	1 to 16777215

The following table below the Info Object type drop-down menu shows the configured values for the selected Info Object. Info Object Name cannot be edited in this table.

Bitstring Mapping Settings

Table 6-223: Bitstring Mapping Settings

Setting	Description	Range	Default
<i>Info Object Settings</i>			
Info Object Name	The name of the information object as entered on the New Info Object window. Read only.	N/A	N/A
Address	The address of this entry.	1 to 16777215	
Interrogation Group	The interrogation group used for reporting this information object.	Not Used Group 1 ... Group 16	Not Used
Interrogation Response	Specify whether to include this information object in a general interrogation response.	Include Exclude	Include
Report Class	Specify if spontaneous events for this object are reported as class 1 or class 2 messages. Applies to unbalanced mode and spontaneous events only.	Class 1 Class 2	Class 1
Periodic Update Mode	The type of periodic updating	Not Used Background Scan	Not Used
Periodic Update Interval	The time (in seconds) between periodic reports. Used only if Periodic Update Mode is not set to <i>Not Used</i> .	0 to 65535	0
Periodic Report On Power Up	Specify if periodic reporting (if enabled) should begin immediately upon startup.	Disabled Enabled	Disabled

Setting	Description	Range	Default
Time Tag	The type of time tag to use.	None With Time Tag With CP56 Time Tag	None
<i>Per-Point Settings</i>			
Bit Position	Bit Position	1 to 32	Incremented from 1
Line ID	Shows the Line ID of the selected point. Read only.	Not editable	System Assigned Identifier
Device ID	Shows the Device ID of the selected point. Read only.	Not editable	System Assigned Identifier
Bay ID	Shows the Bay ID of the selected point. Read only.	Not editable	System Assigned Identifier
Home Directory	Shows the Home Directory of the selected point from the Point Picker. Read only.	Not editable	System Assigned Identifier
Point ID	Shows the Point ID of the selected DI point from the Digital Input Point map. Read only.	Not editable	System Generated Point Identifier
Point Reference	A short identifier for the selected DI point from the Point Picker. Read Only.	Up to 66 ASCII Characters Not editable	Assigned point name
Point Description	A detailed and localized description of the selected point in the Binary Input map. Read only.	Up to 128 characters Not editable	Assigned IED point description
Invert	Select if the value of the mapped points should be inverted.	True or False	False

Double Command Mapping Settings

Table 6-224: Double Command Mapping Settings

Setting	Description	Range	Default
<i>Info Object Settings</i>			
Info Object Name	The name of the information object as entered on the New Info Object window. Read only.	N/A	N/A
Starting Address	The starting address of this entry.	1 to 16777215	
Time Tag	The type of time tag to use.	None With Time Tag With CP56 Time Tag	None
<i>Per-Point Settings</i>			
Address	The address of this entry.	(Current Starting Address) to (Next configured starting address)	Auto incremented from last assigned

Setting	Description	Range	Default
Control Type	The type of control to operate.	Trip/Close Regulating Persistent	Persistent
Short Pulse Duration	The control duration (in milliseconds) of the short pulse output.	1 to 2147483647	1000
Long Pulse Duration	The control duration (in milliseconds) of the long pulse output.	1 to 2147483647	2000
Transmission Type	The type of transmission used for control command execution; either a select and execute command sequence or direct execute command sequence.	Select and Execute Direct Execute	Select and Execute
Point 1 Source	First of two digital output source points selected from the Point Picker to comprise the 4-state point being monitored. Based on the user-selected DO point, the point ID of Source Point One is prefixed with the home directory of that point.	Not editable	System assigned identifier
Point 1 Device	Shows the Device ID of the selected point. Read only.	Not editable	System Assigned Identifier
Point 1 Description	A detailed and localized description of the selected Source Point One. Read Only	Not editable	Assigned IED point Description
Point 2 Source	Second of two digital output source points selected to comprise the 4-state point being monitored.	Home Directory, Point ID selected via Point Picker	System Assigned Identifier
Point 2 Device	Shows the Device ID of the selected point. Read only.	Not editable	System Assigned Identifier
Point 2 Description	A detailed and localized description of the selected Source Point Two. Read Only	Not editable	Assigned IED point Description

Double Point Mapping Settings

Table 6-225: Double Point Mapping Settings

Setting	Description	Range	Default
<i>Info Object Settings</i>			
Info Object Name	The name of the information object as entered on the New Info Object window. Read only.	N/A	N/A
Starting Address	The starting address of this entry.	1 to 16777215	
Interrogation Group	The interrogation group used for reporting this information object.	Not Used Group 1 Group 16	Not Used
Interrogation Response	Specify whether to include this information object in a general interrogation response.	Include Exclude	Include
Report Class	Specify if spontaneous events for this object are reported as class 1 or class 2 messages. Applies to unbalanced mode and spontaneous events only.	Class 1 Class 2	Class 1

Setting	Description	Range	Default
Periodic Update Mode	The type of periodic updating	Not Used Background Scan	Not Used
Periodic Update Interval	The time (in seconds) between periodic reports. Used only if Periodic Update Mode is not set to <i>Not Used</i> .	0 to 65535	0
Periodic Report On Power Up	Specify if periodic reporting (if enabled) should begin immediately upon startup.	Disabled Enabled	Disabled
Time Tag	The type of time tag to use.	None With Time Tag With CP56 Time Tag	None
Valid Time	The minimum amount of time (in milliseconds) that both digital input points must be stable before an ON or OFF state is reported. -1 disables this setting.	-1 to 65535	-1
Suppress Time	The minimum amount of time (in milliseconds) that both digital input points must be stable before an indeterminate state is reported. -1 disables this setting.	-1 to 65535	-1
Addressing (SQ)	The DPA shall report as ASDU with SQ=0 when this flag is set to <i>Single (SQ=0)</i> (Default value) and SQ=1 when set to <i>Sequence (SQ=1)</i> . Note: When the flag is set to Sequence (SQ=1), the following conditions must be met before an ASDU is reported with SQ=1: 1. The IOAs for the points in the Info Objects are consecutive. 2. The ASDU is reported with Cause of Transmission 1,2,5, or 20-36.	Single (SQ=0) Sequence (SQ=1)	Single (SQ=0)
<i>Per-Point Settings</i>			
Address	The address of the entry.	(Current Starting Address) to (Next configured starting address)	Auto incremented from last assigned
Off Point Source	Home directory and Point ID of the Off point selected from the Point Picker. Read only.	Not editable	System Assigned Identifier
Off Point Device	Line ID Device ID Bay ID of the Off point selected from the Point Picker. Read only.	Not editable	System Assigned Identifier
Off Point Description	Point description of the Off point selected from the Point Picker. Read only.	Not editable	System Assigned Identifier
On Point Source	Home directory and Point ID of the On point selected from the On Point Picker.	Home Directory, Point ID selected via Point Picker	System Assigned Identifier

Setting	Description	Range	Default
On Point Device	Line ID Device ID Bay ID of the On point selected from the Point Picker. Read only.	Not editable	System Assigned Identifier
On Point Description	Point description of the On point selected from the Point Picker. Read only.	Not editable	System Assigned Identifier
Invert	Select if the value of the mapped points should be inverted.	True or False	False

Note:

To assist in the workflow of point selection – when an Off Point is selected from a device in the point picker tree list, then the next point from that device will be automatically selected as On Point. This allows also for bulk mapping of all points using the parent checkbox in the Point Picker Tree. Clicking on the parent checkbox when is partially selected (gray) will remove all mappings under that level.

After the initial automated selection the On Point can be changed with any other point from the available devices in the point picker tree list for double points.

If the point selected for the Off point is the last point in the device then the On point will be same as the Off point, this will require manual re-mapping of the On point.

If the application requires to report a single digital input point as DNP3 Double-Bit, then map the same single digital input point as both Off Point and On Point.

Integrated Total Mapping Settings

Table 6-226: Integrated Total Mapping Settings

Setting	Description	Range	Default
<i>Info Object Settings</i>			
Info Object Name	The name of the information object as entered on the New Info Object window. Read only.	N/A	N/A
Starting Address	The starting address of this entry.	1 to 16777215	
Interrogation Group	The interrogation group used for reporting this information object.	Not Used Group 1 ... Group 4	Not Used
Interrogation Response	Specify whether to include or exclude this information object in a general interrogation response.	Include Exclude	Include
Report Class	Specify if spontaneous events for this object are reported as class 1 or class 2 messages. Applies to unbalanced mode and spontaneous events only.	Class 1 Class 2	Class 1
Time Tag	The type of time tag to use.	None With Time Tag With CP56 Time Tag	None
Periodic Update Mode	The type of periodic updating	Not Used Background Scan	Not Used

Setting	Description	Range	Default
Periodic Update Interval	The time (in seconds) between periodic reports. Used only if Periodic Update Mode is not set to <i>Not Used</i> .	0 to 65535	0
Periodic Report On Power Up	Specify if periodic reporting (if enabled) should begin immediately upon startup.	Disabled Enabled	Disabled
<i>Per-Point Settings</i>			
Address	The address of the entry.	(Current Starting Address) to (Next configured starting address)	Auto incremented from last assigned
Line ID	Shows the Line ID of the selected point. Read only.	Not editable	System Assigned Identifier
Device ID	Shows the Device ID of the selected point. Read only.	Not editable	System Assigned Identifier
Bay ID	Shows the Bay ID of the selected point. Read only.	Not editable	System Assigned Identifier
Home Directory	Shows the Home Directory of the selected point from the Point Picker. Read only.	Not editable	System Assigned Identifier
Point ID	Shows the Point ID of the selected point from the Point Picker. Read only.	Not editable	System Generated Point Identifier
Point Description	A detailed and localized text description of the selected point in the Accumulator point map. Read only.	Up to 128 Unicode characters	Assigned IED point Description
Point Reference	A short identifier for the selected ACC point from the Point Picker. Read Only.	Up to 66 ASCII Characters Not editable	Assigned point name
Accumulator Type	Specifies whether every change (transition) or every pair of changes (pulse) in the monitored accumulator point value increments the reported count.	Pulse Transition	Pulse
Accumulator Return Type	Specifies whether the running or frozen accumulator value is reported.	Running Frozen	Running
Accumulator Freeze	Specifies whether the master station can freeze the monitored accumulator point.	Enabled Disabled	Disabled
Accumulator Clear	Specifies whether or not the master station is allowed to clear the monitored accumulator point.	Enabled Disabled	Disabled
Threshold	Specifies the minimum change in accumulator value required to produce a spontaneous report or event. Only used when the Accumulator Return Type is <i>Running</i> .	0 to 1000000	1

Measurand Mapping Settings

Table 6-227: Measurand Mapping Settings

Setting	Description	Range	Default
<i>Info Object Settings</i>			
Info Object Name	The name of the information object as entered on the New Info Object window. Read only.	N/A	N/A
Starting Address	The starting address of this entry.	1 to 16777215	
Interrogation Group	The interrogation group used for reporting this information object.	Not Used Group 1 ... Group 16	Not Used
Interrogation Response	Specify whether to include this information object in a general interrogation response.	Include Exclude	Include
Report Class	Specify if spontaneous events for this object are reported as class 1 or class 2 messages. Applies to unbalanced mode and spontaneous events only.	Class 1 Class 2	Class 1
Periodic Update Mode	The type of periodic updating	Not Used Background Scan Periodic/Cyclic	Not Used
Periodic Update Interval	The time (in seconds) between periodic reports. Used only if Periodic Update Mode is not set to <i>Not Used</i> .	0 to 65535	0
Periodic Report On Power Up	Specify if periodic reporting (if enabled) should begin immediately upon startup.	Disabled Enabled	Disabled
Time Tag	The type of time tag to use.	None With Time Tag With CP56 Time Tag	None
Conversion	The type of setpoint command. There are 3 possible types: - Normalized – value is between -1 and +1 -2⁻¹⁵ - Scaled – value is scaled using multiplier and offset to -2¹⁵ to +2¹⁵ – 1 - Short Floating Point – value is a 32-bit floating point.	Normalized Scaled ShortFP	Normalized
Quality	Whether quality information is included with this entity.	With Quality Descriptor Without Quality Descriptor	With Quality Descriptor
Addressing (SQ)	The DPA shall report as ASDU with SQ=0 when this flag is set to <i>Single</i> (SQ=0) (Default value) and SQ=1 when set to <i>Sequence</i> (SQ=1). Note: When the flag is set to Sequence (SQ=1), the following conditions must be met before an ASDU is reported with SQ=1: - The IOAs for the points in the Info Objects are consecutive. - The ASDU is reported with Cause of Transmission 1,2,5, or 20-36.	Single (SQ=0) Sequence (SQ=1)	Single (SQ=0)

Setting	Description	Range	Default
<i>Per-Point Settings</i>			
Address	The address of the entry.	(Current Starting Address) to (Next configured starting address)	Auto incremented from last assigned
Line ID	Shows the Line ID of the selected point. Read only.	Not editable	System Assigned Identifier
Device ID	Shows the Device ID of the selected point. Read only.	Not editable	System Assigned Identifier
Bay ID	Shows the Bay ID of the selected point. Read only.	Not editable	System Assigned Identifier
Home Directory	Shows the Home Directory of the selected point from the Point Picker. Read only.	Not editable	System Assigned Identifier
Point ID	Shows the Point ID of the selected point from the Point Picker. Read only.	Not editable	System Generated Point Identifier
Point Reference	A short identifier for the selected AI point from the Point Picker. Read Only.	Up to 66 ASCII Characters Not editable	Assigned point name
Point Description	A detailed and localized text description of the selected point in the Analog Input map. Read only.	Up to 128 Unicode characters. Non-Editable	Assigned IED point description
Multiplier	Scale factor of the point (m of formula $mx + b$)	Full range of 64-bit Float	1.0
Offset	Scale factor of the point (b of formula $mx + b$)	Full range of 64-bit Float	0.0
Polarity	Specifies whether a negative analog value is valid.	Bipolar Value Unipolar Value	Bipolar Value
Threshold	The initial minimum change in the analog input value that is required to produce a spontaneous report or event.	0 to 1,000,000,000	5
High Limit	The initial high limit that is required for an analog input value to exceed to produce an event.	-1.0E+12 to 1.0E+12	1.0E+12
Low Limit	The initial low limit that is required for an analog input value to exceed to produce an event.	-1.0E+12 to 1.0E+12	-1.0E+12

Packed Single Point Mapping Settings

Table 6-228: Packed Single Point Mapping Settings

Setting	Description	Range	Default
<i>Info Object Settings</i>			
Info Object Name	The name of the information object as entered on the New Info Object window. Read only.	N/A	N/A
Address	The address of this entry.	N/A	N/A
Interrogation Group	The interrogation group used for reporting this information object.	Not Used Group 1 ... Group 16	Not Used
Interrogation Response	Specify whether to include this information object in a general interrogation response.	Include Exclude	Include
Report Class	Specify if spontaneous events for this object are reported as class 1 or class 2 messages. Applies to unbalanced mode and spontaneous events only.	Class 1 Class 2	Class 1
Periodic Update Mode	The type of periodic updating	Not Used Background Scan	Not Used
Periodic Update Interval	The time (in seconds) between periodic reports. Used only if Periodic Update Mode is not set to <i>Not Used</i> .	0 to 65535	0
Periodic Report On Power Up	Specify if periodic reporting (if enabled) should begin immediately upon startup.	Disabled Enabled	Disabled
<i>Per-Point Settings</i>			
Bit Position	Specifies the bit position within the information object element.	1 to 16	Incremented from 1
Line ID	Shows the Line ID of the selected point. Read only.	Not editable	System Assigned Identifier
Device ID	Shows the Device ID of the selected point. Read only.	Not editable	System Assigned Identifier
Bay ID	Shows the Bay ID of the selected point. Read only.	Not editable	System Assigned Identifier
Home Directory	Shows the Home Directory of the selected point from the Point Picker. Read only.	Not editable	System Assigned Identifier
Point ID	Shows the Point ID of the selected point from the Point Picker. Read only.	Not editable	System Generated Point Identifier
Point Reference	A short identifier for the selected point from the Point Picker. Read Only.	Up to 66 ASCII Characters Not editable	Assigned point name
Point Description	A detailed and localized text description of the selected DI point in the Binary Input map. Read only.	Up to 128 Unicode characters Not editable	Assigned IED point description
Invert	Select if the value of the mapped points should be inverted.	True or False	False

Regulating Command Mapping Settings

Table 6-229: Regulating Command Mapping Settings

Setting	Description	Range	Default
<i>Info Object Settings</i>			
Info Object Name	The name of the information object as entered on the New Info Object window. Read only.	N/A	N/A
Starting Address	The starting address of this entry.	1 to 16777215	
Time Tag	The type of time tag to use.	None With Time Tag With CP56 Time Tag	None
<i>Per-Point Settings</i>			
Address	The address of the entry.	(Current Starting Address) to (Next configured starting address)	Auto incremented from last assigned
Control Type	The type of control to operate.	Trip/Close Regulating Persistent	Persistent
Short Pulse Duration	The control duration (in milliseconds) of the short pulse output.	1 to 2147483647	1000
Long Pulse Duration	The control duration (in milliseconds) of the long pulse output.	1 to 2147483647	2000
Transmission Type	The type of transmission used for command control execution; either a select and execute command sequence or direct execute command sequence.	Select and Execute Direct Execute	Select and Execute
Source Point One	First of two digital output source points selected from the Point Picker to comprise the 4-state point being monitored. Based on the user-selected DO point, the point ID of Source Point One is prefixed with the home directory of that point.	Not editable	System Assigned Identifier
Point 1 Device	Shows the Device ID of the selected point. Read only.	Not editable	System Assigned Identifier
Point 1 Description	A detailed and localized description of the selected Source Point One. Read Only.	Not editable	Assigned IED point Description
Source Point Two	Second of two digital output source points selected to comprise the 4-state point being monitored.	Home Directory, Point ID selected via Point Picker	System Assigned Identifier
Point 2 Device	Shows the Device ID of the selected point. Read only.	Not editable	System Assigned Identifier
Point 2 Description	A detailed and localized description of the selected Source Point Two. Read Only.	Not editable	Assigned IED point Description

Setpoint Command Mapping Settings

Table 6-230: Setpoint Command Mapping Settings

Setting	Description	Range	Default
Info Object Settings			
Info Object Name	The name of the information object as entered on the New Info Object window. Read only.	N/A	N/A
Starting Address	The starting address of this entry.	1 to 16777215	none
Time Tag	The type of time tag to use.	None With Time Tag With CP56 Time Tag	None
Conversion	The type of setpoint command. There are 3 possible types: - Normalized - value is between -1 and +1 - Scaled - value is scaled using multiplier and offset to -2^{15} to $+2^{15} - 1$ - Short Floating Point - value is a 32-bit floating point	Normalized Scaled ShortFP	Normalized
Per-Point Settings			
Address	The address of the entry.	(Current Starting Address) to (Next configured starting address)	Auto incremented from last assigned
Line ID	Shows the Line ID of the selected point. Read only.	Not editable	System Assigned Identifier
Device ID	Shows the Device ID of the selected point. Read only.	Not editable	System Assigned Identifier
Bay ID	Shows the Bay ID of the selected point. Read only.	Not editable	System Assigned Identifier
Home Directory	Shows the Home Directory of the selected point from the Point Picker. Read only.	Not editable	System Assigned Identifier
Point ID	Shows the Point ID of the selected point from the Point Picker. Read only.	Not editable	System Generated Point Identifier
Point Reference	A short identifier of the selected AO point from the Point Picker. Read Only.	Up to 66 ASCII Characters Not editable	Assigned point name
Point Description	A detailed and localized text description of the point in the selected AO point map. Read only.	Up to 128 Unicode characters Not editable	Assigned IED point description
Multiplier	Scale factor of the point (m of formula mx + b)	Full range of 64-bit Float	1.0

Setting	Description	Range	Default
Offset	Scale factor of the point (b of formula mx + b)	Full range of 64-bit Float	0.0
Polarity	Specifies whether a negative analog value is valid.	Bipolar Value Unipolar Value	Bipolar Value
Transmission Type	The type of transmission used for control command execution; either a select and execute command sequence or only an execute command sequence.	Select and Execute Direct Execute	Select and Execute
Send Ackterm	Specifies whether the application sends an ACTTERM response to the master station when a C_SE setpoint command completes	No Yes	No

Single Command Mapping Settings

Table 6-231: Single Command Mapping Settings

Setting	Description	Range	Default
Info Object Settings			
Info Object Name	The name of the information object as entered on the New Info Object window. Read only.	N/A	N/A
Starting Address	The starting address of this entry.	1 to 16777215	
Time Tag	The type of time tag to use.	None With Time Tag With CP56 Time Tag	None
Per-Point Settings			
Address	The address of the entry.	(Current Starting Address) to (Next configured starting address)	Auto incremented from last assigned
Control Type	The type of control to operate.	Trip/Close Regulating Persistent	Persistent
Short Pulse Duration	The control duration (in milliseconds) of the short pulse output.	1 to 2147483647	1000
Long Pulse Duration	The control duration (in milliseconds) of the long pulse output.	1 to 2147483647	2000
Transmission Type	The type of transmission; either a select and execute command sequence or only an execute command sequence.	Select and Execute Direct Execute	Select and Execute
Source Point One	First of two digital input source points selected from the Point Picker to comprise the 4-state point being monitored. Based on user configured DO point name post fixed with system assigned identifier (Point ID).	Not editable	System assigned identifier

Setting	Description	Range	Default
Point 1 Device	Shows the Device ID of the selected point. Read only.	Not editable	System Assigned Identifier
Point 1 Description	A detailed and localized description of the selected Source Point One. Read Only.	Not editable	Assigned IED point Description
Source Point Two	Second of two digital input source points selected to comprise the 4-state point being monitored.	Home Directory, Point ID selected via Point Picker	System Assigned Identifier
Point 2 Device	Shows the Device ID of the selected point. Read only.	Not editable	System Assigned Identifier
Point 2 Description	A detailed and localized description of the selected Source Point Two. Read Only.	Not editable	Assigned IED point Description

Single Point Mapping Settings

Table 6-232: Single Point Mapping Settings

Setting	Description	Range	Default
Info Object Settings			
Info Object Name	The name of the information object as entered on the New Info Object window. Read only.	N/A	N/A
Starting Address	The starting address of this entry.	1 to 16777215	none
Interrogation Group	The interrogation group used for reporting this information object.	Not Used Group 1 ... Group 16	Not Used
Interrogation Response	Specify whether to include this information object in a general interrogation response.	Include Exclude	Include
Report Class	Specify if spontaneous events for this object are reported as class 1 or class 2 messages. Applies to unbalanced mode and spontaneous events only.	Class 1 Class 2	Class 1
Periodic Update Mode	The type of periodic updating	Not Used Background Scan	Not Used
Periodic Update Interval	The time (in seconds) between periodic reports. Used only if Periodic Update Mode is not set to <i>Not Used</i> .	0 to 65535	0
Periodic Report On Power Up	Specify if periodic reporting (if enabled) should begin immediately upon startup.	Disabled Enabled	Disabled
Time Tag	The type of time tag to use.	None With Time Tag With CP56 Time Tag	None
Addressing (SQ)	The DPA shall report as ASDU with SQ=0 when this flag is set to Single (SQ=0)	Single (SQ=0) Sequence (SQ=1)	Single (SQ=0)

Setting	Description	Range	Default
	(Default value) and SQ=1 when set to Sequence (SQ=1). Note: When the flag is set to Sequence (SQ=1), the following conditions must be met before an ASDU is reported with SQ=1: 1. The IOAs for the points in the Info Objects are consecutive. 2. The ASDU is reported with Cause of Transmission 1,2,5, or 20-36.		
Per-Point Settings			
Address	The address of the entry.	(Current Starting Address) to (Next configured starting address)	Auto incremented from last assigned
Line ID	Shows the Line ID of the selected point. Read only.	Not editable	System Assigned Identifier
Device ID	Shows the Device ID of the selected point. Read only.	Not editable	System Assigned Identifier
Bay ID	Shows the Bay ID of the selected point. Read only.	Not editable	System Assigned Identifier
Home Directory	Shows the Home Directory of the selected point from the Point Picker. Read only.	Not editable	System Assigned Identifier
Point ID	Shows the Point ID of the selected point from the Point Picker. Read only.	Not editable	System Generated Point Identifier
Point Description	A detailed and localized text description of the selected point in the Binary Input map. Read only.	Up to 128 Unicode characters Not editable	Assigned IED point description
Point Reference	A short identifier of the selected DI point from the Point Picker. Read Only.	Up to 66 ASCII Characters Not editable	Assigned point name
Invert	Select if the value of the mapped points should be inverted.	True or False	False

Step Position Mapping Settings

Table 6-233: Step Position Mapping Settings

Setting	Description	Range	Default
Info Object Settings			
Info Object Name	The name of the information object as entered on the New Info Object window. Read only.	N/A	N/A
Starting Address	The starting address of this entry.	1 to 16777215	none

Setting	Description	Range	Default
Interrogation Group	The interrogation group used for reporting this information object.	Not Used Group 1... Group 16	Not Used
Interrogation Response	Specify whether to include this information object in a general interrogation response.	Include Exclude	Include
Report Class	Specify if spontaneous events for this object are reported as class 1 or class 2 messages. Applies to unbalanced mode and spontaneous events only.	Class 1 Class 2	Class 1
Periodic Update Mode	The type of periodic updating	Not Used Background Scan	Not Used
Periodic Update Interval	The time (in seconds) between periodic reports. Used only if Periodic Update Mode is not set to <i>Not Used</i> .	1 to 255	60
Periodic Report On Power Up	Specify if periodic reporting (if enabled) should begin immediately upon startup.	Disabled Enabled	Disabled
Time Tag	The type of time tag to use.	None With Time Tag With CP56 Time Tag	None
Addressing (SQ)	The DPA shall report as ASDU with SQ=0 when this flag is set to Single (SQ=0) (Default value) and SQ=1 when set to Sequence (SQ=1). Note: When the flag is set to Sequence (SQ=1), the following conditions must be met before an ASDU is reported with SQ=1: 1. The IOAs for the points in the Info Objects are consecutive. 2. The ASDU is reported with Cause of Transmission 1,2,5, or 20-36.	Single (SQ=0) Sequence (SQ=1)	Single (SQ=0)
Per-Point Settings			
Address	The address of the entry.	(Current Starting Address) to (Next configured starting address)	Auto incremented from last assigned
Line ID	Shows the Line ID of the selected point. Read only.	Not editable	System Assigned Identifier
Device ID	Shows the Device ID of the selected point. Read only.	Not editable	System Assigned Identifier
Bay ID	Shows the Bay ID of the selected point. Read only.	Not editable	System Assigned Identifier
Home Directory	Shows the Home Directory of the selected point from the Point Picker. Read only.	Not editable	System Assigned Identifier

Setting	Description	Range	Default
Point ID	Shows the Point ID of the selected AI point from the Digital Input Point map. Read only.	Not editable	System Generated Point Identifier
Point Reference	A short identifier of the selected AI point from the Point Picker. Read Only.	Up to 66 ASCII Characters Not editable	Assigned point name
Point Description	A detailed and localized text description of the selected point in the Analog Input map. Read only.	Up to 128 characters Not editable	Assigned IED point description
Multiplier	Scale factor of the point (m of formula mx + b)	Full range of 64-bit Float	1.0
Offset	Scale factor of the point (b of formula mx + b)	Full range of 64-bit Float	0.0
Polarity	Specifies whether a negative analog value is valid.	Bipolar Value Unipolar Value	Bipolar Value
Threshold	The initial minimum change in the analog input value that is required to produce a spontaneous report or event.	0 to 100,000,000	5
High Limit	The initial high limit that is required for an analog input value to exceed to produce an event.	-1.0E+12 to 1.0E+12	1.0E+12
Low Limit	The initial low limit that is required for an analog input value to exceed to produce an event.	-1.0E+12 to 1.0E+12	-1.0E+12

Tejas V Server

The Tejas V Server applications allow a remote master station to retrieve data from and/or operate commands to the MCP using the Tejas V protocol.

One or more instances (LRU) of Tejas V Server can be configured.

The Tejas V Server map defines how the MCP is configured to present data to Tejas V masters. The MCP supports the following configurable Tejas V point types:

- [Analog Input](#)
- [Setpoint](#)
- [Status Points \(DI\)](#)
- [Raise/Lower Control](#)
- [Control](#)
- [Accumulator](#)
- [Special – LRU Local/Remote Input](#)

In the Tejas V protocol, each point type has a contiguous address range starting from 0.

However, the Server Map Editor allows to configure sparse point addresses for each point type.

For example, when configuring Tejas V point addresses 1, 3, 10, 25 the gaps are 0, 2, 4-9, 11-24. These gaps are treated as undefined spare points in the Tejas V point map.

If is desired to pad the remaining addresses (to the end) with undefined spare points – add one point with maximum address which would be mapped to a dummy RTDB point (e.g., a Calculator empty expression); this will create the desired gaps.

The Tejas V Server reports below default values for spare points:

- Analog Input: 0
- Setpoint: 0
- Status (Bit value): 0
- Accumulator: 0

The Tejas V Server responds to a command request with an error response if the command is directed to a spare point.

Tejas V Server Analog Input

Settings are available on the **Analog Input** tab. The default property values are defined in the lower pane. The MCP provides the mapping settings for Analog Input points as shown below.

Analog Input Mapping Settings

Table 6-234: Analog Input Mapping Settings

Setting	Description	Range	Default
Tejas V Point	Point Index (0 Based). Each point index number must be unique.	0 to 509	Incremented from 0.
Line ID	Shows the Line ID of the selected point. Read only.	N/A	System Assigned Identifier
Device ID	Shows the Device ID of the selected point. Read only.	N/A	System Assigned Identifier
Bay ID	Shows the Bay ID of the selected point. Read only.	N/A	System Assigned Identifier
Home Directory	Home directory of the device of the AI point selected from the Point Picker. Read only.	N/A	System Assigned Identifier
Point Description	Point description of the AI point selected from the Point Picker. Read only.	N/A	System Assigned Identifier.
Point Reference	Point reference of the AI point selected from the Point Picker. Read only	N/A	System Assigned Identifier
Point ID	Point ID of the AI point selected from the Point Picker. Read only.	N/A	System Assigned Identifier
Multiplier	Scale factor of the point, where Tejas V value = Multiplier x RTDB AI Value + Offset	Full range of 64-bit Float	0.0625
Offset	Scale factor of the point, where Tejas V value = Multiplier x RTDB AI Value + Offset	Full range of 64-bit Float	0.0

Setting	Description	Range	Default
Input Mode	Specifies the input mode for this point. Available input modes are: • Bipolar Input Bipolar inputs may have both negative and positive values and are reported as a 12-bit 2s complement binary number. • Unipolar Input Unipolar inputs are restricted to positive values only and are reported as a 12-bit unsigned binary number. If the value of a unipolar input is negative, it will be reported as positive.	Bipolar Unipolar	Bipolar

Note:

Tejas V AI are Integers.

For Bipolar: if the resultant scaled value is outside the range -2048...2047, it will be clipped in this manner:

- if the value is less than -2048, it will be set to -2048
- if the value is greater than 2047, it will be set to 2047

For Unipolar: if the resultant scaled value is outside the range 0...4095, it will be clipped in this manner:

- if the value is less than 0, it will be multiplied by -1
- if the value is greater than 4095, it will be set to 4095

Default Settings are available in the lower pane of the **Analog Input** tab. The configuration settings defined below are used to configure the default values at the time of mapping for Analog Input points defined in the Tejas V server map.

Analog Input Properties

Table 6-235: Analog Input Properties

Setting	Description	Range	Default
Default Input Mode	Specifies a default Input Mode for the point	Bipolar Unipolar	Bipolar
Default Multiplier	Specifies a default Multiplier for the point, where Tejas V value = Multiplier x RTDB AI Value + Offset	Full range of 64-bit Float	0.0625
Default Offset	Specifies a default Offset for the point, where Tejas V value = Multiplier x RTDB AI Value + Offset	Full range of 64-bit Float	0

Tejas V Server Setpoint

Settings are available on the **Setpoint** tab. The default property values are defined in the lower pane. The MCP provides the mapping settings for Setpoint points as shown below.

Setpoint Mapping Settings

Table 6-236: Setpoint Mapping Settings

Setting	Description	Range	Default
Tejas V Point	Point Index (0 Based). Each point index number must be unique.	0 to 63	Incremented from 0.
Line ID	Shows the Line ID of the selected point. Read only.	N/A	System Assigned Identifier

Setting	Description	Range	Default
Device ID	Shows the Device ID of the selected point. Read only.	N/A	System Assigned Identifier
Bay ID	Shows the Bay ID of the selected point. Read only.	N/A	System Assigned Identifier
Home Directory	Home Directory of the device of the AO point selected from the Point Picker. Read only.	N/A	System Assigned Identifier
Point Description	Point Description of the AO point selected from the Point Picker. Read only.	N/A	System Assigned Identifier
Point Reference	Point Reference of the AO point selected from the Point Picker. Read only.	N/A	System Assigned Identifier
Point ID	Point ID of the AO point selected from the Point Picker. Read only.	N/A	System Assigned Identifier
Multiplier	Scale factor of the point, where RTDB AO value = Multiplier x Tejas V Setpoint Value + Offset	Full range of 64-bit Float	16
Offset	Scale factor of the point, where RTDB AO value = Multiplier x Tejas V Setpoint Value + Offset	Full range of 64-bit Float	0.0
Output Mode	Specifies the output mode for this point. Available output modes are: - Bipolar setpoint Bipolar setpoints accept both negative and positive values and are reported as a 12-bit 2s complement binary number - Unipolar setpoint Unipolar setpoint are restricted to positive values only and are reported as a 12-bit unsigned binary number	Bipolar Unipolar	Bipolar

Default Settings are available in the lower pane of the **Setpoint** tab. The configuration settings defined below are used to configure the default values at the time of mapping for Setpoint points defined in the Tejas V server map.

Setpoint Properties

Table 6-237: Setpoint Properties

Setting	Description	Range	Default
Default Output Mode	Specifies a default Output Mode for the point	Bipolar Unipolar	Bipolar
Default Multiplier	Specifies a default Multiplier for the point, where RTDB AO value = Multiplier x Tejas V Setpoint Value + Offset	Full range of 64-bit Float	16
Default Offset	Specifies a default Offset for the point, where RTDB AO value = Multiplier x Tejas V Setpoint Value + Offset	Full range of 64-bit Float	0

Tejas V Server Status Points (DI)

Settings are available on the **Status** tab. The default property values are defined in the lower pane. The MCP provides the mapping settings for Status points as shown below.

Status Mapping Settings

Table 6-238: Status Mapping Settings

Setting	Description	Range	Default
Tejas V Point	Point Index (0 Based). Each point index number must be unique. If the highest status point index plus 1 is not divisible by 8, the additional point(s) required to make it divisible by 8 will be treated as undefined spare points in the Tejas V point map. For example, if the highest configured status index is 254, then status index 255 will be automatically added by the Tejas V Server as an undefined spare point to make the highest index plus 1 (i.e., 256) divisible by 8. Spare points are reported with a value of 0.	0 to 255	Incremented from 0.
Line ID	Shows the Line ID of the selected point. Read only.	N/A	System Assigned Identifier
Device ID	Shows the Device ID of the selected point. Read only.	N/A	System Assigned Identifier
Bay ID	Shows the Bay ID of the selected point. Read only.	N/A	System Assigned Identifier
Home Directory	Home Directory of the device of the DI point selected from the Point Picker. Read only.	N/A	System Assigned Identifier
Point Description	Point Description of the DI point selected from the Point Picker. Read only.	N/A	System Assigned Identifier
Point Reference	Point Reference of the DI point selected from the Point Picker. Read only.	N/A	System Assigned Identifier
Point ID	Point ID of the DI point selected from the Point Picker. Read only.	N/A	System Assigned Identifier
Invert	Select if the value of the mapped points should be inverted.	True or False	False

Default Settings are available in the lower pane of the **Status** tab. The configuration settings defined below are used to configure the default values at the time of mapping for Status points defined in the Tejas V server map.

Status Properties

Table 6-239: Status Properties

Setting	Description	Range	Default
Default Invert	Specifies a default Invert setting for the point, which indicates whether a mapped DI point value should be inverted.	True or False	False

Tejas V Server Raise/Lower Control

Settings are available on the **Raise/Lower Control** tab. The MCP provides the mapping settings for Raise/Lower Control points as shown below.

Raise/Lower Control Mapping Settings

Table 6-240: Raise/Lower Control Mapping Settings

Setting	Description	Range	Default
Tejas V Group	Group Index (0 Based). Each group index number must be unique.	0 to 3	Incremented from 0.
Tejas V Point	Paired Point Index. Each paired point index number within a group must be unique.	1 or 2	1
Source Raise Point	Composed of Home Directory and Point ID of DO point selected from the Point Picker. Read only.	N/A	System Assigned Identifier
Raise Point Device	Composed of Line ID, Device ID and Bay ID of DO point selected from the Point Picker. Read only.	N/A	System Assigned Identifier
Raise Point Description	Point Description of the DO point selected from the Point Picker. Read only.	N/A	System Assigned Identifier
Source Lower Point	Composed of Home Directory and Point ID of DO point selected from the Point Picker. Read only.	N/A	System Assigned Identifier
Lower Point Device	Composed of Line ID, Device ID and Bay ID of DO point selected from the Point Picker. Read only.	N/A	System Assigned Identifier
Lower Point Description	Point Description of the DO point selected from the Point Picker. Read only.	N/A	System Assigned Identifier

Notes:

To assist in the workflow of point selection – when a Source Raise Point is selected from a device in the point picker tree list, then the next point from that device will be automatically selected as Source Lower Point. This allows for bulk mapping of all points using the parent checkbox in the Point Picker Tree. Clicking on the parent checkbox when is partially selected (gray) will remove all mappings under that level.

After the initial automated selection the Source Lower Point can be changed with any other point from the available devices in the point picker tree list.

If the point selected for the Source Raise Point is the last point in the device then the Source Lower Point will be same as the Source Raise Point, this will require manual re-mapping of the Source Lower Point.

If at runtime a command is received from the Master while the paired command is still in progress – the first issued command will be cancelled only if the target DO point belongs to D.20 IO. For any other DO target points the first issued command cannot be cancelled, and the new command will be queued.

Tejas V Server Control

Settings are available on the **Control** tab. The default property values are defined in the lower pane. The MCP provides the mapping settings for Control points as shown below.

Control Mapping Settings

Table 6-241: Control Mapping Settings

Setting	Description	Range	Default
Line ID	Shows the Line ID of the selected point. Read only.	N/A	System Assigned Identifier
Device ID	Shows the Device ID of the selected point. Read only.	N/A	System Assigned Identifier
Bay ID	Shows the Bay ID of the selected point. Read only.	N/A	System Assigned Identifier
Home Directory	Home Directory of the device of the DO point selected from the Point Picker. Read only.	N/A	System Assigned Identifier
Point Description	Point Description of the DO point selected from the Point Picker. Read only.	N/A	System Assigned Identifier
Point Reference	Point Reference of the DO point selected from the Point Picker. Read only.	N/A	System Assigned Identifier
Point ID	Point ID of the DO point selected from the Point Picker. Read only.	N/A	System Assigned Identifier
Close/Pulse Tejas V Point	Close/Pulse Control Point Index (0 Based). Each point index number must be unique. This number is the entire point number field of the Tejas V protocol message. Typically, a Tejas V master uses the least significant bit of the entire point number field to select the resulting control operation (i.e., 0 for Close and 1 for Trip) and the remaining most significant bits as a point number. If this is the case, you must double the point number configured in the master and enter the result here.	0 to 255	Incremented from 0.

Setting	Description	Range	Default
Trip Tejas V Point	Trip Control Point Index (0 Based). Each point index number must be unique. This number is the entire point number field of the Tejas V protocol message. Typically, a Tejas V master uses the least significant bit of the entire point number field to select the resulting control operation (i.e., 0 for Close and 1 for Trip) and the remaining most significant bits as a point number. If this is the case, you must double the point number configured in the master and add one to select the Trip operation. Then, enter the result here.	0 to 255	Incremented from 0.
Output Mode	Specifies Output Mode for the points in the row. Available output modes are: • Close/Trip Output • Pulse Output • Close Output • Trip Output Trip and Close outputs are operated in conjunction with the Master Trip or Close relay, while Pulse outputs are operated individually.	Close/Trip Pulse Close Trip	Close/Trip

Note:

To assist in the workflow of assigning Tejas V Point Indexes – when DO Points are selected from a device in the point picker tree list, then the Tejas V Point Indexes are assigned and automatically incremented according to the Default Output Mode.

This allows for bulk mapping of all points using the parent checkbox in the Point Picker Tree, in conjunction with the Default Output Mode. Clicking on the parent checkbox when is partially selected (gray) will remove all mappings under that level.

After the initial automated assignment the Tejas V Point Index(es) can be changed as desired, as long as the value remains unique and within the valid range 0 - 255.

Default Settings are available in the lower pane of the Control tab. The configuration settings defined below are used to configure the default values at the time of mapping for Control points defined in the Tejas V server map.

Control Properties

Table 6-242: Control Properties

Setting	Description	Range	Default
Default Output Mode	Specifies a default Output Mode for the point.	Close/Trip Pulse Pair, Close First Pair, Trip First	Close/Trip

Tejas V Server Accumulator

Settings are available on the **Accumulator** tab. The default property values are defined in the lower pane. The MCP provides the mapping settings for Accumulator points as shown below.

Accumulator Mapping Settings

Table 6-243: Accumulator Mapping Settings

Setting	Description	Range	Default
Tejas V Point	Point Index (0 Based). Each point index number must be unique.	0 to 509	Incremented from 0.
Line ID	Shows the Line ID of the selected point. Read only.	N/A	System Assigned Identifier
Device ID	Shows the Device ID of the selected point. Read only.	N/A	System Assigned Identifier
Bay ID	Shows the Bay ID of the selected point. Read only.	N/A	System Assigned Identifier
Home Directory	Home Directory of the device of the Accumulator point selected from the Point Picker. Read only.	N/A	System Assigned Identifier
Point Description	Point Description of the Accumulator point selected from the Point Picker. Read only.	N/A	System Assigned Identifier
Point Reference	Point Reference of the Accumulator point selected from the Point Picker. Read only.	N/A	System Assigned Identifier
Point ID	Point ID of the Accumulator point selected from the Point Picker. Read only.	N/A	System Assigned Identifier
Accumulator Type	Specifies the Accumulator type for this point. Available types are: - Transition Counter - Pulse Counter Transition counters are reported as having the same value as the RTDB counter, while pulse counters are reported as having half the value of the RTDB counter.	Transition Counter Pulse Counter	Transition Counter

Setting	Description	Range	Default
Freeze Ownership	Defines the operations that an LRU may perform on that accumulator. Available ownership types are: • May not be Frozen or Cleared • May be Frozen • May be Cleared • May be Frozen and Cleared Master requests to perform a specific operation on one or more accumulators only affect those accumulators that have that operation enabled via this parameter. This ownership type does not affect the ability of the LRU to read and report the value of the accumulator.	May Not Be Frozen/Cleared May Be Frozen May Be Cleared May Be Frozen & Cleared	May Not Be Frozen/Cleared

Default Settings available in the lower pane on the **Accumulator** tab. The configuration settings defined below are used to configure the default values at the time of mapping for accumulator points defined in the Tejas V server.

Accumulator Properties

Table 6-244: Accumulator Properties

Setting	Description	Range	Default
Default Accumulator Type	Specifies the default Accumulator Type for the point	Transition Counter Pulse Counter	Transition Counter
Default Freeze Ownership	Specifies the default Freeze Ownership for the point, which determines whether the point may be frozen.	May Not Be Frozen/Cleared May Be Frozen May Be Cleared May Be Frozen & Cleared	May Not Be Frozen/Cleared

Tejas V Server Special

This Special point enables Tejas V LRU to be assigned with a Digital Input and a state that specify a Special Indication Type:

Local Mode Indication

Assign a Digital Input point for the LRU to enter its local mode of operation. When the state of this Digital Input changes to the specified Indication State, the LRU will be in Local Mode and will not accept control or setpoint commands from the master. If one of these commands is received while the LRU is in local mode, the LRU will set a bit in its status byte and respond with a four-byte error message. When the LRU is not in local mode, it will be in remote mode where all control and setpoint commands are accepted.

The local/remote Digital Input is configurable on a per LRU basis so that all Tejas V LRUs can use the same input point or different points as required.

Only one DI can be assigned as Local Mode Indication in a Tejas V server map.

This feature can be disabled by not mapping any Digital Input point.

Frozen Accumulators Indication

Assign a Digital Input point for the LRU to indicate that mapped Accumulators have been frozen by another application, active when the state of this Digital Input changes to the specified Indication State.

Typically the application should be Accumulator Freeze (in System Point Manager) and the assigned DI should be the Freeze Feedback DI of the Accumulator Freeze Group.

Only one DI can be assigned as Frozen Accumulators Indication in a Tejas V server map, therefore only one Accumulator Freeze Group is supported to be used.

This feature can be disabled by not mapping any Digital Input point.

The mapping settings for Special Indication Types are shown below.

Special Indication Settings

Table 6-245: Special Indication Settings

Setting	Description	Range	Default
Line ID	Shows the Line ID of the selected point. Read only.	N/A	System Assigned Identifier
Device ID	Shows the Device ID of the selected point. Read only.	N/A	System Assigned Identifier
Bay ID	Shows the Bay ID of the selected point. Read only.	N/A	System Assigned Identifier
Home Directory	Home Directory of the device of the DI point selected from the Point Picker. Read only.	N/A	System Assigned Identifier
Point Description	Point Description of the DI point selected from the Point Picker. Read only.	N/A	System Assigned Identifier
Point Reference	Point Reference of the DI point selected from the Point Picker. Read only.	N/A	System Assigned Identifier
Point ID	Point ID of the DI point selected from the Point Picker. Read only.	N/A	System Assigned Identifier
Special Indication Type	- Local Mode Indication - Frozen Accumulators Indication	N/A	N/A
Indication State	Value of the mapped Digital Input to activate the selected Special Indication Type	ON OFF	ON

Configuring Server Applications

Server Configuration Overview

User can customize the MCP to transmit the necessary data from Intelligent Electronic Devices (IEDs) to master stations. Server applications in the MCP allow the MCP to retrieve selected data from event queues and the real-time database and send the data to the master station according to the how the SCADA protocol is defined.

The MCP configuration tool supports configuration of protocol-specific object references, scaling factors, and user-defined names for various objects configured for transmission. Where applicable, user can also configure additional device-level settings (for the same protocol) at the same time.

» **To configure server applications for use on the MCP, perform the following typical tasks:**

1. Create MCP server map file for each master station and protocol type.
2. Select data points and assign point indices.
3. Configure protocol-specific settings.
4. Configure scaling and enable reverse scaling (reverse effect of scaling applied by a client application).
5. Set up serial and network master connections.
6. Configure protocol-specific settings for each master connection.
7. Save the configuration file.
8. Run the configuration file in the MCP by committing the changes.

DNP3 Serial Master Stations

The Distributed Network Protocol (DNP3) supports communication with one or more devices over dedicated serial links, as well as over Ethernet. The MCP supports communications to DNP3 devices using the DNP3 client application. It collects the point values from the devices based on the protocol and device settings and stores them in the system point database.

The DNP3 protocol is highly configurable. You have the option of configuring the way the DNP3 client application on the MCP behaves by modifying the DNP3 protocol settings or use the default configuration settings.

The following settings are used when configuring a DNP3 Master Station. If a Modem connection is used, refer to the additional settings defined in [Dial-up Modem Settings](#).

DNP3 Master Stations

Table 6-246: DNP3 Master Stations

Setting	Description	Range	Default
LRU Name	Text description to identify the master station being connected to.	1 to 32 ASCII characters	MASTERX
LRU Address	Unique DNP3 address of the server application instance.	0 to 65519	X
Map File	Name of the Client map file to be used with the specific device.	List of users configured client map files.	N/A
Application Parameters	Select the application parameters defining this connection. The default parameters can be used, or a custom configuration can be created. Refer to DNP3 Server Application Parameters .	Use Default Create New...	Use Default
Auto Start	Indicates if the client application automatically starts when the configuration is changed and reloaded or when the MCP re-boots.	Disabled Enabled	Enabled
Master Address	DNP3 Master Station address.	0 to 65519	1

Multiple Logical Remote Units (LRU)

You can configure multiple logical remote units on a single or redundant serial connection. This allows a remote DNP3 master station to communicate with multiple logical remote units within a physical MCP unit using a single serial link. You can use multiple LRU functionality to test a system configuration without needing to connect to multiple physical devices.

Multiple LRU Overview

Figure 6-7: Multiple LRU Overview

To add an LRU to communicate over a serial link with a DNP3 Master Station, click the **Add** button under *Configuration Parameters* and configure the row.

In the example below, a DNP3 Master Station is configured on serial port 1 of the MCP. Under *Configuration Parameters*, four rows are added and configured as follows:

LRU Name	LRU Address	Map File	Application Parameters	Auto Start
LRU A	1	LRUA.xml	Use Default	✓
LRU B	2	LRUB.xml	Use Default	✓
LRU C	3	LRUC.xml	Use Default	✓
LRU D	4	LRUD.xml	Use Default	✓

Figure 6-8: Example Remote LRU Configuration

In this example, the DNP3 master station can connect to each of the four LRUs through the serial connection (COM1). Each LRU has a unique DNP address so that they can be communicated with independently. Each LRU can reference the same or different server map file. If the same server map file is referenced by multiple LRUs, each of these LRUs will serve the same data to the remote DNP3 master station.

DNP3 Server Application Parameters

Basic and Advanced DNP3 server settings are available under the **Application Parameters** field.

DNP3 Server Communication Settings - Basic

Table 6-247: DNP3 Server Communication Settings - Basic

Setting	Description	Range	Default
Max Application Retry	Number of times the DNP3 resends an unconfirmed application message before taking a degraded timeout.	0 to 300	2
Application Timeout	Time (in milliseconds) the DNP3 waits for the remote station to confirm an application message before re-sending it. Set the value much higher for a dial-up modem connection, i.e., 60000.	1 to 120000	6000
Data Link Confirmation Bitmask	Defines when the DNP3 requests remote-station confirmation of a data link message.	0 - Never 1 - Multi-fragment only 2 - Event only 3 - Event or Multi-fragment 4 - IIN only 5 - IIN or Multi-fragment 6 - Event or IIN 7 - Event, IIN or Multi-fragment 8 - Always	Never
Data Link Max Retry	Number of times the DNP3 Server resends an unconfirmed data link message before taking a degraded timeout.	0 to 300	2
Data Link Timeout	Time (in milliseconds) the DNP3 Server waits for remote-station confirmation of a data link message before re-sending it. Set the value higher for a dial-up modem connection, i.e., 60000.	1 to 120000	1000
Degraded Timeout	Time (in milliseconds) the DNP3 Server delays between retry cycles when seeking confirmation of an application message.	1 to 7200000	5000
Transmission Fragment Size	Maximum size (in bytes) of an unsolicited application message or response message fragment (minimum is 249 bytes).	249 to 2048	2048

Setting	Description	Range	Default	
IIN Time Sync Frequency (Serial only)	The Frequency (in minutes) at which Need Time Sync IIN is sent to the master station. A configured value of:	-1 0 1 to 1446	0	
	-1			Never sends “Need Time Sync IIN”; Rejects Time Sync Requests sent from Master.
	0			Sends the “Need Time Sync IIN” only during Stat-up; Accepts Time Sync Requests sent from Master.
	1 to 1446			Sends the “Need Time Sync IIN” every configured interval; Accepts Time Sync Requests send from Master
Communication Timeout	This timeout (in seconds) is used with the CommStatus Indication pseudo point. • A value of zero disables the CommStatus Indication feature. • Enter Value > { [Application Timeout + (Application Timeout * Max Application Retry)] + [Data-Link Timeout + (Data-Link Timeout * Data-Link Max Retry)] }/1000, otherwise minimum value will be used. The CommStatus pseudo point value changes to zero if it does not receive a message from the master station within the configured timeout.	0 to 86,400 seconds (1 day)	30	
Unsolicited Mode Class 1	Flag that enables or disables DNP3 Server unsolicited message support for class 1 events	True False	False	
Unsolicited Mode Class 2	Flag that enables or disables DNP3 Server unsolicited message support for class 2 events	True False	False	
Unsolicited Mode Class 3	Flag that enables or disables DNP3 Server unsolicited message support for class 3 events	True False	False	
Unsolicited Poll Frequency	Frequency (in milliseconds) at which the DNP3 Server checks for unreported data.	1 to 120,000 milliseconds	1,000	
Select Timeout	Time (in seconds) the DNP3 Server waits for an operate request before canceling the select.	0.01 to 65,535 seconds	30	
Time Zone	Specifies the configured time zone for this instance of DCA or DPA	One of listed Time Zones and geographic locations	GMT	
Startup Quality Event Suppress Interval	Duration for which DNP DPA does not report quality events to Master Station.	0 to 600 seconds	20	

Setting	Description	Range	Default
Accept Any Master	If "True" is selected, the DPA ignores the Master Address configuration parameter and will respond to any Master that connects to it. The parameter Master Address is only used for sending destination address in initial unsolicited messages. If "False" is selected, the DPA considers the Master Address configuration parameter and will respond to the configured Master only.	True False	False
Report Remote Forced and Offline Points	When set to "true", the DPA reports static data objects which simultaneously have offline and remote forced quality. When set to "false", the DPA will not report data objects which simultaneously have offline and remote forced quality.	True False	True

The advanced settings listed in the table below are for adjustment by experienced system engineering personnel and project engineers deploying the product in a specified configuration. Typically, these settings should not require modification.

DNP3 Server Communication Settings - Advanced

Table 6-248: DNP3 Server Communication Settings - Advanced

Setting	Description	Range	Default
Application Confirmation Bitmask	Defines when the DNP3 Server requests remote-station confirmation of an application message.	0 - Never 1 - Multi-fragment only 2 - Event only 3 - Event or Multi-fragment 4 - IIN only 5 - IIN or Multi-fragment 6 - Event or IIN 7 - Event, IIN or Multi-fragment 8 - Always	7 - Event, IIN or Multi-fragment
Internal Indication Confirm	Indicates whether local-station indications require confirmation on change in status.	Buffer Overflow None	Buffer Overflow
Reboot On Cold Start	Reboot the MCP upon receiving a cold restart from the Master Station. - True = Enable cold restart - False = Disable cold restart	True False	True
Response Fragment Size	Maximum size of a solicited application message fragment (minimum is 249 bytes).	249 to 2048	2048
Report CommFailure As Offline	Determines if a MCP Data Point must be reported as Offline to the Master Station when the MCP COMM-FAILED quality attribute is set.	True False	True
Unsolicited Data	What information the DNP3 Server sends to the remote station in unsolicited messages.	Events and indications Indications only	Events and indications

Setting	Description	Range	Default
Unsolicited Startup	Defines what data the DNP3 Server sends in the initial unsolicited startup message.	Events and indications Indications only	Indications only
Buffer Overflow Policy	Indicates whether the DNP3 Server discards newest or oldest event when a class event queue overflow occurs.	Discard Newest Discard Oldest	Discard Oldest
Internal Buffer Location	Specifies how to store the unreported events collected from Event Queues.	RAM	RAM
Internal Event Buffer Capacity	Number of events that can be contained in the Internal buffer of the DNP3 Server.	512, 1024, 2048, 4096, 8192, 16384	2048
Max Class 1 Events	Maximum number of Class 1 Events that can be buffered. This can either be "Up to Capacity", or a Number. If a Number is entered, the sum Max. Lengths for all Class Queues cannot exceed the Internal Event Buffer Capacity.	512, 1024, 2048, 4096, 8192, 16384, Up to Capacity	Up to Capacity
Max Class 2 Events	Maximum number of Class 2 Events that can be buffered. This can either be "Up to Capacity", or a Number. If a Number is entered, the sum Max. Lengths for all Class Queues cannot exceed the Internal Event Buffer Capacity.	512, 1024, 2048, 4096, 8192, 16384, Up to Capacity	Up to Capacity
Max Class 3 Events	Maximum number of Class 3 Events that can be buffered. This can either be "Up to Capacity", or a Number. If a Number is entered, the sum Max. Lengths for all Class Queues cannot exceed the Internal Event Buffer Capacity.	512, 1024, 2048, 4096, 8192, 16384, Up to Capacity	Up to Capacity
Broadcast on both ports	When enabled, all unsolicited events and poll responses are sent simultaneously on both the Primary and backup serial ports.	True False	False
Disable Online/Offline Quality Change Event	If this parameter is set to True, DNP3DPA disables Quality change events being reported to the Master station when quality of the mapped points changes from Online to Offline and Vice-Versa.	False True	False
Default Binary Input Event Time Type	Indicates which time type (absolute or relative) the DPA reports in response to a binary input event poll with variation 0 or a class poll.	Absolute Relative	Relative

Binary Input Event Variation same as Queued Variation	The Event Variation parameter in the Digital Input tab of the DNP Server Map Editor together with the Default Binary Input Event Time Type define the variation with which the DPA responds to a master read request for one or more (Double-Bit) Binary Input group objects using variation 0 or a Class poll. The Queued Variation defines whether the DPA queues Digital Input events internally With Time or Without Time. The effect this parameter has on the Queued Variation is defined as follows: <table><tr><th>Event Variation</th><th>Binary Input Variation same as Queued Variation</th><th>Queued Variation</th></tr><tr><td>With Time</td><td>True</td><td>With Time</td></tr><tr><td>Without Time</td><td>True</td><td>Without Time</td></tr><tr><td>Don't Care</td><td>False</td><td>With Time</td></tr></table> To understand how this affects the actual variation with which the DPA responds, we define the Preferred Variation as follows: <table><tr><th>Master request specifies non-zero variation</th><th>Event Variation</th><th>Default Binary Input Event Time Type</th><th>Preferred Variation</th></tr><tr><td>No</td><td>With Time</td><td>Relative</td><td>With Relative Time</td></tr><tr><td>No</td><td>With Time</td><td>Absolute</td><td>With Absolute Time</td></tr><tr><td>No</td><td>Without Time</td><td>Don't care</td><td>Without Time</td></tr><tr><td>Yes</td><td>Don't care</td><td>Don't care</td><td>Same as Master Request</td></tr></table> Based on the Queued Variation and Preferred Variation, the actual variation with which the DPA responds is defined as follows: <table><tr><th>Preferred Variation</th><th>Queued Variation</th><th>Actual Response Variation</th></tr><tr><td>With Relative Time</td><td>With Time</td><td>With Relative Time</td></tr><tr><td>With Absolute Time</td><td>With Time</td><td>With Absolute Time</td></tr></table>	Event Variation	Binary Input Variation same as Queued Variation	Queued Variation	With Time	True	With Time	Without Time	True	Without Time	Don't Care	False	With Time	Master request specifies non-zero variation	Event Variation	Default Binary Input Event Time Type	Preferred Variation	No	With Time	Relative	With Relative Time	No	With Time	Absolute	With Absolute Time	No	Without Time	Don't care	Without Time	Yes	Don't care	Don't care	Same as Master Request	Preferred Variation	Queued Variation	Actual Response Variation	With Relative Time	With Time	With Relative Time	With Absolute Time	With Time	With Absolute Time	True / False	False
Event Variation	Binary Input Variation same as Queued Variation	Queued Variation																																										
With Time	True	With Time																																										
Without Time	True	Without Time																																										
Don't Care	False	With Time																																										
Master request specifies non-zero variation	Event Variation	Default Binary Input Event Time Type	Preferred Variation																																									
No	With Time	Relative	With Relative Time																																									
No	With Time	Absolute	With Absolute Time																																									
No	Without Time	Don't care	Without Time																																									
Yes	Don't care	Don't care	Same as Master Request																																									
Preferred Variation	Queued Variation	Actual Response Variation																																										
With Relative Time	With Time	With Relative Time																																										
With Absolute Time	With Time	With Absolute Time																																										

Setting	Description			Range	Default
	Without Time	Don't Care	Without Time		
	With Relative Time	Without Time	Without Time		
	With Absolute Time	Without Time	Without Time		
Offline Sets Local IIN	When Offline Sets Local IIN is true and any binary output mapped by the DNP DPA is Invalid or Control Inhibited, the DNP DPA will set the local Internal Indication (IIN) bit in all responses to the master. In this case, the state of local IIN is determined by both the Force Controls Lockout Digital Output pseudo point owned by the DNP DPA and Invalid/Control Inhibited condition of any of the binary output points mapped by the DNP DPA. When Offline Sets Local IIN is false, the Invalid/Control Inhibited state of any binary output mapped by the DNP DPA has no effect on the state of the local IIN, and the state of the local IIN is determined only by the Force Controls Lockout Digital Output pseudo point. Note that according to IEEE Std 1815-2012 (DNP3), the Local IIN indication must be set if any binary output point is in local control mode. Binary output points supplied by D20 peripherals will be set to Offline if the peripheral is in local control mode. Therefore, it is advisable to set Offline Sets Local IIN to true in order to comply with IEEE Std 1815-2012 whenever Digital Output points are mapped from D20 peripherals.			True / False	True

IEC 60870-5-101 Master Station

The following settings are used when configuring an IEC 60870-5-101 Master Station connection.

IEC 60870-5-101 Master Station Settings

Table 6-249: IEC 60870-5-101 Master Station Settings

Setting	Description	Range	Default
Transmission Mode	The link transmission mode used by the application. NOTE: Backup ports are not supported on <i>Balanced</i> mode.	Balanced Unbalanced	Unbalanced
Link Address Size	The number of octets used for the link address of the LRU.	1 or 2	1

Setting	Description	Range	Default
LRU Name	The name of the LRU/master station connection	1 to 32 ASCII characters	MASTERx
Common Address of ASDU Size	The number of octets used for the common address of ASDU for the LRU. NOTE: All LRUs on the same connection must have the same Common Address of ASDU Size.	1 or 2	1
Common Address of ASDU	The Common Address of ASDU for the LRU.	1 to 254 [1 octet size] 1 to 65534 [2 octet size]	1
Link Address	The Primary link address of the LRU.	0 to 65535	1
Backup Port Link Address	This is Backup port link address of the LRU, which is available when the Backup port is configured.	0 to 65535	Not Used (-1)
Map File	Name of the server map file to be used with the specific LRU.	List of users configured server map files.	N/A
Application Parameters	Select the application parameters defining this connection. The default parameters can be used, or a custom configuration can be created. Refer to IEC 60870-5-101 Master Station Application Settings .	Use Default List of user-customized application configuration files	Use Default
Auto Start	Indicates if the server application automatically starts when the configuration is changed and reloaded or when the MCP re-boots.	Disabled Enabled	Disabled

IEC 60870-5-101 Master Station Application

IEC 60870-5-101 settings are available under the **Application Parameters** field for Master Stations.

IEC 60870-5-101 Master Station Application Settings

Table 6-250: IEC 60870-5-101 Master Station Application Settings

Setting	Description	Range	Default
Application tab			
Info Object Address Length	The number of octets used by the LRU for information object addresses. NOTE: For multiple LRUs on the same serial channel, only the first LRU's setting is used for this parameter.	1, 2, or 3	2
Time Mode	Specifies if the master station can set or use the main MCP and/or local LRU time. If "set main/use main" is selected and one of PTP / IRIG-B / NTP is configured as time source input and the input signal is valid, all time sync requests from the master station will be ignored.	Set main/use main time Set local/use local time Set local/use main time	Set main/use main time

Setting	Description	Range	Default
Time Sync Timeout	The maximum allowed time (in seconds) between time synchronization attempts from the IEC 60870-5-101/104 master station before time tagged data is reported as invalid by the LRU. Set to "0" for the time tags to never reported as invalid by the LRU, except the mapped points quality flags indicate time invalid.	0 to 86400	900
Reject Time Sync if Invalid Time	Whether the MCP rejects a clock synchronization command (Type ID 103) if the invalid flag in the seven octet binary time is set. By reject it is meant that the MCP shall return a negative activation confirmation and NOT update the time. If this parameter is Disabled, the MCP will accept a clock synchronization command regardless of the state of the invalid flag.	Enabled Disabled	Disabled
Control Select Timeout	The maximum allowed time (in seconds) between the control select and the control execute commands (for digital and analog output points) from the IEC 60870-5-101/104 master station.	0.01 to 60.0	5.0
Double Point Valid Time	The minimum time (in seconds) that both digital input points must be stable before an ON/OFF state is reported. NOTE: The value of this property only applies when the corresponding parameters of a double point information object are specified as undefined. Not used when set to 0.	0 to 65535	500
Double Point Suppress Time	The minimum time (in seconds) that both digital input points must be stable before an indeterminate state is reported. NOTE: The value of this property only applies when the corresponding parameters of a double point information object are specified as undefined. Not used when set to 0.	0 to 65535	1000
LRU Event Buffer Size	The number of events (non-time-tagged, time-tagged, and hour update objects) that are buffered by this LRU.	50 to 65535	255
LRU Event Buffer Location	The location where unreported events that are collected from event queues are stored.	RAM	RAM
Event Buffer Overflow Policy	Specify whether the newest or oldest events are discarded when the server event buffer is filled.	Discard Newest Discard Oldest	Discard Newest
Event Buffer Low Threshold	A percent value of the total event buffer. When the amount of available buffer space drops below this threshold, a server event buffer low indication is reported by the application.	10 to 100	20

Setting	Description	Range	Default
DI Cancels Select	Specify whether digital output select requests are automatically cancelled when any digital input changes are detected.	Enabled Disabled	Disabled
Buffer AI	Specify whether analog input changes (spontaneous, periodic, background scan) are buffered for reporting. When this is enabled, the LRU reports each analog change separately. For example, if an analog input point exceeds the threshold 3 times before the LRU is polled for data in unbalanced mode, the LRU reports all 3 value changes. If this feature is disabled, the LRU reports only the most recent value.	Enabled Disabled	Disabled
Zero Threshold Reporting	Specify how the LRU should treat a zero value for the Threshold configuration parameter for an analog input. If this setting is enabled, setting the threshold configuration parameter of an analog input point to zero (i.e., 0.0) spontaneously reports all changes for the point. If disabled, setting the Threshold configuration parameter of an analog input point to zero disables spontaneous reporting for the point.	Enabled Disabled	Disabled
Time Tagging	Specifies when to report time-tag data. If configured as <i>Not on Interrogations</i> , the LRU shall report a time tag only for spontaneous, periodic/cyclic, or background scan cause of transmission (i.e., LRU shall suppress time tag for interrogated data). If configured as <i>Always</i> , the LRU shall report time tag for all causes of transmission. NOTE: This flag MUST be set to “Not on Interrogations” for compliance with IEC 60870-5-101 Edition 2. The setting of “Always” is only valid for IEC 60870-5-101 Edition 1, and will result in interoperability issues if used with a Controlling Station complying with IEC 60870-5-101 Edition 2.	Not on Interrogations Always	Not on Interrogations
Clear Statistics	Specify if the application should reset all LRU statistics to zero at startup.	Enabled Disabled	Disabled
Comm Log Mode	The logging mode for all I/O communications traffic with the LRU.	Disabled ASCII Hex ASCII and Hex	Hex
Number of Files Supported	The number of information object addresses reserved for file transfer. Not used when set to 0.	0 to 128	0
Time to Live	The time (in seconds) a queued control command is to be treated as active in the system. If the configured value is 0, the RTDB setting is used.	0.0 to 60.0	0.0

Setting	Description	Range	Default
Cause of TX Length	The number of octets used for the Cause of Transmission field. NOTE: For multiple LRUs on the same serial channel, only the first LRU's setting is used for this parameter.	1 or 2	1
Broadcast on both ports	When enabled, all unsolicited events and poll responses are sent simultaneously on both the Primary and backup serial ports. NOTE: For multiple LRUs on the same serial channel, only the first LRU's setting is used for this parameter.	True False	False
Time Zone	This option allows you to configure a custom time zone offset which is applied to messages received through this application. By default, the timestamps of messages received through the IEC 60870-101 server applications are in UTC time. NOTE: For multiple LRUs on the same serial channel, only the first LRU's Time Zone is used for this parameter.	One of listed Time Zones and geographic locations	UTC
Addressing (SQ) Driven by Info Object	When set to <i>True</i> , a flag in the Info Object defines whether the Info Object is reported with <i>Single (SQ=0)</i> or <i>Sequence (SQ=1)</i> addressing. When set to <i>False</i> (Default value), the flag in the Info Object is ignored.	True, False	False
Unbalanced Serial Link tab			
Max ASDU Frame Length	The maximum length (in octets) of non-background messages (excluding framing overhead). NOTE: For multiple LRUs on the same serial channel, only the first LRU's setting is used for this parameter.	24 to 255	255
Extra Frame Timeout	The time (in milliseconds) that the application adds to the frame timeout calculation. NOTE: For multiple LRUs on the same serial channel, only the first LRU's setting is used for this parameter.	0 to 65535	150
Single Char Acknowledge	Specify if the application should respond to the master station with a single character acknowledgement message. NOTE: For multiple LRUs on the same serial channel, only the first LRU's setting is used for this parameter.	Enabled Disabled	Disabled
Comm Fail Timeout	The maximum allowed time (in seconds) for when there is no available connection in the STARTDT state (that is, no communication from the master station) before the application assumes communications have failed. Not used when set to 0. NOTE: For multiple LRUs on the same serial channel, only the first LRU's setting is used for this parameter.	0 to 86400	30

Setting	Description	Range	Default
File Transfer Report Class	The report class to use when sending file transfer related PDU. Used in unbalanced mode only. NOTE: For multiple LRUs on the same serial channel, only the first LRU's setting is used for this parameter.	Class 1 Class 2	Class 2
Balanced Serial Link tab			
Max ASDU Frame Length	The maximum length (in octets) of non-background messages (excluding framing overhead). NOTE: For multiple LRUs on the same serial channel, only the first LRU's setting is used for this parameter.	24 to 255	255
Extra Frame Timeout	The time (in milliseconds) that the application adds to the frame timeout calculation. NOTE: For multiple LRUs on the same serial channel, only the first LRU's setting is used for this parameter.	0 to 65535	150
Single Char Acknowledgement	Specify if the application should respond to the master station with a single character acknowledgement message. NOTE: For multiple LRUs on the same serial channel, only the first LRU's setting is used for this parameter.	Enabled Disabled	Disabled
Transmit Retries	The maximum number of transmission retries when no acknowledgement is received from the master station before the application assumes communications has failed. NOTE: For multiple LRUs on the same serial channel, only the first LRU's setting is used for this parameter.	0 to 255	1
Extra Response Timeout	The time (in milliseconds) that the application adds to the frame timeout calculation. NOTE: For multiple LRUs on the same serial channel, only the first LRU's setting is used for this parameter.	0 to 65535	200
Inter Frame Gap	The minimum idle time (in milliseconds) between frames transmitted by the application. NOTE: For multiple LRUs on the same serial channel, only the first LRU's setting is used for this parameter.	0 to 1000	0
Holding Time	The maximum delay (in milliseconds) of reporting spontaneous data changes to the master station after the data is available for transmission.	0.1 to 500000.0	0.2
Retry Time	The interval (in seconds) between LRU attempts to resend messages held in its buffer after previous failed transmissions. NOTE: For multiple LRUs on the same serial channel, only the first LRU's setting is used for this parameter.	0.1 to 86400.0	5.0

Modbus Serial Master Station

The following settings are used when configuring a Modbus Master Station.

Modbus Master Station Settings

Table 6-251: Modbus Master Station Settings

Setting	Description	Range	Default
LRU Name	Text description to identify the master station being connected to.	1 to 32 ASCII characters	MASTERX
LRU Address	Modbus address of the server application instance.	0 to 65519	X
Map File	Name of the Client map file to be used with the specific device.	List of users configured client map files.	N/A
Application Parameters	Select the application parameters defining this connection. The default parameters can be used, or a custom configuration can be created. Refer to Modbus Server Application Settings .	Use Default Create New...	Use Default
Auto Start	Indicates if the client application automatically starts when the configuration is changed and reloaded or when the MCP re-boots.	Disabled Enabled	Disabled

Modbus Server Application Settings

Modbus Server settings are available under the **Application Parameters** field.

Modbus Server Application Parameters

Table 6-252: Modbus Server Application Parameters

Setting	Description	Range	Default
NACK Offline Digitals	If enabled, the MCP is to NACK the offline coils upon receiving the <i>Force Single Coil</i> or <i>Force Multiple Coils</i> command with an Exception code 4 in the response. If disabled, the MCP reports the offline coil with the value OFF.	Yes No	No
NACK Offline Analogs	If enabled, the MCP is to NACK the offline registers upon receiving the <i>Preset Single Register</i> or <i>Preset Multiple Register</i> command with an Exception code 4 in the response. If disabled, the MCP reports the value of the offline registers as 0.	Yes No	No
Offline analog value	The value reported by points that are offline.	-32768 to 32767	0
Broadcast on both ports	When enabled, all unsolicited events and poll responses are sent simultaneously on both the Primary and backup serial ports.	True False	False

Tejas V Master Stations

The following settings are used when configuring a Tejas V master connection.

Tejas V Master Stations

Table 6-253: Tejas V Master Stations

Setting	Description	Range	Default																		
LRU Address Size	LRU address size in Octets.	1 or 2	1																		
Minimum Inter Character Timeout	READ ONLY Displays the Minimum Inter Character Timeout value (in ms), based on selected Baud Rate. <table><thead><tr><th>Baud Rate</th><th>Minimum (ms)</th></tr></thead><tbody><tr><td>300</td><td>83</td></tr><tr><td>600</td><td>42</td></tr><tr><td>1200</td><td>21</td></tr><tr><td>2400</td><td>10</td></tr><tr><td>4800</td><td>5</td></tr><tr><td>9600</td><td>3</td></tr><tr><td>19200</td><td>3</td></tr><tr><td>38400</td><td>2</td></tr></tbody></table>	Baud Rate	Minimum (ms)	300	83	600	42	1200	21	2400	10	4800	5	9600	3	19200	3	38400	2	N/A	21
Baud Rate	Minimum (ms)																				
300	83																				
600	42																				
1200	21																				
2400	10																				
4800	5																				
9600	3																				
19200	3																				
38400	2																				
Additional Inter Character Timeout	This is an additional amount of time in milliseconds that may be added to the Minimum Inter Character Timeout.	0 to 1500	0																		
Message Integrity Algorithm	Message Integrity Check Algorithm. Available algorithm types are: • LRC For the LRC Integrity Code, Byte 5 or 6 will contain the LRC integrity code. The LRC character will consist of vertical even parity, calculated for each column, of the eight data bits of each byte in the message. The parity column will not be included in the LRC calculation. The parity bit of the LRC byte will be calculated as the configured parity (odd parity by default) for the eight data bits of the LRC character, like other message bytes. • CRC-16 For the CRC-16 Integrity Code, Byte 5 to 6 or 6 to 7 will contain the CRC-16 integrity code. The CRC-16 code will be least significant byte first if the LRU address size is 2, otherwise the CRC-16 code will be most significant byte first. The parity bit of the CRC-16 bytes will be calculated as the configured parity (odd parity by default) for the eight data bits of each CRC-16 character, like other message bytes.	LRC CRC-16	LRC																		

Setting	Description	Range	Default
LRU Name	Text description to identify the master station being connected to.	1 to 32 ASCII characters	TEJAS V MASTER X
LRU Address	Unique Tejas V LRU address of the server application instance.	1-byte LRU Address Size: 1 to 127 2-byte LRU Address Size: 1 to 32767	X
Map File	Name of the server map file to be used with the specific device.	List of users configured server map files.	N/A
Application Parameters	Select the application parameters defining this connection. The default parameters can be used, or a custom configuration can be created. Refer to Tejas V Master Stations Application Parameters .	Use Default Create New	Use Default
Auto Start	Indicates if the server application automatically starts when the configuration is changed and reloaded or when the MCP re-boots.	Disabled Enabled	Enabled

The following tables show the settings that have different ranges, defaults, or both from those defined in Table 6-93, Table 6-94, Table 6-95 and Table 6-96 respectively. Differences are highlighted in **bold**.

Table 6-254 Tejas V Master Station Connection Differences

Setting	Description	Range	Default
Baud Rate	The speed of information being transmitted across the serial connection, in bits per second (bps).	List of baud rates (300 to 38400)	1200
Parity	A bit added to a group of bits to detect the presence of an error.	Even None Odd	Odd

Table 6-255 Tejas V Master Station Connection RTS Values Differences

Setting	Description	Range	Default
Flow Control	Specifies whether or not RTS Flow Control is enabled	Enabled Disabled	Enabled
Pre-Trans Delay	Specifies the time (in milliseconds) that RTS is asserted before data is transmitted. Also known as the RTS preamble.	0 to 2500	40
Post-Trans Delay	Specifies the time (in milliseconds) after data is transmitted that RTS is held asserted. Also known as the RTS postamble.	0 to 2500	20

Table 6-256 Tejas V Master Station Connection CTS Values Differences

Setting	Description	Range	Default
Flow Control	Specifies whether or not CTS Flow Control is enabled	Enabled Disabled	Enabled

Table 6-257 Tejas V Master Station Connection DCD Values Differences

Setting	Description	Range	Default
Flow Control	Specifies whether or not DCD Flow Control is enabled	Enabled Disabled	Enabled

Setting	Description	Range	Default
Receive Inhibit Delay	Specifies the Receive Inhibit Delay, in milliseconds.	0 to 2500	0

Tejas V Master Stations Application Parameters

Table 6-258: Tejas V Master Stations Application Parameters

Setting	Description	Range	Default
Basic			
Communications Fail Timeout	Specifies the maximum allowed time (in seconds) between received message from the master station, before the DPA assumes communication is failed.	1 to 32767	30
Initial Bipolar Analog Deadband	The initial deadband value to be assigned to all bipolar analog inputs of this LRU. This deadband value is the number of 12-bit counts which must be exceeded before an analog input is marked as an exception.	0 to 255	0
Initial Unipolar Analog Deadband	The initial deadband value to be assigned to all unipolar analog inputs of this LRU. This deadband value is the number of 12-bit counts which must be exceeded before an analog input is marked as an exception.	0 to 255	0
Setpoint Select Timeout	The maximum amount of time, in milliseconds, that may expire between a setpoint select request and the setpoint execute request. If this time expires before the execute request arrives, the setpoint is de-selected.	1 to 65535	30000
Accumulator Size	Specifies the size, in bits, of the accumulators allocated to this LRU. Valid values are 12 or 16 only.	12 or 16	12
COS Counter Include Flag	Specifies if the value of the COS counter in every LRU response contains all recorded COS or all unreported COS. All recorded COS includes any COS which are currently being reported. All unreported COS does not include any COS that are currently being reported. A value of "No" specifies that the COS counter contains the number of unreported COS, while a value of "Yes" specifies that the COS counter contains the number of recorded COS.	Yes No	No
Offline Analog Report Flag	If the flag is "Report Last Value", the last analog value before the point went offline is reported. If the flag is "Always Report Zero" and the point is offline, zero is reported.	Always Report Zero Report Last Value	Always Report Zero

DNP3 Network Master Stations

The following settings are used when configuring a DNP3 master station connection.

DNP3 Master connection settings

Table 6-259: DNP3 Master Connection Settings

Setting	Description	Range	Default
LRU Name	Text description to identify the master station being connected to.	1 to 32 ASCII characters	N/A
Map File	Name of the server map file to be used with the specific master.	List of users configured map files.	N/A
Auto Start	Indicates if the application automatically starts when the configuration is changed and reloaded or when the MCP re-boots.	Automatic Disabled	Automatic
LRU Address	DNP3 address of the server application instance.	0 to 65519	0
Transport Layer	Whether to use TCP or UDP network protocol.	TCP UDP	TCP
Network Port	The MCP port number on which the master station communicates.	0 to 65535	20001
Application Parameters	Select the application parameters defining this connection. The default parameters can be used, or a custom configuration can be created. Refer to DNP3 Server Communication Settings - Regular and DNP3 Server Communication Settings - Advanced .	Use Default Use Custom	Use Default
Permitted Remote Hosts	IP Addresses of master stations permitted to connect to the MCP. If all are set to 0.0.0.0, all hosts can connect.	Up to 8 IP Addresses	0.0.0.0
Accept All Hosts	If checked, all hosts can connect.	Disabled Enabled	Disabled
Master Address	DNP3 Master Station address	0 to 65519	1

IEC 60870-5-104 Master Station

The following settings are used when configuring an IEC 60870-5-104 Master Station connection.

IEC 60870-5-104 Master Station

Table 6-260: IEC 60870-5-104 Master Station

Setting	Description	Range	Default
LRU Name	Text description to identify the master station associated with this serial connection.	1 to 32 ASCII characters	N/A
Map File	Name of the Server map file to be used with the specific master.	List of users configured client map files.	N/A
Auto Start	Indicates if the client application automatically starts when the configuration is changed and reloaded or when the MCP re-boots.	Automatic Disabled	Disabled
Common Address of ASDU	The device's common address of ASDU.	1 to 65534	1

Setting	Description	Range	Default
Transport Layer	Whether to use TCP or UDP network protocol.	Non-editable	TCP
Network Port	The MCP port number on which the master station communicates.	0 to 65535	2404
Application Parameters	Select the application parameters defining this connection. The default parameters can be used, or a custom configuration can be created. Refer to IEC 60870-5-104 Master Station Application Settings .	Use Default Use Custom	Use Default
Accept All Hosts	If enabled, all remote hosts can connect.	Enabled Disabled	Disabled
Permitted Remote Hosts	IP Addresses of master stations permitted to connect to the MCP. If <i>Accept All Hosts</i> is enabled, these fields are disabled and ignored.	Up to 8 IP Addresses	0.0.0.0
Accept All Hosts	If checked, all hosts can connect.	Disabled Enabled	Disabled

IEC 60870-5-104 Master Station Application Settings

IEC 60870-5-104 settings are available under the Application Parameters field for Master Stations.

IEC 60870-5-104 Master Station Application Parameters

Table 6-261: IEC 60870-5-104 Master Station Application Parameters

Setting	Description	Range	Default
<i>Application tab</i>			
Time Mode	Specifies if the master station can set or use the main MCP and/or local LRU time.	Set main/use main time Set local/use local time Set local/use main time	Set main/use main time
Time Sync Timeout	The maximum allowed time (in seconds) between time synchronization attempts from the IEC 60870-5-101/104 master station before time tagged data is reported as invalid by the LRU. Set to "0" for the time tags to never reported as invalid by the LRU, except the mapped points quality flags indicate time invalid.	0 to 86400	900
Reject Time Sync if Invalid Time	Whether the MCP rejects a clock synchronization command (Type ID 103) if the invalid flag in the seven octet binary time is set. By reject it is meant that the MCP shall return a negative activation confirmation and NOT update the time. If this parameter is Disabled, the MCP will accept a clock synchronization command regardless of the state of the invalid flag.	Enabled Disabled	Disabled
Control Select Timeout	The maximum allowed time (in seconds) between the control select and the control execute commands (for digital and analog output points) from the IEC 60870-5-101/104 master station.	0.01 to 60.0	5.0

Setting	Description	Range	Default
Double Point Valid Time	The minimum time (in seconds) that both digital input points must be stable before an ON/OFF state is reported. NOTE: The value of this property only applies when the corresponding parameters of a double point information object are specified as undefined. Not used when set to 0.	0 to 65535	500
Double Point Suppress Time	The minimum time (in seconds) that both digital input points must be stable before an indeterminate state is reported. NOTE: The value of this property only applies when the corresponding parameters of a double point information object are specified as undefined. Not used when set to 0.	0 to 65535	1000
LRU Event Buffer Size	The number of events (non-time-tagged, time-tagged, and hour update objects) that are buffered by this LRU.	50 to 65535	255
LRU Event Buffer Location	The location where unreported events that are collected from event queues are stored.	RAM	RAM
Event Buffer Overflow Policy	Specify whether the newest or oldest events are discarded when the server event buffer is filled.	Discard Newest Discard Oldest	Discard Newest
Event Buffer Low Threshold	A percent value of the total event buffer. When the amount of available buffer space drops below this threshold, a server event buffer low indication is reported by the application.	10 to 100	20
DI Cancels Select	Specify whether digital output select requests are automatically cancelled when any digital input changes are detected.	Enabled Disabled	Disabled
Buffer AI	Specify whether analog input changes (spontaneous, periodic, background scan) are buffered for reporting. When this is enabled, the LRU reports each analog change separately. For example, if an analog input point exceeds the threshold 3 times before the LRU is polled for data in unbalanced mode, the LRU reports all 3 value changes. If this feature is disabled, the LRU reports only the most recent value.	Enabled Disabled	Disabled
Zero Threshold Reporting	Specify how the LRU should treat a zero value for the Threshold configuration parameter for an analog input. If this setting is enabled, setting the threshold configuration parameter of an analog input point to zero (i.e., 0.0) spontaneously reports all changes for the point. If disabled, setting the Threshold configuration parameter of an analog input point to zero disables spontaneous reporting for the point.	Enabled Disabled	Disabled

Setting	Description	Range	Default
Time Tagging	Specifies when to report time-tag data. If configured as <i>Not on Interrogations</i> , the LRU shall report a time tag only for spontaneous, periodic/cyclic, or background scan causes of transmission (i.e., LRU shall suppress time tag for interrogated data). If configured as <i>Always</i> , the LRU shall report time tag for all causes of transmission. NOTE: This flag MUST be set to “Not on Interrogations” for compliance with IEC 60870-5-104 Edition 2. The setting of “Always” is only valid for IEC 60870-5-104 Edition 1, and will result in interoperability issues if used with a Controlling Station complying with IEC 60870-5-104 Edition 2.	Not on Interrogations Always	Not on Interrogations
Clear Statistics	Specify if the application should reset all LRU statistics to zero at startup.	Enabled Disabled	Disabled
Comm Log Mode	The logging mode for all I/O communications traffic with the LRU.	Disabled ASCII Hex ASCII and Hex	Hex
Number of Files Supported	The number of information object addresses reserved for file transfer. Not used when set to 0.	0 to 128	0
Time to Live	The time (in seconds) a queued control command is to be treated as active in the system. If the configured value is 0, the RTDB setting is used.	0.0 to 60.0	0.0
Holding Time	The maximum delay (in milliseconds) of reporting spontaneous data changes to the master station after the data is available for transmission.	0.1 to 500000.0	0.2
Control Time Window	The time range (in seconds) used to qualify a time-tagged request.	0.001 to 86400.0	1
Time Zone	This option allows you to configure a custom time zone offset which is applied to messages received through this application. By default, the timestamps of messages received through the IEC 60870-104 server applications are in UTC time.	One of listed Time Zones and geographic locations	UTC
Addressing (SQ) Driven by Info Object	When set to <i>True</i> , a flag in the Info Object defines whether the Info Object is reported with <i>Single</i> (SQ=0) or <i>Sequence</i> (SQ=1) addressing. When set to <i>False</i> (Default value), the flag in the Info Object is ignored.	True, False	False
Network tab			
Comm Fail Timeout	The maximum allowed time (in seconds) for when there is no available connection in the STARTDT state (that is, no communication from the master station) before the application assumes communications have failed. Not used when set to 0.	0 to 86400	30

Setting	Description	Range	Default
Max TX Frames Before Ack	The maximum number of information frames that the application transmits before it must receive an acknowledgement message (value of w).	1 to 32,767	8
Max RX Frames Before Ack	The maximum number of information frames that the application receives before it must send an acknowledgement message (value of k).	1 to 32,767	12
Connect Timeout	The maximum time (in seconds) that the application waits for the TCP transport layer to establish a connection (value of t0).	1 to 255	30
Send Timeout	The maximum time (in seconds) that the application waits for an acknowledgement after sending a frame (value of t1).	1 to 255	15
No Data Timeout	The maximum time (in seconds) that the application waits before sending a supervisory acknowledgement (S) frame (value of t2).	1 to 255	10
Idle Timeout	The period during which no messages are received, in seconds, that the application allows pass before sending a test frame (value of t3).	1 to 255	20
Max APDU Frame Length	The maximum length (in octets) of APDU frames.	253	Not editable

Modbus TCP Master

The following settings are used when configuring a Modbus TCP master connection.

Modbus TCP Master connection settings

Table 6-262: Modbus TCP Master connection settings

Setting	Description	Range	Default
LRU Name	Text description to identify the master station associated with this connection.	1 to 32 ASCII characters	N/A
Map File	Name of the Server map file to be used with the specific master.	List of users configured map files.	N/A
Auto Start	Indicates if the application automatically starts when the configuration is changed and reloaded or when the MCP re-boots.	Automatic Disabled	N/A
LRU Address	Address of the server application instance.	0 to 65519	0
Transport Layer	Whether to use TCP or UDP network protocol. Only TCP is supported at this time.	TCP	TCP
Network Port	The MCP port number on which the master station communicates.	0 to 65535	20001
Application Parameters	Select the application parameters defining this connection. The default parameters can be used, or a custom configuration can be created. Refer to Modbus TCP Master Application Parameters .	Use Default Use Custom	Use Default

Setting	Description	Range	Default
Permitted Remote Hosts	IP Addresses of master stations permitted to connect to the MCP. If all are set to 0.0.0.0, all hosts can connect.	Up to 8 IP Addresses	0.0.0.0
Accept All Hosts	If checked, all hosts can connect.	Disabled Enabled	Disabled

Modbus TCP Master Application Parameters

Modbus TCP master settings are available under the **Application Parameters** field.

Modbus TCP Master application parameters

Table 6-263: Modbus TCP Master application parameters

Setting	Description	Range	Default
NACK Offline Digitals	If enabled, the MCP is to NACK offline digital points upon receiving a command with an Exception code 4 in the response. If disabled, the MCP reports the offline point with the value OFF.	Yes No	No
NACK Offline Analogs	If enabled, the MCP is to NACK offline analog points upon receiving a command with an Exception code 4 in the response. If disabled, the MCP reports the offline point with the value OFF.	Yes No	No
Offline analog value	The value reported by points that are offline.	-32768 to 32767	0
Broadcast on both ports	When enabled, all unsolicited events and poll responses are sent simultaneously on both the Primary and backup ports.	True False	False

Build HMI One-Line Diagrams

This chapter contains the following sections and sub sections:

One-Line Viewer

View One-Line Diagrams

One-Line Viewer toolbar

Drawing tasks

Executing One-Line Diagram Commands

One-Line Designer - Overview

Standard Toolbar

Stencil Panel

Designer Canvas

Property Panel

Object Configuration Settings

Data Source Configuration Settings

One-Line Viewer

The One-Line (also referred to as the Single Line Diagram - SLD) Viewer displays:

- The main drawing (main.dra) by default.
- Simplified schematic diagrams during runtime that represent the interconnections in a substation, including devices and the real-time values and/or state of selected ports and points.

These custom-built diagrams are built using the following two types of objects from the MCP HMI library:

- Static objects that do not change during runtime. Examples of static objects are buttons, labels, lines and other shapes used to lay out the drawing.
- Dynamic objects that represent a data source and are updated continually as new information becomes available. Examples of dynamic objects are circuit breakers, switches, and value boxes.

The source of the data can be the [Real-Time Database](#), the Active Alarms  (Digital Event Manager) application or other MCP resources.

The **One-Line Viewer** diagrams are designed and configured using the [One-Line Designer](#).

The following related action can be performed: [Issue a command](#).

View One-Line Diagrams

The **One-Line Viewer** displays configured one-line diagrams.

» To view one-line diagrams:

- Click the **One-Line Viewer** button on the Power bar.

The pre-defined main one-line drawing displays.

One-Line Viewer toolbar

Table 6-264: One-Line Viewer Toolbar

Button	Name	Action	Keyboard Shortcut
	Home Screen	Return to the default diagram (<i>main.dra</i>)	CTRL + H
	Previous Screen	View the previous diagram (if navigation history is available)	CTRL + B
	Next Screen	View the next diagram (if navigation history is available)	CTRL + F
	Browse Screen	Open a diagram stored on the MCP	CTRL + O
	Animation (Play)	Refresh the currently displayed diagram and start (or restart) the continuous update of dynamic objects	<i>none</i>
	Animation (Stop)	Stop redrawing the diagram and stop the continuous updating of dynamic objects	<i>none</i>
	Display Tooltips	Toggles the visibility of tooltips when mouse hovers above objects in this drawing. Default value is Visible. Can be set independently for each diagram. This is a runtime setting which overrides the pre-configured value, and is then persisted per drawing / per user / per HMI instance. Reset Persistency will default to the configured value.	<i>none</i>

Drawing tasks

» To display the current data quality status:

- Point to a dynamic object.

» To open the linked diagram (replaces page currently displayed):

- Click the diagram buttons.

» To open the Command Interface window for the object:

- Double-click a dynamic object with control/set-point functionality (for example, Circuit Breaker, Transformer, Button, Value Box).

» To access other functions:

- Right-click a dynamic object, if available, for the selected object:
 - [Execute Control](#),
 - [Execute Set Point](#),
 - [Tag/Inhibit](#),
 - [Local Force](#),

- [Acknowledge Alarm](#),
- [Acknowledge Alarm Group](#), or
- [Navigate to Active Alarm Page](#) (according to alarm group or point group).

Executing One-Line Diagram Commands

You can execute the following commands from a One-Line Diagram:

- [Acknowledge an Alarm](#)
- [Acknowledge an Alarm Group](#)
- [Analog Output Interface](#)
- [Analog Set-point Interface](#)
- [Digital Control Interface](#)
- [Digital Output Interface](#)
- [Local \(Point\) Force Interface](#)
- [Navigate to Active Alarm Page](#)
- [Raise/Lower Control Interface](#)
- [Tag/Inhibit Interface](#)

One-Line Designer - Overview

The **One-Line Designer** is a specialized drawing tool for creating substation one-line diagrams and forms, such as a Digital Event Manager panel. The One-Line Designer is accessed from within the MCP Offline Configuration Tool (DS Agile Studio).

To start the one-line configuration tool:

- From DS Agile Studio, click the Configuration button on the Power bar.

You must have Supervisor or Administrator privileges to access the runtime configuration tool. Only one Supervisor user at a time can be logged in to perform configuration functions.

The **One-Line Designer** allows you to create a two-dimensional diagram of your electrical grid, which can be accessed by MCP users through the **One-Line Viewer**.

Each One-Line diagram at runtime is a stand-alone drawing file with a unique name within a configured MCP.

A drawing has Canvass properties, and it contains the instantiated Objects.

The link between the RTDB points and Objects is done using Data Sources (on one hand these point to RTDB, on the other can be selected by Objects). A single Data Source can be used by one or multiple Objects. Data Sources are saved within a drawing file. This approach allows users to change RTDB points driving Object animation without clicking on objects, and also makes easy to re-use drawing(s) across different configurations where the One-Line diagrams are the same and only the RTDB points are different.

The One-Line Designer screen contains a toolbar and three windows:

- Standard Toolbar** - Save and open diagrams, modify the placement of objects, and change the way the Drawing Area appears.
- Stencil Panel** - Select from this list to create a new object
- Designer Canvas** - The window containing the one-line drawing. All drawing elements are created within this area.
- Property Panel** - This screen gives you access to all the parameters and configuration options for the currently selected object.

» **To save a drawing:**

- Click the  **Save** button.
- Enter a filename.

» **To open an existing drawing:**

- Click the  **Open** button.
- Select a file from the list.

» **To clear the designer canvas to create a new drawing:**

- Click the  **New** button.

Tip: To make a drawing the default drawing that opens in the One-Line Viewer name it *main.dra*. This setting can be changed on the Global Settings tab section of the Configuration > Systemwide page.

Standard Toolbar

The One-Line Designer is a tool that enables you to create specialized diagrams and forms, customized to your substation environment and viewable via the **One-Line Viewer**.

In addition to creating a diagram or schematic of your network, you can display real time readouts of the values of selected ports and points.

The standard toolbar provides tools to save and open diagrams, modify the placement of objects, and change the way the Drawing Area appears.

If you forget the function of a toolbar button, hover the mouse pointer over the button and a short description of the button's function is provided in the upper right of the display. A shortcut key combination is also shown that you can use to invoke the command.

Table 6-265: Standard Toolbar

Toolbar Button	Command	Keyboard Shortcut	Description
	New	Ctrl + N	Create a new OneLine Designer drawing.
	Open	Ctrl + O	Open an existing OneLine Designer drawing. Retrieve and edit any drawing that has been previously saved. When the Open a Diagram window appears, select the desired file name from the list and click the Open button.

Toolbar Button	Command	Keyboard Shortcut	Description
	Save	Ctrl + S	As with any application, it is imperative that you save your data in a regular and ongoing fashion. Click the Save Toolbar button. When the Save a Diagram window appears, enter a file name or select a file name, and then click the Save button. NOTE: If you want the drawing to be the default diagram (the one that is loaded when you use the One Line Viewer), then the filename must be <i>main.dra</i> . You can also set the default diagram on the Systemwide > Runtime GUI > Global configuration tab on the Configuration window.
	Refresh Symbols		Refresh a symbol imported into a drawing. NOTE: Refreshing taking effect only when the selected symbol file has same filename as the symbol imported into the drawing.
	Open Symbol		Open an existing symbol (drawing) file to edit. A symbol is useful when you have designed a drawing with a group of objects and want to reuse this drawing as a common symbol in multiple drawings.
	Save Symbol		Save opened drawing as a symbol or save opened symbol file. The saved symbol file can then be imported into drawings or other symbol files.
	Cut	Ctrl + X	Cut the currently selected object(s) from the screen to the clipboard.
	Copy	Ctrl + C	Copy the currently selected object(s) to the clipboard.
	Paste	Ctrl + V	Paste objects from the clipboard to the screen. When paste to the same screen as the one copied from it includes Data Source. When paste to a different screen does not include Data Source.
	Paste with DS		Paste objects from the clipboard to the screen including the Data Source(s) of the copied object(s). Applies when paste onto a different screen than the one of the copied object.
	Undo	Ctrl + U	Undo recently made changes to the workspace.
	Redo	Ctrl + D	Redo recently undone changes to the workspace.
	Align Left	Ctrl + L	Multiple objects may be aligned so that any of their four edges or two axes are in alignment and level along the grid no matter what their size. Buttons for each of the four edges and two axes are provided on the upper toolbar.
	Align Horizontal Center		
	Align Right	Ctrl + R	
	Align Top	Ctrl + T	
	Align Vertical Center		

Toolbar Button	Command	Keyboard Shortcut	Description
	Align Bottom	Ctrl + B	
	Distribute Horizontally		Multiple objects may be distributed horizontally; the selected objects that are furthest to the left and right remain in place while the remaining selected objects are distributed evenly based on their centers.
	Distribute Vertically		Multiple objects may be distributed vertically, the top and bottom selected objects remain in place while the remaining selected objects are distributed evenly based on their centers.
	Make Width Same Size	Ctrl + W	Make multiple objects the same size on the horizontal plane.
	Make Height Same Size	Ctrl + H	Make multiple objects the same size on the vertical plane.
	Make Both Same Size	Ctrl + E	Make multiple objects the same size on the horizontal and vertical planes.
	Bring to Front	Ctrl + F	Bring the selected object to appear in front of the other objects.
	Send to Back	Ctrl + K	Send the selected object to appear behind the other objects.
	Snap to Grid		Indicates that Snap To Grid is enabled. When enabled, a dragged and dropped object size snaps to the grid. Click to disable Snap to Grid.
			Indicates that Snap To Grid is disabled. When disabled, a dragged and dropped object size does not snap to the grid, the grid. Click to enable Snap to Grid.
			The grid size is selected, in the number pixels.

Stencil Panel

The **Stencil Panel** on the **One-Line Designer** page allows you to create drawing objects from a list of pre-defined object types.

To add an object to a drawing, click on an object from the Stencil Panel. Then, click and hold your left mouse button down on the Designer Canvas as you drag the cursor diagonally across the screen. When you release the mouse button, an object is drawn to fill the selected area.

Objects can be re-sized and customized according to their corresponding Property Panel attributes.

You cannot add new dynamic objects or change the runtime shapes of existing dynamic objects.

Drawing Objects

A general listing of the object types available is shown below. The shortcuts are activated once the Designer Canvas window has the focus.

Table 6-266: Drawing Objects

Icon	Name / Detailed Settings	Shortcut	Description
	Pointer	Alt + P	Click the Pointer tool, then click the cursor on an object to make it the active object. Confirm that the object is selected by observing a series of eight (8) boxes surrounding the object, located one to each corner and one to the middle of each edge. NOTE: Even in the case of rounded objects, such as circles, the highlight boxes are in a square configuration. Since a line is one-dimensional, there is space only for two highlight boxes, one on each end of the chosen line.
	Label / settings	Alt + B	The Label tool allows you to create a box designed specifically to insert text.
	Button / settings	Alt + Z	The Button tool allows you to create a button that performs an action when clicked.
	Alarm Box / settings	Alt + Y	Use this tool to create a box that changes color depending on the alarm status of a polled data source.
	Line / settings	Alt + L	Use this tool to create a one-dimensional line.
	Rectangle / settings	Alt + R	Use this tool to create a four-sided box of any size. You can modify the color of the border and the fill, the border type and thickness, and the URL Anchor for linking to another drawing.
	Polygon / settings	Alt + P	Use this tool to create a circle or a three-sided to ten-sided polygon of any size. You can modify the color of the border and the fill, the border type and thickness,
	Circle / settings	Alt + C	Use this tool to create a round object of any dimension. You can modify the color of the border and the fill, the border type and thickness, and the URL Anchor for linking to another drawing.
	Image / settings	Alt + I	This tool allows you to place an image on the drawing area, such as a scanned image of a piece of equipment or another specialized element not provided for in the default object types.
	Value Box / settings	Alt + V	A Value Box can contain any IED value that is being polled by the MCP.

Icon	Name / Detailed Settings	Shortcut	Description
	Circuit Breaker Box / settings	Alt + X	The CBox object is designed to schematically represent a power system circuit breaker. The CBox object accepts status inputs from 2 digital points (BitStrings).
	Transformer / settings	Alt + T	This object is a basic graphic representation of a transformer and has the same Property Value characteristics as a standard rectangle (except for the fill choice), including border color and type, and rotation. The URL Anchor is also available for linking to another drawing.
	Ground / settings	Alt + G	This object is a basic graphic representation of a ground and is limited to the same Property Value characteristics as a standard line, including border color and type. The URL Anchor is also available for linking to another drawing.
	Switch / settings	Alt + S	This object represents a switch in the substation configuration. As such, it has Property Values that can be drawn from existing equipment. You must assign the appropriate IEDname and the PointName for the switch. You also need to identify the correct Property Value for when the switch is closed (0 or 1) and apply the opposite value for the open position; note that the graphic configuration changes its appearance relative to the switch's condition.
	Capacitor / settings	Alt + A	This object is a basic graphic representation of a capacitor and has the same Property Value characteristics as a standard rectangle (except for the fill choice), including border color and type, and rotation. The URL Anchor is also available for linking to another drawing.
	Reactor / settings	Alt + E	This object is a basic graphic representation of a reactor and has the same Property Value characteristics as a standard rectangle (except for the fill choice), including border color and type, and rotation. The URL Anchor is also available for linking to another drawing.
	Range-Aware Line / settings	Alt + N	Use this tool to create a line that changes color depending on the value of a polled data source.
	Range-Aware Value Box / settings	Alt + O	Use this tool to create a value box that contains the value of that polled data source that changes color depending on the value.
	Range-Aware Chart / settings	Alt + H	Use this tool to create a bar chart that contains the value of a polled data source that changes color depending on the value.

Icon	Name / Detailed Settings	Shortcut	Description
	Data-Source Wizard	Alt + 0	Click this button to run the Data-Source Wizard. This wizard helps manage the data sources objects. If Create a new DataSource option is selected, the supported DataSource Types appear. Select the required DataSource Type and click Next. The wizard displays respective configuration window to create the DataSource object. If Modify existing DataSource option is selected, the supported DataSource Types appear. Upon Selecting the required DataSource Type, the existing DataSource objects under the selected DataSource Type appear. Select the required DataSource object to reconfigure its settings. If Delete existing DataSource option is selected, the supported DataSource Types appear. Upon selecting the required DataSource Type, the existing DataSource objects under the selected DataSource Type appear. Select the required DataSource object and click Finish to delete the selected DataSource object. NOTE: if a DataSource is referenced by one or more element(s), and DataSource is removed, the reference to DataSource from element(s) is automatically removed.
	Import Symbol	Alt + 1	Add the selected symbol file into the drawing or symbol currently being edited.

Designer Canvas

The **Designer Canvas** on the **One Line Designer** page is the workspace in which you can create and edit one-line drawings.

To build a drawing, click on an object from the **Stencil Panel**. Then, click and hold your left mouse button down as you drag the cursor diagonally across the Designer Canvas window. When you release the mouse button, an object is drawn to fill the selected area.

Drawing Tasks

Table 6-267: Drawing Tasks

To...	Do this...
Select item(s)	Click on the item with your left mouse button or click and hold your left mouse button down on an empty area of the screen and drag the cursor to encompass the items you want to select.
Select additional items	Click and drag across multiple objects. OR 1. Click on an object. 2. Right-click on additional objects.
Move an object	Select it and drag it to the desired location. A dotted outline of the object is shown as you move it to assist you in positioning.
To delete an object from the canvas	Select it and click your Delete key
To cut an object	Select it and press CTRL + X or Select it and press the  Cut button.
To copy an object	Select it and press CTRL + C or Select it and press the  Copy button.

To...	Do this...
To paste an object	Select it and press CTRL + V <i>or</i> Select it and press the  Paste button.
To undo an action	Press CTRL + U <i>or</i> Click the  Undo button.
To redo an action	Press CTRL + D <i>or</i> Click the  Redo button.

Positioning and Sizing Objects

Table 6-268: Positioning and Sizing Objects

Icon	Description	Shortcut
	Align all selected objects to the left edge of the object that was selected first.	ALT + L
	Align all selected objects vertically to the center of the object that was selected first.	
	Align all selected objects to the right edge of the object that was selected first.	ALT + R
	Align all selected objects to the top edge of the object that was selected first.	ALT + T
	Align all selected objects horizontally to the center of the object that was selected first.	
	Align all selected objects to the bottom edge of the object that was selected first.	ALT + B
	The selected objects that are furthest to the left and right remain in place while the remaining selected objects are distributed evenly based on their centers.	
	The top and bottom selected objects remain in place while the remaining selected objects are distributed evenly based on their centers.	
	Set the width of all selected objects to the largest width from all selected objects.	ALT + W
	Set the height of all selected objects to the largest height from all selected objects.	ALT + H
	Set the height and width of all selected objects to the largest height and width from all selected objects.	ALT + E
	Move the selected object in front of all other objects.	ALT + F
	Move the selected object behind of all other objects.	ALT + K

Quality Attribute Symbol Mnemonics

The animated objects created in an OLD drawing have associated quality attributes mnemonics visible at runtime.

The mnemonics can be represented in form of either GIF or TEXT, selectable on a per drawing basis.

A set of quality attributes mnemonics can have an optional associated name, which becomes available for selection across all other drawings.

A set of quality attributes mnemonics in a drawing can be applied to other drawings in the device configuration, or can be set as new default for future new drawings.

Both GIF and TEXT mnemonics can be modified from the initial defaults using the Canvas Property Panel.

When changing the GIF mnemonics please ensure the size and position of the new GIF object is similar with the default one to ensure runtime display in the correct area.

When changing the TEXT mnemonics - each one can have different font attributes, text and background color combinations.

The Quality Attribute Symbol mnemonics available for the OLD objects are listed in the [Quality Attributes](#) section on page no. 171.

Note: Quality attribute mnemonics customization applies only to OLD drawings. The quality attribute mnemonics in Point Details remain with their defaults and cannot be changed.

Property Panel

The **Property Panel** on the **One Line Designer** page displays all parameters associated with the object currently selected on the **Designer Canvas**. When multiple elements are selected, all common parameters are shown so that you can edit them at one time. By modifying the values shown in this window you can alter the behavior and appearance of the objects in your diagram.

» To modify object properties:

1. Select an object on the **Designer Canvas**.
2. On the **Property Panel**, double-click the **Value** field of the **Property Name** you want to modify.
3. Enter the new value, or if you see a drop-down list, select a pre-defined option.
4. Click anywhere outside of the field to activate your changes.

Object Configuration Settings

Property Panel - Object Tables

The Property Panel displays the properties associated with the currently selected object.

The One Line Designer Object types are:

- [Canvas Settings](#)
- [Alarm Box Object Settings](#)
- [Button Object Settings](#)
- [Capacitor Object Settings](#)
- [Circle Object Settings](#)
- [Circuit Breaker Box Object Settings](#)
- [Ground Object Settings](#)
- [Image Object Settings](#)
- [Label Object Settings](#)
- [Line Object Settings](#)
- [Range Aware Bar Object Settings](#)
- [Range Aware Line Object Settings](#)
- [Range Aware Value Box Object Settings](#)
- [Reactor Object Settings](#)
- [Rectangle Object Settings](#)
- [Polygon Object Settings](#)
- [Switch Object Settings](#)
- [Transformer Object Settings](#)
- [Value Box Object Settings](#)

Data Source Attributes

Some of the Objects have a Data Source Attribute selection (see next). This allows users to choose the object runtime animation to be based on quality flags instead of the value. The Data Source Attributes list is:

- Value,
- Offline,
- Restart,
- Communications Lost,
- Remotely Forced,
- Reference Check,
- Chatter/Over-range,
- Old Data,
- Test,
- Time Invalid,
- Questionable,
- Invalid,
- Remote Scan Inhibit,
- Overflow,
- Remote Time,
- Control Inhibit,
- Alarm Inhibit,
- Scan Inhibit,
- Tagged,
- Manually Forced,
- Secondary Source,
- Secondary Invalid,
- Secondary Forced,
- Local Control Active,
- Remote Control Active,
- Suppressed,
- Block Close Command (used only in IST Projects Applications),
- Block Open Command (used only in IST Projects Applications),
- Highlight (used only in IST Projects Applications)

Canvas Settings

The Canvas has settings associated with the drawing.

Click anywhere in the Canvas area to display the Canvas properties dialog and edit the settings.

Table 6-269: Canvas Object Settings

Setting	Description	Default
Name	Name of this drawing	Drawpanel
Width	Canvas width in pixels	580
Height	Canvas height in pixels	600
Background Color	Selects canvas background color and transparency level	Gray
Foreground Color	Selects canvas foreground color (e.g., static text) and transparency level	Black

Setting	Description	Default
Apply above canvas as default	Button – makes the above settings as defaults in the device configuration	N/A
Allow controls on the page	Setting which allows controls to be executed on this drawing screen (page) at runtime	Allow
Apply below set to other screens	Button – allows user to apply the settings below the button to other drawing screens (is followed by a dialog with checkboxes): - All - Each Drawings (Screen) name Set as default	N/A
Quality and Tooltip Set Name	Optional Enter a name for the quality and tooltip attributes set, which then can be selected in all drawings	<blank>
Quality Mode	Display the quality mnemonics at runtime as GIF or TEXT Each quality attribute can be customized within the named set. The set is in the context of the drawing, and can be applied to other drawings using button “ <i>Apply this set to other screens</i> ”	GIF
Secondary Source	Value to show at runtime when this quality attribute is on	2
Secondary Invalid	Value to show at runtime when this quality attribute is on	2x
Questionable Icon	Value to show at runtime when this quality attribute is on	?
Alarm Icon	Value to show at runtime when this quality attribute is on	A
Control Icon	Value to show at runtime when this quality attribute is on	C
LOCAL Lockout Active	Value to show at runtime when this quality attribute is on	LC
Local Force Icon	Value to show at runtime when this quality attribute is on	M
Point Suppressed	Value to show at runtime when this quality attribute is on	P
Remote Force Icon	Value to show at runtime when this quality attribute is on	R
REMOTE Lockout Active	Value to show at runtime when this quality attribute is on	RC
Scan Icon	Value to show at runtime when this quality attribute is on	S
Tag Icon	Value to show at runtime when this quality attribute is on	T
Invalid Icon	Value to show at runtime when this quality attribute is on	X
Test Icon	Value to show at runtime when this quality attribute is on	TS
Default Tooltip Visibility	Visibility of object tooltips in this drawing at runtime. Note: 1. In case all tooltip individual parameters are set to “Hidden”, only the object data is displayed. 2. The tooltip only shows information from the points configured. 3. The tooltip indicates if a point is a Control/ Feedback point with a suffix number if there is more than one point. Example: Control 1, Control 2 and so on.	Visible
Tooltip: Point Reference	Visibility of Point Reference inside the tooltip in this drawing at runtime	Visible

Setting	Description	Default
Tooltip: Point Description	Visibility of Point Description inside the tooltip in this drawing at runtime	Visible
Tooltip: Device	Visibility of Device ID information inside the tooltip in this drawing at runtime	Visible
Tooltip: Point Tag	Visibility of Point Tag inside the tooltip in this drawing at runtime	Visible

Alarm Box Object Settings

The Alarm Box Object:

- Is a Dynamic Object that is associated with a single Alarm or Alarm Group Object.
- Appears with a color and text that indicates whether the alarm is in active or normal state.

Table 6-270: Alarm Box Object Settings

Setting	Description	Range	Default
Name	Name of the One Line Designer object.	Text	Alarmbox
X	X (horizontal) pixel position from the top left corner of the screen to the top left corner of the area used to display the object	0 to the Draw Panel width less the object width	0
Y	Y (vertical) pixel position from the top left corner of the screen to the top left corner of the area used to display the object	0 to the Draw Panel height less the object height	0
Border Type	Defines the type of border to display	One of No border, Symmetric borders, raised borders, Sunken borders, Outdent borders, Indent borders, Picture borders, Double raised, Double sunken, Bottom right borders, Top left borders.	No border
Border Color	Defines the color to apply to the border around the perimeter of the display area of the object	Any 24-bit RGB color.	Gray
Border Variant	Defines the width of the border to display	0 to 9	0
Border Multiplier	Defines the thickness of the border to display	One of None (x1), x2, x3, x4, x5, x6, x7, x8	None (x1)
Width	Pixel width of the rectangular area used to display the object	1 to the Draw Panel width	None
Height	Pixel height of the rectangular area used to display the object	1 to the Draw Panel height	None
Font Type	The type of font used to display text	One of SansSerif, Serif, Monospaced, DialogInput	SansSerif
Font Style	The font style to apply to the display of text	One of normal, bold, or italic	Normal
Font Size	The size of the font used to display text	1 to 100	11
Alignment	The horizontal alignment of the text within the object's display area	One of Left, Center, or Right	Left

Setting	Description	Range	Default
Vertical Alignment	The vertical alignment of the text within the object's display area	One of Bottom or Top	Top
Alternate Blink Color	The alternate color to apply to blinking element	Any 24-bit RGB color	White
Offline	An Offline alarm can be set to blink.	No Blink, Blink Text, Blink Border, Blink Background	No Blink
- Text	The text displayed for this alarm condition.	Any ASCII text.	Offline
- Text Color	The color of the alarm text.	See color selection window.	Black
- BG Color	The background color of the alarm text.	See color selection window.	Pink
Neutral	A Neutral alarm can be set to blink.	No Blink, Blink Text, Blink Border, Blink Background	No Blink
- Text	The text displayed for this alarm condition.	Any ASCII text.	Neutral
- Text Color	The color of the alarm text.	See color selection window.	Black
- BG Color	The background color of the alarm text.	See color selection window.	Green
Ack'd Alarm	An Acknowledged alarm can be set to blink.	No Blink, Blink Text, Blink Border, Blink Background	No Blink
- Text	The text displayed for this alarm condition.	Any ASCII text.	Ack'd Alarm
- Text Color	The color of the alarm text.	See color selection window.	Black
- BG Color	The background color of the alarm text.	See color selection window.	Pink
Alarm,No Ack	An alarm that has not been acknowledged can be set to blink.	No Blink, Blink Text, Blink Border, Blink Background	No Blink
- Text	The text displayed for this alarm condition.	Any ASCII text.	Alarm
- Text Color	The color of the alarm text.	See color selection window.	Black
- BG Color	The background color of the alarm text.	See color selection window.	Pink
Reset,No Ack	An alarm that has been reset, but has not been acknowledged, can be set to blink.	No Blink, Blink Text, Blink Border, Blink Background	No Blink
- Text	The text displayed for this alarm condition.	Any ASCII texts.	Reset
- Text Color	The color of the alarm text.	See color selection window.	Black
- BG Color	The background color of the alarm text.	See color selection window.	Green

Setting	Description	Range	Default
Acknowledgement Action	Defines the user mouse action required to acknowledge an alarm box	One of Single Left Click, Double Left Click, Single Right Click, Double Right Click, or No Mouse Click	Double Left Click
Navigation Action	Defines the user mouse action required to navigate to the active alarm page. If the alarm datasource mapped to an alarm group, the navigation action displays the mapped alarm group on the active alarm page; if a point is selected in the alarm datasource, navigation action displays the alarm group of the selected point on the active alarm page.	One of Single Left Click, Double Left Click, Single Right Click, Double Right Click, No Mouse Click	No Mouse Click
Data Source	Unique identifier for the data source required for the Alarm Box.	Select a data source	None
Quality Horizontal Alignment	The horizontal alignment of the quality display within the object's display area	One of Left, Center, Right	Center
Quality Vertical Alignment	The vertical alignment of the quality display within the object's display area	One of Bottom, Top	Bottom
Quality Orientation	The orientation of the quality display within the object's display area	One of Horizontal, Vertical	Horizontal

Button Object Settings

The Button Object:

- Is a Static Object that displays text centered within a rectangular area.
- Performs the configured action when you left click the object.

Table 6-271: Button Box Object Settings

Setting	Description	Range	Default
Name	Name of the One Line Designer object.	Text	Button
X	X (horizontal) pixel position from the top left corner of the screen to the top left corner of the area used to display the object	0 to the Draw Panel width less the object width	0
Y	Y (vertical) pixel position from the top left corner of the screen to the top left corner of the area used to display the object	0 to the Draw Panel height less the object height	0
Border Type	Defines the type of border to display	One of No border, Symmetric borders, raised borders, Sunken borders, Outdent borders, Indent borders, Picture borders, double raised, Double sunken, Bottom right borders, Top left borders	0
Border Color	Defines the color to apply to the border around the perimeter of the display area of the object	Any 24-bit RGB Color	Grey

Setting	Description	Range	Default
Border Variant	Defines the width of the border to display	0 to 9	0
Border Multiplier	Defines the thickness of the border to display	One of None (x1), x2, x3, x4, x5, x6, x7, x8	None (x1)
Width	Pixel width of the rectangular area used to display the object	1 to the Draw Panel width	40
Height	Pixel height of the rectangular area used to display the object	1 to the Draw Panel height	20
Caption	Text for the object to display	Text	Button
Font Type	The type of font used to display text	One of SansSerif, Serif, Monospaced, DialogInput	SansSerif
Font Style	The font style to apply to the display of text	One of normal, bold, or italic	Normal
Font Size	The size of the font used to display text	1 to 100	11
Fore Color	The color to apply to text	Any 24-bit RGB Color	Black
Back Color	The color to apply to the background	Any 24-bit RGB Color	Grey
Action Type	Defines the action to occur when the user selects the button	One of: • Open Analog Set Point Interface • Open Digital Control Interface • Open Raise/Lower Control Interface • User Specified URL	None
Data Source	Unique identifier for the data source required for the Button object.	Select a data source	None
URL Action	Specifies whether to load the URL Address into the same window, or a new window. URL address will always open in new browser tab or window.	Same or New	Same
URL Address	Specify a link from this object, to either a: • URL address, or • Online Designer drawing, or • Active Alarms with Group Reference	Any valid URL address, or existing Online Designer drawing or Active Alarms pre-filtered by Group	None

Capacitor Object Settings

The Capacitor Object is a Static Object that displays a single vector image of a capacitor.

Table 6-272: Capacitor Object Settings

Setting	Description	Range	Default
Name	Name of the One Line Designer object.	Text	Capacitor
X	X (horizontal) pixel position from the top left corner of the screen to the top left corner of the area used to display the object	0 to the Draw Panel width less the object width	0
Y	Y (vertical) pixel position from the top left corner of the screen to the top left corner of the area used to display the object	0 to the Draw Panel height less the object height	0

Setting	Description	Range	Default
Border Type	Defines the type of border to display	One of No border, Symmetric borders, raised borders, Sunken borders, Outdent borders, Indent borders, Picture borders, double raised, Double sunken, Bottom right borders, Top left borders	0
Border Color	Defines the color to apply to the border around the perimeter of the display area of the object	Any 24-bit RGB Color	Gray
Border Variant	Defines the width of the border to display	0 to 9	0
Border Multiplier	Defines the thickness of the border to display	One of None (x1), x2, x3, x4, x5, x6, x7, x8	None (x1)
Width	Pixel width of the rectangular area used to display the object	1 to the Draw Panel width	32
Height	Pixel height of the rectangular area used to display the object	1 to the Draw Panel height	32
Back Color	The color to apply to the background	Any 24-bit RGB Color	Gray
Fore Color	The color to apply to text	Any 24-bit RGB Color	Black
Rotation	Angle of clockwise rotation (in degrees) to apply to the object	0,90,180,270	0
File Path	File path of alternate (non-default) image to display	Any existing server-side image file	None
URL Action	Specifies whether to load the URL Address into the same window, or a new window. URL address will always open in new browser tab or window.	Same or New	Same
URL Address	Specify a link from this object, to either a: • URL address, or • Online Designer drawing, or • Active Alarms with Group Reference	Any valid URL address, or existing Online Designer drawing or Active Alarms pre-filtered by Group	None

Circle Object Settings

The Circle Object is a Static Object that displays a single vector-based circle or ellipse.

Table 6-273: Circle Object Settings

Setting	Description	Range	Default
Name	Name of the One Line Designer object.	Text	Circle
X	X (horizontal) pixel position from the top left corner of the screen to the top left corner of the area used to display the object	0 to the Draw Panel width less the object width	0
Y	Y (vertical) pixel position from the top left corner of the screen to the top left corner of the area used to display the object	0 to the Draw Panel height less the object height	0

Setting	Description	Range	Default
Border Type	Defines the type of border to display	One of No border, Symmetric borders, raised borders, Sunken borders, Outdent borders, Indent borders, Picture borders, double raised, Double sunken, Bottom right borders, Top left borders	0
Border Color	Defines the color to apply to the border around the perimeter of the display area of the object	Any 24-bit RGB Color	Grey
Border Variant	Defines the width of the border to display	0 to 9	0
Border Multiplier	Defines the thickness of the border to display	One of None (x1), x2, x3, x4, x5, x6, x7, x8	None (x1)
Fill Color	Defines the color to apply to the inside of the object shape.	Any 24-bit RGB Color	Red
Width	Pixel width of the rectangular area used to display the object	1 to the Draw Panel width	12
Height	Pixel height of the rectangular area used to display the object	1 to the Draw Panel height	12
Back Color	The background color with which to fill the object	Any 24-bit RGB Color	Grey
URL Action	Specifies whether to load the URL Address into the same window, or a new window. URL address will always open in new browser tab or window.	Same or New	Same
URL Address	Specify a link from this object, to either a: • URL address, or • Online Designer drawing, or • Active Alarms with Group Reference	Any valid URL address, or existing Online Designer drawing or Active Alarms pre-filtered by Group	None

Circuit Breaker Box Object Settings

The Circuit Breaker Box Object is:

- A Dynamic Object that displays a single rectangular vector image.
- Color-coded to indicate the current state value from a Digital Status Object or Digital Control Object.

You can program the fill-colors of the breaker object, by setting colors to the following properties:

- FT_Color
- FF_Color
- TT_Color
- TF_Color

Based on the logic levels of the Digital Points selected, the fill color of the CBBBox changes appropriately in the Run_Mode.

In the design mode, you can set the properties of Digital Input Value1 True State and Digital Input Value2 True State to 0 or 1 and verify that the fill color settings are satisfactory.

Table 6-274: Circuit Breaker Box Object Settings

Setting	Description	Range	Default
Name	Name of the One Line Designer object.	Text	Circuitbreakerbox
X	X (horizontal) pixel position from the top left corner of the screen to the top left corner of the area used to display the object	0 to the Draw Panel width less the object width	0
Y	Y (vertical) pixel position from the top left corner of the screen to the top left corner of the area used to display the object	0 to the Draw Panel height less the object height	0
Border Type	Defines the type of border to display	One of No border, Symmetric borders, raised borders, Sunken borders, Outdent borders, Indent borders, Picture borders, double raised, Double sunken, Bottom right borders, Top left borders	No border
Border Color	Defines the color to apply to the border around the perimeter of the display area of the object	Any 24-bit RGB Color	Gray
Border Variant	Defines the width of the border to display	0 to 9	0
Border Multiplier	Defines the thickness of the border to display	One of None (x1), x2, x3, x4, x5, x6, x7, x8	None (x1)
Width	Pixel width of the rectangular area used to display the object	1 to the Draw Panel width	12
Height	Pixel height of the rectangular area used to display the object	1 to the Draw Panel height	12
Digital Input Value 1 True State	Digital input 1 value to associate with a "true" state	0 or 1	1
Digital Input Value 2 True State	Digital input 2 value to associate with a "true" state	0 or 1	1
FF_Color	The background color to display when the digital input 1 value (high or leftmost bit) corresponds to the false state, and the digital input 2 value (low or rightmost bit) corresponds to the false state.	Any 24-bit RGB Color	Gray

Setting	Description	Range	Default
FT_Color	The background color to display when the digital input 1 value (high or leftmost bit) corresponds to the false state, and the digital input 2 value (low or rightmost bit) corresponds to the true state.	Any 24-bit RGB Color	Gray
TF_Color	The background color to display when the digital input 1 value (high or leftmost bit) corresponds to the true state, and the digital input 2 value (low or rightmost bit) corresponds to the false state.	Any 24-bit RGB Color	Gray
TT_Color	The background color to display when the digital input 1 value (high or leftmost bit) corresponds to the true state, and the digital input 2 value (low or rightmost bit) corresponds to the true state.	Any 24-bit RGB Color	Gray
Data Source	Unique identifier for the data source required for the Circuit Breaker Box object. When the Digital Control datasource type is selected and Feedback Enabled is set to True, then the displayed Circuit Breaker background color changes, based upon feedback from Digital Input points. When the Digital Control datasource type is selected and Feedback Enabled is set to False, then the displayed Circuit Breaker background color does not change when the Digital Output point value changes.	Select a data source	None
Quality Horizontal Alignment	The horizontal alignment of the quality display within the object's display area	One of Left, Center, Right	Center
Quality Vertical Alignment	The vertical alignment of the quality display within the object's display area	One of Bottom, Top	Bottom
Quality Orientation	The orientation of the quality display within the object's display area	One of Horizontal, Vertical	Horizontal
Caption	Text for the object to display	Text	Label
Font Type	The type of font used to display text	One of SansSerif, Serif, Monospaced, DialogInput	SansSerif
Font Style	The font style to apply to the display of text	One of normal, bold, or italic	Normal
Font Size	The size of the font used to display text	1 to 100	9
Foreground	The color to apply to text	Any 24-bit RGB Color	Black
Text Alignment	The horizontal alignment of the text within the object's display area	One of Left, Center, or Right	Center

Ground Object Settings

The Ground Object is a Static Object that displays a single vector image of an electrical ground.

Table 6-275: Ground Object Settings

Setting	Description	Range	Default
Name	Name of the One Line Designer object.	Text	Ground
X	X (horizontal) pixel position from the top left corner of the screen to the top left corner of the area used to display the object	0 to the Draw Panel width less the object width	0
Y	Y (vertical) pixel position from the top left corner of the screen to the top left corner of the area used to display the object	0 to the Draw Panel height less the object height	0
Border Type	Defines the type of border to display	One of No border, Symmetric borders, raised borders, Sunken borders, Outdent borders, Indent borders, Picture borders, double raised, Double sunken, Bottom right borders, Top left borders	No border
Border Color	Defines the color to apply to the border around the perimeter of the display area of the object	Any 24-bit RGB Color	Gray
Border Variant	Defines the width of the border to display	0 to 9	0
Border Multiplier	Defines the thickness of the border to display	One of None (x1), x2, x3, x4, x5, x6, x7, x8	None (x1)
Width	Pixel width of the rectangular area used to display the object	1 to the Draw Panel width	20
Height	Pixel height of the rectangular area used to display the object	1 to the Draw Panel height	20
Back Color	The color to apply to the background	Any 24-bit RGB Color	Gray
Fore Color	The color to apply to text	Any 24-bit RGB Color	Black
Rotation	Angle of clockwise rotation (in degrees) to apply to the image	0,90,180,270	0
URL Action	Specifies whether to load the URL Address into the same window, or a new window. URL address will always open in new browser tab or window.	Same or New	Same
URL Address	Specify a link from this object, to either a: • URL address, or • Online Designer drawing, or • Active Alarms with Group Reference	Any valid URL address, or existing Online Designer drawing or Active Alarms pre-filtered by Group	None

Image Object Settings

The Image Object is a Static Object that displays a single image.

When an image object is initially added, the image field is empty.

» To assign an image:

1. Double-click the value box for the property labeled File Path.
Result: A list of all images contained in the MCP's mnt/usr/Configure/Images directory appears.
2. Select the desired Image File and click **OK**.
3. If required, change the border color, border type, and URL Anchor for linking to another drawing.
4. If required, the image can be rotated 90 or 180 degrees.

Table 6-276: Image Object Settings

Setting	Description	Range	Default
Name	Name of the One Line Designer object.	Text	Image
X	X (horizontal) pixel position from the top left corner of the screen to the top left corner of the area used to display the object	0 to the Draw Panel width less the object width	0
Y	Y (vertical) pixel position from the top left corner of the screen to the top left corner of the area used to display the object	0 to the Draw Panel height less the object height	0
Border Type	Defines the type of border to display	One of No border, Symmetric borders, raised borders, Sunken borders, Outdent borders, Indent borders, Picture borders, double raised, Double sunken, Bottom right borders, Top left borders	No border
Border Color	Defines the color to apply to the border around the perimeter of the display area of the object	Any 24-bit RGB Color	Gray
Border Variant	Defines the width of the border to display	0 to 9	0
Border Multiplier	Defines the thickness of the border to display	One of None (x1), x2, x3, x4, x5, x6, x7, x8	None (x1)
Width	Pixel width of the rectangular area used to display the object	1 to the Draw Panel width	12
Height	Pixel height of the rectangular area used to display the object	1 to the Draw Panel height	12
Rotation	Angle of clockwise rotation (in degrees) to apply to the image	0,90,180,270	0
File Path	File path of image to display	Any existing server-side image file	Built In
URL Action	Specifies whether to load the URL Address into the same window, or a new window. URL address will always open in new browser tab or window.	Same or New	Same

Setting	Description	Range	Default
URL Address	Specify a link from this object, to either a: • URL address, or • Online Designer drawing, or • Active Alarms with Group Reference	Any valid URL address, or existing Oneline Designer drawing or Active Alarms pre-filtered by Group	None
Data Source	Unique identifier for the data source required for the image. If no datasource is specified, the image is still shown.	Select a data source	None
Data Source Attribute	Attribute for the data source. See Quality Attributes .	See list of Data Source Attributes	Value
Show Image When	If data source is mapped, the image is shown/hidden in the following circumstances. If Value is selected in Data Source Attribute, mapped Digital Status Data Source Feedback Size 2 State: • Only show the image when the specified Data Source Value (0 or 1) is equal to 2 states 0 or 1(00, 01). • Data Source Feedback Size 4 State: • Only show image when the specified Data Source Value (0,1,2,3) is equal to 4 states 0, 1, 2 or 3(00, 01, 10, 11) If any quality attribute is selected, except Value in Data Source Attribute: • Show image when the select quality attribute is set. • Show image when the select quality attribute is not set	If Value is selected for Data Source Attribute: • Digital Status Data Source with Feedback Size 2 State: - o 2 State: 00 - o 2 State: 01 • Digital Status Data Source with Feedback Size 4 State: - o 4 State: 00 - o 4 State: 01 - o 4 State: 10 - o 4 State: 11 If Value is not selected for Data Source Attribute: - o Selected Quality Set - o Selected Quality Not Set	1

Label Object Settings

The Label Object is a Static Object that displays a caption within a rectangular area.

In the One Line Designer, the user first creates the box; text is added or altered by using the **Properties** display located on the right side of the screen. Clicking into the Values entry labeled *Caption* allows you to enter the desired text. Other properties that may be changed include the alignment of the text inside the box (limited to left-aligned or centered), the color of the text (*Foreground*), the box's background color (*Background*) and the box's border color. Double-clicking in the *Font* value enables you to change both the font type and size.

The Label object, as well as other objects, contains the capability to link to another drawing created by the One-Line Designer and stored on the MCP In the **Property Pane** box, click the mouse into the value column associated with the URL Anchor choice. To link to another drawing, type in the correct file name (note that all One-Line Designer files are saved with a dot extension of .dra, which must be typed as part of the filename). Likewise, to link to a web page, type in the full web address. In this manner, you may create complex interlinked drawings. This enables someone viewing a file to go to a different diagram that may provide further detail. Should a user want to know more readings associated with a device, clicking on that device image launches him or her into another diagram that has been created to provide such magnified detail.

Table 6-277: Label Object Settings

Setting	Description	Range	Default
Name	Name of the One Line Designer object.	Text	Label
X	X (horizontal) pixel position from the top left corner of the screen to the top left corner of the area used to display the object	0 to the Draw Panel width less the object width	0
Y	Y (vertical) pixel position from the top left corner of the screen to the top left corner of the area used to display the object	0 to the Draw Panel height less the object height	0
Border Type	Defines the type of border to display	One of No border, Symmetric borders, raised borders, Sunken borders, Outdent borders, Indent borders, Picture borders, double raised, Double sunken, Bottom right borders, Top left borders	No border
Border Color	Defines the color to apply to the border around the perimeter of the display area of the object	Any 24-bit RGB Color	Gray
Border Variant	Defines the width of the border to display	0 to 9	0
Border Multiplier	Defines the thickness of the border to display	One of None (x1), x2, x3, x4, x5, x6, x7, x8	None (x1)
Caption	Text for the object to display	Text	Label
Width	Pixel width of the rectangular area used to display the object	1 to the Draw Panel width	32
Height	Pixel height of the rectangular area used to display the object	1 to the Draw Panel height	12
Foreground	The color to apply to text	Any 24-bit RGB Color	Black
Background	The color to apply to the background	Any 24-bit RGB Color	White
Text Horizontal Alignment	The horizontal alignment of the text within the object's display area	One of Left, Center, or Right	Left
Font Type	The type of font used to display text	One of SansSerif, Serif, Monospaced, DialogInput	SansSerif
Font Style	The font style to apply to the display of text	One of normal, bold, or italic	Normal
Font Size	The size of the font used to display text	1 to 100	9
URL Action	Specifies whether to load the URL Address into the same window, or a new window. URL address will always open in new browser tab or window.	Same or New	Same
URL Address	Specify a link from this object, to either a: • URL address, or • Online Designer drawing, or • Active Alarms with Group Reference	Any valid URL address, or existing Online Designer drawing or Active Alarms pre-filtered by Group	None

Line Object Settings

The Line Object is a Static Object that displays a single line.

Table 6-278: Line Object Settings

Setting	Description	Range	Default
Name	Name of the One Line Designer object.	Text	Line
X1	X (horizontal) pixel position from the top left corner of the screen to the top left corner of the start point of the line	0 to the Draw Panel width	0
Y1	Y (vertical) pixel position from the top left corner of the screen to the top left corner of the start point of the line	0 to the Draw Panel height	0
X2	X (horizontal) pixel position from the top left corner of the screen to the top left corner of the end point of the line	0 to the Draw Panel width	0
Y2	Y (vertical) pixel position from the top left corner of the screen to the top left corner of the end point of the line	0 to the Draw Panel height	0
Width	Defines the pixel width of the line	1 to 100	1
Color	Defines the color to apply to the line	Any 24-bit RGB color	Black
Line Type	Defines the type of line to draw	One of Solid, Dotted, or Dashed	Solid
Arrow	Defines the type of arrowhead to apply to the line at the X1, Y2 position (start of line) and/or the X2, Y2 position (end of line)	One of No Arrow, Start Arrow, End Arrow, or Both Start and End Arrows	No Arrow
Data Source	Unique identifier for the data source required for the Line.	Select a data source	None
Data Source Attribute	Attribute for the data source. See Quality Attributes.	See list of Data Source Attributes	Value
FF_Color	The background color to display when the digital input 1 value (high or leftmost bit) corresponds to the false state, and the digital input 2 value (low or rightmost bit) corresponds to the false state.	Any 24-bit RGB Color	Light Green
FT_Color	The background color to display when the digital input 1 value (high or leftmost bit) corresponds to the false state, and the digital input 2 value (low or rightmost bit) corresponds to the true state.	Any 24-bit RGB Color	Dark Red
TF Color	The background color to display when the digital input 1 value (high or leftmost bit) corresponds to the true state, and the digital input 2 value (low or rightmost bit) corresponds to the false state.	Any 24-bit RGB Color	Light Gray
TT_Color	The background color to display when the digital input 1 value (high or leftmost bit) corresponds to the true state, and the digital input 2 value (low or rightmost bit) corresponds to the true state.	Any 24-bit RGB Color	Gray

Range Aware Bar Object Settings

The Range Aware Bar Object is a Dynamic Object that highlights a percentage of a rectangular area based on the:

- Real time value of the configured Analog Status or
- Accumulator Status Object divided by the configured Bar Scaling Value.

Table 6-279: Range Aware Bar Object Settings

Setting	Description	Range	Default
Name	Name of the One Line Designer object.	Text	Rangeawarebar
X	X (horizontal) pixel position from the top left corner of the screen to the top left corner of the area used to display the object	0 to the Draw Panel width less the object width	0
Y	Y (vertical) pixel position from the top left corner of the screen to the top left corner of the area used to display the object	0 to the Draw Panel height less the object height	0
Border Type	Defines the type of border to display	One of No border, Symmetric borders, raised borders, Sunken borders, Outdent borders, Indent borders, Picture borders, double raised, Double sunken, Bottom right borders, Top left borders	No border
Border Color	Defines the color to apply to the border around the perimeter of the display area of the object	Any 24-bit RGB Color	Gray
Border Variant	Defines the width of the border to display	0 to 9	0
Border Multiplier	Defines the thickness of the border to display	One of None (x1), x2, x3, x4, x5, x6, x7, x8	None (x1)
Width	Pixel width of the rectangular area used to display the object	1 to the Draw Panel width	32
Height	Pixel height of the rectangular area used to display the object	1 to the Draw Panel height	32
Font Type	The type of font used to display the scaling value as text	One of SansSerif, Serif, Monospaced, DialogInput	SansSerif
Font Style	The font style to apply to the display of the scaling value as text	One of normal, bold, or italic	Normal
Font Size	The size of the font used to display the scaling value as text	1 to 100	11
Foreground Color	The color to apply to scaling value displayed as text	Any 24-bit RGB Color	Black
Background Color	The color to apply to the background, non-highlighted area of the bar chart.	Any 24-bit RGB Color	Red

Setting	Description	Range	Default
High Color	The color to apply to the highlighted area, but only when the real-time value exceeds the configured High Value.	Any 24-bit RGB Color	Red
Low Color	The color to apply to the highlighted area, but only when the real-time value is less than or equal to the configured High Value.	Any 24-bit RGB Color	Red
High Value	The value, which when exceeded by the real-time value, results the highlighted area of the bar chart being displayed in the High Color, and which when the real-time value is less than or equal to, results in the highlighted area of the bar chart being displayed in the Low Color.	Any 64-bit floating point value	0.0
Scale Value	The value by which the real-time values are divided to calculate a full-scale percentage that determines the height of the bar during run-time.	Any 64-bit floating point value	1.0
Fill Direction	Fill direction defines the way the highlighted area is drawn: If set to bottom, the highlighted area rises vertically upwards, being filled from its bottom edge upwards ending at a horizontal line that corresponds to the percentage of the real-time value as compared to the configured bar scaling value. If set to top, the highlighted area rises vertically downwards, being filled from its top edge downwards ending at a horizontal line that corresponds to the percentage of the real-time value as compared to the configured bar scaling value. If set to left, the highlighted area rises horizontally to the right, being filled from its left edge to the right ending at a vertical line that corresponds to the percentage of the real-time value as compared to the configured bar scaling value. If set to right, the highlighted area rises horizontally to the left, being filled from its right edge to the left ending at a vertical line that corresponds to the percentage of the real-time value as compared to the configured bar scaling value.	One of Top, Bottom, Left, or Right	Bottom
Data Source	Unique identifier for the data source required for the Range Aware Bar Chart.	Select a data source	None
URL Action	Specifies whether to load the URL Address into the same window, or a new window. URL address will always open in new browser tab or window.	Same or New	Same

Setting	Description	Range	Default
URL Address	Specify a link from this object, to either a: - URL address, or - Online Designer drawing, or - Active Alarms with Group Reference	Any valid URL address, or existing Online Designer drawing or Active Alarms pre-filtered by Group	None
Quality Horizontal Alignment	The horizontal alignment of the quality display within the object's display area	One of Left, Center, Right	Center
Quality Vertical Alignment	The vertical alignment of the quality display within the object's display area	One of Bottom, Top	Bottom
Quality Orientation	The orientation of the quality display within the object's display area	One of Horizontal, Vertical	Horizontal
Number of Decimal Points	Number of decimal points to display at runtime	0 to 6	3
Display	Runtime display mode when Data Source is Analog Status (AI): <i>Value</i> , or corresponding <i>Text Enumeration</i> , or <i>Both</i> . If Text Enumeration is not configured for the selected Data Source AI, and the Display setting here is selected as Text Enumeration: at runtime the words <i>NO_TXT_ENUM</i> will be shown.	One of Value, Text Enumeration, Text Enumeration (Value)	Value

Range Aware Line Object Settings

The Range Aware Line Object is a Dynamic Object that displays a color representing the summation of run-time values from three configured Analog Status Objects.

Table 6-280: Range Aware Line Object Settings

Setting	Description	Range	Default
Name	Name of the One Line Designer object.	Text	Rangeawareline
X1	X (horizontal) pixel position from the top left corner of the screen to the top left corner of the start point of the line	0 to the Draw Panel width	0
Y1	Y (vertical) pixel position from the top left corner of the screen to the top left corner of the start point of the line	0 to the Draw Panel height	0
X2	X (horizontal) pixel position from the top left corner of the screen to the top left corner of the end point of the line	0 to the Draw Panel width	0
Y2	Y (vertical) pixel position from the top left corner of the screen to the top left corner of the end point of the line	0 to the Draw Panel height	0
Width	Defines the pixel width of the line	1 to 100	1
Line Type	Defines the type of line to draw	One of Solid, Dotted, or Dashed	Solid

Setting	Description	Range	Default
Arrow	Defines the type of arrowhead to apply to the line at the X1, Y2 position (start of line) and/or the X2, Y2 position (end of line)	One of No Arrow, Start Arrow, End Arrow, or Both Start and End Arrows	No Arrow
Very Low Value	The value, which when the real-time value is lower, results in the line being drawn with the Very Low Color. NOTE: Very Low Value $\leq$ Low Value $<$ High Value $\leq$ Very High Value.	Any 64-bit floating point value	0.0
Low Value	The value, which when the real-time value is lower, but higher than or equal to the Very Low Value, results in the line being drawn with the Low Color. NOTE: Very Low Value $\leq$ Low Value $<$ High Value $\leq$ Very High Value.	Any 64-bit floating point value	0.0
High Value	The value, which when the real-time value is the same or lower, but higher than or equal to the Low Value, results in the line being drawn with the Normal Color. Also, the value, which when the real-time value is higher, but less than or equal to the Very High Value, results in the line being drawn with the High Color. NOTE: Very Low Value $\leq$ Low Value $<$ High Value $\leq$ Very High Value.	Any 64-bit floating point value	0.0
Very High Value	The value, which when the real-time value is the higher, results in the line being drawn with the Very High Color. NOTE: Very Low Value $\leq$ Low Value $<$ High Value $\leq$ Very High Value.	Any 64-bit floating point value	0.0
Low Color	The color to apply to the line, but only when the summation of the three Analog Status values exceeds the configured Very Low Value and is less than the Low Value.	Any 24-bit RGB Color	Black
Very Low Color	The color to apply to the line, but only when the summation of the three Analog Status values is less than or equal to the Very Low Value.	Any 24-bit RGB Color	Black
Normal Color	The color to apply to the line, but only when the summation of the three Analog Status values is greater than or equal to the configured Low Value and is less than or equal to the High Value.	Any 24-bit RGB Color	Black
High Color	The color to apply to the line, but only when the summation of the three Analog Status values exceeds the configured High Value and is less than or equal to the Very High Value.	Any 24-bit RGB Color	Black

Setting	Description	Range	Default
Very High Color	The color to apply to the line, but only when the summation of the three Analog Status values exceeds the configured Very High Value.	Any 24-bit RGB Color	Black
Data Source 1	Unique identifier for the data source required for the Range Aware Line.	Select a data source	None
Data Source 2	Unique identifier for the data source required for the Range Aware Line.	Select a data source	None
Data Source 3	Unique identifier for the data source required for the Range Aware Line.	Select a data source	None
Quality Horizontal Alignment	The horizontal alignment of the quality display within the object's display area	One of Left, Center, Right	Center
Quality Vertical Alignment	The vertical alignment of the quality display within the object's display area	One of Bottom, Top	Bottom

Range Aware Value Box Object Settings

The Range Aware Value Box Object is a Dynamic Object that displays the current value and [Quality Attributes](#) of an Analog Status Object or Accumulator Status Object.

Table 6-281: Range Aware Value Box Object Settings

Setting	Description	Range	Default
Name	Name of the One Line Designer object.	Text	Rangeawarevaluebox
X	X (horizontal) pixel position from the top left corner of the screen to the top left corner of the area used to display the object	0 to the Draw Panel width less the object width	0
Y	Y (vertical) pixel position from the top left corner of the screen to the top left corner of the area used to display the object	0 to the Draw Panel height less the object height	0
Border Type	Defines the type of border to display	One of No border, Symmetric borders, raised borders, Sunken borders, Outdent borders, Indent borders, Picture borders, double raised, Double sunken, Bottom right borders, Top left borders	No border
Border Color	Defines the color to apply to the border around the perimeter of the display area of the object	Any 24-bit RGB Color	Gray
Border Variant	Defines the width of the border to display	0 to 9	0
Border Multiplier	Defines the thickness of the border to display	One of None (x1), x2, x3, x4, x5, x6, x7, x8	None (x1)

Setting	Description	Range	Default
Width	Pixel width of the rectangular area used to display the object	1 to the Draw Panel width	32
Height	Pixel height of the rectangular area used to display the object	1 to the Draw Panel height	12
Alignment	The horizontal alignment of the value displayed as text within the object's display area	One of Left, Center, or Right	Left
Font Type	The type of font used to display value as text	One of SansSerif, Serif, Monospaced, DialogInput	SansSerif
Font Style	The font style to apply to the display of the value as text	One of normal, bold, or italic	Normal
Font Size	The size of the font used to display value as text	1 to 100	11
Fore Color	The color to apply to the value displayed as text	Any 24-bit RGB Color	Black
High Value	The value, which when the real-time value is higher, results in the background being displayed with the High Color.	Any 64-bit floating point value	0.0
Low Value	The value, which when the real-time value is lower, results in the background being displayed with the Low Color.	Any 64-bit floating point value	0.0
High Color	The color to apply to the background, but only when the real-time value exceeds the configured High Value.	Any 24-bit RGB Color	Red
Low Color	The color to apply to the background, but only when the real-time value is less than the configured Low Value.	Any 24-bit RGB Color	Red
Mid Color	The color to apply to the background, but only when the real-time value is greater than or equal to the configured Low Value and is less than or equal to the configured High Value.	Any 24-bit RGB Color	Red
Data Source	Unique identifier for the data source required for the Range Aware Value Box.	Select a data source	None
Quality Horizontal Alignment	The horizontal alignment of the quality display within the object's display area	One of Left, Center, Right	Center
Quality Vertical Alignment	The vertical alignment of the quality display within the object's display area	One of Bottom, Top	Bottom
Number of Decimal Points	Number of decimal points to display at runtime	0 to 6	3

Setting	Description	Range	Default
Quality Orientation	The orientation of the quality display within the object's display area	One of Horizontal, Vertical	Horizontal
Display	Runtime display mode when Data Source is Analog Status (AI): <i>Value</i>, or corresponding <i>Text Enumeration</i>, or <i>Both</i>. If Text Enumeration is not configured for the selected Data Source AI, and the Display setting here is selected as Text Enumeration: at runtime the words <i>NO_TXT_ENUM</i> will be shown.	One of Value, Text Enumeration, Text Enumeration (Value)	Value

Reactor Object Settings

The Reactor Object is a Static Object that displays a single vector image of a reactor, as positioned by the One Line Designer.

Table 6-282: Reactor Object Settings

Setting	Description	Range	Default
Name	Name of the One Line Designer object.	Text	Reactor
X	X (horizontal) pixel position from the top left corner of the screen to the top left corner of the area used to display the object	0 to the Draw Panel width less the object width	0
Y	Y (vertical) pixel position from the top left corner of the screen to the top left corner of the area used to display the object	0 to the Draw Panel height less the object height	0
Border Type	Defines the type of border to display	One of No border, Symmetric borders, raised borders, Sunken borders, Outdent borders, Indent borders, Picture borders, double raised, Double sunken, Bottom right borders, Top left borders	No border
Border Color	Defines the color to apply to the border around the perimeter of the display area of the object	Any 24-bit RGB Color	Gray
Border Variant	Defines the width of the border to display	0 to 9	0
Border Multiplier	Defines the thickness of the border to display	One of None (x1), x2, x3, x4, x5, x6, x7, x8	None (x1)
Width	Pixel width of the rectangular area used to display the object	1 to the Draw Panel width	32
Height	Pixel height of the rectangular area used to display the object	1 to the Draw Panel height	32
Back Color	The color to apply to the background	Any 24-bit RGB Color	Gray
Fore Color	The color to apply to the value displayed as text	Any 24-bit RGB Color	Black

Setting	Description	Range	Default
Rotation	Angle of clockwise rotation (in degrees) to apply to the image	0,90,180,270	0
URL Action	Specifies whether to load the URL Address into the same window, or a new window. URL address will always open in new browser tab or window.	Same or New	Same
URL Address	Specify a link from this object, to either a: • URL address, or • Online Designer drawing, or • Active Alarms with Group Reference	Any valid URL address, or existing Online Designer drawing or Active Alarms pre-filtered by Group	None

Rectangle Object Settings

The Rectangle Object is a Static Object that displays a single rectangle, as positioned by the One Line Designer.

Table 6-283: Rectangle Object Settings

Setting	Description	Range	Default
Name	Name of the One Line Designer object.	Text	Rectangle
X	X (horizontal) pixel position from the top left corner of the screen to the top left corner of the area used to display the object	0 to the Draw Panel width less the object width	0
Y	Y (vertical) pixel position from the top left corner of the screen to the top left corner of the area used to display the object	0 to the Draw Panel height less the object height	0
Border Type	Defines the type of border to display	One of No border, Symmetric borders, raised borders, Sunken borders, Outdent borders, Indent borders, Picture borders, double raised, Double sunken, Bottom right borders, Top left borders	No border
Border Color	Defines the color to apply to the border around the perimeter of the display area of the object	Any 24-bit RGB Color	Gray
Border Variant	Defines the width of the border to display	0 to 9	0
Border Multiplier	Defines the thickness of the border to display	One of None (x1), x2, x3, x4, x5, x6, x7, x8	None (x1)
Fill Color	Defines the color to apply to the inside of the object shape.	Any 24-bit RGB Color	Red
Width	Pixel width of the rectangular area used to display the object	1 to the Draw Panel width	12
Height	Pixel height of the rectangular area used to display the object	1 to the Draw Panel height	12
URL Action	Specifies whether to load the URL Address into the same window, or a new window. URL address will always open in new browser tab or window.	Same or New	Same

Setting	Description	Range	Default
URL Address	Specify a link from this object, to either a: • URL address, or • Online Designer drawing, or • Active Alarms with Group Reference	Any valid URL address, or existing Online Designer drawing or Active Alarms pre-filtered by Group	None

Polygon Object Settings

The Polygon Object is a Static Object that displays a circle or a 3- to 10-sided polygon, as positioned by the One Line Designer.

Table 6-284: Polygon Object Settings

Setting	Description	Range	Default
Name	Name of the One Line Designer object.	Text	Polygon
X	X (horizontal) pixel position from the top left corner of the screen to the top left corner of the area used to display the object.	0 to the Draw Panel width less the object width	0
Y	Y (vertical) pixel position from the top left corner of the screen to the top left corner of the area used to display the object.	0 to the Draw Panel height less the object height	0
Border Type	Specify the type of border to display.	One of No border, Symmetric borders, raised borders, Sunken borders, Outdent borders, Indent borders, Picture borders, double raised, Double sunken, Bottom right borders, Top left borders	No border
Border Color	Specify the color to apply to the border around the perimeter of the screen area of the object.	Any 24-bit RGB Color	Gray
Border Variant	Specify the width of the border to display.	0 to 9	0
Border Multiplier	Specify the thickness of the border to appear.	One of None (x1), x2, x3, x4, x5, x6, x7, x8	None (x1)
Width	Pixel width of the rectangular area used to show the object.	1 to the Draw Panel width	12
Height	Pixel height of the rectangular area used to show the object.	1 to the Draw Panel height	12
Polygon Type	Specify the shape of the object; that is, a circle or a polygon.	0 = Circle 3 = Triangle 4 = Tetragon 5 = Pentagon 6 = Hexagon 7 = Heptagon 8 = Octagon 9 = Enneagon 10 = Decagon	Triangle (3)
Rotation	Angle of clockwise rotation (in degrees) to apply to the object	0,90,180,270	0

Setting	Description	Range	Default
Digital Input Value1 True State	Digital input 1 value to associate with a “true” state	0 or 1	1
Digital Input Value2 True State	Digital input 2 value to associate with a “true” state	0 or 1	1
FT_Color	The background color to display when the digital input 1 value (high or left-most bit) corresponds to the false state, and the digital input 2 value (low or right-most bit) corresponds to the true state.	Any 24-bit RGB Color	Dark pink
Data Source	Unique identifier for the data source required for the Polygon.	Select a data source	None
Data Source Attribute	Attribute for the data source. See Quality Attributes.	See list of Data Source Attributes	Value
Quality Horizontal Alignment	The horizontal alignment of the quality display within the object’s display area	One of: Left, Center, Right	Center
Quality Vertical Alignment	The vertical alignment of the quality display within the object’s display area	One of: Bottom, Top	Bottom
Quality Orientation	The orientation of the quality display within the object’s display area	One of Horizontal, Vertical	Horizontal
Line Width	Line width in pixels	1 to 100	0
Line Data Source	Unique identifier for the data source required for the Line.	Select a data source	None
(Line) Data Source Attribute	Attribute for the data source. See Quality Attributes.	See list of Data Source Attributes	Value
Line FT Color	The color to display when the digital input 1 value (high or left-most bit) corresponds to the false state, and the digital input 2 value (low or right-most bit) corresponds to the true state.	Any 24-bit RGB Color	Dark pink
Line Gray when DS SO offline	When a Digital Control Data Source is selected for the Line – this setting being “Yes” will cause the line to be Gray at runtime if the DO point in the Line Data Source is offline. If is “No” the runtime color of the line is not affected by the DO point being offline or not.	One of Yes, No	Yes

Switch Object Settings

The Switch Object:

- Is a Dynamic Object that visually represents (with vector images) the real-time status of a substation switch.
- Monitors the values of one or two digital input points it is configured to reference from a Digital Status Object.

For Digital Status Objects configured to reference:

- a) Two digital input points, the Switch Object is in one of four states at any given time: open, in transit, closed, or invalid.
- b) Only one digital input point, the Switch Object is in one of two states at any given time: open or closed.

The available switch object states are:

Table 6-285: Switch Object States

Setting	Description
Open	
Closed	
In Transit	
Invalid	

Table 6-286: Switch Object Settings

Setting	Description	Range	Default
Name	Name of the One Line Designer object.	Text	Switch
X	X (horizontal) pixel position from the top left corner of the screen to the top left corner of the area used to display the object	0 to the Draw Panel width less the object width	0
Y	Y (vertical) pixel position from the top left corner of the screen to the top left corner of the area used to display the object	0 to the Draw Panel height less the object height	0
Border Type	Defines the type of border to display	One of No border, Symmetric borders, raised borders, Sunken borders, Outdent borders, Indent borders, Picture borders, double raised, Double sunken, Bottom right borders, Top left borders	No border
Border Color	Defines the color to apply to the border around the perimeter of the display area of the object	Any 24-bit RGB Color	Gray
Border Variant	Defines the width of the border to display	0 to 9	0
Border Multiplier	Defines the thickness of the border to display	One of None (x1), x2, x3, x4, x5, x6, x7, x8	None (x1)
Width	Pixel width of the rectangular area used to display the object	1 to the Draw Panel width	32
Height	Pixel height of the rectangular area used to display the object	1 to the Draw Panel height	32
Back Color	The color to apply to the background	Any 24-bit RGB Color	Grey

Setting	Description	Range	Default
Orientation	Whether to draw the switch state representations in a horizontal or vertical orientation	Horizontal or Vertical	Horizontal
Line Color	Defines the color with which to draw the lines that comprise the switch display	Any 24-bit RGB Color	Black
Line Width	Line width in pixels	1 to 100	1
00 Switch State	If the Digital Status Object is a 4-State Digital Switch: The switch state to display when the digital input 1 value (high or leftmost bit) corresponds to the 0 state, and the digital input 2 value (low or rightmost bit) corresponds to the 0 state.	One of Open, Closed, In Transit, or Invalid	Open
01 Switch State	If the Digital Status Object is a 4-State Digital Switch: The switch state to display when the digital input 1 value (high or leftmost bit) corresponds to the 0 state, and the digital input 2 value (low or rightmost bit) corresponds to the 1 state.	One of Open, Closed, In Transit, or Invalid	Closed
10 Switch State	If the Digital Status Object is a 4-State Digital Switch: The switch state to display when the digital input 1 value (high or leftmost bit) corresponds to the 1 state, and the digital input 2 value (low or rightmost bit) corresponds to the 0 state.	One of Open, Closed, In Transit, or Invalid	Invalid
11 Switch State	If the Digital Status Object is a 4-State Digital Switch: The switch state to display when the digital input 1 value (high or leftmost bit) corresponds to the 1 state, and the digital input 2 value (low or rightmost bit) corresponds to the 1 state.	One of Open, Closed, In Transit, or Invalid	Invalid
URL Action	Specifies whether to load the URL Address into the same window, or a new window. URL address will always open in new browser tab or window.	Same or New	Same
URL Address	Specify a link from this object, to either a: • URL address, or • Online Designer drawing, or • Active Alarms with Group Reference	Any valid URL address, or existing Online Designer drawing or Active Alarms pre-filtered by Group	None

Setting	Description	Range	Default
Data Source	Unique identifier for the data source required for the Switch Box. When a Digital Control datasource type is selected and Feedback Enabled is set to True, then the displayed switch state changes, based upon feedback from Digital Input points. When a Digital Control datasource type is selected and Feedback Enabled is set to False, then the displayed switch state does not change when the Digital Output point value changes.	Select a data source	None
Quality Horizontal Alignment	The horizontal alignment of the quality display within the object's display area	One of Left, Center, Right	Center
Quality Vertical Alignment	The vertical alignment of the quality display within the object's display area	One of Bottom, Top	Bottom
Quality Orientation	The orientation of the quality display within the object's display area	One of Horizontal, Vertical	Horizontal

Transformer Object Settings

The Transformer Object is a Dynamic Object that displays a single vector image of a 2 winding or 3 winding transformers, as positioned by the One Line Designer.

Table 6-287: Transformer Object Settings

Setting	Description	Range	Default
Name	Name of the One Line Designer object.	Text	Transformer
X	X (horizontal) pixel position from the top left corner of the screen to the top left corner of the area used to display the object	0 to the Draw Panel width less the object width	0
Y	Y (vertical) pixel position from the top left corner of the screen to the top left corner of the area used to display the object	0 to the Draw Panel height less the object height	0
Border Type	Defines the type of border to display	One of No border, Symmetric borders, raised borders, Sunken borders, Outdent borders, Indent borders, Picture borders, double raised, Double sunken, Bottom right borders, Top left borders	No border
Border Color	Defines the color to apply to the border around the perimeter of the display area of the object	Any 24-bit RGB Color	Gray
Border Variant	Defines the width of the border to display	0 to 9	0

Setting	Description	Range	Default
Border Multiplier	Defines the thickness of the border to display	One of None (x1), x2, x3, x4, x5, x6, x7, x8	None (x1)
Width	Pixel width of the rectangular area used to display the object	1 to the Draw Panel width	32
Height	Pixel height of the rectangular area used to display the object	1 to the Draw Panel height	32
Back Color	The color to apply to the background	Any 24-bit RGB Color	Gray
Orientation	Whether to draw the object transformer windings in a horizontal or vertical orientation	Horizontal or Vertical	Horizontal
Number of Windings	Defines the number of transformer windings to include in the object	2 or 3	2
Winding 1 Line Width	Line width of the first winding in pixels	1 to 100	1
Winding 1 Line Color	Line color of the first winding	Any 24-bit RGB Color	Black
Winding 2 Line Width	Line width of the second winding in pixels	1 to 100	1
Winding 2 Line Color	Line color of the second winding	Any 24-bit RGB Color	Black
Winding 3 Line Width	If Number of Windings are Configured as 3: Line width of the third winding in pixels	1 to 100	1
Winding 3 Line Color	If Number of Windings are Configured as 3: Line color of the third winding	Any 24-bit RGB Color	Black
Load Tap Changer Line Width	Line width of the load tap changer arrow	1 to 100	1
Load Tap Changer Line Color	Line color of the load tap changer arrow	Any 24-bit RGB Color	Black
Load Tap Changer Winding #	Defines which winding to draw the load tap changer arrow over top of (with 0 indicating to not draw a load tap changer arrow)	0, 1, 2, or 3	0
URL Action	Specifies whether to load the URL Address into the same window, or a new window. URL address will always open in new browser tab or window.	Same or New	Same
URL Address	Specify a link from this object, to either a: • URL address, or • Oneline Designer drawing, or • Active Alarms with Group Reference	Any valid URL address, or existing Oneline Designer drawing, or Active Alarms pre-filtered by Group	None
Data Source	Unique identifier for the data source required for the Value Box.	Select a data source	None
Quality Horizontal Alignment	The horizontal alignment of the quality display within the object's display area	One of Left, Center, Right	Center

Setting	Description	Range	Default
Quality Vertical Alignment	The vertical alignment of the quality display within the object's display area	One of Bottom, Top	Bottom
Quality Orientation	The orientation of the quality display within the object's display area	One of Horizontal, Vertical	Horizontal

Value Box Object Settings

The Value Box Object is a Dynamic Object that displays the current run-time value of an Analog Set Point, Analog Status, Accumulator Status, Digital Status Object, or Text Object

Table 6-288: Value Box Object Settings

Setting	Description	Range	Default
Name	Name of the One Line Designer object.	Text	Valuebox
X	X (horizontal) pixel position from the top left corner of the screen to the top left corner of the area used to display the object	0 to the Draw Panel width less the object width	0
Y	Y (vertical) pixel position from the top left corner of the screen to the top left corner of the area used to display the object	0 to the Draw Panel height less the object height	0
Border Type	Defines the type of border to display	One of No border, Symmetric borders, raised borders, Sunken borders, Outdent borders, Indent borders, Picture borders, double raised, Double sunken, Bottom right borders, Top left borders	No border
Border Color	Defines the color to apply to the border around the perimeter of the display area of the object	Any 24-bit RGB Color	Gray
Border Variant	Defines the width of the border to display	0 to 9	0
Border Multiplier	Defines the thickness of the border to display	One of None (x1), x2, x3, x4, x5, x6, x7, x8	None (x1)
Width	Pixel width of the rectangular area used to display the object	1 to the Draw Panel width	45
Height	Pixel height of the rectangular area used to display the object	1 to the Draw Panel height	16
Alignment	The horizontal alignment of the value displayed as text within the object's display area	One of Left, Center, or Right	Right

Setting	Description	Range	Default
Font Type	The type of font used to display value as text	One of SansSerif, Serif, Monospaced, DialogInput	SansSerif
Font Style	The font style to apply to the display of the value as text	One of normal, bold, or italic	Normal
Font Size	The size of the font used to display value as text	1 to 100	9
Foreground Color	The color to apply to the value displayed as text	Any 24-bit RGB Color	Black
Background Color	The color to apply to the background	Any 24-bit RGB Color	White
Data Source	Unique identifier for the data source required for the Value Box.	Select a data source	None
Quality Horizontal Alignment	The horizontal alignment of the quality display within the object's display area	One of Left, Center, Right	Center
Quality Vertical Alignment	The vertical alignment of the quality display within the object's display area	One of Bottom, Top	Bottom
Quality Orientation	The orientation of the quality display within the object's display area	One of Horizontal, Vertical	Horizontal
Number of Decimal Points	Number of decimal points to display at runtime	0 to 6	3
Display	Runtime display mode when Data Source is Analog Status (AI): <i>Value</i> , or corresponding <i>Text Enumeration</i> , or <i>Both</i> . If Text Enumeration is not configured for the selected Data Source AI, and the Display setting here is selected as Text Enumeration: at runtime the words <i>NO_TXT_ENUM</i> will be shown.	One of Value, Text Enumeration, Text Enumeration (Value)	Value

Beginning with MCP V540, for the Value Box Name: when selected data source is *Digital Status* - users can enter a pattern in the form of:

@{DS_PointName,DS_StateText}

Where:

- **DS_PointName** is the *Point Name* in the object selected *Digital Status* Data Source
- **DS_StateText** is one of the *State Texts* in the object selected *Digital Status* Data Source

At runtime this will not show anything, except when the *Digital Status* Text Value matches the **DS_StateText** – and will be displayed as:

[DS_PointNameDS_StateText](#)

For example:

Data Source is Digital Status, configured as below:

Data Source Wizard

Digital Status DataSource

Name	Value
Name	F2_DI
Feedback Size	2 State
Primary IED Name	CA00000
Primary Point Name	F2 : F2 Point Desc
Secondary IED Name	
Secondary Point Name	
State 00 Text	Text_OFF
State 01 Text	Text_ON
State 10 Text	
State 11 Text	

Name
Name of the Digital Status data source.

Back Next Finish Cancel

The Value Box is configured as below:

Property Panel

Properties Table

Property Name	Value ^
Name	@{F2,Text_ON}
Border Variant	0
Y	160
Font Size	20
Number of Decimal Points	3
Height	30
X	70
Width	80
Quality Vertical Alignment	Bottom
Quality Horizontal Alignment	Center
Data Source	F2_DI
Quality Orientation	Horizontal
Background Color	
Foreground Color	
Border Color	
Border Multiplier	None (x1)
Font Style	Normal
Alignment	Right
Font Type	SansSerif
Border Type	Symmetric borders

Then at runtime when F2 DI value is 1 this Value Box will display as below:

And in all other cases will display no content:

Data Source Configuration Settings

Property Panel - Data Source Tables

The Property Panel displays the properties associated with the currently selected data source type. Based on the type of data source selected, the properties window shows different options.

To aid in the *IED Name* and *Point Name* selection workflow, sorting and filtering capabilities are provided in the picker dialogs.

The Data Source types are:

- [Accumulator Status Data Source Settings](#)
- [Alarm Data Source Settings](#)
- [Analog Set Point Data Source Settings](#)
- [Analog Status Data Source Settings](#)
- [Digital Control Data Source Settings](#)
- [Digital Status Data Source Settings](#)
- [Raise/Lower Control Data Source Settings](#)
- [Text Data Source Settings](#)

Accumulator Status Data Source Settings

Table 6-289: Accumulator Status Data Source Settings

Setting	Description	Range	Default
Name	Name of the Accumulator data source.	Text	Accumulator Status
IED Name	Name of the IED.	Existing IED name	None
Point Name	Name of the single alarm accumulator point.	Existing accumulator point identifier	None
Accumulator Type	Whether to monitor status on frozen or running value	One of Frozen or Running	Running

Alarm Data Source Settings

Table 6-290: Alarm Data Source Settings

Setting	Description	Range	Default
Name	Name of the Alarm data source.	Text	Alarm
Point Name	Name of the single alarm indicator point or alarm group. If alarm group is selected, acknowledgement action in oneline viewer acknowledges all alarms belonging to this alarm group.	Existing alarm indicator point identifier or existing alarm group	None

Analog Set Point Data Source Settings

Table 6-291: Analog Set Point Data Source Settings

Setting	Description	Range	Default
Name	Name of the Analog Set Point data source.	Text	Analog Set Point
Primary IED Name	IED identifier where the identifier consists of the device name.	Existing IED name	None
Primary Point Name	Point identifier for a single analog output point on which to operate a set point command.	Existing point name	None
Minimum Value	Minimum permitted set point value	Any 64-bit floating point value	0.0
Maximum Value	Maximum permitted set point value	Any 64-bit floating point value	0.0
Function Code	The type of protocol request to send as part of the set point command	One of Direct Operate, or Direct Operate with No Acknowledgement	Direct Operate
Feedback Enabled	Whether to enable a feedback analog input point to receive status on a set point command. NOTE: In a distributed system, the only reliable way to determine the success of a control operation is through a hardwired digital input or analog input point providing the feedback of the process state being controlled.	True or False	False
Feedback IED Name	If Feedback Enabled is True: IED name for Analog feedback.	Existing IED name	None
Feedback Point Name	If Feedback Enabled is True: Point identifier for a single analog input point on which to receive the feedback value in response to a set point command.	Existing analog input point name	None
Timeout (sec)	If Enable Feedback is True: the timeout period (in seconds) during which the feedback point value must change to correspond to the set point value to indicate successful completion of the set point command. A value of 0 indicates there is no timeout.	0 to 65535	120
Deadband	If Enable Feedback is True: the feedback value maximum percentage variation from the set point value by which the feedback value is still considered to be equal to the set point value.	0 to 65535	0

Setting	Description	Range	Default
Require Confirmation	Defines whether the GUI is to display a confirmation dialog immediately prior to executing a set point	True or False	True

Analog Status Data Source Settings

Table 6-292: Analog Status Data Source Settings

Setting	Description	Range	Default
Name	Name of the Analog Status data source.	Text	Analog Status
IED Name	Name of the IED.	Existing IED name	None
Point Name	Name for a single analog input point.	Existing analog input point identifier	None
Deadband	The percentage variation from the last value that exceeded deadband, which once exceeded becomes reported, and becomes the new last value for future reporting	0 to 65535	0

Digital Control Data Source Settings

Table 6-293: Digital Control Data Source Settings

Setting	Description	Range	Default
Name	Name of the Digital Control datasource.	Text	Digital Control
Secondary Output Enabled	Whether to enable a Secondary output point or not. When a Primary output exists but a Secondary is not enabled, both an on and off control state are associated with the Primary output point. Setting a control state to on or off has the result of executing the configured control code on the Primary output point. When a Primary output and a Secondary output is enabled, then the on-control state must be assigned to only one of them, and the off-control state must be assigned to the other output. Setting a control state to on or off in this case has the result of executing the configured control code on either the Primary or Secondary output point, but never both.	True or False	False
Secondary Control State	If Secondary Output Enabled set to True: whether to associate the Secondary output point with the On State or Off State. The Primary output point is associated with whichever state the Secondary is not associated with.	On or Off	Off
Primary IED Name	IED identifier where the identifier consists of the device name.	Existing IED name	None
Primary Point Name	Point identifier of a digital output point where the identifier consists of the device point descriptor. If size is 4-state, this maps to the left-most bit.	Existing point name	None

Setting	Description	Range	Default
Function Code	The protocol function code to pass as part of the digital control command sent to a device.	One of Direct Operate, Direct Operate with No Acknowledgement, Select Before Operate, Select, Operate	Direct Operate
Primary Pulse On Time	Primary control pulse on time in milliseconds (applies only to Control Codes of type Pulse On, Pulse Off, Trip, or Close).	0 to 65535	0
Primary Pulse Off Time	Primary control pulse off time in milliseconds (applies only to Control Codes of type Pulse On, Pulse Off, Trip, or Close).	0 to 65535	0
On State Control Code	Protocol control code to send as part of the digital control command, when the user requests to send an On state.	One of Latch On, Latch Off, Pulse On, Pulse Off, Trip, or Close	Latch On
Off State Control Code	Protocol control code to send as part of the digital control command when the user requests to send an Off state.	One of Latch On, Latch Off, Pulse On, Pulse Off, Trip, or Close	Latch Off
On State Control Text	The user defined text used to describe the operation to turn the digital control to “on”	Any text	Textual representation of the configured control code
Off State Control Text	The user defined text used to describe the operation to turn the digital control to “off”	Any text	Textual representation of the configured control code
Num Operations	Number of times to consecutively repeat a control code, applying the pulse on and pulse off times to each control pulse repetition. A value of 1 specifies that the control code is issued once (i.e., no repetition).	1 to 255	1
Secondary IED Name	If Secondary Output Enabled set to True: IED identifier where the identifier consists of the device name.	Existing IED name	None
Secondary Point Name	If Secondary Output Enabled set to True: point identifier of a digital output point where the identifier consists of the point descriptor. If size is 4-state, this maps to the right-most bit.	Existing point name	None
Secondary Pulse On Time	If Secondary Output Enabled set to True: Secondary control pulse on time in milliseconds (applies only to Control Codes of type Pulse On, Pulse Off, Trip, or Close).	0 to 65535	0

Setting	Description	Range	Default
Secondary Pulse Off Time	If Secondary Output Enabled set to True: Secondary control pulse off time in milliseconds (applies only to Control Codes of type Pulse On, Pulse Off, Trip, or Close).	0 to 65535	0
Feedback Enabled	Whether or not to enable feedback status. NOTE: In a distributed system, the only reliable way to determine the success of a control operation is through a hardwired digital input or analog input point providing the feedback of the process state being controlled.	True or False	False
Feedback Size	If Feedback Enabled set to True: whether to utilize 2 state feedback or 4-state feedback.	2 State or 4 State	None
Primary Feedback IED Name	If Feedback Enabled set to True: IED identifier where the identifier consists of the device name.	Existing IED name	None
Primary Feedback Point Name	If Feedback Enabled set to True: point identifier for a single two state feedback point consisting of a single digital input point, or of the first of two digital input points required to represent four state status, where the identifier consists of the device point descriptor. If size is 4-state, this maps to the left-most bit.	Existing point name	None
Secondary Feedback IED Name	If Feedback Enabled set to True, and Feedback Size set to 4-state: IED identifier, where the identifier consists of the device name.	Existing IED name	None
Secondary Feedback Point Name	If Feedback Enabled set to True, and Feedback Size set to 4-state: point identifier for the second of two digital input points required to represent four state status, where the identifier consists of the device point descriptor. If size is 4-state, this maps to the right-most bit.	Existing point name	None
Feedback Timeout	If Feedback Enabled set to True: the timeout period after which a digital control is executed that the feedback state must change to correspond to the digital control state. If the digital control state does not correspond within the timeout period, the control is to be aborted. A value of 0 indicates no timeout.	0 to 65535	120
State 00 Text	If Feedback Enabled set to True, and Feedback Size set to 4, the user defined text used to represent a 4-state feedback value of 00.	Any text	Off
State 01 Text	If Feedback Enabled set to True, and Feedback Size set to 4, the user defined text used to represent a 4-state feedback value of 01.	Any text	On
State 10 Text	If Feedback Enabled set to True, and Feedback Size set to 4, the user defined text used to represent a 4-state feedback value of 10.	Any text	Empty

Setting	Description	Range	Default
State 11 Text	If Feedback Enabled set to True, and Feedback Size set to 4, the user defined text used to represent a 4-state feedback value of 11.	Any text	Empty
On Control State Feedback State	The feedback state required to occur in response to an On State sent to a control, for the control to be considered successful.	If 2 State, one of 0 or 1. If 4 State, one of 00, 01, 10, or 11.	None
Off Control State Feedback State	The feedback state required to occur in response to an Off State sent to a control, for the control to be considered successful.	If 2 State, one of 0 or 1. If 4 State, one of 00, 01, 10, or 11.	None
Require Confirmation	Defines whether the GUI is to display a confirmation dialog immediately prior to executing a control	True or False	True

Digital Status Data Source Settings

Table 6-294: Digital Status Data Source Settings

Setting	Description	Range	Default
Name	Name of the Digital Status data source.	Text	Digital Status
Feedback Size	Whether to utilize 2 state status or 4 state status	2 State or 4 State	2 State
Primary IED Name	Name of the Primary IED.	Existing IED name	None
Primary Point Name	Name of the Primary point. If size is 4-state, this maps to the left-most bit.	Existing point name	None
Secondary IED Name	Name of the Secondary IED.	Existing IED name	Empty
Secondary Point Name	Name of the Secondary point. If size is 4-state, this maps to the right-most bit.	Existing point name	Empty
State 00 Text	State 00 text.	Any text	In Transit
State 01 Text	State 01 text.	Any text	Open
State 10 Text	State 10 text.	Any text	Empty
State 11 Text	State 11 text.	Any text	Empty

Raise/Lower Control Data Source Settings

Table 6-295: Raise/Lower Control Data Source Settings

Setting	Description	Range	Default
Name	Name of the Raise/Lower Control data source.	Text	Raise Lower Control
Primary IED Name	Name of the Primary IED.	Existing IED name	None
Primary Point Name	Name of the Primary point. If size is 4-state, this maps to the left-most bit.	Existing point name	None

Setting	Description	Range	Default
Function Code	The protocol function code to pass as part of the digital control command sent to a device.	One of Direct Operate, Direct Operate with No Acknowledgement, Select Before Operate, Select, Operate	Direct Operate
Primary Pulse On Time	Primary control pulse on time in milliseconds	0 to 65535	0
Primary Pulse Off Time	Primary control pulse off time in milliseconds	0 to 65535	0
Raise State Control Code	Protocol control code to send as part of the control command when the user requests to send a Raise.	One of Pulse On, Pulse Off, Trip, or Close	Pulse On
Lower State Control Code	Protocol control code to send as part of the control command when the user requests to send a Lower.	One of Pulse On, Pulse Off, Trip, or Close	Pulse On
Num Operations	Number of operations.	1 to 255	1
Secondary Output Enabled	Whether to enable a Secondary output point or not. When a Primary output exists but a Secondary is not enabled, a raise and lower control state are both associated with the Primary output point. Setting a control state to raise or lower has the result of executing the configured control code on the Primary output point. When a Primary output and a Secondary output is enabled, then the raise control state must be assigned to only one of them, and the lower control state must be assigned to the other output. Setting a control state to raise or lower in this case has the result of executing the configured control code on either the Primary or Secondary output point, but never both.	True or False	False
Secondary IED Name	Name of the Secondary IED.	Existing IED name	Empty
Secondary Point Name	Name of the Secondary point. If size is 4-state, this maps to the right-most bit.	Existing point name	Empty
Secondary Pulse On Time	If Secondary Output Enabled set to True: Secondary control pulse on time in milliseconds	0 to 65535	Empty
Secondary Pulse Off Time	If Secondary Output Enabled set to True: Secondary control pulse off time in milliseconds	0 to 65535	Empty
Secondary Control State	If Secondary Output Enabled set to True: whether to associate the Secondary output point with the Raise State or Lower State. The Primary output point is associated with whichever state the Secondary is not associated with.	On or Off	Empty

Setting	Description	Range	Default
Feedback Enabled	Whether or not to enable feedback status. NOTE: In a distributed system, the only reliable way to determine the success of a control operation is through a hardwired digital input or analog input point providing the feedback of the process state being controlled.	True or False	False
Analog Feedback IED Name	Name of the analog feedback IED.	Existing IED name	Empty
Analog Feedback Point Name	Name of the analog feedback point.	Existing point name	Empty
Require Confirmation	Defines whether the GUI is to display a confirmation dialog immediately prior to executing a control	True or False	True

Text Data Source Settings

Table 6-296: Text Data Source Settings

Setting	Description	Range	Default
Name	Name of the Text data source.	Text	Text
IED Name	Name of the IED.	Existing IED name	None
Point Name	Name for a single RTDB text point.	Existing text point name	None

Create Analog Reports

This functionality is supported in:

- G100 up to and including v2.30
- G500 up to and including v2.50

Newer versions of MCP do not include Analog Reports functionality.

Analog Report Generation - Overview

Not available after and including MCP V2.60.

This feature allows you to generate an Analog Report log.

Each Electric Utility Substation requires that various analog parameters from different bays be logged. Logging of this substation equipment information is required for:

- Records
- Periodic maintenance
- Preventive maintenance

In a substation where no Substation Automation System is available, the shift operator uses a log sheet to manually enter parameters into pre-printed log sheets.

In a substation where a Substation Automation System is available, automated report generation:

- Logs the values of the selected analog parameters.
- Uses logged parameter data in online and offline report formats.
- Creates online reports as per the user-configured tabular formats.

- Creates offline reports as per the existing or user-configured tabular formats (that is, templates created from Reports).
- Provides a view of the online report in a separate window.
- Allows you to list, view, print, and download the offline reports.
- Exports the online report to xls or pdf file formats.

The Analog Report Log is accessed from the System log for information and provides Offline Analog Reports. This log will be updated when a:

- New report is generated.
- Report is automatically deleted by the Analog Report application.
- Report has been manually deleted by a user.
- Report(s) has been downloaded by a user.

Analog Report - Viewing

Not available after and including MCP V2.60.

The Analog Report Viewer allows you to:

- View online reports.
- Save and view offline reports.

NOTE: The Analog Report Viewer is only available in the remote HMI due to limited resources available in the local HMI.

NOTE: A maximum of 50000 updated data values can be viewed in a report at one time with a maximum socket timeout of 30 seconds.

Online Reports

Online Reports are the Periodic Data-logger reports configured in the Data Logger application.

Online Report Fields

Table 6-297: Online Report Fields

Field	Description
Periodic Datalogger Reports	Choose the available Datalogger Reports.
Templates	Choose the available Online Template. Only one Default Online Template can exist in the MCP.
Start Date	Set the start date that data is to start populating the generated Reports. Use the checkbox to enable and disable the start date: • Select the checkbox to enable a start date. • Clear the checkbox to disable a start date. When the Start Date field is enabled, you can either: 1. Click the Start Date field. Result: The Select Date/Time window appears. 2. Select the date and time. 3. Click Select. or • Use the up-arrow and down-arrow buttons to change the Date/Time.

Field	Description
End Date	Set the end date that data is to stop populating the generated Reports. Use the checkbox to enable and disable the end date: • Select the checkbox to enable an end date. • Clear the checkbox to disable an end date. When the End Date field is enabled, you can either: 1. Click the End Date field. Result: The Select Date/Time window appears. 2. Select the date and time 3. Click Select. or • Use the up-arrow and down-arrow buttons to change the Date/Time.

Online Report - Top Table

This table lists the Analog Points Mapped in the Online Data Logger Applications. The online Report Viewer allows you to generate Online Reports in any of the following file formats:

- HTML
- PDF
- XLS

Table 6-298: Online Report - Top Table

Column	Description	Value determined by ...
Name	Report parameter name: • customer • substation • bay ID • voltageLevel • title	... the Online report templates.
Description	Default description of the report parameter.	
Value	Description of the report parameter.	 the user.

Online Report - Bottom Table

This table lists the source Analog Points Mapped in the Data Logger Application.

Table 6-299: Online Report - Bottom Table

Column	Description
Selection	Check this box to select the Analog Input Point to generate the Online Report.
Source	The Home Directory and Point ID of Analog Input Point.
Bay ID	The Bay ID of the Analog Input point
Point Description	The Point Description of the Analog Input Point.
Point Reference	The Point Reference of the Analog Input Point.

Online Report Controls

Table 6-300: Online Report Controls

Control	Description
File Type	Select the file format of the periodic data logger reports to be viewed: • html • pdf • xls
Show button	Click to view a Datalogger report.

Offline Reports

Offline reports are generated by the Analog Report Generation application.

This feature allows you to view and download the Analog Reports generated over a period in any of the following file formats:

- html
- pdf
- xls

All available reports are listed in the file tree structure in the left pane.

Report names with:

- Suffix In **Progress**: indicates that the report is still in the process of being logged.
- Prefix **Archived <N>**: indicates that the report is archived on the MCP to avoid logging records having the same record time on the same offline report file before and after the system date/time changed. <N> is sequence number.

Records having the same record time might be found in archived offline report and regular offline report.

Offline Report Fields

Table 6-301: Offline Report Fields

Field	Description
Disk Usage	Indicates disk usage in percent against total disk size configured.
Estimated Days of Disk Full	Estimated number of days that the disk will be full. This approximation is based on the various parameters such as the Number of configured Reports, Size of each Report and the Available Disk Space.
Total Reports	Indicates the total number of reports currently available on disk.
Total Shift Reports	Indicates the total number of shift type reports currently available on disk.
Total Daily Reports	Indicates the total number of daily type reports currently available on disk
Total Weekly Reports	Indicates the total number of weekly type reports currently available on disk
Total Monthly Reports	Indicates the total number of monthly type reports currently available on disk

Offline Report Controls

Allows user to save and delete Reports.

Table 6-302: Offline Report Controls

Control	Description
checkbox	Use the checkbox to select and de-select the Reports • Checkbox to Select a Report • Clear the checkbox to de-select a Report
File Type	Select the file format of the periodic data logger reports to be viewed: • html • pdf • xls
Save  button	To save one or more reports: 1. Select the report(s) in the file tree structure in the left pane. Use the checkbox to select and de-select reports. 2. Click Save.
Delete  button	To delete one or more reports: 1. Select the report(s) in the file tree structure in the left pane. Use the checkbox to select and de-select reports. 2. Click Delete.
Filter  button	Click the Filter down-arrow to view the filter options. Result: The Select Filter window appears. You can either: • Type in a specific Report Name, or • Choose a set of Analog Reports that were generated between the Start and End Dates. Click the Apply button to list the reports that match the specified filter conditions. Click the Show All button to list all available reports. Click X (top-right) to close the Select Filter window.

Analog Report Generation - Configuration

The configuration page provides three tabs:

- Reports tab
- Templates tab
- Global Settings tab

Reports tab

The Reports tab of the Analog Reports Generation configuration window allows you to configure different sets of reports in the system.

>> To create a new Analog Report:

1. Log into the MCP web HMI.
2. Click the **Configuration** power bar button.
3. Click the **Analog Report** tab.

4. Click the  button to initiate the creation of a new Analog Report.
Result: A default report name appears in the Reports pane on the left.
Result: The **Reports > Properties** tab fields appear.
5. Enter values in the **Properties** fields.
Result: The entered **Report Name** appears in the Reports pane.
6. Click the **Reports > Points Map** tab.
Result: A report parameter list appears in a Point Map table. The list of report parameters is determined by which Template Name was selected in the previous step.
7. Click on a report parameter.
Result: The selected table row appears with a light-blue background.
8. Map a point to the point parameter by double-clicking a point in the file tree structure.
Result: The mapped point details appear.
9. Click the **Save** icon.
Result: A confirmation window appears.
Result: The created report is saved in the HMI.
10. Click **Commit Changes** to apply the changes to the MCP.

Known Issue:

The current Offline Analog Report is created with incorrect start time and end time if the MCP time is manually changed when DST is enabled (Daylight Saving Time). Note that the DST is enabled automatically based on the Time zone configured.

If an Offline Analog Report is in the process of gathering data records when DST is enabled:

- The first Offline Analog Report will contain an extra 1 hour of records; this additional 1-hour of records should have been included with the next report.
- The next report will not contain the first 1 hour of records.

For example:

1. A 4-hour duration shift report starts at 00:00 and is to end at 03:45.
2. DST is enabled at 2 am.
3. The reports are created:
 - The first report contains records gathered from 00:00 to 03:45 and 04:00 to 04:45.
 - The next report contains records gathered from 05:00 to 07:45; that is, it does not contain the 04:00 to 04:45 records.

Subsequent reports are created and logged correctly.

>> To delete an Analog Report:

1. Log into the MCP web HMI.
2. Click the **Configuration** power bar button.
3. Click the **Analog Report** tab.
4. Select a report name in the Reports pane.
5. Click the  button.
Result: The Delete Report confirmation window appears.
6. Click **Yes** to delete the report.
7. Click the **Save** icon.
Result: A confirmation window appears.
Result: The report is removed from the HMI.

8. Click **Commit Changes** to apply the changes to the MCP.

Reports > Properties Sub-tab Fields

Table 6-303: Reports - Properties

Field	Description
Report ID	Auto-generated unique report identifier number.
Report Name	Type the report name.
Template Name	Select the template: ☐ Battery Chargers ☐ Circuit Breaker ☐ Transformer Reactor Temperature ☐ Meter Readings ☐ EHV Line ☐ EHV_Transformers ☐ Daily Voltage Summary ☐ Polled Data NOTE: The MCP Analog Report Generation Application also allows you to add additional (user-configurable) templates. Refer to the Jasper iReport Configuration Manual.
Report Type	Select the type of report: ☐ Shift ☐ Daily ☐ Weekly ☐ Monthly
Enable Logging	Check this box to enable logging of the configured analog data.
Report Duration	Select the duration period in which data is to be logged before a report is generated: ☐ 4 hours ☐ 6 hours ☐ 8 hours ☐ 12 hours
Log Interval	Select the interval at which a new record is to be logged for the report: ☐ 15 Minutes ☐ 30 Minutes ☐ 60 Minutes
Start Time Alignment (Hour of Day)	Select the hour of the day (on a 24-hour clock) at which a new report will start to log data. The range is 0 to 23 hours.
Logging Alignment (Minute of Hour)	Select the minute of the hour at which every record will be aligned in a report: ☐ xx:00 ☐ xx:15 ☐ xx:30 ☐ xx:45

Reports > Point Map Sub-tab

Table 6-304: Reports - Point Map

Point Map Table		
Column	Description	Value determined by ...
Name	Report parameter ID.	... the Template selected in the Properties fields.
Description	Report parameter description	
Home Dir	Home Directory of the source Analog Point Mapped for logging	... which point has been mapped to this report parameter.
Point ID	Point ID of the source Analog Point Mapped for logging	
Point Description	Point Description of the source Analog Point Mapped for logging	
Point Reference	Point Reference of the source Analog Point Mapped for logging	

Reports > Parameters Map Sub-tab

Table 6-305: Reports - Parameters Map

Parameter Map Table		
Column	Description	Value determined by ...
Name	Name of Parameter Map.	... the Template selected in the Properties fields.
Description	Description of Parameter Map.	
Value	Type the suitable text for each row. The entered text appears as the header and footer of the generated reports. The position of the header and footer in the layout of the generated report can be pre-defined in the Template	... the Template selected in the Properties fields. This field can be edited

Templates tab

The Templates tab allows you to:

- Upload a user-configured Template to the MCP
- Download available Templates from the MCP
- Preview the available user-configured Templates.

Upload a Template to MCP

Only use this procedure if you have created Templates using Jasper iReports Software. For more details, refer to the iReport Designer manual. This manual is available in the GE Vernova Grid Solutions Technical Support Library.

For manuals, login and navigate to: Substation Automation Products > MCP > Manuals

For the template files, login and navigate to:

Substation Automation Products > MCP > Manuals > Analog Reports Templates

>> To upload a template to the MCP:

1. Log into the MCP Web HMI from the PC where the **Templates** are available.
2. Click the **Configuration** power bar button.

3. Click the **Analog Report** tab.
4. Click the **Templates** sub-tab
5. Either:
 - Select an existing template from the Templates pane.
 - or
 - Create a new template by clicking the  button.
6. Click the **Upload** button.
Result: The Open window appears.
7. Navigate to select the required **.rz** file.
8. Click **Open**.
Result: The **.rz** file is opened and the Open window closes.
9. Click the **Save** icon.
Result: A confirmation window appears.
Result: The created template is saved in the HMI.
10. Click **Commit Changes** to apply the changes to the MCP.

NOTE:

- If a template is uploaded onto an existing template which is being used by a report, you might need to reconfigure the report for mapped points and parameters. This occurs only if parameter list or point list changed in new template; that is, a parameter or point field has been added or removed.
- To ensure that a new template is working well, it is recommended that you preview the report before saving and committing the report.

>> To download a report template from the MCP:

1. Log into the MCP Web HMI.
2. Click the **Configuration** power bar button.
3. Click the **Analog Report** tab.
4. Click the **Templates** sub-tab.
5. Select an existing report template from the Templates pane.
6. Ensure that the report template has been saved and committed.
7. Click the **Download** button.
Result: The Save window appears.
8. Navigate to the folder which is to contain the **.rz** file.
9. Click **Save**.
Result: The Save window closes and the Download Template confirmation window appears.
10. Click **OK**.
Result: The Download Template confirmation window closes.
11. Click the **Save** icon.
Result: A confirmation window appears.
Result: The created template is saved in the HMI.
12. Click **Commit Changes** to apply the changes to the MCP.

>> To preview a report template:

1. Log into the MCP HMI.
2. Click the **Configuration** power bar button.
3. Click the **Analog Report** tab.
4. Click the **Templates** sub-tab.
5. Select an existing report template from the Templates pane.
6. Click the **Preview** button.

Result: A preview of the report appears.

Templates tab Fields**Table 6-306: Templates tab Fields**

Field	Description
Template Name	Type the template name.
Jasper File	Displays the name of the Jasper file.
XML File	Displays the name of the .Jrxml file.
Details	
Creation Time	The time that this template was created.
Installation Time	The time that this template was uploaded to this MCP.
Template Description	The description of the template file provided by the Template.

Templates tab Buttons**Table 6-307: Templates tab Buttons**

Button	Description
Upload	Upload a report template to the MCP. For example, the uploaded report template could have been created using Jasper iReports Software.
Download	Download a report template from the MCP.
Preview	Preview a report template.

Global Settings tab

The Global Settings tab allows you to configure global settings which affect all reports.

Table 6-308: Global Settings tab

Field	Description
Storage Full Action	Select an action to occur when the configured Analog Report Generation storage space is full. The options are: • Delete Oldest Reports • Stop New Reports
Threshold (%) for Storage Full	Set the percentage of storage space at which a warning message appears. The valid range is 50% to 95%.
Time Zone	Select a time zone from the list provided. This parameter affects the Start Time Alignment and Logging Alignment of the report.

Configure System Security

This chapter contains the following sections and sub-sections:

Security Features

System Security

Password Complexity

Connection Security

Secure Application Parameters

User Accounts and Authentication

User Management tab

Local Authentication

Setting Up a User Account

Secure Access

Software Licensing Tools for MCP

Software Licensing Tools for D2X

Firewall Settings

Automatic logout

Security Features

The MCP employs several security measures to ensure the safety of the MCP system from unauthorized users, including:

- Log in using password security and authentication
- Secure HMI access using security certificates
- [User access levels](#) to limit access to MCP functions
- User authentication before executing control commands
- [Secure shell \(SSH\) log in](#) for terminal session (optional)
- Automatic logout
- [TLS based encryption and identity verification](#) on serial and Ethernet connections
- Password Complexity

System Security

The MCP provides security features to authenticate its identity and to maintain the privacy of information between the MCP and your computer when communicating over the Internet. The MCP makes use of digital signatures and secure Web access to ensure this security.

Secure Web access to the MCP is provided using the Transport Layer Security (TLS) protocol version 1.2 over a 128-bit connection. To support the MCP's secure Web access features, you need to obtain and install a security certificate and a private key on the MCP.

Password Complexity

To ensure the strength of user passwords, it is recommended that a specific set of rules be presented to users.

Passwords for accessing Email/Dial Out

Currently G500 uses "Password" field to support/access the third-party relays, E-Mail Servers and LDAP Servers.

- Email/Dial-Out Passwords:
 - o Email/Dial-out configuration uses Password fields to access to the E-Mail Servers/ Dial-out
 - o These Password fields are configured using DSAS Online/Offline GUI
 - o Only 32 characters long password

Password Type	Supported / Valid Characters as per Schema
Email/Dial-out	A B C D E F G H I J K L M N O P Q R S T U V W X Y Z a b c d e f g h i j k l m n o p q r s t u v w x y z 0 1 2 3 4 5 6 7 8 9 ! @ # \$ % ^ & * ' () - _ + = < > { } [\ ; : ? " . , ~ ` /

Passwords for accessing G500 Administrator Users

Administrator Users are configured using mcpcfg or Settings GUI.

Password Type	Supported / Valid Characters as per Schema
Administrator User	A B C D E F G H I J K L M N O P Q R S T U V W X Y Z a b c d e f g h i j k l m n o p q r s t u v w x y z 0 1 2 3 4 5 6 7 8 9 \$ % @ ! &

Passwords for accessing G500 HMI Users

Apart from the above password fields, G500 also uses the Password fields to access the G500 from DSAS/HMI/SSH.

These Passwords along with Usernames are configured using mcpcfg/Settings GUI/Runtime HMI.

Password Type	Supported / Valid Characters as per Schema
Supervisor/Operator/Observer/Passthrough/rdtunnel	The length of the password is between 8 and 128 characters. The passwords cannot contain the user's account name or parts of the user's full name that exceeds two consecutive characters. Passwords must contain characters from the following four categories: • English uppercase characters (A through Z). • English lowercase characters (a through z). • Base 10 digits (0 through 9). • Non-alphabetic characters (only \$ % @ ! &)

Connection Security

The MCP supports the below security features for the pass-through supported and terminal server applications. This can be configured using the **Connection** tab > **Secure Type** option. The Secure type options are:

- Disabled (default)
- Telnet : The MCP supports pass-through and terminal server access to the devices from PC-based configuration tools and, if necessary, COM port redirection software. These connections are accessible through a TCP port on the MCP.
- TLS Security : The MCP supports Transport Layer Security (TLS) which is cryptographic protocol that provide security for communications over networks such as the Internet. TLS encrypt the segments of network connections at the Application Layer to ensure secure end-to-end transit at the Transport Layer.
- SSH Secure Tunnel : The MCP supports SSH Secure Tunnel to provide secure access to pass through and terminal server connections.

The Telnet, TLS Security, SSH Secure Tunnel features are available on the following types of connections:

- [IEC 60870-5-103 Multi-drop](#) (Passthrough-Telnet)
- [Modbus Multi-drop](#) (Passthrough-Telnet)
- [Generic ASCII Client](#) (Passthrough-Telnet)
- [SEL Binary \(MCP as Master\)](#) (Passthrough-Telnet)
- [Terminal Server](#) (Telnet)

NOTICE**SECURITY NOTICE**

The following services are considered unsecure:

[IEC 60870-5-103 Multi-drop](#) (Passthrough-Telnet)

[Modbus Multi-drop](#) (Passthrough-Telnet)

[Generic ASCII Client](#) (Passthrough-Telnet)

[SEL Binary \(MCP as Master\)](#) (Passthrough-Telnet)

[Terminal Server](#) (Telnet)

It is strongly recommended that TLS tunnels or SSH Tunnels are used for sessions across unprotected / external networks.

The user assumes all responsibility for the system design and associated security risks when unsecured sessions are used, for e.g., Telnet.

The following parameters can be configured on any security-enabled connection.

Secure Application Parameters

Table 6-309: Secure Application Parameters

Setting	Description	Range	Default
Parameters			
Enable insecure authentication	When enabled, connection security features are not enforced. You should only enable this setting if alternate security features are available for the connection.	Disabled Enabled	Disabled
Session key renegotiation interval	The maximum amount of time, in seconds, that can pass before the connection session key is renegotiated. Frequently renegotiating the session key increases the security of the connection.	600 to 7200	900
Session key renegotiation count	The amount of data, in bytes, that can be transmitted between devices before the connection session key is renegotiated.	10000 to 1000000	100000
Session key renegotiation timeout	The amount of time, in milliseconds, that the MCP waits for a response to a renegotiation request before the connection is considered timed out and is disconnected.	500 to 120000	2000
Issuers			
PEER	The text string that must match the common name as provided on the certificate provided by the remote device.	Free text entry	N/A
Issuer	The name of the issuer that generated the certificate provided by the remote device.	List of installed issuer certificates	N/A
Enable PEER identity validation	If enabled, connections are only permitted to devices that provide a certificate that contains a common name included in the list above and that was provided by the associated issuer. If disabled, PEER identity validation is not performed.	Disabled Enabled	Enabled

Setting	Description	Range	Default
Ciphers			
Cipher name	A list of ciphers supported by the MCP. When a connection is established with a remote device, a list of enabled ciphers is exchanged, and the most secure cipher is selected to secure the connection.	N/A	N/A
Enable	Select whether to enable the associated cipher. If the remote device does not support at least one of the enabled ciphers, the connection is not established. List Of Supported Ciphers: EDH-DSS-DES-CBC3-SHA:DHE-DSS-AES128-SHA:DHE-DSS-AES256-SHA:EDH-RSA-DES-CBC3-SHA:DHE-RSA-AES128-SHA:DES-CBC3-SHA:@STRENGTH	Disabled Enabled	Disabled
Permit null encryption	If checked, null encryption ciphers are permitted. If a null encryption cipher is used, the connection itself is unencrypted and is vulnerable to interception attacks.	Disabled Enabled	Disabled
Secure protocol	Select the protocol used to secure the connection.	TLS 1.0 TLS 1.1	TLS1.0

User Accounts and Authentication

The User Management, VPN Client Configuration, Authentication Configuration and Automatic Login are available in the Access tab of DS Agile Configuration tool.

User Management tab

On the **User Management** tab on the **Configuration** page you can set up accounts for MCP users, including usernames, passwords and access level. The settings on this tab are not available if you are using a TACACS+ or LDAP remote authentication server.

Note: Starting with MCP V520, Cisco® TACACS+ is no longer available.

User settings

Table 6-310: User Management tab Settings

Name	Description
Username	Enter a username to identify the user to the MCP. This is the username when logging into the system. Usernames may only contain numbers, lower-case letters, and the dash (-) and underscore (_) characters.
Privilege Level	Select an access level assigned to the user: Observer, Operator, Supervisor or SSHPassThrough, Rdtunnel.
Full Name	Enter the full name of the user.
Password	Enter a password for the user. The password displays as asterisks (*).
Confirm Password	Enter the same password as above.
User Home Page	Select the UI page from the dropdown list. For details see section: Configure User Home Page on page 279.

Local Authentication

Local authentication makes use of files stored locally to control user authentication, as opposed to connecting to a remote server to obtain username and password information. This is the default authentication mode available in the MCP.

The MCP has two types of administrative users.

- | | |
|-------------------------|--|
| Default Administrator | - Default username is defadmin and the default password is defadmin. When user logs in using defadmin, only minimal configuration (adding new administrator user, configuring LAN and rebooting the unit) will only be available. Using this Default Administrator User would need to configure a nominated/custom administrator-level user(s) to login and configure MCP. |
| Nominated Administrator | - Supervisor-level access to all configuration, runtime, operation, and system administration runtime screens in the Online MCP HMI as well as full access to run commands at the MCP command line interface when the sudo command is used (see section Setting up a Terminal Session). OpenVPN configuration and Runtime viewers are only available from Runtime HMI using administrator-level users only. |

Remote Authentication

Note: Starting with MCP V520, Cisco® TACACS+ is no longer available.

The MCP supports two remote authentication modes:

- Cisco® TACACS+
- LDAP

To enable Local, Cisco® TACACS+, LDAP authentication modes, you must login to the MCP HMI as an Administrator User and then click on **Settings > Access > Authentication** tab.

Cisco TACACS+ remote authentication mode requires the following settings:

- TACACS+ server address – valid IPV4 address
- TACACS+ Secondary server address (if enabled) – valid IPV4 address. If the Primary server does not respond, the MCP automatically attempts to connect to the server at this address instead.
- Encryption – select whether to enable or disable encryption for the connection between the MCP and the TACACS+ server
- Shared secret (if enabled) – as provided by TACACS+ server administrator
- Enable reporting of remote host IP Address – if enabled, the MCP reports the IP Address of the MCP to the authentication server. Only enable this if you are using an authentication server that supports this feature.

The screenshot shows the MCP Software Configuration Guide V5.40 R0 interface. The top navigation bar includes icons for User Screens, Trends, Reports, Operator Notes, Connections, ARRM Status, Point Details, Logs, History Events, SOE, and Active Alarms. The main content area is titled 'Settings' and includes a 'Commit Changes' button and a 'Discard Changes' button. Below this, there are tabs for 'Access' and 'Utilities'. The 'Utilities' tab is selected, showing a 'Save' button and a list of configuration options: 'User Management', 'Authentication', 'Automatic Login', and 'VPN Client List'. The 'Authentication' option is selected, showing a dropdown menu for 'Authentication Mode' set to 'Cisco Security ACS(TACPLU...'. Below this, there is a table with columns 'Name' and 'Value'.

Name	Value
Primary Host IP Address(*)	172.12.235.67
Secondary Host IP Address	
Enable Encryption	true
Shared Secret(*)	*****
Reporting of Remote Host IP	true

NOTE: If working in redundancy, above configuration need to be done in both Active and Standby devices.
At least one emergency admin user needs to be configured in Emergency users.
Remote authentication server should be up and running.

Configure IP Address of PEER Gateway: Use this function to set the unique IP Address of the other MCP device configured within the redundant system. If the PEER MCP has a second Ethernet interface, you can configure it as well. The adapter IP Addresses of the PEER MCP must be entered here (see the *Ethernet Connections* topic in the MCP online help).

NOTE: In redundancy, both MCPs must be configured with the same authentication mode (i.e., either Local or Remote). Setup Public Key authentication with PEER Gateway.

How Cisco TACACS+ privilege levels are configured has changed slightly to accommodate the "SSHPassThrough" group. Refer to Cisco TACACS+ for information on configuring your TACACS+ server.

The following table provides an example of configuring Cisco TACACS+ including new user privilege level "SSHPassThrough":

User	MCP Group ID	Cisco TACACS+ privilege level
Observer	501	0 -3
Operator	502	4-7
Supervisor	503	8 -11
SSHPassThrough	504	12
Administrator	0	14-15
Rdtunnel	507	13

The **Lightweight Directory Access Protocol (LDAP)** remote authentication mode requires the following settings:

- Full Qualified Domain Name FQDN of LDAP server.
- LDAP server IP Address – valid IPV4 address
- LDAP authentication mechanism (TLS or SSK) and the configured port number. For example, for the Windows Active Directory:
 - Portnumber = 389 for TLS communication
 - Portnumber = 636 for SSL communication
- Bind username (in DN format) & password.
 - For example: Bind Username (in DN format) = cn=MCPadmin,cn=Users,dc=central,dc=home
- LDAP search base directory in DN format. For example: dc=central,dc=home
- LDAP user ID attribute map. For example: sAMAccountName or uid for the Windows Active Directory.
- LDAP homeDirectory attribute map. For example: unixHomeDirectory for the Windows Active Directory.
- Test the LDAP Server to validate the user configured LDAP details and its connectivity. If the LDAP configuration is invalid, an error message displays to correct the configuration details and to avoid the user from locking down to access MCP.
- Enable the LDAP Server Authentication Mode to configure the LDAP certificate with the LDAP server.

Refer to the SWM0111, SWM0112, SWM0113 “Configuring the MCP device for Centralized LDAP Authentication” for additional information on configuring your LDAP Server.

NOTE: In redundancy, both MCPs must be configured with the same authentication mode (i.e., either Local or Remote) and user need not do “Setup Public Key authentication with PEER Gateway” while switching from Local to Remote authentication and vice versa.

Also, when authentication is switched from Local to Remote or Remote to Local, user must navigate to Redundancy Manager Point details page in Active MCP and apply DO command on "Sync Config" DO pseudo point so synchronize the authentication settings to the Standby MCP.

Setting Up a User Account

You can manage user accounts by:

- [Adding a User](#)
- [Changing a User Account](#)
- [Deleting a User](#)
- [Changing User Access Levels](#)

User assigned access level appears in the top right corner of the title bar of the MCP HMI screen when you log in. User access levels are configured on the **User Management** tab in the **Configuration Tool** → **Access tab**.

Secure Access

NOTICE**SECURITY NOTICE**

The default secure services that MCP employs are HTTPS, SFTP, and SSH.

The SFTP, and SSH services are automatically configured by default.

The HTTPS service is enabled by default. It is the user's responsibility to install a server certificate.

Software Licensing Tools for MCP

The MCP contains a set of utilities to manage software licensing for optional applications and features. Licensing is controlled through a single license file stored on your MCP.

» To unlock an application using a license code:

1. Start a terminal session and log into the MCP with an Administrator-level user account.
2. At the prompt, enter the following commands
**cd /home/MCP_APPS/
sudo ./swlic-unlock -l <26 digit license code>**

NOTE: The parameter -l above is a lower-case letter "L"

3. Reboot the MCP device.

Result: The feature is unlocked and available for use.

» To update existing MCP licenses using a batch file:

GE Vernova Grid Solutions can issue a batch license file, which contains licenses for multiple MCP units associated with a given Customer account. This is useful when updating licensing features across many MCP units or when licensing several applications on one MCP unit. The batch license file must be placed in the root of a USB drive.

Important: The batch license workflow is intended for updates. This requires the MCP device has a valid license file already present before the update begins. This is because the batch file uses the serial number of the MCP to determine which licenses to install, and that serial number is only in the license file (i.e. the serial number of the MCP is not available to the software by any other means).

1. Start a terminal session and log into the MCP with an Administrator-level user account.
2. Connect a USB drive containing the MCP batch license file.
3. At the prompt, enter the following commands
**cd /home/MCP_APPS/
sudo ./swlic-batch**
4. Reboot the MCP device.

Result: The tool locates the license file and licenses all applicable features for the current MCP. Repeat steps 1 to 3 for each remaining MCP unit.

Successful example messages:

```
[sudo] password for admin:
#####
                Install Batch License File
#####
Mounting the usb. It will take few seconds
Please wait
Searching for serial number <this serial number>
Found Serial number record
Success : License file updated
License installation successful
USB drive may now be removed
```

Failed example messages:

```
[sudo] password for admin:
#####
                Install Batch License File
#####
Mounting the usb. It will take few seconds
Please wait
Searching for serial number <this serial number>
Could not find record in batch file for this unit
Failed to install license
USB drive may now be removed
```

» To view detailed information on your MCP license:

1. Start a terminal session and log into the MCP with an Administrator-level user account.
2. At the prompt, enter the following commands
cd /home/MCP_APPS/
sudo ./swlic-report

Result: The application output shows the MCP ownership information and a list of available features. Each item under Application License represents an application or feature that can be licensed. They are shown in the format:

Application ID number: Description of feature | License status

There are four possible license statuses:

Table 6-311: MCP License Statuses

License Status	Description
Unlocked	The feature has been licensed and is available for use.
Trial Disabled	A trial license is available for this feature. To enable, see the instructions below.
Trial Enabled (Expires YYYY-MM-DD)	The feature is available for use under a temporary trial license. The license expires on the date shown.
Disabled	A trial license was used, and the feature has now been disabled. This feature cannot be re-activated unless a license is purchased.

Entries shown as "Unknown" indicate the licensed function is not available in this firmware version.

» To enable a trial license for an application or feature:

A 30-day trial license can be obtained for any application listed as Trial Disabled in the Application License report.

1. Start a terminal session and log into the MCP with an Administrator-level user account.
2. At the prompt, enter the following commands

```
cd /home/MCP_APPS/  
sudo ./swlic-trial -id <ID number>
```

NOTE: <ID number> is either the 3 numerical digit associated with application licenses, or a 4 characters identifier starting with "C" for container licenses.

The <ID number> for licenses that can be trial enabled can be obtained using no id parameter:

```
sudo ./swlic-trial
```

3. Reboot the MCP device.

Result: The 30-day trial license is enabled for the feature. Once the 30 days has elapsed, the feature is disabled. A trial license can only be enabled once for each feature.

» To obtain information about your MCP:

Some older MCP units may not contain a license file. In this case, Technical Support can generate a replacement license file for you. To do this, you must provide unique identifying information about your MCP.

1. Start a terminal session and log into the MCP with an Administrator-level user account.
2. At the prompt, enter the following commands

```
cd /home/ MCP_APPS/  
sudo ./swlic-info
```

3. Provide the information shown to Technical Support.

» DSAS based workflow

Users have the possibility to read/extract/apply licenses to MCP using the Licensing option available in the DSAS Configuration Tool.

To access these options:

1. Open Device Properties for your DSAS offline Device in your Project. If one was not created, please follow the normal workflow to create one.

2. Go to the Licensing tab.

3. Under License Management there are the following buttons:
- [Read License](#)
 - [Extract License](#)
 - [Apply License](#)
 - [Refresh License Information](#)
4. When user clicks on any of the buttons, a login dialog is prompted to connect to MCP with Administrator privileges (this role is required to access any of the licensing information).
5. After successful authentication, user is authorized to access the license information. If the user stays within this tab, subsequent button actions will not prompt again to login.

Read License

This option displays the license information of the live target unit (connected MCP device).

Displayed information may be copied to the Windows Clipboard with regular actions (mouse click and drag or CTRL+A to select, right click or CTRL+C to copy).

Extract License

This option allows user to extract the current license file from the live target unit to a specified PC location, for example to archive a copy.

The extracted license file is saved as a *.key file (default name is license but can be changed as desired).

Apply License

This option allows user to apply a compatible license key, from a location in the PC, to the live target unit.

NOTE: The live target unit is restarted at the end of this process, not immediately, and only if a hardware compatible license file was selected.

When browsing for license files, user must select the folder containing one or more license files. The action does not include sub-folders of the selection.

In the resulting dialog only license files (any filename) that match the Hardware Identifier of the live target unit are displayed for selection. This is the reason why users must first login to the live device as Administrators.

Both MCP and D2x license files are shown, the D2x ones typically end in -D (if present).

Maximum one MCP and one D2x license can be selected at same time.

If the selected folder has no license compatible with the connected live unit, an information dialog is presented to this effect:

If a valid license file has been selected it will be applied and the device restarts:

The workflow to apply a license can be cancelled at any time before selecting a valid license and click on OK.

Refresh License Information

Refresh License Information should be used only when license.key file has been deployed to target device outside of DSAS and the device was not yet restarted – causing DSAS to not be able to read the license information.

Software Licensing Tools for D2X

NOTICE

D2x License files can be deployed to G100 v4.00 – however the D2x functionality is not present in G100 v4.00.

Starting with MCP v4.00 the D2X function inside MCP contains a set of utilities to manage software licensing for optional applications and features. Licensing is controlled through a single license file stored on your MCP.

» To unlock an application using a license code:

1. Start a terminal session and log into the MCP with an Administrator-level user account.
2. At the prompt, enter the following commands
`cd /home/MCP_APPS/
sudo ./d2xswlic-unlock -l <26 digit license code>`

NOTE: The parameter -l above is a lower-case letter “L”

Result: The feature is unlocked and available for use.

» To update existing D2X licenses using a batch file:

GE Vernova Grid Solutions can issue a batch license file, which contains licenses for multiple MCP units associated with a given Customer account. This is useful when updating licensing features across many MCP units or when licensing several applications on one MCP unit. The batch license file must be placed in the root of a USB drive.

Important: The batch license workflow is intended for updates. This requires the MCP device has a valid license file already present before the update begins. This is because the batch file uses the serial number of the MCP to determine which licenses to install, and that serial number is only in the license file (i.e. the serial number of the MCP is not available to the software by any other means).

1. Start a terminal session and log into the MCP with an Administrator-level user account.
2. Connect a USB drive containing the MCP batch license file.
3. At the prompt, enter the following commands
`cd /home/MCP_APPS/
sudo ./d2xswlic-batch`

Result: The tool locates the license file and licenses all applicable features for the current MCP. Repeat steps 1 to 3 for each remaining MCP unit.

Successful example messages:

```
[sudo] password for admin:
#####
                Install Batch License File
#####
Mounting the usb. It will take few seconds
Please wait
Searching for serial number <this serial number>-D
Found Serial number record
Success : License file updated
```

License installation successful
USB drive may now be removed

Failed example messages:

[sudo] password for admin:

```
#####
                Install Batch License File
#####
```

Mounting the usb. It will take few seconds

Please wait

Searching for serial number <this serial number>-D

Could not find record in batch file for this unit

Failed to install license

USB drive may now be removed

» To view detailed information on your D2X license:

1. Start a terminal session and log into the MCP with an Administrator-level user account.
2. At the prompt, enter the following commands
**cd /home/MCP_APPS/
sudo ./d2xswlic-report**

Result: The application output shows the D2X license information and a list of available features. Each item under Application License represents an application or feature that can be licensed. They are shown in the format: *Application ID number: Description of feature | License status*

There are four possible license statuses:

Table 6-312: D2X License Statuses

License Status	Description
Unlocked	The feature has been licensed and is available for use.
Trial Disabled	A trial license is available for this feature. To enable, see the instructions below.
Trial Enabled (Expires YYYY-MM-DD)	The feature is available for use under a temporary trial license. The license expires on the date shown.
Disabled	A trial license was used, and the feature has now been disabled. This feature cannot be re-activated unless a license is purchased.

Entries shown as "Unknown" indicate the licensed function is not available in this firmware version.

» To enable a trial license for an application or feature:

A 30-day trial license can be obtained for any application listed as Trial Disabled in the Application License report.

1. Start a terminal session and log into the MCP with an Administrator-level user account.
2. At the prompt, enter the following commands
**cd /home/MCP_APPS/
sudo ./d2xswlic-trial -id <ID number>**

NOTE: <ID number> is either the 3 numerical digit associated with application licenses, or a 4 characters identifier starting with "C" for container licenses.

The <ID number> for licenses that can be trial enabled can be obtained using no id parameter:

sudo ./d2xswlic-trial

Result: The 30-day trial license is enabled for the feature. Once the 30 days has elapsed, the feature is disabled. A trial license can only be enabled once for each feature.

» To obtain information about your D2X inside MCP:

Below commands provide unique identifying information about your D2X inside MCP.

1. Start a terminal session and log into the MCP with an Administrator-level user account.
2. At the prompt, enter the following commands
**cd /home/ MCP_APPS/
sudo ./d2xswlic-info**
3. Provide the information shown to Technical Support.

» DSAS based workflow

Starting with MCP V4.00 users have the possibility to read/extract/apply D2X licenses to MCP using the Licensing option available in the DSAS Configuration Tool. This is available only if the configured device function is D or C.

To access these options:

1. Open Device Properties for your DSAS offline Device in your Project. If one was not created, please follow the normal workflow to create one.
2. Go to the Licensing tab.

3. Under License Management there are the following buttons:
 - a. [Read License](#)
 - b. [Extract License](#)
 - c. [Apply License](#)
 - d. [Refresh License Information](#)
4. When user clicks on any of the buttons, a login dialog is prompted to connect to MCP with Administrator privileges (this role is required to access any of the licensing information).
5. After successful authentication, user is authorized to access the license information. If the user stays within this tab, subsequent button actions will not prompt again to login.

Read License

This option displays the license information of the live target unit (connected MCP / D2x device). Both MCP and D2x licenses reports are shown (D2x is under the MCP-D Target Unit – if present).

Displayed information may be copied to the Windows Clipboard with regular actions (mouse click and drag or CTRL+A to select, right click or CTRL+C to copy).

License created from   : License Utilities V1.0.4
=====
```

Extract License

This option allows user to extract the current license file from the live target unit to a specified PC location, for example to archive a copy.

The extracted license file is saved as a *.key file (default name is license but can be changed as desired).

This applies to both MCP and D2x licenses (if present).

Apply License

This option allows user to apply a compatible license key, from a location in the PC, to the live target unit.

NOTE: The live target unit is restarted at the end of this process, not immediately, and only if a hardware compatible license file was selected.

When browsing for license files, user must select the folder containing one or more license files. The action does not include sub-folders of the selection.

In the resulting dialog only license files (any filename) that match the Hardware Identifier of the live target unit are displayed for selection. This is the reason why users must first login to the live device as Administrators.

Both MCP and D2x license files are shown, the D2x ones end in -D (if present).

Maximum one MCP and one D2x license can be selected at same time.

If the selected folder has no license compatible with the connected live unit, an information dialog is presented to this effect:

If a valid license file has been selected it will be applied and the device restarts:

The workflow to apply a license can be cancelled at any time before selecting a valid license and click on OK.

Refresh License Information

Refresh License Information should be used only when license.key file has been deployed to target device outside of DSAS and the device was not yet restarted – causing DSAS to not be able to read the license information.

Firewall Settings

The MCP contains a firewall capable of stateful packet inspection to protect your device from unauthorized access. By default, network interfaces on the MCP drops packets that are determined to be invalidly routed or unsolicited.

NOTICE

SECURITY NOTICE

The MCP firewall is intended only to protect itself and does not extend protection to other devices on the network. As such, it does not replace the need for a network firewall which offers deep packet inspection and detailed configuration capabilities.

The MCP firewall is automatically configured by default to its most secure setting. The user assumes all responsibility for associated security risks if the firewall configuration is manually changed.

It is the user's responsibility to connect Internal zone interfaces to networks that are protected from unauthorized use.

The MCP firewall is intended only to protect itself and does not extend protection to other devices on the network. As such, it does not replace the need for a network firewall which offers deep packet inspection and detailed configuration capabilities.

Network interfaces can operate in one of two modes:

- Internal - The Internal mode permits traffic from known protocols and should only be enabled on interfaces connected to known devices only. The Internal mode is the default mode for Net0, Net1 and would typically be used when the interface is connected to the substation LAN.
- External - The External mode offers a stricter set of rules and is the default mode for all interfaces except Net0 and Net1. The External mode would typically be used when the interface is connected to a WAN.

Default modes can be changed by user.

To configure Firewall via mcpcfg, refer Configure Firewall or via Settings GUI, refer Configure Firewall.

Automatic logout

For security, the MCP includes a configurable automatic logout feature. You are automatically logged out of the MCP system when the [Inactivity timeout period](#) is reached.

Thirty seconds before the configured inactivity timeout period is to expire, a warning message appears asking you whether you wish to continue. Click **Renew Session** to continue using the HMI.

When an automatic logout occurs, a message appears indicating that you have been disconnected from the MCP and you are prompted to close your Web browser.

» To log back in:

- Re-open your runtime HMI and [log in](#) as usual.

System Utilities

This chapter contains the following sections and sub-sections:

Utilities

Utilities Log In

Certificate Import

[Diffie Hellman parameter files](#)

[Private key file](#)

Certificate Management

[Local tab](#)

[Issuer tab](#)

[CRL tab](#)

[Certificate Error Codes](#)

Export Database

[Export Database](#)

[Export Database .CSV Files](#)

Generate Gateway Key Pair

Exporting VPN Client Configuration File

Upload SSL server Certificate/Server Key

Utilities

The **Utilities** page provides access to software tools installed on your MCP device. All available utilities are listed along with a description of the functionality they provide.

NOTE: Except Login to the MCP utility other configuration options are only supported through Local HMI of MCP and not available either in MCP Remote HMI or MCP Offline Configuration Tool.

The following related actions can be performed:

Login to the MCP utility functions	This Utility is used for an SSH (Secure Shell) terminal session to the MCP. To login you must have Administrator access and your username and password.
Import Certificates	Import certificates and Certificate Revocation Lists (CRLs) from an externally mounted filesystem or the local import directories.
Manage Certificates	Manage Local Certificates, Issuer Certificates, and Certificate Revocation Lists.
Export Database utility	Export/Backup Local Database.
Generate Gateway Key Pair	Generate Public/Private key pairs in the Gateway/MCP for the SSH terminal session or SFTP. This utility provides an option to: • Save the generated Public key to the host computer. • Delete the existing keys.
Exporting VPN Client Configuration File	Export the VPN Client Configuration File into a PC/Shared Location/USB. The VPN Client File is used to configure the VPN Client to establish VPN connection with the VPN server running in the MCP. You must install a Server Certificate prior to exporting the VPN Client File. Go to the Configuration power bar button > Communications tab, and then select Network Connection and Network Connection Type: VPN Server .

Utilities Log In

For security reasons, some advanced MCP configuration and system administration functions are available only at the MCP command line interface. In MCP versions up to and including V510, the **Utilities** page provides a Secure Shell (SSH) login to establish a remote terminal session with the MCP. Alternatively, you may use the MCP Secure Terminal Emulator (see [Appendix B](#)) to establish a remote terminal session via SSH with the MCP. You must have Supervisor-level access to proceed with Utilities Log In. Access to the command line interface requires an additional Administrator log in.

If the **Utilities** page displays an **SSH** button, the security portal has been configured for a Secure Shell (SSH) login.

» To log in:

1. Click **SSH**.
2. Enter your Administrator username.
3. Click **OK** to verify the MCP unit name.
4. Acknowledge the security message.
5. Enter your administrator password.

Result: The command line interface appears.

Certificate Import

The **Certificate Import** window allows you to copy local certificates, issuer certificates, and certificate revocation lists (CRLs) from a connected USB drive or from the user CompactFlash card. These certificates and revocation lists are used to facilitate [secure connections](#) to remote devices.

Your local certificate may or may not contain Diffie Hellman parameters, the private key, and/or the issuer chain. In the event these are not included within your local certificate, you can install them using the procedures specified below.

Diffie Hellman parameter files

If a cipher that uses the Diffie Hellman key exchange protocol is used (such as those shown in the HMI with a prefix of *dhe*), the associated Diffie Hellman parameters must be available on the MCP. These parameters are either provided as part of the local certificate file or in a separate file. If the parameters are included in the local certificate file, no further action is required after the certificate is installed. If the parameters are in a separate file, it can be stored in the same location as the local certificate (with the same basename) and it will be automatically installed when the local certificate is imported. If multiple files containing Diffie Hellman parameters are found, the one with the largest key size is imported.

Private key file

When a local certificate is installed on a MCP, the associated private key must also be made available. The private key is either provided as part of the local certificate file or in a separate file. If the key is included in the local certificate file, no further action is required after the certificate is installed. If the key is in a separate file, it can be stored in the same location as the local certificate (with the same base name) and it is automatically installed when the local certificate is imported.

» To import certificates:

1. Plug a USB drive containing the certificates, CRLs, Diffie Hellman parameter files, or private key files in a root folder called *SecureScadaTransfer* into one of the USB ports
or
Copy the files to the */mnt/usr/SecureScadaTransfer/* folder using a utility such as Secure File Browser from DS Agile MCP Studio. Note that the local USB method is more secure than transferring the files over an unprotected Ethernet connection.
2. On the [Utilities](#) page, click the **Import** button that is shown under the *Certificate Import* heading.
3. The **Certificate Import** window opens and displays the progress of the task. Once the files have been imported, a message is shown indicating the number of items that were successfully copied over.
4. Close the **Certificate Import** window.
5. Disconnect the USB drive
or
Close the SCP connection to the MCP.

Once the certificate files have been imported to the MCP, they must be installed using the [Certificate Management](#) window on the [Utilities](#) page. You must install these files within 96 hours of importing them or else they are automatically deleted. For more details, refer to [Appendix G - Security Certificates Creation for MCP](#).

Certificate Management

The **Certificate Management** window allows you to install the local certificates, issuer certificates, and certificate revocation lists (CRLs) that have been copied to the MCP using the [Certificate Import](#) utility. Diffie Hellman parameter files and private key files are automatically installed when they are imported using this tool. For more details, refer to [Appendix G - Security Certificates Creation for MCP](#).

To enable [connection security](#), you must have:

- A local certificate installed
- An issuer certificate available for all certificate authorities used by remote devices

Certificates belonging to remote devices are transferred automatically when the secure connection is established, so they do not need to be managed using this utility.

Local tab

The **Local** tab contains the certificate that is provided to remote devices to allow them to verify the identity of the MCP unit. The *Staged Local Certificates* area shows all the local certificates that have been copied to the MCP. Select one and click the **Install** button to install it as the local certificate. Though there is no limit on the number of local certificates that can be staged, only one can be installed on the MCP device at any time.

Issuer tab

The **Issuer** tab contains the certification authority certificates that are used by the MCP to verify the integrity of certificates provided by remote devices. Refer to the [Connection Security](#) section for an explanation of how issuer certificates are used. You must install the issuer certificate belonging to the provider of the identity certificate of each remote device you are connecting to. However, multiple devices can refer to the same issuer certificate if the same issuer was used.

The *Staged Issuer Certificates* area shows all the issuer certificates that have been copied to the MCP. Select one and click the **Install** button to install it. Though there is no limit on the number of issuer certificates that can be staged, only one certificate per issuer can be installed at any time (up to a maximum of 32 issuers).

NOTE: You must install all the certificates in the issuer chain. For example, you may be using an intermediate signing certificate provided by a certificate authority to issue your own certificates for remote devices. In this case, you would need to install both the intermediate signing certificate and the issuer's root certificate.

CRL tab

The **CRL** tab contains certificate revocation lists provided by third party certificate issuers. These lists are used to revoke invalid certificates that were previously issued under the authority of the issuer. By maintaining accurate CRLs, you can ensure that revoked certificates are not accepted. The *Staged CRLs* area shows all the CRLs that have been copied to the MCP. Select one and click the **Install** button to install it. Though there is no limit on the number of CRLs that can be staged, only one CRL per issuer can be installed at any time.

Certificate Error Codes

Table 6-313: Certificate Error Codes

Error Number	Message	Description
2	unable to get issuer certificate	The issuer certificate of a looked-up certificate could not be found. This normally means the list of trusted certificates is not complete.
3	unable to get certificate CRL	The CRL of a certificate could not be found.
4	unable to decrypt certificate's signature	The certificate signature could not be decrypted. This means that the actual signature value could not be determined, rather than it did not match the expected value. This only applies to RSA keys.

Error Number	Message	Description
5	unable to decrypt CRL's signature	The CRL signature could not be decrypted. This means that the actual signature value could not be determined, rather than it did not match the expected value. Not used.
6	unable to decode issuer public key	The public key in the certificate SubjectPublicKeyInfo could not be read.
7	certificate signature failure	The signature of the certificate is invalid.
8	CRL signature failure	The signature of the CRL is invalid.
9	certificate is not yet valid	The certificate is not yet valid; that is, the notBefore date is after the current time.
10	certificate has expired	The certificate has expired; that is, the notAfter date is before the current time.
11	CRL is not yet valid	The CRL is not yet valid.
12	CRL has expired	The CRL has expired.
13	format error in certificate's notBefore field	The certificate notBefore field contains an invalid time.
14	format error in certificate's notAfter field	The certificate notAfter field contains an invalid time.
15	format error in CRL's lastUpdate field	The CRL lastUpdate field contains an invalid time.
16	format error in CRL's nextUpdate field	The CRL nextUpdate field contains an invalid time.
17	out of memory	An error occurred trying to allocate memory. This should never happen.
18	self-signed certificate	The passed certificate is self-signed, and the same certificate cannot be found in the list of trusted certificates.
19	self-signed certificate in certificate chain	The certificate chain could be built up using the untrusted certificates, but the root could not be found locally.
20	unable to get local issuer certificate	The issuer certificate could not be found: this occurs if the issuer certificate of an untrusted certificate cannot be found.
21	unable to verify the first certificate	No signatures could be verified because the chain contains only one certificate and it is not self-signed.
22	certificate chain too long	The certificate chain length is greater than the supplied maximum depth. Unused.
23	certificate revoked	The certificate has been revoked.
24	invalid CA certificate	A CA certificate is invalid. Either it is not a CA or its extensions are not consistent with the supplied purpose.
25	path length constraint exceeded	The basicConstraints pathlength parameter has been exceeded.
26	unsupported certificate purpose	The supplied certificate cannot be used for the specified purpose.
27	certificate not trusted	The root CA is not marked as trusted for the specified purpose.
28	certificate rejected	The root CA is marked to reject the specified purpose.

Error Number	Message	Description
29	subject issuer mismatch	The current candidate issuer certificate was rejected because its subject name did not match the issuer name of the current certificate. Only displayed when the -issuer_checks option is set.
30	authority and subject key identifier mismatch	The current candidate issuer certificate was rejected because its subject key identifier was present and did not match the authority key identifier current certificate. Only displayed when the -issuer_checks option is set.
31	authority and issuer serial number mismatch	The current candidate issuer certificate was rejected because its issuer name and serial number was present and did not match the authority key identifier of the current certificate. Only displayed when the -issuer_checks option is set.
32	key usage does not include certificate signing	The current candidate issuer certificate was rejected because its keyUsage extension does not permit certificate signing.
50	application verification failure	An application specific error. Unused.

Export Database

Export Database

The Database Export utility allows you to save sequence of events and analog data logger points from your MCP device to your local computer in comma-separated values (CSV) format.

» **To export data using the Export Database utility:**

1. Click the **Export Database > Export (button)** on the **Utilities** page.
Result: The Export Database utility is launched in a new window.
2. Click the ellipsis button (...) next to the **Path** field and select the directory where the .csv files is to be stored.
NOTE: In Local HMI, the logs (.csv files) must be exported to **/home/hmi/logs** or into the USB mounted on the MCP.
3. Enter the **Start Date** using the pattern shown in the field or select **Earliest Record**.
4. Enter the **End Date** using the pattern shown in the field or select **No End Date**.
5. Select the data sources to be exported. If **Sequence of Events** is selected, all SOE data within the configured time limit is included. If **Analog Datalogger** is selected, a tree view is shown allowing you to select the specific points, reports, or report types to be included.
6. Click the **Extract** button.

The status bar displays the progress of the operation. All downloaded files are stored in a sub-folder within the configured path (the name of the subfolder is the date and time of the export). Once the export task is complete, the status bar shows the message, *<Time and date> Download Complete*.

Refer to [Export Database CSV Files](#) for an explanation of the files that may have been exported.

NOTES:

- The Export Database utility does not support simultaneous export by multiple users. You should verify that no other export operations are in progress before beginning a new one.

- If no data logger records exist within the selected time limit, the exported file contains one entry that shows the first available value before the selected start time. This does not apply to SOE records.
- In Local HMI, the logs (.csv files) must be exported to **/home/hmi/logs** or into the USB mounted on the MCP.

» **To download all records that have been created since your last export:**

1. Select the path where you stored the files from the previous export. You should select the higher-level directory and not the subfolder containing the CSV files that were downloaded.
2. Click the **Load Settings** button. The options that were previously selected are restored.
3. Ensure that the **Continue from last download** checkbox is enabled. This automatically downloads the new records.

If the selection of data sources is changed, the **Continue from last download** feature is not available.

4. Click the **Extract** button.

This procedure can be repeated as often as desired to keep the local export files current. As before, all downloaded files are stored in a new subfolder within the configured path (the name of the subfolder is the date and time of the export).

Interrupted Transfers

If an export is cancelled or interrupted before all records are transferred, one of two actions may occur.

- If an SOE export was interrupted, there is no option to resume the export. You can either overwrite the partially downloaded file with new data or you can save the new data file in a different directory.
- If a Data Logger export was interrupted, a warning message appears during the next export operation. If you click **Yes**, the utility completes the download that was interrupted using the previously configured options (any new options selected are ignored). If you click **No**, the utility exports the data from the beginning based on the settings configured. You can choose to overwrite the existing partial data files or to save them in a different directory.

Export Database .CSV Files

The following files are created when the [Export Database](#) utility is used to export data from your MCP device.

In Local HMI, the logs (.csv files) must be exported to **/home/hmi/logs** or into the USB mounted on the MCP.

Sequence of Events

SOE data is exported directly from the MCP system database to a single .csv file.

SOEvents.csv

Table 6-314: Sequence of Events

Field	Description
Record ID	A unique numerical identifier for the record.
Source Point ID	The unique numerical identifier of the point referenced in the record.
Source Point Reference	The short user-defined name for the source point.
Source Point Description	The user-defined block of text that provides a detailed and localized description of the source point.
Point Type	The type of point that the source point is, either single or double point.

Field	Description
Event Value	The binary state of the point, either 0 or 1. For the Double Point, the value of the state is 2 to 5, where - State 2 = Open - State 3 = Close - State 4 = In transit - State 5 = Invalid
Event Date	The date and time of the record.
Originator	The source of the control command. See Originators for more information. 0 indicates "Not Supported".
Quality	For most events, this field equals 32768 or 0. If this field contains 32768, the time values in the <i>EventSec</i> , <i>EventuSec</i> , and <i>EventTimeVal</i> fields were populated based on the time stamp from the device. If this field contains 0, the protocol reporting the event does not support time stamps, so the event was time stamped by the MCP when it was received from the device. In some places, quality attributes (flags) are presented as a numeric value instead of a list of discrete flags. To determine which quality flags are set, refer to the Quality Attributes section on page no. 171.
State Description	The user-defined description for the binary state of the point.
Home Directory	The Home Directory of the device or application that generated the record.
Line ID	The user-defined line ID for the device or application that generated the record.
Device ID	The user-defined ID for the device or application that generated the record.
Bay ID	The user-defined bay ID for the device or application that generated the record.
Device Type	The user-defined map file or device type, as applicable

NOTE: In Local HMI, the logs (.csv files) must be exported to **/home/hmi/logs** or into the USB mounted on the MCP.

Data Logger

Data logger records are exported across several .csv files. These relational tables can be linked together using several fields.

Figure 6-9: Data Logger - Data Flow

The Loggers.csv file contains one row for each trend exported from the Data Logger. Each logger row can be linked to a report using the *Report ID* field (linked to the *ID* field in Reports.csv), to a point in the points table with the *Point ID* field (linked to the *ID* field in Points.csv), and to the dataset itself, which is stored in a file called Records_*n*.csv, where *n* is the ID field in Loggers.csv.

Reports.csv

This csv report file contains information on all exported Data Logger reports.

Table 6-315: Data Logger - Reports

Field	Description
ID	A unique numerical identifier for the report.
Type	The report type, either: - ContinuousReport, - PeriodicReport, or - OutOfRangeReport.
Name	The user-defined name for the report.
Active	Whether the report is enabled on the MCP device, either <i>Active</i> , or <i>Deactivated</i> .
inTriggeredState	Records if the report was in the Triggered state at the time of export, either <i>TRUE</i> or <i>FALSE</i> .
File Size	The amount of disk space, in bytes, allocated for the report within the Data Logger Configuration Tool on the MCP device.
Usage	The amount of disk space, in bytes, the report is currently consuming.
Percentage	The percentage of disk space used by the report divided by the amount of disk space allocated for it.

Points.csv

This csv report file contains a listing of all unique points referenced in the reports. Though points may be referenced multiple times in different reports, they only appear once in this file.

Table 6-316: Data Logger - Points

Field	Description
ID	A unique numerical identifier for the point.
DataType	The data type of the point, currently only <i>ANALOG_IN</i> is supported.
IED	The user-defined name for the device that contains the point.
Point Ref	Point Reference, the short user-defined name for the source point.
PointDescription	The user-defined block of text that provides a detailed and localized description of the source point.
numLoggers	The number of loggers assigned to this point.

Loggers.csv

This csv report file contains a listing of all the trends that were exported. There is one record for each point in each report (that is, points referenced in multiple reports are repeated in this table).

Table 6-317: Loggers

Field	Description
ID	A unique numerical identifier for the logger. The number shown here corresponds to <i>Records_n.csv</i> , which contains the dataset for this logger.
ReportID	A numerical reference to the ID field in the <i>Reports.csv</i> file.
PointID	A numerical reference to the ID field in the <i>Points.csv</i> file.
OldestRecordID	The ID of the oldest record contained in the corresponding <i>Records_n.csv</i> file.
OldestTime	The timestamp of when the oldest record was created (based on the MCP device clock).
OldestMSecs	The milliseconds portion of the <i>oldestTime</i> timestamp (based on the MCP device clock).

Field	Description
NewestRecordID	The ID of the newest record contained in the corresponding <i>Records_n.csv</i> file.
NewestTime	The timestamp of when the newest record was created (based on the MCP device clock).
NewestMSecs	The milliseconds portion of the <i>newestTime</i> timestamp (based on the MCP device clock).

Records_n.csv

One .csv file is created for each logger trend above. The *n* in the filename corresponds to the *ID* field shown in the *Loggers.csv* file.

Table 6-318: Records_n

Field	Description
ID	A unique numerical identifier for the row.
Time	The timestamp of when the record was created (based on the MCP device clock).
MSecs	The milliseconds portion of the timestamp (based on the MCP device clock).
Value	The recorded value.
Quality	The recorded quality flag , if available.

Generate Gateway Key Pair

Generate Public/Private key pairs in the Gateway/MCP for the SSH terminal session or SFTP.

This utility provides an option to:

- Save the generated Public key to the host computer
- Delete the existing keys

Exporting VPN Client Configuration File

The VPN client configuration file is generated by the MCP. This client configuration is archived with password protection into a file and exported into a PC or a shared location using option Export VPN Client

File from the Utilities button .

To export a VPN Client file:

1. Go to Export VPN Client File option and click the **Export** button.

2. Select the Client from configured drop-down list of configured Clients.

3. Select the Local Gateway IP Address to which the VPN Client will need to connect from the list of Configured IP Address of the MCP.

4. Enter the Password to save the Client Configuration file in protected & compressed format. You need to use the same password to uncompress the Client configuration file using 7Zip or WinRAR software.

- Securely save the file into a PC/Shared Location/USB.

NOTE: Exporting VPN Client Configuration options is also available through File Explorer functionality in Local HMI. The compressed Client Configuration file is available in the USB.

Upload SSL server Certificate/Server Key

When MCP first time boots up, it will create a default SSL server certificate and server key for HTTPS communication. Alternatively, the MCP allows users with administrator privilege to upload their own SSL server certificate and private key by using DSAS (method 1) or Local HMI Utilities (method 2).

In the MCP, a p12 file (RFC 7292 – PKCS #12: Personal Information Exchange Syntax v1.1) is used for the certificate and private key transfer. Create the p12 file by exporting the server certificate and its private key. The MCP supports the password privacy and password integrity modes defined by PKCS#12, and they must share the same password.

When creating a p12 file you will be asked to create an export password. You will be prompted for this password later.

Method 1: To upload SSL Server Certificate/Server Key from DSAS:

- Go to “Upload SSL Server Certificate/Server Key” option and click the **Upload** button.

2. Select the p12 file by clicking the **File** button and then input/confirm the export password. Then click the **“Upload”** button to start uploading the bundle.

3. Then a warning window will pop up. If you understand and accept, then click “Yes” button to proceed.

If the upload succeeds, the current online editor will be closed automatically. You will need to reconnect to the MCP due to the new p12 file being applied.

Method 2: To upload SSL Server Certificate/Server Key from the Local HMI:

1. Copy the p12 file to a USB flash drive formatted with FAT32 (must have a partition table).
2. Insert the USB flash drive into a USB slot on the MCP.
3. Open the file explorer from the top Power Bar and select **Mount USB**.
4. Go to “Upload SSL Server Certificate/Server Key” option and click the **Upload** button.

5. Select the p12 file by clicking the **File** button and browse to the USB flash drive. Input/confirm the export password, and then click the **“Upload”** button to start uploading the p12 file.

6. Then a warning window will pop up. If you understand and accept, then click “Yes” button to proceed.

There is no need to restart the local HMI because it uses an internal connection, which does not require a certificate.

Miscellaneous Utilities

This chapter contains the following sections:

[Utilities Overview](#)

[Setting up a Terminal Session](#)

[Pass-Through Connections](#)

[Direct Connect \(mcpconnect\)](#)

[MCP Configuration Manager](#)

Utilities Overview

Configuration information related to the MCP system is changed using utility programs that are installed on the MCP platform.

The MCP system utilities are typically used during the initial setup of the MCP and for changing the basic configuration of the system, including the network connections, system date and time, and administrator passwords.

The utilities are intended for use by service personnel and application engineers responsible for setting up and maintaining the MCP. Because of the advanced functionality, it is helpful to have basic knowledge of Telnet, ftp and Linux commands to execute the commands for your specific system setup.

The MCP includes the following utility programs:

- [MCP Configuration Manager](#)
- [Direct Connect \(mcpconnect\)](#)
- [Software licensing tools](#)

These advanced MCP configuration and system administration functions are available at the MCP command line interface.

Setting up a Terminal Session

You can access these system utilities directly at the MCP command prompt through the local maintenance port through the Utilities Power bar button in the MCP HMI. The Utilities page provides a Secure Shell (SSH) login to establish a remote terminal session with the MCP.

Access to the command line interface requires an Administrator or root log in.

NOTE: When accessing the MCP with an Administrator-level user account, you may not have enough security privileges to execute the commands listed in this manual. If this occurs, type **sudo** in front of each command.

SSH Log In

For security reasons, some advanced MCP configuration and system administration functions are available only at the MCP command line interface. The Utilities page provides a Secure Shell (SSH) login to establish a remote terminal session with the MCP.

You must have Supervisor-level access to proceed with SSH Log In. Access to the command line interface requires an additional Administrator log in.

If the Utilities Log In page shows a Utilities Login via SSH button, the security portal has been configured for a Secure Shell (SSH) login.

» To log in:

1. Click Utilities Login > **SSH** button.
2. Enter your Administrator username.
3. Click **OK** to verify the MCP unit name.
4. Enter your Administrator password.

Result: If your login is successful, the command line interface appears.

Pass-Through Connections

For client applications that support pass-through connections, these connections are accessible through a TCP port on the MCP. You can connect to the device through the MCP using PC-based configuration tools and, if necessary, COM port redirection software.

» To enable client pass-through connections:

1. Click the **Configuration** Power bar button.
2. Click the **Systemwide** tab.
3. Click **System** in the left-hand menu and then select the **Security** tab.
4. For **Pass-Through and Terminal Server Access**, select **Allow Network Connections**.

Result: The port number is automatically assigned as 8000 plus the serial port number the client is using. For example, if the client is configured to use serial port 1, the pass-through connection port is 8001.

To enable pass-through connections on a serial port without enabling a client application, the port must be configured as an automatic terminal server.

» To enable pass-through connections without a client application:

1. On the **Connection** tab of the MCP Online Configuration Tool, configure the port as **Terminal Server**.
2. Set the Startup parameter to **Automatic**.
3. On the **Systemwide** tab of the MCP Online Configuration Tool, click **System** in the left-hand menu and then select the **Security** tab.
4. Go to the **Connection** tab, click **Secure Type** and select the **Telnet** option from the drop-down list.

For Pass-Through and Terminal Server Access, select Allow Network Connections.

The port number is automatically assigned as 8000 plus the serial port number. For example, if the terminal server is assigned to serial port 2, the pass-through connection port is 8002.

SSH Secure Tunnel Pass-Through Connections

For client applications that supports SSH secure tunnel pass-through connections, you can connect to the device through the MCP using SSH Client (e.g., Secure Terminal Emulator from DS Agile MCP Studio) configuration tools. These connections are accessible through an SSH port on the MCP.

» To enable client supported SSH Secure Tunnel pass-through connections:

1. Click the **Configuration** Power bar button.
2. Click the **Systemwide** tab.
3. Click **System** in the left-hand menu and then select the **Security** tab.
4. For **Pass-Through and Terminal Server Access**, select **Allow Network Connections**.
Result: The port number is automatically assigned as 8000 plus the serial port number the client is using. For example, if the client is configured to use serial port 1, the pass-through connection port is 8001.
5. Select **SSH Security Tunnel Idle Timeout** under the **Security** tab and change (if you want to change the default value of 120 seconds).
6. Go to the **Connection** tab, click **Secure Type** and select the **SSH Secure Tunnel** option from the drop-down list.

To enable SSH Secure pass-through connections on a serial port without enabling a client application, the port must be configured as an automatic terminal server.

» To enable SSH Secure Tunnel pass-through/Terminal Server connections without a client application:

1. On the **Connection** tab of the MCP Online Configuration Tool, configure the port as **Terminal Server**.
2. Set the Startup parameter to **Automatic**.
3. On the **Systemwide** tab of the MCP Online Configuration Tool, click **System** in the left-hand menu and then select the **Security** tab.
4. Select **Allow Network Connections** for **Pass-Through and Terminal Server Access**.
5. Select **SSH Security Tunnel Idle Timeout** under the **Security** tab and change (if you want to change the default value of 120 seconds).
6. Go to the **Connection** tab, click **Secure Type** and select the **SSH secure tunnel** option from the drop-down list.

For **SSH secure tunnel Pass-Through and SSH secure tunnel Terminal Server Access**, select **Allow Network Connections**.

The port number is automatically assigned as 8000 plus the serial port number. For example, if the terminal server or pass through enabled client connection is assigned to serial port 2, the SSH Secure Tunnel terminal server or client pass-through connection port is 8002.

Use SSH client software (e.g., Secure Terminal Emulator from DS Agile MCP Studio) in a PC and connect to the pass-through server port or terminal server port.

For Security reasons, SSH Secure Tunnel Pass Through and Terminal Server Connections are available only to the Administrator and SSHPassThrough level users only. Refer to [User Management](#) Section for details about SSHPassThrough User Role.

Direct Connect (mcpconnect)

Using the mcpconnect utility, you can communicate directly with devices via the MCP. The mcpconnect utility establishes a terminal session with a device connected to one of the MCP serial ports and transfers binary data without modification.

The direct connect utility is set up at the MCP command prompt.

NOTE: You cannot launch the mcpconnect utility on a serial port that already has an automatic terminal server configured.

» To start mcpconnect:

1. Connect and configure devices in the MCP Configuration Tool.
2. Start a terminal session and log into the MCP.
3. At the MCP#>>, enter the following commands:

```
cd /home/MCP_APPS/
```

```
./mcpconnect -d -u <MCP port number>
```

For example, the command in the format `./mcpconnect -d -u 1` enables communications to a device connected to Serial Port 1 on the MCP.

The device command prompt appears.

4. Configure or query the connected device as usual.

Tip Type `./mcpconnect -h` to view help information about the tool. Type `./mcpconnect -hx` for documentation on extended options of the tool.

» To exit mcpconnect:

- Press **CTRL + C**, and press **Enter**.
Result: The MCP command prompt appears.

MCP Configuration Manager

The MCP Configuration Manager provides two modes of operation. In redundant systems, the utility synchronizes configurations between the two MCP units to ensure that both are configured identically. In non-redundant setups, you may launch it manually to copy configurations from the current MCP to another MCP connected over a network or to a location in the MCP's file system, like a connected USB drive.

In redundant systems, the MCP Configuration Manager can also be activated by operating the *SyncConfig* digital output point, which copies the configuration from the active unit to the standby unit. See for more information.

NOTE: The MCP Configuration Manager does not synchronize the configuration parameters defined in the *mcpcfg* utility. You must apply these settings manually.

» To use the MCP Configuration Manager:

1. Start a terminal session and log into the MCP.
2. At the prompt, enter the following command:

```
cd /home/MCP_APPS/
```

```
./configmgr.pl <command line parameters>
```

When executing the application, the following command-line parameters are accepted:

Table 6-319: MCP Configuration Manager - Command Line Parameters

Parameter	Description	Arguments
-m	Mode	<i>network, local, or tar.</i>
-i	IP Address (network mode only)	The IP Address of the remote MCP device.
-l [Lower-case L]	Local Path (local and tar modes only)	The local path to transfer the configuration to. In local mode, the entire directory structure containing the configuration files is copied to a specified location (for example, the path to a USB drive may be <i>/dev/sda1</i>). In tar mode, the configuration files are stored in a single compressed archive file. When specifying the path, include a filename ending in .tar.gz
-u	Username (network mode only)	Username that is used to access the remote MCP unit.
-p	Password Prompt (network mode only)	<i>yes, no.</i> If a password is required to access the network MCP device, entering <i>yes</i> for this parameter prompts you for a password during the connection. If <i>no</i> is entered, SSH key authentication must be enabled to allow communication between the MCP devices. (See Sync Manager for more information about SSH key authentication.) If the <i>-p</i> parameter is not specified, the default action is <i>yes</i> .
-f	Reset Flag	<i>yes, no.</i> Entering <i>yes</i> triggers a restart of all applications running on the remote MCP device once the configuration has been synchronized. If <i>no</i> is entered, the applications are not restarted. If the <i>-f</i> parameter is not specified, the default action is <i>no</i> .

For example, to trigger a network synchronization followed by a restart of the applications running on the remote unit, you would enter the command:

```
./configmgr.pl -m network -i <IP Address of remote computer> -u <username of remote MCP unit>
-p yes -f yes
```

If the transfer of the configuration is successful, a confirmation notice appears. If any errors occur, a description of the failure is shown.

Chapter 7 - D2x Configuration and Operation

This chapter contains the following sections:

Specific G500 D2x Characteristics and Limitations

Use MCP as D2x

Offline D2x User Workflows in DSAS Project

- Basic configuration rules
- Configure Project LAN properties for D2x
- Create the MCP device with D2x functionality
- Change MCP/D2x Device
- Import Existing D2x Configuration
- Generate D2x configuration
- Compare MCP-D2x imported configuration with the Source D2x configuration
- D2x Users and Credentials Management
- MCP-D2x Firmware Models
- MCP-D2x Firmware Images

Runtime Interactive User Interface (UI)

- Deploying D2x Firmware Image using DSAS workflow
- Sync To of configuration (“download”)
- Sync From of configuration (“upload”)
- Save and Restore Snapshot “as configured”
- Restore to Factory Default
- MCP Function Specific UI
- D2x Function Specific UI

VAR Deploying and D2x Firmware Integrators

- VAR Deploying Unsigned D2x Firmware file using manual file transfer

In this context **D2x RTU** means:

- Single CPU D20 RTU, or
- Single CPU D200 RTU, or
- Single Partition D20MX RTU.

Starting with G500 version 4.00 is possible to run legacy D2x applications in the embedded device, either combined or distinct – subject to a separate set of licenses and depending on the G500 device model.

In the context of this Chapter – the below naming conventions are used:

- “**MCP**” == the MCP “core” *Function* inside an MCP device, i.e., same as MCP v3.x.
- “**D2x**” == the D2x RTU *Function* inside an MCP device.
- “**MCPv4**” == the MCP v4.00 platform which allows MCP and D2x *Functions* (G500 only)

This Chapter describes workflows and functions related to the D2x *Function* inside an MCPv4 device.

It is assumed that users know already how to configure and operate legacy D20, D200 or D20MX products.

The compatibility with existing D.20 Peripheral I/O modules and devices is shown in the *G500 Substation Gateway Instruction Manual (994-0152)*.

Specific G500 D2x Characteristics and Limitations:

D2x has an associated *Environment Type* in the G500 which is equivalent to a hardware based CPU Board.

Only D2x configurations equivalent to Single Node D20/D200 or Single Partition D20MX are supported. Configurations using Multiple Nodes D200 or Multiple Partitions D20MX are not supported unless are first scaled down to a single node / partition.

G500 cannot use the exact same D20 Firmware from D20 based RTUs (SABxxxx or SANxxxx). The D2x Firmware running in G500 is specific to MCP platform (is similar to a CCU Base D20ME firmware but uses different applications). Existing configurations will go through a D2x Firmware Upgrade process for G500 D2x.

Redundant CCU option is not supported in D.20 Communication Parameters; use instead the D2X Application Communication Watchdog (A026-1S) to monitor the redundant CCU state.

Secondary IP Addressing in LAN Settings is not supported.

If changing or reloading D2x configuration while in "sa com" in 68k shell - the D2X doesn't start again. Requires reboot of the G500 and then deploy again the D2x configuration using “d2xload” command or “sync to”.

Type **SMC-0001-11** ("G500-D20 Environment, RAM only, single partition, max 7 serial ports") has the following characteristics and limitations:

- NVRAM is not available in G500 as D2x RTU – even if D2x application settings are configured for NVRAM. This applies also to "Save Points on Power Fail" not being possible.
- Only COM1 to COM7 are available to D2x applications (same as in a single board D20 CPU).

Type **SMC-0001-01** ("G500-D20 Environment, single partition, max 7 serial ports ") has the following characteristics and limitations:

- Enables NVRAM for G500-D2X Applications.
- Only COM1 to COM7 are available to D2x applications (same as in a single board D20 CPU).
- Requires **DSAS Firmware Library** with **SMXA0.401** or later.
- Requires **D2x Firmware** Name and Version **SMXA0.401** or later.
- DSAS v4.10 contains these updates.
- For DSAS v4.00 users:
 - o Install above exhibits, packaged in a single "meta package" file:
"G500-D2X_SMXA0_401_20240430_NVRAM_MetaPackage.7zip".
 - o Technical Note **TN0128** describes how to install and enable the above.

Type **SMC-0001-02** ("G500-D20 Environment, single partition, max 20 serial ports ") has the following characteristics and limitations:

- Enables NVRAM for G500-D2X Applications.
- COM1-8, COMA1-4, COMB1-4, COMC1-4 are available to D2x applications.
- Requires **DSAS Firmware Library** with **SMXA0.411** or later.
- Requires **D2x Firmware** Name and Version **SMXA0.411** or later.
- Requires **DSAS v5.10** or later.

Starting with **DSAS v4.10** and **SMXA0.410** (using B014-1S V600 or later) - the D2x WESMAINT access Passwords are encrypted and cannot be visualized anymore in the B014-1S table. In addition – the following rules are enforced for WESMAINT users and passwords:

- User name cannot be blank.
- The rules for entering strong passwords are:
 - o Between 8 and 22 English characters.
 - o At least one English uppercase character (A through Z).
 - o At least one English lowercase character (a through z).
 - o At least one number, Base 10 digits (0 through 9).
 - o At least one non-alpha-numeric character.
- When creating a new device configuration – strong passwords must be entered.
- After importing D20MX configurations – strong passwords must be entered.
- After importing D20 (not D20MX) configurations – the original D20 passwords are retained as long as changes are not done again for the passwords. If password changes are required – then strong password rules are enforced and apply.

Use MCP as D2x

MCP devices (v4.00 and later) can be configured to run D2x applications by performing the following high level actions.

Where applicable - the detailed steps of each high level action are described further in this chapter.

1. Install DS Agile Studio 4.00 or later, make sure you select the “D2x Apps” option during installation:

2. Acquire from GE Vernova the D2x Firmware.
3. Acquire from GE Vernova a D2x (MCP-D) License for the HW ID of the MCP device (this is a separate file from the MCP Core license).
4. If needed - upgrade the Firmware in the MCP device to V4.00 or later.
5. Deploy the D2x Firmware to the MCP device (use DSAS).
6. Deploy the D2x License file to the MCP device (recommended to use DSAS).
7. Reboot the MCP device.
8. Verify the “As-Is” model number shows the D2x associated digits with the values reflecting the D2x Firmware and D2x License. There should be no “U X ?” in the model number digit values. At this point it will still be MCP only (“S”).
9. Run MCP Studio in DSAS v4.00 or later.
10. If there is an existing MCP configuration you wish to carry forward (if not skip these steps):
 - a. Make a copy of this MCP configuration, into a new Project (recommended) – or make a copy of the Project.

- b. Open MCP Device Properties
 - i. Edit the Model Number
 - In the resulting dialog select the Application Version 4.0 (or later).
 - Keep the function “S” for now.
 - Click OK to close the Edit Model Number dialog.
 - ii. Click OK to close the Device Properties.
 - iii. Wait for the upgrade to finish successfully.
 - c. On the upgraded MCP device – open Device Properties.
 - i. Edit the Model Number.
 - In the resulting dialog select the Function “D” (for only D2x and no MCP), or “C” (for Combined MCP and D2x). **Note:** “C” is available only for G500 4-cores CPU.
 - Click OK to close the Edit Model Number dialog.
 - ii. New tabs are now available for the D2x associated settings. Finalize the D2x associated settings:
 - Licenses / D2x
 - D2x Environment
 - Redundancy
 - iii. Close the Device Properties
 - d. This MCP configuration is now ready to be configured for D2x Applications, similar to how D20 or D20MX devices are configured.
11. If there is an existing D20, Single CPU D200 or single partition D20MX configuration you wish to run in the MCP D2x device:
 - a. Select the MCP “C” or “D” device created above, or create a new one.
 - b. Import the D2x configuration by selecting the source D2x device in your DSAS repository.
 - c. Finalize the D2x configuration.
12. When your D2x configuration is finalized – perform a sync to the target MCP device (G500 v4.00 in this release).
13. Use the WESMAINT interface to operate the D2x device running in the MCP.

Offline D2x User Workflows in DSAS Project

Once DS Agile Studio 4.00 or later has been installed with the “D2x Apps” option during installation – launching the MCP Studio application will automatically start both MCP and D2x Environments.

Basic configuration rules

Each function (D2x or MCP) inherits its own native features and uses same configuration editor workflows and rules as it would be a standalone D20 or MCP, respectively.

On MCP devices configured with D2x or MCP/D2x function is possible to open the D2x Application List and from there the individual application editors (like with D20), to configure the D2x applications, save tables and generate D2x and iSCS configurations.

On MCP devices configured with MCP or MCP/D2x function is possible to open the offline MCP editor to configure the MCP function applications.

On MCP devices configured with MCP/D2x function is possible to open simultaneously the D2x Applications editor and MCP offline editor.

MCP devices configured with MCP function “S” have all serial ports, D.20 HDLC and LAN allocated to MCP.

MCP devices configured with D2x function “D” have serial ports 1-8 and D.20 HDLC allocated to D2x. LAN ports Net1 – Net4 can be allocated to either D2x or MCP, according to LAN A - LAN D selection in D2x LAN settings.

MCP devices configured with MCP/D2x function “C” have serial ports 1-8 and D.20 HDLC allocations configurable to either MCP or D2x. LAN ports Net1 – Net4 can be allocated to either D2x or MCP, according to LAN A- LAN D selection in D2x LAN settings. All other serial ports and Net0, Net 5-6 are allocated to MCP.

The D2x and MCP editors retain their native look and feel, workflows, and are separately configured.

If LogicLinux is enabled in MCP it can be configured using MCP workflows.

If LogicLinux is enabled in D2x it can be configured using D20 workflows.

If LogicLinux is enabled in MCP and in D2x – only one LogicLinux Editor instance can be used at a time (MCP or D2x).

The main D2x related workflows are described next.

D2x Configuration and Operation Notes

- Devices configured for Function “D” and with Device Redundancy Enabled – must have their configuration deployed separately from DSAS, the WESMAINT DATABASE SYNC is not operational.
- Time sync of DNP3 outstations using DNP3 DCA (B023-0) has a time accuracy jitter of up to 60 msec, therefore should be avoided and outstations obtain their own time synch where possible.
- LogicLinx B082-0S application and D2x WIN database don’t support floating point values.
- Applications IRIG-B (B012-0S) and SNTP (B099-0S) provide the pseudo-points for backward database compatibility, the time synchronization is still configured and performed in MCP Core (see [MCP Local Configuration Utility \(mcpcfg\)](#) / [MCP Settings GUI](#)).
- When using B071-0 WESMAINT File Upload via COM0 (d2xcon): select ZMODEM as protocol and the file will be automatically placed in the folder from where “sudo d2xcon” command was launched from.

Configure Project LAN properties for D2x

For new projects, if the D2x configuration requires LAN connections – configure the “LAN Properties” under Project Properties > D2x tab. This is required later for setting the IP addresses for the D2x device.

Create the MCP device with D2x functionality

Create a new MCP device in the project by dragging the MCP icon from Device Templates.

Fill in the minimum required fields: *Name*, *IP Address*.

Note: The *Name* can exceed 8 characters. D2x Configuration will inherit this *Name* and will still operate correctly with a Name of more than 8 characters, but it will be displayed in 68k Monitor as trimmed with ~n at the end, where n is a number related to the exceeded length.

For e.g., both Device Names: *DEV_NAME1* and *DEV_NAME2* will be shown in D2x 68k Monitor as *DEV_NA~1* making it difficult to identify the original offline device Name.

For this reason, MCP-D2x device names should be kept up to 8 characters if possible, to later be able to identify which configuration name runs in D2x.

The screenshot shows the 'MCP Properties' dialog box with the 'Properties' tab selected. The dialog has a dark header bar with the title 'MCP Properties'. Below the header, there are tabs for 'Model Number', 'Licensing', 'Redundancy', and 'iSCS'. The 'Properties' tab is active, showing fields for 'Name' (containing 'DEV_NAME'), 'Description' (a text area with the placeholder 'Enter a description for this device'), and 'Asset Identifier' (a text field with the placeholder 'Enter Asset identifier'). Below these fields is a 'Communications' section with an 'IP Address' field (containing '192 . 168 . 168 . 81'), a 'Read Firmware' button, and a checked checkbox for 'Use secure connections on port 443'. At the bottom, there is a 'Model Number' section with an empty text field, an information icon, and an 'Edit' button. A 'Notes' column is visible on the right side of the dialog.

Select the Device Function

Click on the Edit button for the Model Number. In the resulting dialog select:

- Product Type: G500
- Application Version: D0 – v4.0
- Function: **D** or **C** (C is available only if CPU option is selected as “B” 4 cores)

If the product type is not G500, or the Application Version is previous to 4.0 – the device Function is always set to “S” (only MCP), for full backwards compatibility.

MCP Model Editor

Model Number: **G500-BHU8-UUUUUU-BUUU-UUD-UUU-C-CAD0000-?????00**

Product Type: **G500** Application Version: **D0 - v4.0** Function: **C - MCP/D2x**

Product Option

CPU	B - 2.7 GHz 4 core APU, 16 GB DDR3 SDRAM
Primary Power Supply	H - MCP PSU HV 90-264 VAC/88-330VDC (521-2001LF-CC)
Redundant Power Supply	U - None
Serial Ports	8 - 8x Serial Ports, RS-232/ RS-485 independently configurable and isolated
Ethernet Interface 1 - SFP Type	U - None
Ethernet Interface 2 - SFP Type	U - None
Ethernet Interface 3 - SFP Type	U - None
Ethernet Interface 4 - SFP Type	U - None
Ethernet Interface 5 - SFP Type	U - None
Ethernet Interface 6 - SFP Type	U - None
Storage M.2 SATA SSD - Drive 1	B - 256 GB Self encrypted Solid State Drive
Storage M.2 SATA SSD - Drive 2	U - None
Storage M.2 SATA SSD - Drive 3	U - None
Storage SATA SSD - Drive 4	U - None
PCIe Expansion Module - Slot 1	U - None
PCIe Expansion Module - Slot 2	U - None
PCIe Expansion Module - Slot 3	D - D.20 Link HDLC Ports

OK Cancel Reset Invalid Options

Select the other interfaces to match your device model number, e.g., PCIe Slot 3 to have D.20 Link HDLC Ports.

Click **OK**.

The resulting model number is updated and shown just under the banner of the MCP Properties window.

At this stage the D2x digits are shown as ? because the D2x options have not yet been selected.

Selected Function is “MCP”

- This makes the device operate as MCP only.
- In G500 sets the digit (3) to “S” (as in Single MCP) and the last set of digits (4) to “UUUUUUU”.
- The resulting G500 model number is same as previous versions of G500.
- All Serial Ports are allocated to the MCP function.
- D.20 HDLC (if present) is allocated to the MCP function.
- All LAN ports are allocated to the MCP function.
- All offline configuration follows MCP workflows.

Selected Function is “D2x”

- Applicable only to G500, makes the device operate as D2x only.
- In G500 sets the digit (3) to “D” (as in D2x) and the last set of digits (4) to what the D2x Firmware NAME, VERSION and LICENSES will be selected in a further step.
- Immediately after a D2x selection, when the user didn't yet go to other tabs to select D2x Firmware NAME, VERSION and LICENSES the digits (4) are set to “?????00”.
- Serial Ports 1-8 are allocated to D2x function.
- D.20 HDLC (if present) is allocated to the D2x function.
- LAN ports are allocated to the D2x function based on selection when configuring D2x LAN.
- MCP settings (mcpcfg, Settings GUI) are still required to be performed on the device.

Selected Function is “MCP/D2x”

The option “MCP/D2x” (5) is available in MCP v4.00 and later only for “G500” type and for “CPU 4 cores”.

- This makes the G500 device operate as MCP and D2x simultaneously and separately.
- In G500 with CPU 4 cores this sets the digit (3) to “C” (as in Combined) and the last set of digits (4) to what the D2x Firmware NAME, VERSION and LICENSES will be selected in a further step.
- Immediately after a D2x selection, when the user didn't yet go to other tabs to select D2x Firmware NAME, VERSION and LICENSES the digits (4) are set to “?????00”.
- A new device properties tab named “Ports Allocation” becomes available to the user, allowing assignment of ports to either MCP or D2x functions (same group of ports cannot be assigned to both MCP and D2x functions).
- LAN ports are allocated to the D2x function based on selection when configuring D2x LAN.
- MCP settings (mcpcfg, Settings GUI) are still required to be performed on the device.
- All offline configuration for MCP follows MCP workflows.
- All offline configuration for D2x follows D2x RTU workflows.

Set the D2x Licenses in Device Properties

Go to the Licensing tab and select the D2x License options that match your G500 device.

The screenshot shows the 'MCP Properties' dialog box with the 'Licensing' tab selected. The 'Model Number' field displays 'G500-BHU8-UUUUUU-BUUU-UUD-UUU-D-CAD0000-?????03'. Below the tabs, the 'D2x Licensed applications' section contains a text box with '03' and two checked checkboxes: 'D2x Classic Applications' and 'Advanced Automation'.

Set the D2x Environment in Device Properties

Go to the D2x Function tab and select the desired options for the D2x Environment:

The screenshot shows the 'MCP Properties' dialog box with the 'D2x Function' tab selected. The 'Model Number' field displays 'G500-BHU8-UUUUUU-BUUU-UUD-UUU-D-CAD0000-?????03'. The 'Environment' section includes a 'Type' dropdown, a 'Firmware Version' dropdown, a 'Firmware Name' dropdown with 'SMX' selected, and an unchecked 'LAN-based device' checkbox. An 'Apply' button is at the bottom.

Type: SMC-0001-11 (this is equivalent to a D20 CPU card).

Firmware Version: 400 (this is the first general release D2x firmware version)

Firmware Name: SMX A0 (this is the first general release D2x firmware name).

Note: Custom created SMX names cannot be applied when creating a new device, instead finish the workflow and then open again Device Properties and select the custom SMX name.

The model number is updated with the selected options.

Select the LAN-Based device checkbox if this D2x device require external LAN connections.

Click the Apply button.

The screenshot shows the 'MCP Properties' dialog box with the 'D2x Function' tab selected. The 'Model Number' field displays 'G500-BHU8-UUUUUU-BUUU-UUU-UUU-D-CAD0000-A040003'. Below the tabs, the 'Environment' section contains the following fields:

- Type: SMC-0001-11 (dropdown)
- Firmware Version: 400 (dropdown)
- Firmware Name: SMX A0 (dropdown)
- ☒ LAN-based device
- Apply button

Wait for the message “Enabling D2x environment” to end.

Note: any time in future after changing “Environment” values in the D2x Function tab (i.e. above the “Apply” button) – the new values must be applied. A message to this effect will be displayed if trying to click OK to close the device properties window:

Finalize the D2x LAN Settings as needed (similar workflow as D20 RTUs).

D2x LAN and MCP Net interfaces

The correspondence between D2x LAN and MCP Physical LAN ports is:

- D2x LAN A is MCP Net 1
- D2x LAN B is MCP Net 2
- D2x LAN C is MCP Net 3
- D2x LAN D is MCP Net 4

When a D2x LAN checkbox is selected – the corresponding MCP Net PAIR is associated only with D2x.

The dissociation from MCP is in pairs, meaning that if for e.g., only LAN A or only LAN B is selected for D2x – then the pair of MCP Net1-2 are assigned to D2x. Similar for LAN C/D and Net3-4.

Rules:

- The selected LAN A or B ports in D2x are automatically removed from MCP in pair Net1-2 (if function is D2x or MCP/D2x) and are automatically allocated to the D2x function and configured based on the D2x configuration.
- The selected LAN C or D ports in D2x are automatically removed from MCP in pair Net3-4 (if function is D2x or MCP/D2x) and are automatically allocated to the D2x function and configured based on the D2x configuration.
- The Net1-2 pair interfaces shall be again under mcpcfg/Settings GUI control when the D2x application no longer uses neither of LAN A or LAN B, or when D2x LAN is disabled, or when D2x function is disabled all together.
- The Net3-4 pair interfaces shall be again under mcpcfg/Settings GUI control when the D2x application no longer uses neither of LAN C or LAN D, or when D2x LAN is disabled, or when D2x function is disabled all together.
- LAN A corresponds to Net1, when selected shall disable configuration of pair Net1-2 in mcpcfg/Settings GUI (after the configuration has been sync'ed to, reboot device if necessary).
- LAN B corresponds to Net2, when selected shall disable configuration of pair Net1-2 in mcpcfg/Settings GUI (after the configuration has been sync'ed to, reboot device if necessary).
- LAN C corresponds to Net3, when selected shall disable configuration of pair Net3-4 in mcpcfg/Settings GUI (after the configuration has been sync'ed to, reboot device if necessary).
- LAN D corresponds to Net4, when selected shall disable configuration of pair Net3-4 in mcpcfg/Settings GUI (after the configuration has been sync'ed to, reboot device if necessary).
- If only LAN A D2x interface is enabled, and if the pair of Net1-2 is configured as **SINGLE** – then Net1 shall be used by LAN A D2x, and Net2 will be removed from MCP and disabled.
- If only LAN B D2x interface is enabled, and if the pair of Net1-2 is configured as **SINGLE** – then Net2 shall be used by LAN B D2x, and Net1 will be removed from MCP and disabled.
- If only LAN C D2x interface is enabled, and if the pair of Net3-4 is configured as **SINGLE** – then Net3 shall be used by LAN C D2x, and Net4 will be removed from MCP and disabled.

- If only LAN D D2x interface is enabled, and if the pair of Net3-4 is configured as **SINGLE** – then Net4 shall be used by LAN D D2x, and Net3 will be removed from MCP and disabled.
- **REDUNDANT LAN** and **PRP** are available only in G500 and are implemented using the G500 FPGA. Because of this – the configuration of Redundant/PRP is not done in D2x editor and functionality is not achieved in D2x firmware, instead is achieved in “mcpcfg” / “Settings GUI”.
- If only LAN A D2x interface is enabled, and if the pair of Net1-2 is configured as **REDUNDANT or PRP** – then both Net1 and Net2 in pair shall be used by the D2x, using the D2x configuration of the single LAN A.
- If only LAN C D2x interface is enabled, and if the pair of Net3-4 is configured as **REDUNDANT or PRP** – then both Net3 and Net4 in pair shall be used by the D2x, using the D2x configuration of the single LAN C.
- If the pair of Net1-2 is configured as **REDUNDANT or PRP** – then D2x configuration of the LAN B is not used, even if is enabled.
- If the pair of Net3-4 is configured as **REDUNDANT or PRP** – then D2x configuration of the LAN D is not used, even if is enabled.

Below table summarizes the effect on Netx ownership based on D2x LAN selections:

<i>D2x LAN choices</i>				<i>MCP Netx ownership</i>			
LAN A	LAN B	LAN C	LAN D	Net1	Net2	Net3	Net4
Yes	Any	No	No	By D2x	By D2x	By MCP	By MCP
Any	Yes	No	No	By D2x	By D2x	By MCP	By MCP
No	No	Yes	Any	By MCP	By MCP	By D2x	By D2x
No	No	Any	Yes	By MCP	By MCP	By D2x	By D2x
No	No	No	No	By MCP	By MCP	By MCP	By MCP

All interfaces configured by D2x are in “Internal” zone and this cannot be changed (this is imposed by design due to cyber security limitations around D2x without a firewall in place).

Internal D2x-MCPCore LAN I

When the D2x function is enabled – there is always an internal LAN I, non-configurable, which is solely for the purpose of inter-container communications (between D2x and MCP Core), and is not tied to external Net interfaces.

Regardless of the LAN-based device checkbox being selected or not – the internal LAN-I is always enabled, with pre-defined read-only settings.

MCP Properties

Model Number: **G500-BH08-UUUUUU-BUUU-UUD-UUU-D-CAD0000-A040003**

General | **LAN Specific** | Services

LAN I

Host Name: **D2X-I**

LAN Address	169 . 169 . 169 . 0
Subnet Mask	255 . 255 . 255 . 0
Host Address	169 . 169 . 169 . 20

B100HOST includes the following entries (added by DSAS automatically after Generate D2x Configuration):

Host Name	IP Address				Is Default
D2X-I	169	169	169	20	DEFAULT
MCP-I	169	169	169	10	DEFAULT

iSCS LAN

If the device function is “C” and if the MCP Core applications require iSCS LAN addressing (see MCP Device Properties > Tab iSCS) – the “Host Name Override” under D2x Function / LAN **must** be configured to a meaningful and unique name different than the MCP Device Name. This ensures that – after an iSCS Generate – the Host Names of the D2x application LAN interfaces and the Host Names of the MCP iSCS LAN interfaces are unique.

Allocate ports to MCP or D2x (only for function “C”)

If the selected function is “C” MCP/D2x the “Ports Allocation” tab becomes visible. This allows the user to decide which function (D2x or MCP) controls the respective group of ports.

The serial ports are in groups of 4 (i.e. each Serial Ports Card).

MCP Properties

Model Number: **G500-BHU8-UUUUUU-BUUU-UUD-UUU-C-CAD0095-A040003**

Properties | Licensing | D2x Function | **Ports Allocation** | Redundancy | D2x Firmware | iSCS

Serial Ports

COM 1-4 ☐ MCP ☒ D2x

COM 5-8 ☒ MCP ☐ D2x

D.20 PCIe

D.20 Link HDLC ☐ MCP ☒ D2x

If the model number doesn't have all serial ports – then missing ones are not visible.

If the model number doesn't have D.20 HDLC – then this option is not visible.

If the D.20 HDLC is allocated to the D2x – then in the MCP Editor the D.20 node shows “Used By D2x” and cannot be enabled.

If the serial ports are allocated to the D2x – then in the MCP Editor these are shown as “Used By D2x”.

If the D.20 HDLC is allocated to the MCP – there are no programmatic checks in place to prevent the configuration of D2x B003 application, is up to the user to ensure this is not in conflict with the allocation.

Please use the Ctrl and Shift keys to select multiple applications

Applications	Enabled	Application Version	Date Modified	Modified
Client Applications				
D.20 Peripheral Link	Disabled	B003 V752 (Rev 0)	2024-03-12 5:46:00 PM	NotModified

If serial ports are allocated to the MCP and configured in D2x Applications – a warning message is displayed in the Generate D2x Device Log, for e.g.:

Enable Redundancy when Function is D2x

When the selected function is “D” D2x – the redundant options are: “None” and “Warm-Standby D2x” (the word “D2x indicates to user this is achieved via D2x function).

When redundancy is enabled in “D” function – the device operates same as a Redundant D20 RTU.

MCP core applications don’t run in this case.

Arbitration and configuration is done using only D20 methods and D2x Applications:

- must enable and configure B034-0S with SERIAL PING (D.20 HDLC PING is not available),
- optionally enable and configure A118 for Failover,
- must wire and use an RS232 Switch Panel.
- must have the configuration sync to (deployed) separately from DSAS, once for Device A and again for Device B (WESMAINT DATABASE SYNC is not operational).

>		Failover DTA		Enabled	A118 V103 (Rev 0)
>		Redundant Monitor		Enabled	B034-0S V210 (Rev 0)

The “mcpcfg” and “Settings GUI” under “Redundancy” option display in this case: **By D2x** and there is no MCP redundancy configured.

```

=====
Gateway (G500) Settings Menu
Redundancy: By D2x

0.    Back

Enter Your Choice : ( 0 ) : 

```

Enable Redundancy when Function is MCP/D2x

When the selected function is “C” MCP/D2x – the redundant options are same as in MCP only function.

MCP Properties

Model Number: G500-BHU8-UUUUUU-BUUU-UUD-UUU-C-CAD0095-A040003

Properties | Licensing | D2x Function | Ports Allocation | **Redundancy** | D2x Firmware | iSCS

Details

Redundancy Mode: ☐ None ☒ Hot-Hot MCP/Warm-Standby D2x

Words “Warm-Standby D2x” are added as clarifications to indicate to user that while MCP function is driven by MCP redundancy – the D2x remains Warm-Standby.

Redundancy arbitration and configuration is done using only MCP methods.

The device operates the MCP core applications same as in MCP hot-hot redundancy.

The D2x must not be configured as redundant (no B034, no A118). The device operates the D2x applications only when the MCP status is ACTIVE. When the MCP is in STANDBY it does NOT run the D2x applications.

Redundant link across units A and B requires at least one LAN connection to ensure database synchronization. Using only the serial “PING” cable will not be possible anymore, because of the Hot-Hot runtime database/events updates across (which requires LAN).

Change MCP/D2x Device

After an MCP-D2x device has been created – is always possible to change the Function, Licenses, D2x Environment, Ports Allocation and Redundancy by opening again the device properties and modify settings in the respective tabs.

Configuration impact after function change

When the device function changes from one selection to another – the following D2x Configuration Generate trigger (flag) and MCP states (e.g., Loader Generate, Uncommitted changes) apply – depending on what was before and after the change. A change is considered final after “Apply” button or “OK” and close device properties.

Table 7-1: Device Function / Type

	To "MCP" (S)	To "D2x" (D)	To "MCP/D2x" (C)
From "MCP" (S)	N/A	Must Generate D2X, Let MCP dormant	Must Generate D2X, Keep MCP As-Is

	To "MCP" (S)	To "D2x" (D)	To "MCP/D2x" (C)
From "D2x" (D)	Let D2X dormant, Use MCP as was last (or new MCP if no last)	N/A	Keep D2X As-Is, Use MCP as was last (or new MCP if no last)
From "MCP/D2x" (C)	Let D2X dormant, Keep MCP As-Is	Keep D2X As-Is, Let MCP dormant	N/A

Import Existing D2x Configuration

Users can import existing D2x configurations into the MCP-D2x device. This process leaves the source D2x Device configuration unmodified.

The "Import D2x configuration" option is available only if the selected device has the function D2x or MCP/D2x.

For Existing D2x devices with LAN enabled – it is recommended the MCP-D2x device is first created in the same project, so to appear as same as the original D2x device from a LAN perspective.

Select the MCP-D2x device and *Import D2x configuration*

A dialog opens and allows the selection of a compatible source device from the DSAS PC repository (same or other projects).

To be compatible - the source device must be a D20, a D200 single node, a D20MX single partition or an MCP with D2x function configured. Source devices which have not been previously generated without errors (i.e. have the red dot) cannot be imported, they must be generated first.

If confirmed – this operation shall overwrite the D2x configuration in the selected MCP device with the imported D2x configuration. This includes all LAN settings and services (if present in the source D2x). If the source D2x has no configured LAN – the selected MCP device shall get the D2x LAN unselected.

During the import operation – the applications shall be upgraded to the D2x firmware model in the receiving MCP device, using a workflow similar to when creating D20MX.

Regardless of the result of the import – the selected source device remains un-changed.

The import result shall be subject to the D2x Firmware Model in the MCP-D2x, following a similar workflow like when creating a D20MX from a D2x.

A Successful import D2x configuration process is indicated with a final dialog:

Users should carefully inspect the Device Log and – if needed – manually reconcile data modified as a result of D2x applications definitions being upgraded (same process as for a D20 firmware upgrade).

Note: TELx ports are removed from the MCP-D2x configuration due to TELNET not being supported, users must manually delete row entries using TEL ports.

A red border around the MCP-D2x device indicates the import process was not finished, in which case users need to finalize the interrupted steps:

Generate D2x configuration

After the D2x applications have been configured using editors and workflows similar to D20/D20MX – the D2x configuration must be “Generated”.

During this process the enabled D2x applications are checked for mapping errors and the configured serial ports are checked against the allocation in MCP/D2x.

If there are incorrect serial ports allocations these are indicated in the Generate Device Log.

This Generate D2x action is independent of other MCP actions (e.g., Loader Generate, etc.).

A successful D2x Generate makes the device ready for the next step: *Sync To of configuration* (“download”).

Compare MCP-D2x imported configuration with the Source D2x configuration

After generating the D2x configuration - users may perform a side by side comparison of the Source D2x configuration versus the imported MCP-D2x configuration using: D2x Detailed Config Compare.

Select the MCP-D2x device and initiate the comparison workflow:

Select the source D2x configuration device, click OK:

The resulting open window shows any differences in red (side by side and application by application); the lower area shows the details for the application selected in the tree.

Only enabled applications are compared.

D2x Users and Credentials Management

The MCP Administrator users are managed under the “Configure Authentication” menu (mcpcfg / Settings GUI), using Linux User Groups (same as in MCP V310).

The MCP Supervisor users are managed under the Runtime HMI “Settings / User Management” menu (same as in MCP V310).

The D2x users and associated passwords are managed under B014, same as in a D20ME RTU.

RADIUS remote authentication is not supported in MCP-D2x.

MCP-D2x Firmware Models

Users may acquire updated MCP-D2x Firmware Models via GE Vernova Support Channels and load these in DSAS using the *D2xAppsFirmwareLibrary* package.

MCP-D2x Firmware Images

Users may acquire released and GE Vernova signed MCP-D2x Firmware Images via GE Vernova Support Channels.

The file name for the MCP-D2x Firmware distribution is:

`SMXNN_VVV_BBBB.D2xFirmwareUpdate.DS7zip`

Where:

- NN is the SMX NAME
- VVV is the SMX VERSION (starts with 400)
- BBBB is the SMX BUILD within the NAME and VERSION
- `D2xFirmwareUpdate.DS7zip` is the signed MCP-D2x Firmware Image file extension

The content of the signed MCP-D2x Firmware Image is a set of files which are always deployed together and should not be changed individually by end users:

- MIMIC – the MCP-D2x emulation environment
- `BOOT.BIN` – the D2x Bootrom image
- `PROM.BIN` – the D2x Applications image
- `MODULE.MAK` – the D2x Applications BOM. The contained `PART_NUMBER` is used to build the MCP model number and to check sync to D2x firmware compatibility
- `CONFIG.device.DS7zip` – the Default D2x Configuration Archive (required by sync from operations)
- `DEVICE.IMG` – the Default D2x Configuration image (loaded at runtime initially or after Restore To Factory Default action)

Runtime Interactive User Interfaces (UI)

If the Device Properties dialog is used only to perform below device interactive workflows **and** if there have been no other changes done - then is recommended to exit using the “Cancel” button when finished, otherwise the device changed “red square” will be triggered if exit using the “OK” button, requiring a new (un-necessary) D2x Generate Configuration action.

- Properties > Model Number > Update
- Licensing > License Management
- Localization
- Service Updates

Deploying D2x Firmware Image using DSAS workflow

D2x Firmware Images can be deployed to G500 devices V4.00 regardless of their Function.

After deploying a new D2x Firmware Image:

- The D2x digits in the “As-Is” model number are updated,
- If the current device Function is “C” or “D”: the D2x device shall run using the Default D2x configuration contained in the D2x Firmware file (assuming the D2x License is present and valid).
 - Any previously present D2x configuration is erased and – if needed – shall be (re)deployed by users later using DSAS sync to operation.
- If the current device Function is “S”: the D2x device is not started, but the D2x Firmware is loaded.

The MCP configuration (if is a “C” Function) is not modified when D2x Firmware is deployed.

In DSAS - open the Device Properties for the MCP-D2x device and navigate to the tab: *D2x Firmware*

If there are D2x Firmware Images already imported in the DSAS PC environment – these will show up in the upper tab “Imported D2x Firmware Updates in PC”.

If there are none yet – select *Import From File System* browse for and select the signed D2x Firmware Image file obtained from GE Vernova, file name format:

SMXNN_VVV_BBBB.D2xFirmwareUpdate.DS7zip

Click **OK**. A confirmation dialog indicates success:

The imported D2x Firmware Image is listed now in the upper tab. This process must be performed only once for each DSAS PC and each SMX D2x Firmware Image.

The lower tab shows the D2x Firmware Images compatible with the MCP Version of the selected device (e.g., 400).

Click on the button “Details” to show information about the selected D2x Firmware Update:

- Minimum DSAS Build Version
- Minimum MCP Firmware Release compatible with the D2x Firmware
- Minimum MCP Build Number compatible with the D2x Firmware

Click on the button “Install D2x Firmware Update” to connect to the target G500 device (using the IP address configured in the Properties tab) and proceed with the D2x Firmware Image deployment.

A confirmation dialog shows success, and the D2x Firmware Update Log shows the changed data.

You may now close the device properties window using CANCEL button (so to not trigger the red dot change indicator in the DSAS project device).

Sync To of configuration (“download”)

The Synchronize To operation handles both D2x and MCP functions, as enabled (i.e. there are no separate Synch To buttons for MCP and D2x).

The credentials required for Sync To operations are:

MCP Administrators

MCP Supervisors

D2x B014 users credentials are not required for Sync To operations.

Sync to operation is allowed only if the offline device and the target (receiving) device have the same MCP Version and D2x Environment.

The offline and target device **Function** may be different, this is how users can change the function of target devices.

Note: If the target device is of “S” function (MCP only) or has been upgraded from previous versions – the last D2x associated digits in the model number would be all U (there is no D2x Firmware Image loaded yet). In this case the Sync To operation of “C” or “D” functions offline devices will fail because the target device doesn’t have a D2x Environment. In this scenario users shall first deploy the appropriate D2x Firmware Image Name and Version – which will set the D2x Environment model digits in the target device.

If the offline device is “C” (MCP/D2x) or “D” (D2x) – the user has a choice to Sync To with the option to restore the D2x configuration later (using Sync From) or without the restore D2x configuration option.

The default Sync To Device action is with D2x restore. In commissioned installations users should always perform a full sync to, including the D2x Configuration Archive (so later the sync from can read back the D2x configuration, if needed).

The first time after the D2x configuration has been generated – a D2x Device Archive will be created if this sync to option is selected; this may take some minutes, depending on the D2x configuration size. This D2x Device Archive is sent to the target device, to be used later during Sync From operations, if needed.

As long as the Generate D2x Device is not performed again – subsequent sync to operations with D2x restore will not create this archive again, and will re-use the last one created.

If the option Sync To Device without D2x restore is selected – then only the D2x configuration binary image is sent. Users will not be able to restore later the D2x configuration using “Sync From”. This workflow is suitable when changed D2x configurations are to be tested quickly and a restore D2x action is not necessary, e.g., in a Lab Test environment (it saves the time to create the D2x Device Archive unnecessary).

If Sync To Device without D2x restore is selected – users must acknowledge that D2x cannot be restored:

If the target and offline device **functions** are different – the user will see a warning message after successful logon indicating that target device function is different, and they will have a choice to continue or cancel.

If continue – the target device will be rebooted at the end to initialize the new function.

If cancel – the target device will remain un-modified and the sync to operation is cancelled.

If the target and offline device ports (hardware) **allocations** are different – the user will see a warning message after successful logon indicating that target device hardware allocation is different, and they will have a choice to continue or cancel.

If continue – the target device will be rebooted at the end to initialize the new hardware allocation.

If cancel – the target device will remain un-modified and the sync to operation is cancelled.

If the target and offline device **D2x Environment** are different – the user will see an error message indicating this and the Sync To operation is cancelled. Users must first reconcile either the D2x Environment in the target device (e.g., deploy the correct matching D2x Firmware Image) or in the Device Properties D2x Function tab.

If the function and the hardware allocations are identical between the target device and the offline device – the device will restart only the required / impacted subsystems (MCP, D2x applications).

Sync To operation can be performed only if the MCP and D2x configurations have been finalized, meaning:

- When configured function is S or C – the MCP configuration has been saved and there are no other pending actions required.
- When configured function is D or C – the D2x configuration has been generated and there are no errors or other pending actions required.

Note: If the **target unit** is found to be un-suitable for “C” function (i.e. is **not** a G500 4 cores CPU) – the sync to operation will prompt the user with a message and then abandon the operation without performing any changes to the target device.

Sync To operation end is indicated by a dialog:

Regardless of Function – both MCP Core and D2x Applications will restart after successful sync to operation.

Sync From of configuration (“upload”)

The Synchronize From operation handles both D2x and MCP functions, as enabled (i.e. there are no separate Synch From buttons for MCP and D2x).

The credentials required for Sync From operations are:

MCP Administrators

MCP Supervisors

D2x B014 users credentials are not required for Sync From operations.

Synch From operation is allowed only if the running device and the offline (receiving) device have the same MCP Version and Function.

The running and offline device **D2x Environment** may be different.

If the running and offline device Function is different – the user will see an error message indicating that “synch from” operation cannot continue due to this difference. It is expected the user shall then update / create the offline device to match the running function and repeat the operation.

If a D2x Device Archive is present in the running device (i.e. was part of the previous Sync To operation) – the user is asked to confirm to update the offline D2x Configuration and Environment:

If YES – the offline device D2x Configuration (and D2x Environment if different) will be overwritten with the running device.

If NO – these will not be updated.

If there is no D2x Device Archive in the running device (because was not deployed previously part of last Sync To operation) – the sync from of D2x data will not be performed, the user will see a message to this effect.

Sync From operation end is indicated by a dialog:

The D2x associated digits in the “As-Is” model number in the offline device are updated after sync from operation to reflect what the target device has.

Save and Restore Snapshot “as configured”

The Save and Restore Snapshot operations handle both D2x and MCP functions, as enabled (i.e. no separate buttons for MCP and D2x).

The credentials required for Snapshot operations are:

MCP Administrators

D2x B014 users credentials are not required for Snapshot operations.

Saved Clone Snapshots contain the Function, MCP and D2x Configurations, Port Allocations, D2x Environment and D2x Firmware Binaries from the running device.

Restored Clone Snapshots restore the Function, MCP and D2x Configurations, Port Allocations, D2x Environment and D2x Firmware Binaries from the saved clone snapshot.

Note: When a snapshot being restored has a different Function or Port Allocation compared to the MCP device – the MCP device will restart twice (first to restore data, second to change the Function or Port Allocation).

If the snapshot to be restored has function C, and if the **target device unit** is found to be un-suitable for “C” function (i.e. is **not** a G500 4 cores CPU) – the restore snapshot operation will prompt the user with a message and then abandon the operation without performing any changes to the target device.

Restore to Factory Default

When the MCP-D2x device is restored to Factory Default configuration – the “function” (S,C,D) and Hardware Allocation (port assignments) settings will be based on the “As-Built” model number (if present), as following:

- If the “As-Built” model number indicates “S”, or is a previous model G100 without “S”:
 - o the default configuration shall be as an MCP, function “S”
 - o in this case runs the MCP default configuration (similar to previous MCP versions)
 - o ports are allocated as below:
 - COM Groups 1-2 (G500) to MCP
 - COM Groups 3-5 (G500) to MCP or U as per the “As-Built” corresponding digits
 - COM Group 1 (G100) to MCP
 - COM Groups 2-5 (G100) to U
 - HDLC D.20 to MCP or U as per the “As-Built” corresponding digit
 - NET pairs 1 and 2 are assigned to MCP
 - NET 0, and pairs 3-4 are never allocated and remain available for MCP core functions
- If the “As-Built” model number indicates “D”:
 - o the default configuration shall be as a D2X, function “D”
 - o in this case runs the D2x default Environment and configuration present in the file SMXNN_VVV_BBBB.zip located in /mnt/data/log/D2x (if available)
 - o ports are allocated as below:
 - COM Groups 1-2 (G500) to D2X
 - COM Groups 3-5 (G500) to U
 - HDLC D.20 to D2X or U as per the “As-Built” corresponding digit
 - NET pairs 1 and 2 are assigned to D2X
 - NET 0, and pairs 3-4 are never allocated and remain available for MCP core functions
- If the “As-Built” model number indicates “C” and the “As-Is” CPU is 4-cores:
 - o the default configuration shall be as an MCP/D2X, function “C”
 - o in this case runs the MCP default configuration (similar to previous MCP versions),
 - o in this case runs the D2x default Environment and configuration present in the file SMXNN_VVV_BBBB.zip located in /mnt/data/log/D2x (if available)
 - o ports are allocated as below:
 - COM Groups 1-2 (G500) to D2X
 - COM Groups 3-5 (G500) to MCP or U as per the “As-Built” corresponding digits
 - HDLC D.20 to D2X or U as per the “As-Built” corresponding digit
 - NET pairs 1 and 2 are assigned to D2X

- NET 0, and pairs 3-4 are never allocated and remain available for MCP core functions
- If the “As-Built” model number is missing:
 - o the default configuration shall be as an MCP, function “S”
 - o in this case runs the MCP default configuration (similar to previous MCP versions),
 - o ports are allocated as below:
 - COM Groups 1-2 (G500) to MCP
 - COM Groups 3-5 (G500) to MCP or U as per the “**As-Is**” corresponding digits
 - COM Group 1 (G100) to MCP
 - COM Groups 2-5 (G100) to U
 - HDLC D.20 to MCP or U as per the “**As-Is**” corresponding digit
 - NET pairs 1 and 2 are assigned to MCP
 - NET 0, and pairs 3-4 are never allocated to D2x and remain available for MCP core functions

MCP Function Specific UI

All MCP interactive user interfaces and the Firewall remain the same as in previous MCP versions when the configured Function mode is MCP or MCP/D2x.

Some user interactive interfaces are not available when the configured Function mode is D2x (only) – see below.

MCP Shell commands for D2x

The MCP Shell and associated firewall control access retain the same functionality as in MCP v3.10 (serial maintenance, SSH) regardless of the configured Function mode (D2x, MCP, MCP/D2x).

For interacting with D2x function new commands (and associated applications) are available in MCP Shell:

Table 7-2: MCP Shell commands for D2x

D2x Applicable Commands in MCP Shell	Functionality	Required Role
sudo d2xcon	Connects to COM0 of D2x Container – which brings up WESMAINT after that, same as would be a D20ME COM0 port. Must be MCP Admin, not required to enter password again after sudo.	MCP Admin
CTRL+\ and then X	Escape suite of characters to close D2x COM0 connection and go back to MCP shell	MCP Admin
sudo d2xled	Shows a dynamic simulation of D2x Container LED status as when looking at a D20ME front LEDs:	MCP Admin

D2x Applicable Commands in MCP Shell	Functionality	Required Role
	STAT LED OFF or ON READY LED OFF or ON FAIL LED OFF or ON ^C CTRL+C to end, return to MCP Shell Must be MCP Admin, not required to enter password again after sudo.	
sudo d2xload.sh	Forces a reload of D2x exhibits (Firmware files and DEVICE.IMG) Must be MCP Admin and enter password again for sudo.	MCP Admin, sudo
sudo d2xtransfer.sh	Deploys the newly transferred D2x Firmware ZIP file and the D2x default configuration associated with it. Must be MCP Admin and enter password again for sudo.	MCP Admin, sudo

MCP Firewall Configuration

The MCP firewall configuration entry is available regardless of the configured Function mode (D2x, MCP, MCP/D2x).

However – when D2x application has control of the Net LAN interfaces – those Netx interfaces are removed from the firewall available ones.

The MCP firewall doesn't apply to D2x Applications LAN traffic.

MCP utility “mcpcfg”

The “mcpcfg” utility and user role based access (i.e. must be logged on to MCP Shell as MCP administrators) retain the same functionality as in MCP v3.10 (command line in Shell) regardless of the configured Function mode (D2x, MCP, MCP/D2x).

The table below shows which entries apply to D2x configurations.

Table 7-3: Application entries for D2x configuration

Menu entry	Applies to D2x
0. Back	Yes (navigation)
1. Configure Authentication	Yes (to configure MCP Administrators)
2. Configure Network Settings	No
3. Configure Network Interfaces	Yes (only to configure SINGLE / REDUNDANT / PRP)

Menu entry	Applies to D2x
4. Configure Secure Access	Partial (SSH, Emergency Access)
5. Configure Firewall	Yes (for default MCP rules for user interfaces, except HMI)
6. Configure Host Names	No
7. Configure Time & Time Sync	Yes (D2x and MCP time are both configured here)
8. Reset System Logs	No
9. Reset Database Tables	No
10. Reset File Persistence Data	No
11. Local HMI	No
12. Configure Sync Manager	No
13. Redundancy	Yes (fully configure for C and S functions, configured by D2x in D Function)
14. ARRM	No
15. Suppress Forced Qualities To Masters	No
16. Configure Serial Ports	Yes
17. Configure D.20 Port Settings	Yes
18. EdgeOS Host	No
19. Clear Chassis Intrusion State	No
20. Restore Clone Snapshot	Yes
21. Restore Factory Default	Yes
22. Reboot Device	Yes

MCP Settings GUI

The MCP Settings GUI and associated firewall control access (i.e. port 8081) retain the same functionality as in MCP v3.10 regardless of the configured Function mode (D2x, MCP, MCP/D2x).

MCP Online Editor

The MCP Online Editor and associated firewall control access retain the same functionality as in MCP v3.10 when configured Function mode is MCP or MCP/D2x.

In D2x only Function mode the MCP Online Editor access is not available.

MCP Local HMI

The MCP Local HMI application itself (not the desktop) is available same as in MCP v3.10 when configured Function mode is MCP or MCP/D2x.

In D2x only Function mode the MCP Local HMI application is not available. Upon a logon attempt it shall fail, returning a specific message that MCP function is not enabled.

MCP Remote HMI

The MCP Remote HMI and associated firewall control access is available same as in MCP v3.10 when configured Function mode is MCP or MCP/D2x.

In D2x only Function mode the MCP Remote HMI application is not available. Upon a logon attempt it shall fail, returning a specific message that MCP function is not enabled.

MCP RDP

The MCP RDP and associated firewall control access is available same as in MCP v3.10 regardless of the configured Function mode (D2x, MCP, MCP/D2x).

MCP VPN, PassThrough

The MCP VPN, PassThrough functions and associated firewall control access are available same as in MCP v3.10 regardless of the configured Function mode being MCP or MCP/D2x.

D2x Function Specific UI

For D2x Applications the interactive user interfaces are WESMAINT and LogicLinux Editor (Debug).

These are available only when Function mode is D2x or MCP/D2x and the D2x function has valid corresponding licenses, firmware and configuration.

WESMAINT Access via MCP Shell

Using the MCP Shell as initial access point allows users to interact with both MCP Core as well as D2x WESMAINT via the same MCP Maintenance interfaces (serial USB front in G500, SSH in G500). In essence – this method extends to WESMAINT an access over secure TCP/IP connections (SSH).

When at the MCP Shell command prompt – type:

```
sudo d2xcon
```

This opens a Terminal Emulator connected to the COM0 port of the D2x application.

From here on is same user experience as being connected to a D20ME front WESMAINT port, including observing D2x boot messages, access D2x if in service mode if the configuration is bad.

Press Enter, follow the prompts to login to D2x or WESMAINT using B014 configured users and passwords.

When finished invoke the “escape sequence” CTRL+\ followed by letter X to close the D2x COM0 connection and return to the MCP Shell command prompt.

WESMAINT Access via Direct Serial port

Using a mapped serial port in B014 (e.g., COM1) is possible and the functionality is same as in a D20MX.

D2x LogicLinx Editor (Debug)

Access to the MCP LogicLinx Editor (Debug) is via the DSAS Ribbon:

Both MCP and D2x access to LogicLinx Editor (Debug) are available (if LogicLinx is configured) but only one at a time can be used.

Access to D2x LogicLinx Editor (Debug) function is implemented through the D2x Application List if LogicLinx is enabled and configured in D2x (similar workflow as in D20MX).

Right mouse click action on LogicLinx application:

Or Multiple select actions:

B082 is configured for SERIAL

In this case LogicLinX Editor (Debug) works over a PC serial connection, connected to the configured serial port of the G500 device (e.g., COM2).

B082 is configured for WESMAINT

Start Page		Project: MCP-D		MCP-D/D20_01/LogicLinx (B082-0 V300) ✕	
 Communications Type		 AI Conversion Point Tags		 AO Conversion Point Tags	
🔍 ✕ ◀ ▶ 0 of 0					
	Communications Type	Port Number	Baud rate		
→ 1	+ WESMAINT ▼		9600		

In this case LogicLinx Editor (Debug) works over a PC serial connection, connected to a serial port of the G500 device that can access WESMAINT (G500 COM0 or other configured WESMAINT direct serial access ports).

Debugger access is initiated on the PC side after manually open the WESMAINT Application LogicLinx access (in WESMAINT 3. Applications menu).

This will not work over a WESMAINT session launched from an MCP SSH connection.

B082 is configured for ETHERNET

Start Page		Project: MCP-D		MCP-D/D20_01/LogicLinx (B082-0 V300) ✕	
 Communications Type		 AI Conversion Point Tags		 AO Conversion Point Tags	
🔍 ✕ ◀ ▶ 0 of 0					
	Communications Type	Port Number	Baud rate		
→ 1	+ ETHERNET ▼	1100			

In this case LogicLinx Editor (Debug) works over an SSH tunnel connection (“routed” via the MCP Shell).

The SSH tunnel logon requires MCP Administrators (not the B014 configured user names).

The SSH tunnel is only between the DSAS PC and MCP Core.

VAR and D2x Firmware Integrators

VAR or D2x firmware integrators who need to customize the MCP-D2x FW applications can use the *Project Firmware Library*, copy the standard issued SMX version (in this example is SMXA0.400), give it a new NAME (NN) within the VAR whitelist (e.g., J0, K3, etc.) and edit it after.

The new created MCP-D2x Firmware Model must match the D2x Firmware Image created by VAR and loaded in the MCP device by VAR.

The resulting D2x firmware must remain SMX.

The resulting SMX VERSION (VVV) must be same as the source official GE Vernova version (e.g., 400).

The SMX NAME is restricted to 5 characters (SMXNN).

The VAR MCP-D2x Firmware Image(s) must be created by VAR using same SMX naming standards and compatible SMX applications as the GE Vernova issued one(s) and shall be deployed using the manual workflow (not DSAS based).

These D2x Firmware Images are not signed by GE Vernova and are the sole responsibility of the VAR / System Integrator(s) who created them.

It is not possible to order from the GE Vernova Factory devices already loaded with VAR D2x Firmware.

VAR Deploying Unsigned D2x Firmware file using manual file transfer

Unsigned D2x Firmware Files are in the form of **SMXNN_VVV_BBBB.zip**.

These can be deployed to G500 devices using Secure File Transfer tools.

After deploying a new D2x Firmware Image:

- The D2x digits in the “As-Is” model number are updated,
- If the current device Function is “C” or “D”: the D2x device shall run using the Default D2x configuration contained in the D2x Firmware file (assuming the D2x License is present and valid).
 - Any previously present D2x configuration is erased and – if needed – shall be (re)deployed by users later using DSAS sync to operation.
- If the current device Function is “S”: the D2x device is not started, but the D2x Firmware is loaded.

The MCP configuration (if is a “C” Function) is not modified when D2x Firmware is deployed.

Workflow:

Load the unsigned D2x Firmware file, using DSAS Secure File Browser or other SFTP file transfer tools, to:

```
/mnt/usr/D2xTransfer
```

If more than one **SMXNN_VVV_BBBB.zip** file is placed in above folder – the process will not continue. Is up to users to ensure only one such file is placed there.

After a single valid ZIP file was placed in /mnt/usr/D2xTransfer the user will run script:

```
sudo d2xtransfer.sh
```

This script loads the new D2x Firmware and associated Default configuration.

From now on /mnt/dataLog/D2x is the “at rest” source for D2x Firmware and D2x default configuration.

Users shall NOT modify folder /mnt/dataLog/D2x

Chapter 8 - MCP Pseudo Points

This chapter contains the following sections:

- Application Pseudo Points
- Analog Reports
- Calculator
- Data Logger
- Digital Event Management
- DNP 3.0 with MCP as Master Application
- DNP 3.0 with MCP as Outstation Application
- GENASCI Serial with MCP as Master Application
- IEC 60870-5-101 with MCP as Master Application
- IEC 60870-5-101 with MCP as Controlled Station Application
- IEC 60870-5-104 with MCP as Master Application
- IEC 60870-5-104 with MCP as Controlled Station Application
- IEC 60870-5-103 with MCP as Master Application
- IEC 61850 with MCP as Master Application
- IEC 61850 Application – Global Points
- IEC 61850 Application – Per-Device Points
- Tejas V with MCP as LRU Application
- Load Shed
- LogicLinx
- ARRM
- Modbus with MCP as Master Application
- Modbus with MCP as LRU Application
- Redundancy Manager
- SEL Binary Serial with MCP as Master Application
- System Status Manager
- D.20 Peripheral Link Client Pseudo Points
- GPIO Client Pseudo Points

Application Pseudo Points

Applications may provide status information and allow functions or operations to be initiated through system and/or device level pseudo points. These points can be accessed through the Point Summary page of the Online HMI.

» To access device-level and system-level pseudo points:

1. Log into the online HMI of the MCP unit.
2. Click the  **Point Details** button on the toolbar.
3. For device-level pseudo points, click the **IED** tab. A row appears for the IEC 61850 DCA application with a home directory and other details as per the user configuration.
For system-level pseudo points, click the **Application** tab, and select the **IEC61850Client** application.
4. Click the **Details** button for the selected application.
5. Select the appropriate point type tab to view all points belonging to the group.
6. To send a control request, right-click the point and select **Digital Output Interface**.

Analog Reports

(not available after and including MCP V2.60)

Analog Reports – Analog Input Points

Table 8-1: Analog Reports – Analog Input Points

Pseudo Point Name	Description
Current Percentage Disk Usage	Indicates disk usage in percent against total disk size configured.
Days until Storage Space Available	Estimated number of days that the disk will be full.
Total Report Count	Indicates the total number of reports currently available on disk.
Total Shift Report Count	Indicates the total number of shift type reports currently available on disk.
Total Daily Report Count	Indicates the total number of daily type reports currently available on disk.
Total Weekly Report Count	Indicates the total number of weekly type reports currently available on disk.
Total Monthly Report Count	Indicates the total number of monthly type reports currently available on disk.

Analog Reports – Digital Input Points

Table 8-2: Analog Reports – Digital Input Points

Pseudo Point Name	Description
Storage Space Full	Set to FULL if disk usage exceeds threshold value. Set to AVAILABLE if disk usage does not exceed threshold value.

Calculator

Calculator – Accumulator Points

Table 8-3: Calculator – Accumulator Points

Pseudo Point Name	Description
CommandsReceived	Updated whenever a Control is received
RxdCommandsFailed	Updated whenever a command received by the Calculator DTA fails.
Commands Txd	Updated whenever the Calculator DTA transmits a control request
TxdCommandsFailed	Updated whenever a command transmitted by the Calculator DTA fails.

Calculator – Analog Input Points

Table 8-4: Calculator – Analog Input Points

Pseudo Point Name	Description
TimerCount	Indicates the number of Timers configured.
CalcPointCount	Indicates the number of Calculator Points configured.

Calculator – Digital Input Points

Table 8-5: Calculator – Digital Input Points

Pseudo Point Name	Description
ConfigError	Indicates if errors were detected: - Indicates 0 if no errors were detected. - Indicates 1 if errors were detected.
CalcStatus	Indicates if the Calculator application is functional: - Indicates 1 if the application is functional. - Indicates 0 if application cannot proceed (because of a Config error etc.)
DeviceDisabled	Indicates if the Calculator application is disabled or enabled: - Indicates 1 if the Calculator application is disabled. - Indicates 0 if the Calculator application is running. NOTE: The Calculator application can be disabled or enabled through the Disable Device Digital Output pseudo point.

Calculator – Digital Output Points

Table 8-6: Calculator – Digital Output Points

Pseudo Point Name	Description
DisableDevice	Provides an option to disable/enable the Calculator application (DTA): - Set to 1 to disable the Calculator application. - Set to 0 to enable the Calculator application.

Data Logger

Data Logger – Analog Input Points

Table 8-7: Data Logger – Analog Input Points

Pseudo Point Name	Description
Active Report Count	Indicates how many configured Reports are active
Continuous Report (nn): Storage	Analog Input Displays the % of the configured log space that has been used for Continuous Report(nn).
Periodic Report (nn): Storage	Analog Input Displays the % of the configured log space that has been used for Periodic Report(nn).
Out of Range Report (nn): Storage	Analog Input Displays the % of the configured log space that has been used for Out of Range Report(nn).

Data Logger – Digital Input Points

Table 8-8: Data Logger – Digital Input Points

Pseudo Point Name	Description
Application Status	Set when the application is running.
Configuration Error	Set when a configuration error is detected.

Data Logger – Digital Output Points

Table 8-9: Data Logger – Digital Output Points

Pseudo Point Name	Description
Disable Logging	When set to ON, this point disables logging for all Reports.
Reset All Logs	When set to ON, this point clears the log data of all log records.
Continuous Report (nn): Disable	When set to ON, this point disables logging for the associated Continuous Report(nn).
Continuous Report (nn): Reset	When set to ON, this point clears the log data of all log records for the associated Continuous Report(nn).
Periodic Report (nn): Disable	When set to ON, this point disables logging for the associated Periodic Report (nn).
Periodic Report (nn): Reset	When set to ON, this point clears the log data of all log records for the associated Periodic Report (nn).

Pseudo Point Name	Description
Out of Range Report (nn): Disable	When set to ON, this point disables the log data of all log records for the associated Out of Range Report (nn).
Out of Range Report (nn): Reset	When set to ON, this point clears the log data of all log records for the associated Out of Range Report (nn).

Digital Event Management

Digital Event Manager – Analog Input Points

Table 8-10: Digital Event Manager – Analog Input Points

Pseudo Point Name	Description
Total Number of Alarms	The total number of alarm records in the database including the uncommitted records.
Total Number of UnAck Alarms	The total number of Unacknowledged alarm records in the database including the uncommitted records.
TotalAlarmsDesc-GrpCritical	The total number of alarm records for alarms in the Critical group.
TotalAlarmsDesc-GrpDefault	The total number of alarm records for alarms in the Default group.

Digital Event Manager – Digital Input Points

Table 8-11: Digital Event Manager – Digital Input Points

Pseudo Point Name	Description
Unacknowledged Alarms	TRUE if there are alarm records that are not in reset and not acknowledged.
Points in Alarm	TRUE if there are alarm records that are not in reset.
Points Suppressed	One or more digital inputs in the MCP are in the forced, alarm inhibited, or scan inhibited state.
GroupUnAckDesc-GrpCritical	TRUE if there are alarm records for any alarm in the Critical group that are not acknowledged.
GroupInAckDesc-GrpCritical	TRUE if there are alarm records for any alarm in the Critical group that are not in reset.
GroupInAlarmReFlashDesc-GrpCritical	TRUE if a new alarm record has occurred for any alarm in the Critical group for the configured Alarm Group ReFlash Time.
GroupUnAckDesc-GrpDefault	TRUE if there are alarm records for any alarm in the Default group that are not acknowledged.
GroupInAlarmDesc-GrpDefault	TRUE if there are alarm records for any alarm in the Default group that are not in reset.
GroupInAlarmReFlashDesc-GrpDefault	TRUE if a new alarm record has occurred for any alarm in the Default group for the configured Alarm Group ReFlash Time.

Digital Event Manager – Digital Output Points

Table 8-12: Digital Event Manager – Digital Output Points

Pseudo Point Name	Description
AcknowledgeOrphanAlarms	A latch ON, close, or pulse on operation for this point acknowledges all orphan alarms in the MCP.
GrpAckDesc-GrpCritical	A latch ON, close, or pulse on operation for this point acknowledges all alarms in Critical group.
GrpAckDesc-GrpDefault	A latch ON, close, or pulse on operation for this point acknowledges all alarms in the Default group.

DNP 3.0 with MCP as Master Application

Note: This section applies to both **Serial** and **Ethernet** connection.

DNP 3.0 with MCP as Master – Accumulator Points (Serial / Ethernet)

Table 8-13: DNP 3.0 with MCP as Master – Accumulator Points

Pseudo Point Name	Description
UpdateCount	Accumulation for the total number of points the RTDB has been updated for this DNP outstation.
MsgSent	Accumulation for the total number of requests sent by the DNP DCA to this DNP outstation.
MsgReceived	Accumulation for the total number of responses received by the DNP DCA from this DNP outstation.
MsgTimeOuts	Accumulation for the number of message timeouts detected by the DNP DCA for this DNP outstation.
MsgError	Accumulation for the total number of responses received in error from this DNP outstation.
OperationsRequested	Accumulations for the number of control requests received by the DNP DCA via the RTDB that was directed to this DNP outstation.
OperationsFailed	Accumulations of the number of operation failures detected for this DNP outstation.

DNP 3.0 with MCP as Master – Analog Input Points (Serial / Ethernet)

Table 8-14: DNP 3.0 with MCP as Master – Analog Input Points

Pseudo Point Name	Description
OneWayTransmissionDelay	One-Way Transmission Path Delay in milliseconds.
NumberSuccessTransactions	Number of Successful Transactions with device.
NumberFailedTransactions	Number of Failed Transactions with device.
ActiveChannel	Communications channel being used (0 is primary and 1 is backup).
PercentSuccessTransactionsX100	Percentage of successful transactions multiplied by 100.

DNP 3.0 with MCP as Master – Digital Input Points (Serial / Ethernet)

Table 8-15: DNP 3.0 with MCP as Master – Digital Input Points

Pseudo Point Name	Description
Device Online	Indicates if the Configured DNP outstation is Online (1) or Offline (0).
IEDCommDeviceRestart	This status point is set when the DNP DCA receives a Device Restart IIN from the DNP outstation. The status is reset otherwise.
IEDCommBadConfig	This status point is set when the DNP DCA receives a BAD CONFIG IIN from the DNP outstation. The status point is reset when the DNP outstation does not transmit IINs with BAD CONFIG bit set.
IEDCommNeedTime	This status point is set when the DNP DCA receives a NEED TIME IIN from the DNP outstation. The status point is reset when the DNP outstation does not transmit IINs with NEED TIME bit set.
IEDCommLocal	This status point is set when the DNP DCA receives a LOCAL IIN from the DNP outstation. The status point is reset when the DNP outstation does not transmit IINs with LOCAL bit set.
IEDCommDeviceTrouble	This status point is set when the DNP DCA receives a DEVICE TROUBLE IIN from the DNP outstation. The status point is reset by the DNP DCA when the DNP outstation does not transmit IINs with DEVICE TROUBLE bit set.
IEDCommBadFunc	This status point is set when the DNP DCA receives a BAD FUNCTION IIN from the DNP outstation. The status point is reset when the DNP outstation does not transmit IINs with BAD FUNCTION bit set.
IEDCommObjectUnknown	This status point is set when the DNP DCA receives an OBJECT UNKNOWN IIN from the DNP outstation. The status point is reset when the DNP outstation does not transmit IINs with OBJECT UNKNOWN bit set.
IEDCommParamError	This status point is set when the DNP DCA receives a PARAMETER ERROR IIN from the device. The status point is reset when the DNP outstation does not transmit IINs with PARAMETER ERROR bit set.
IEDCommBufferOverFlow	This status point is set when the DNP DCA receives a BUFFER OVERFLOW IIN from the DNP outstation. The status point is reset when the DNP outstation does not transmit IINs with BUFFER OVERFLOW bit set.
IEDCommAlreadyExec	This status point is set when the DNP DCA receives an ALREADY EXEC IIN from the DNP outstation. The status point is reset when the DNP outstation does not transmit IINs with ALREADY EXEC bit set.
IEDCommAllStations	This status point is set when the DNP DCA receives an ALL STATIONS IIN from the DNP outstation. The status point is reset when the DNP outstation does not transmit IINs with ALL STATIONS bit set.
DCAStatus	Set if DNP DCA application is enabled.
PrimaryPortActiveStatus	Indicates the status of the Configured Primary Port. Active (1) Inactive (0).
BackupPortActiveStatus	Indicates the status of the Configured Backup Port. Active (1) Inactive (0).
PrimaryPortHealthStatus	Indicates the health of the Configured Primary Port. Healthy(1), Unhealthy(0).
BackupPortHealthStatus	Indicates the health of the Configured Backup Port. Healthy(1), Unhealthy(0).
DeviceDisable	Set if DNP Device is disabled. Note: This point is available when the Configuration Parameter “Device Disable Logic Type” is set to “true”.
DeviceEnabled	Set if DNP Device is enabled. Note: This point is available when the Configuration Parameter “Device Disable Logic Type” is set to “false”.

Pseudo Point Name	Description
UnsolicitedResponse	Set if a Control (1) is received on the EnableUnsolicited DO Pseudo point.
PollingDisabled	Set if the polling is disabled. Note: This point is available when the Configuration Parameter “Polling Disable Logic Type” is set to “true”.
PollingEnabled	Set if the polling is enabled. Note: This point is available when the Configuration Parameter “Polling Disable Logic Type” is set to “false”.
DemandPollInProg	Set when a manually initiated poll device for data is pending. Normally Scheduled polls and Automatic polls do not affect the state of this point.
DeviceRestartInProg	Set when Restart Remote Device is pending.
TimeSyncInProg	Set when Time Sync Remote Device is pending.
PropagationDelayInProg	Set when a Propagation Delay Measurement is pending.

DNP 3.0 with MCP as Master – Digital Output Points (Serial / Ethernet)

Table 8-16: DNP 3.0 with MCP as Master – Digital Output Points

Pseudo Point Name	Description
DisableDevice	This pseudo control accepts Latch ON/Latch OFF controls. When set (i.e., latched ON), the DNP DCA disables polling to the DNP outstation. Sets all RTDB points belonging to the DNP outstation OFFLINE, and no scheduled data requests are sent to the DNP outstation. Note: This point is available when the Configuration Parameter “Device Disable Logic Type” is set to “true”.
EnableDevice	This pseudo control accepts Latch ON/Latch OFF controls. When reset (i.e., latched OFF), the DNP DCA disables polling to the DNP outstation. Sets all RTDB points belonging to the DNP outstation OFFLINE, and no scheduled data requests are sent to the DNP outstation. Note: This point is available when the Configuration Parameter “Device Disable Logic Type” is set to “false”.
SendTimeSync	This pseudo control accepts Pulse ON/Pulse OFF controls. When pulsed, the DNP DCA transmits a Time Sync message to the DNP outstation.
SendRestart	This pseudo control accepts Pulse ON/Pulse OFF controls. When pulsed, the DNP DCA transmits a Cold Restart message to the DNP outstation.
EnableUnsolicited	This pseudo control accepts Latch ON/Latch OFF controls. When set (i.e., latched ON), the DNP DCA enables supporting of Unsolicited Messages sent from DNP outstation.
DisablePolling	This control disables or enables scheduled polling of the device, send a DO=1 to disable polling. Note: This point is available when the Configuration Parameter “Polling Disable Logic Type” in the client map file is set to “true”.
EnablePolling	This control disables or enables scheduled polling of the device, send a DO=0 to disable polling. Note: This point is available when the Configuration Parameter “Polling Disable Logic Type” in the client map file is set to “false”.
IntegrityPoll	When a control request is received from this point, the DCA sends one general interrogation to the device.
ClassPoll	When a control request is received from this point, the DNP DCA sends a Class Poll (Class 1, 2 and 3) to the configured DNP outstation.

Pseudo Point Name	Description
SwitchChannel	When a control request is received from this point, the DNP DCA switches to the configured alternate Channel.
ClearStats	When a control request is received from this point, the DNP DCA clears all the values on the Accumulator points.
PropagationDelayMeasure	When a control request is received from this point, the DNP DCA sends a Propagation Delay Measurement request for the device.

DNP 3.0 with MCP as Outstation Application

Note: This section applies to both **Serial** and **Ethernet** connection.

DNP 3.0 with MCP as Outstation – Accumulator Points (Serial / Ethernet)

Table 8-17: DNP 3.0 with MCP as Outstation – Accumulator Points

Pseudo Point Name	Description
MasterMsgIn	Indicates the number of response messages sent by the DNP Master to the DNP DPA.
MasterMsgOut	Indicates the number of request messages received by the DNP Master from the DNP DPA.
RemMsgAckTimeouts	Indicates number of acknowledgement message time out.
RemOperationRequests	Indicates the number of control operation requests received by DNP DPA from DNP Master.
RemOperationsFailed	Indicates number of control operations failed.
CRCErrCnt	Indicates no of CRC errors.
MasterMsgRetryCnt	Indicates the number of messages retried by the DNP DPA to the DNP Master.
BIChangeEventsOut	Indicates the number of binary input change events sent to DNP Master.

DNP 3.0 with MCP as Outstation – Analog Input Point (Serial / Ethernet)

Table 8-18: DNP 3.0 with MCP as Outstation – Analog Input Point

Pseudo Point Name	Description
MasterAdd	Indicates DNP Master station address that DNP DPA is communicating with.
DPAProcessID	Indicates DNP DPA child process ID.
Total Events in Queue	Indicates the total events available in the DNP DPA Event Queues.
Application Identifier	Unique Application Identifier of the DNP DPA application auto defined in the configuration.

DNP 3.0 with MCP as Outstation – Digital Input Points (Serial / Ethernet)

Table 8-19: DNP 3.0 with MCP as Outstation – Digital Input Points

Pseudo Point Name	Description
CommStatus	Indicates DNP DPA communication status. Set when communication with DNP Master is Enabled and Unset when Disabled.
DPAStatus	Indicates the DNP DPA Application status. Set when DNP Master application is Enabled and Unset when Disabled.
PriPortStatus	Indicates the health of the configured Primary Port.
BackPortStatus	Indicates the health of the configured Backup Port. Point is Offline mode if not configured.

DNP 3.0 with MCP as Outstation – Digital Output Points (Serial / Ethernet)

Table 8-20: DNP 3.0 with MCP as Outstation – Digital Output Points

Pseudo Point Name	Description
ForceControlsLockout	Indicates DNP DPA control disable pseudo point. If set DNP DPA does not accept any control operations from DNP Master, Except the command on same point if same is registered by DNP DPA.
Print Event Queue to File	When a control request is received on this point, the DNP DPA dumps all the events in the Event Queue into the file in MCP "/mnt/datalog/DNPDPA_EVENT_QUEUE.<Home Directory>". Here, <Home Directory> is the home directory of the DNP DPA from the Master connections or Point Details in Runtime HMI.
Clear Stats	When a control request is received from this point, the DNP DPA clears all the values on the Accumulator points.

GENASCII Serial with MCP as Master Application

These points comprise:

- DCA Pseudo Points
- IED Pseudo Points

DCA Pseudo Points

Accumulators

Table 8-21: DCA Pseudo Points - Accumulators

Pseudo Point Name	Description
MsgSent	Accumulator for the total number of messages sent to all devices.
MsgReceived	Accumulator for the total number of messages received from all devices.
MsgTimeOuts	Accumulator for the total number of message timeouts detected. It is incremented every time the device has failed to respond to a Request within the allowed timeout.

Digital Input

Table 8-22: DCA Pseudo Points - Digital Input

Pseudo Point Name	Description
DCA Status	Indicates the status of the GenASCII DCA Application. Set to Enabled if DCA Application is initialized correctly. Reset to Disabled if DCA Application failed to initialize correctly.
Enable Polling Of All IEDs Status	Indicates the polling status of all devices. NOTE: If “Polling of IED Status” is Enabled for specific device, but “Enable Polling Of All IEDs Status” is Disabled at DCA Level, polling occurs for the respective device. Set to Enabled if polling is Enabled for all devices. Reset to Disabled if polling is Disabled for all devices.
All Devices Disabled	Indicates the disabled status of all devices. NOTE: If “DeviceDisable” is Enabled for specific device, but “AllDevicesDisabled” is Disabled at DCA Level, the respective device disabled status is Enabled. Set to Enabled if the status of all devices is Enabled. Reset to Disabled if the status of all devices is Disabled.

Digital Output

Table 8-23: DCA Pseudo Points - Digital Output

Pseudo Point Name	Description
Enable Polling Of All IEDs	This control enables or disables polling status of all devices in multi drop device configuration. If disabled, the polling status of all the individual devices will be disabled. If enabled, the polling status of all the individual devices will be enabled. NOTE: If “Enable Polling of IED” DO Pseudo Point is Disabled and if “Enable Polling Of All IEDs” control is Enabled, the polling status of device is given priority. Rest of the devices whose “Enable Polling Of IED” DO Pseudo Point is Enabled will be Enabled.
DisableAllDevices	This control enables or disables the running state of all IEDs. When Set to Enabled, all the individual devices will be enabled unless specific device DO Pseudo Point DisableDevice is in Disabled state. When Reset to Disabled, all the individual devices will be disabled.

IED Pseudo Points

Accumulators

Table 8-24: IED Pseudo Points - Accumulators

Pseudo Point Name	Description
UpdateCount	Accumulator for the total number of points in the RTDB that have been updated for this device.
MsgSent	Accumulator for the total number of messages sent by the Client to the device.
MsgReceived	Accumulator for the total number of messages received by the Client from the device. It is incremented only when the message is received from the device and response is valid.
MsgTimeOuts	Accumulator for the total number of message timeouts detected by the Client for the device. It is incremented every time the device has failed to respond to a Request within the allowed timeout.
MsgError	Accumulator for the total number of frames received in error from the device.

Analog Input

Table 8-25: IED Pseudo Points - Analog Input

Pseudo Point Name	Description
ConfigErrors	Indicates the number of responses received in error because of misconfiguration. This is detected based on the Invalid Pattern definition of the transaction definition in client map file.

Digital Input

Table 8-26: IED Pseudo Points – Digital Input

Pseudo Point Name	Description
Device Online	Indicates if the Configured device is: •ONLINE (1), or •OFFLINE (0).
Primary Port Active Status	Indicates the usage of configured Primary Port. Set to IN USE if Primary port is in use. Reset to NOT INUSE if not in use.
Backup Port Active Status	Indicates the usage of configured Secondary Port. Set to IN USE if backup port is in use. Reset to NOT INUSE if not configured.
DeviceDisable	Indicates the disabled status of device. NOTE: If “DisableAllDevices” control is Disabled, the DeviceDisable DI Pseudo Point will be Disabled. If “DisableAllDevices” control is Enabled, the DeviceDisable DI Pseudo Point will be Enabled only if “DisableDevice” DO Pseudo Point is Enabled. Set to Enabled if the status of device is Enabled. Reset to Disabled if the status of device is Disabled.

Pseudo Point Name	Description
Polling Of IED Status	Indicates the polling status of device. NOTE: If “Enable Polling Of All IEDs” control is Disabled, the Polling Of IED Status DI Pseudo Point will be Disabled. If “Enable Polling Of All IEDs” control is Enabled, the Polling Of IED Status DI Pseudo Point will be Enabled only if “Enable Polling Of IED” DO Pseudo Point is Enabled. Set to Enabled if polling is Enabled for device. Reset to Disabled if polling is Disabled for device.
His_cmd_support	Indicates support for HIS command for SEL device.
Eve_cmd_support	Indicates support for EVE command for SEL device.
Cev_cmd_support	Indicates support for CEV command for SEL device
File Retrieval In-Progress	Value 1 indicates that file retrieval from the SEL device is in-progress. Value 0 indicates that file retrieval from the SEL device is not in-progress.
Pass Through In-Progress	Value 1 indicates that data transfer through the Pass-Through connection with SEL device is in-progress. Value 0 indicates that data transfer through the Pass-Through connection with SEL device is not in-progress.

Digital Output

Table 8-27: IED Pseudo Points – Digital Output

Pseudo Point Name	Description
DisableDevice	This control enables or disables the running state of the device. When Set to Enabled, the device will be enabled. When Reset to Disabled, the device will be disabled and will be declared as OFFLINE.
ClearStats	This control clears all the communication statistics UpdateCount (MsgSent, MsgReceived, MsgTimeouts and MsgErrors) Pseudo Points of the device.
Enable Polling Of IED	This control disables or enables polling to the device. If set to Disabled, the polling to the device is stopped. If reset to Enabled, the polling to the device will be resumed.

Text Points

Table 8-28: IED Pseudo Points – Text Points

Pseudo Point Name	Description
DEVICEINFO_LINEID	Indicates the Line id of the device.
DEVICEINFO_DEVICEID	Indicates the Device id of the device.
DEVICEINFO_BAYID	Indicates the Bay id of the device.
DEVICEINFO_DEVICETYPE	Indicates the device type.

Pseudo Point Name	Description
DEVICEINFO_DEVICEADDRESS	Indicates the device address.
MapFile	Indicates the map file name of the device.

Refer to [Time Sequence Diagrams and Sample Configuration](#) for more detailed explanation.

IEC 60870-5-101 with MCP as Master Application

IEC 101 with MCP as Master – Device Level

IEC 101 with MCP as Master – Device Level – Accumulator Points

Table 8-29: IEC 101 with MCP as Master – Device Level – Accumulator Points

Pseudo Point Name	Description
NewEventsReceived	The number of new events received by the IEC 60870-5-104/101 DCA from the device. Incremented immediately after a previously unrecorded event has been reported by the device.
EventsReported	The number of events successfully reported to the RtDB for a Device.
MsgSent	The number of messages sent by the IEC 60870-5-104/101 DCA to the device. It is incremented immediately after a data link frame is sent to the device. The IEC 60870-5-104/101 DCA increments this statistic for each Device that shares the same link addresses.
MsgReceived	The number of messages received by the IEC 60870-5-104/101 DCA from the device. It is incremented immediately after a data link frame has been successfully received from the device. The IEC 60870-5-104/101 DCA increments this statistic for each Device that shares the same link address if the link address of the message is known. If the link address is unknown, this Pseudo point is not incremented.
MsgTimeouts	The number of message timeouts detected by the IEC 60870-5-104/101 DCA for the device. It is incremented every time the device has failed to respond to a confirmed data link frame (i.e., any Primary frame but function code 4 – Send No Reply) within the allowed timeout. The IEC 60870-5-104/101 DCA increments this statistic for each Device that shares the same link address.
MsgError	The number of frames received in error (e.g., checksum failure). Does not include Respond NACK (function code 4) or Confirm NACK (function code 1) frames, as those would be incremented under MsgReceived. The IEC 60870-5-104/101 DCA increments this statistic for each Device that shares the same link address if the link address of the message is known. If the link address is unknown, this pseudo point is not incremented.
UpdateCount	The number of data change events reported to the RtDB for a Device.
CommandsReceived	The number of Output, Local, or Accumulator Commands received from the RtDB.
CommandsFailed	The number of negative command statuses sent to the RtDB.
RxBadTypeID	The number of invalid or unsupported Type Identification messages received from the Device. As a prerequisite to incrementing this statistic, the ASDU address of the message must be known.
UpdateCount	The number of data change events reported to the RtDB for a Device.

Pseudo Point Name	Description
MsgSent	The number of messages sent by the IEC 60870-5-104/101 DCA to the device. It is incremented immediately after a data link frame is sent to the device. The IEC 60870-5-104/101 DCA increments this statistic for each Device that shares the same link addresses.
MsgReceived	The number of messages received by the IEC 60870-5-104/101 DCA from the device. It is incremented immediately after a data link frame has been successfully received from the device. The IEC 60870-5-104/101 DCA increments this statistic for each Device that shares the same link address if the link address of the message is known. If the link address is unknown, this Pseudo point is not incremented.
MsgTimeOuts	The number of message timeouts detected by the IEC 60870-5-104/101 DCA for the device. It is incremented every time the device has failed to respond to a confirmed data link frame (i.e., any Primary frame but function code 4 – Send No Reply) within the allowed timeout. The IEC 60870-5-104/101 DCA increments this statistic for each Device that shares the same link address.
MsgError	The number of frames received in error (e.g., checksum failure). Does not include Respond NACK (function code 4) or Confirm NACK (function code 1) frames, as those would be incremented under MsgReceived. The IEC 60870-5-104/101 DCA increments this statistic for each Device that shares the same link address if the link address of the message is known. If the link address is unknown, this pseudo point is not incremented.
NewEventsReceived	The number of new events received by the IEC 60870-5-104/101 DCA from the device. Incremented immediately after a previously unrecorded event has been reported by the device.

IEC 101 with MCP as Master – Device Level – Digital Input Points

Table 8-30: IEC 101 with MCP as Master – Device Level – Digital Input Points

Pseudo Point Name	Description
Device Online	Indicates if the communications with the Device is Active (1) or Inactive (0). The DCA sets this to ON after the initialization procedure with a device completes successfully. The DCA sets this to OFF after communications has been lost with the Device or when the Device is Disabled
DeviceDisable	Indicates if the communications with the Device is disabled. Reflects the status of the DisableDevice Digital Output pseudo point or'ed with the DisableAllDevices Digital Output pseudo point.
PollingDisabled	Indicates if the scheduled polling of the Device is disabled. Reflects the status of the DisablePolling Digital Output pseudo point or'ed with the DisableAllPolling Digital Output pseudo point.
IntegrityPollExecution	Indicates the status of Integrity Poll. In progress (pending: 1) or completed (0). Integrity Poll can be manually triggered either by IntegrityPoll or IntegrityPollAllDevices Digital Output pseudo points
TimeSyncExecution	Indicates the status of the Time synchronization. In progress (pending: 1) or completed (0). Time Synchronization can be triggered by either the TimeSync or the TimeSyncAllDevices Digital Output pseudo point is.

Pseudo Point Name	Description
DeviceRestarted	Toggled when Restart or Power On indications are received from the device. Restarted (1) and Running (0) Applicable only to the IEC 60870-5-103 Client.
CounterIntegrityPollExecution	Indicates the status of Counter Integrity Poll. In progress (pending: 1) or completed (0). The Counter Integrity Poll can be triggered by either the CounterIntegrityPoll or CounterIntegrityPollAllDevices Digital Output pseudo points

IEC 101 with MCP as Master – Device Level – Digital Output Points

Table 8-31: IEC 101 with MCP as Master – Device Level – Digital Output Points

Pseudo Point Name	Description
DisableDevice	This control enables or disables communications with the Device.
DisablePolling	When a control request is received from this point, the DCA sends one counter interrogation to the device.
IntegrityPoll	This control disables or enables scheduled polling of the device.
TimeSync	When a control request is received from this point, the DCA issues time synchronization to the device.
CounterIntegrityPoll	When a control request is received from this point, the DCA sends one general interrogation to the device.

IEC 101 with MCP as Master – DCA Level

IEC 101 with MCP as Master – DCA Level – Accumulator Points

Table 8-32: IEC 101 with MCP as Master – DCA Level – Accumulator Points

Pseudo Point Name	Description
MsgSent	Accumulation of the total number of the “MsgSent” accumulator values for all devices managed by the IEC 60870-5-104/101 DCA.
MsgReceived	Accumulation of the total number of the “MsgReceived” accumulator values for all devices managed by the IEC 60870-5-104/101 DCA.
MsgTimeOuts	Accumulation of the total number of the “MsgTimeouts” accumulator values for all devices managed by the IEC 60870-5-104/101 DCA.
RxUnknownASDUAddress	Accumulation of the number of unknown ASDU address messages received on the channel managed by the IEC 60870-5-104/101 DCA.
RxUnknownLinkAddress	Accumulation of the number of unknown link address messages received on the channel managed by the IEC 60870-5-104/101 DCA.
RxFrameErrors	Accumulation of the number of messages with frame errors received on the channel managed by the IEC 60870-5-104/101 DCA.

IEC 101 with MCP as Master – DCA Level – Digital Input Points

Table 8-33: IEC 101 with MCP as Master – DCA Level – Digital Input Points

Pseudo Point Name	Description
DCAStatus	Indicates the status of the IEC 60870-5-104/101 DCA application. Set if IEC 60870-5-104/101 DCA is running. Reset if IEC 60870-5-104/101 DCA is not running.
AllDevicesDisabled	Indicates if all the configured IEC 60870-5-104/101 DCA is disabled.

Pseudo Point Name	Description
	Set if all the IEC 60870-5-104/101 DCA is disabled. Reset if all the IEC 60870-5-104/101 DCA is enabled.
AllPollingDisabled	Indicates if the scheduled polling of all Devices is disabled. Set if polling of all IEC 60870-5-104/101 DCA is disabled. Reset if polling of all IEC 60870-5-104/101 DCA is enabled.

IEC 101 with MCP as Master – DCA Level – Digital Output Points

Table 8-34: IEC 101 with MCP as Master – DCA Level – Digital Output Points

Pseudo Point Name	Description
DisableAllDevices	This control disables or enables communications with all Devices belonging to the IEC 60870-5-104/101 DCA.
IntegrityPollAllDevices	When a control request is received from this point, the IEC 60870-5-104/101 DCA sends one general interrogation to each IEC 60870-5-104/101 controlled station.
CounterIntegrityPollAllDevices	When a control request is received from this point, the IEC 60870-5-104/101 DCA sends one counter interrogation to each IEC 60870-5-104/101 controlled station.
TimeSyncAllDevices	When a control request is received from this point, the IEC 60870-5-104/101 DCA issues time synchronization to each IEC 60870-5-104/101 controlled station.
DisableAllPolling	This control disables or enables scheduled polling of all IEC 60870-5-104/101 controlled stations.

IEC 60870-5-101 with MCP as Controlled Station Application

IEC 101 with MCP as Controlled Station – Accumulator Points

Table 8-35: IEC 101 with MCP as Controlled Station – Accumulator Points

Pseudo Point Name	Description
MasterMsgIn	Increments immediately after a data link frame has been successfully received from the master. The DPA increments this statistic for each LRU that shares the same link addresses.
MasterMsgOut	Increments immediately after a data link frame is sent to the master, including retries. The DPA increments this statistic for each LRU that shares the same link address.
RemMsgAckTimeouts	For Balanced, number of confirmed frames that did not receive an acknowledgement within the response timeout (calculated as Extra Response Timeout + Timeout from Annex 2 in 870-5-2). The DPA increments this statistic for each LRU that shares the same link address. For Unbalanced, not incremented.

Pseudo Point Name	Description
	For 104, number of unacknowledged frames that were outstanding at the time the connection was dropped due to a timeout.
RemOperationRequests	Number of commands received from the master.
RemOperationsFailed	Number of commands that the Server either rejected or could not execute due to an error.
ASDUDataRequestsReceived	Number of ASDU data requests received
ASDUDataRequestsRejected	Number of ASDU data requests rejected
ASDUDataResponsesSent	Number of ASDU data responses sent
SpontaneousASDUDataMessagesSent	Number of spontaneous ASDU data messages sent
SpontaneousASDUDataMessagesNoACK	Number of spontaneous ASDU data messages that did not receive ACK from Master. Not applicable to 101 Unbalanced.
ASDUControlResponsesSent	Number of ASDU control responses sent
ChangeEventsReceivedFromRtDB	Number of RtDB Data, Quality, or Data and Quality change events received.
BufferOverflows	Number of Event buffer overflows detected either in an RtDB FIFO or within the DPA's internal buffers.
RtDBReadRequests	Number of RtDB read requests
RtDBReadFailures	Number of RtDB read failures
RtDBWriteRequests	Number of RtDB write requests
DOAndAOCommandFailures	Number of DO and AO command failures
DOAndAOCommandFailuresDueToSBOTimeout	Number of DO and AO command failures due to SBO timeout
CommandFailuresDueToControlLockout	Number of command failures due to control lockout
AccumulatorCommandsSent	Number of accumulator command requests
AccumulatorCommandsFailed	Number of accumulator command failures
FileTransfersAttempted	Number of file transfers attempted
FileTransfersFailed	Number of file transfers failed

IEC 101 with MCP as Controlled Station – Analog Input Points

Table 8-36: IEC 101 with MCP as Controlled Station – Analog Input Points

Pseudo Point Name	Description
DPAProcessID	Indicates the ID of the DPA child Process.
Application Identifier	Unique Application Identifier of the DPA application auto defined in the configuration.

IEC 101 with MCP as Controlled Station – Digital Input Points

Table 8-37: IEC 101 with MCP as Controlled Station – Digital Input Points

Pseudo Point Name	Description
CommStatus	Indicates the Communication status of the DPA with the configured Master. Set if the DPA is actively communicating with the Master. Reset if the DPA is not communicating with the Master.
DPAStatus	Indicates the status of the DPA application. Set if the DPA is currently running. Reset is the DPA is not running.

Pseudo Point Name	Description
PriPortStatus	Indicates the status of the configured Primary port for communicating with Master. Set while communication is active on the Primary port. Reset while there are no communications on the Primary port.
BackPortStatus	Indicates the status of the configured Backup port for communication. Set while communication is active on the Backup port. Reset while there are no communications on the Backup port.
EventBufferOverflow	Toggled when the DPA detects an event buffer overflow.
EventBufferLow	Indicates whether an internal DPA event buffer low condition exists.

IEC 101 with MCP as Controlled Station – Digital Output Points

Table 8-38: IEC 101 with MCP as Controlled Station – Digital Output Points

Pseudo Point Name	Description
ForceControlsLockout	Set if the DPA refuses the control requests sent by the configured Master Reset if the DPA accepts the control requests and performs the respective operation.

IEC 60870-5-104 with MCP as Master Application

IEC 104 with MCP as Master – Device Level

IEC 104 with MCP as Master – Device Level – Accumulator Points

Table 8-39: IEC 104 with MCP as Master – Device Level – Accumulator Points

Pseudo Point Name	Description
UpdateCount	The number of data change events reported to the RTDB for a Device.
MsgSent	The number of messages sent by the IEC 60870-5-104/101 DCA to the device. It is incremented immediately after a data link frame is sent to the device. The IEC 60870-5-104/101 DCA increments this statistic for each Device that shares the same link addresses.
MsgReceived	The number of messages received by the IEC 60870-5-104/101 DCA from the device. It is incremented immediately after a data link frame has been successfully received from the device. The IEC 60870-5-104/101 DCA increments this statistic for each Device that shares the same link address if the link address of the message is known. If the link address is unknown, this Pseudo point is not incremented.
MsgTimeOuts	The number of message timeouts detected by the IEC 60870-5-104/101 DCA for the device. It is incremented every time the device has failed to respond to a confirmed data link frame (i.e., any Primary frame but function code 4 – Send No Reply) within the allowed timeout. The IEC 60870-5-104/101 DCA increments this statistic for each Device that shares the same link address.
MsgError	The number of frames received in error (e.g., checksum failure). Does not include Respond NACK (function code 4) or Confirm NACK (function code 1) frames, as those would be incremented under MsgReceived. The IEC 60870-5-104/101 DCA increments this statistic for each Device that shares the same link address if the link address of the message is known. If the link address is unknown, this pseudo point is not incremented.

Pseudo Point Name	Description
NewEventsReceived	The number of new events received by the IEC 60870-5-104/101 DCA from the device. Incremented immediately after a previously unrecorded event has been reported by the device.
EventsReported	The number of events successfully reported to the RtDB for a Device.
CommandsReceived	The number of Output, Local, or Accumulator Commands received from the RtDB.
CommandsFailed	The number of negative command statuses sent to the RtDB.
RxBadTypeID	The number of invalid or unsupported Type Identification messages received from the Device. As a prerequisite to incrementing this statistic, the ASDU address of the message must be known.
RxBadQualifier	The number of invalid structure qualifier field messages received from the Device. As a prerequisite to incrementing this statistic, the ASDU address of the message must be known.
RxBadCOT	The number of invalid cause of transmission type field messages received from the Device. As a prerequisite to incrementing this statistic, the ASDU address of the message must be known.
RxBadASDUSize	The number of invalid ASDU size messages received from the Device. As a prerequisite to incrementing this statistic, the ASDU address of the message must be known.
RxBadObjectAddress	The number of invalid information object address messages received from the Device. Note this does not include messages with unknown object addresses since that is very common. An example of a bad object address is a non-zero object address for Type ID 70: End of Initialization. As a prerequisite to incrementing this statistic, the ASDU address of the message must be known.
RaACK	The number of ACK responses received from the Device.
RxNACK	The number of NACK responses received from the Device.

IEC 104 with MCP as Master – Device Level – Digital Input Points

Table 8-40: IEC 104 with MCP as Master – Device Level – Digital Input Points

Pseudo Point Name	Description
Device Online	Indicates if the communications with the Device is Active (1) or Inactive (0). The DCA sets this to ON after the initialization procedure with a device completes successfully. The DCA sets this to OFF after communications has been lost with the Device or when the Device is Disabled.
DeviceDisable	Indicates if the communications with the Device is disabled. Reflects the status of the DisableDevice Digital Output pseudo point or'ed with the DisableAllDevices Digital Output pseudo point.
PollingDisabled	Indicates if the scheduled polling of the Device is disabled. Reflects the status of the DisablePolling Digital Output pseudo point or'ed with the DisableAllPolling Digital Output pseudo point.
IntegrityPollExecution	Indicates the status of Integrity Poll. In progress (pending: 1) or completed (0). Integrity Poll can be manually triggered either by IntegrityPoll or IntegrityPollAllDevices Digital Output pseudo points

Pseudo Point Name	Description
TimeSyncExecution	Indicates the status of Counter Integrity Poll. In progress (pending: 1) or completed (0). The Counter Integrity Poll can be triggered by either the CounterIntegrityPoll or CounterIntegrityPollAllDevices Digital Output pseudo points
DeviceRestarted	Toggled when Restart or Power On indications are received from the device. Restarted (1) and Running (0) Applicable only to the IEC 60870-5-103 Client.
PrimaryChannelHealth	Indicates the health of the Primary communication channel. Applicable only to the IEC 60870-5-104 Client.
secondaryChannelHealth	Indicates the health of the Secondary communication channel. Applicable only to the IEC 60870-5-104 Client.
PrimaryChannelStatus	Indicates whether the Primary communication channel is active. Applicable only to the IEC 60870-5-104 Client.
secondaryChannelStatus	Indicates whether the Secondary communication channel is active. Applicable only to the IEC 60870-5-104 Client.
CounterIntegrityPollExecution	Indicates a Counter Integrity Poll that was triggered by either the CounterIntegrityPoll or CounterIntegrityPollAllDevices Digital Output pseudo point, is either in progress (pending) or completed

IEC 104 with MCP as Master – Device Level – Digital Output Points

Table 8-41: IEC 104 with MCP as Master – Device Level – Digital Output Points

Pseudo Point Name	Description
DisableDevice	This control enables or disables communications with the Device.
DisablePolling	This control disables or enables scheduled polling of the device.
IntegrityPoll	When a control request is received from this point, the DCA sends one general interrogation to the device.
TimeSync	When a control request is received from this point, the DCA issues time synchronization to the device.
ForceDeviceToAlternateChannel	When a control request is received from this point, the DCA forces communications for the device to the alternate channel. Applicable only to the IEC 60870-5-104 Client.
CounterIntegrityPoll	When a control request is received from this point, the DCA sends one counter interrogation to the device.

IEC 104 with MCP as Master – DCA Level

IEC 104 with MCP as Master – DCA Level – Accumulator Points

Table 8-42: IEC 104 with MCP as Master – DCA Level – Accumulator Points

Pseudo Point Name	Description
MsgSent	The total of the “MsgSent” accumulator values for all devices managed by the DCA.
MsgReceived	The total of the “MsgReceived” accumulator values for all devices managed by the DCA.
MsgTimeOuts	The total of the “MsgTimeouts” accumulator values for all devices managed by the DCA.
RxUnknownASDUAddress	The number of unknown ASDU address messages received on the channel managed by the DCA.
RxFrameErrors	The number of messages with frame errors received on the channel managed by the DCA.
T1ConfirmTimeOuts	Number of confirm timeouts t1.
NumSequenceErrors	Number of N(S) sequence number errors.
TCPReadFailures	Number of TCP reads failed.
TCPWriteFailures	Number of TCP writes failed.
ECONNRESETErrors	Number of ECONNRESET socket errors.
ETIMEDOUTErrors	Number of ETIMEDOUT socket errors.
ECONNREFUSEDErrors	Number of ECONNREFUSED socket errors.
EHOSTUNREACHErrors	Number of EHOSTUNREACH socket errors.
EADDRUNAVAILErrors	Number of EADDRUNAVAIL socket errors.
ENOBUFSErrors	Number of ENOBUFS socket errors.
T0ConnTimeOuts	Number of outgoing connections failed due to timeout t0.
OtherConnectErrors	Number of outgoing connections failed due to other error.
ConnClosedByLocal	Number of connections closed by the local end.
ConnClosedByRemote	Number of connections closed by the remote end.
InvalidLengthFieldErrors	Number of invalid length field errors.
InvalidFrameTypeErrors	Number of invalid frame type errors.
ReceivedBufferOverflowErrors	Number of receive buffer overflow errors.
IframeDiscardedLinkInactive	Number of information frames discarded because the link was inactive.

IEC 104 with MCP as Master – DCA Level – Digital Input Points

Table 8-43: IEC 104 with MCP as Master – DCA Level – Digital Input Points

Pseudo Point Name	Description
DCAStatus	Indicates the status of the IEC 60870-5-104/101 DCA application. Set if IEC 60870-5-104/101 DCA is running. Reset if IEC 60870-5-104/101 DCA is not running.
AllDevicesDisabled	Indicates if all the configured IEC 60870-5-104/101 DCA is disabled. Set if all the IEC 60870-5-104/101 DCA is disabled. Reset if all the IEC 60870-5-104/101 DCA is enabled.
AllPollingDisabled	Indicates if the scheduled polling of all Devices is disabled. Set if polling of all IEC 60870-5-104/101 DCA is disabled. Reset if polling of all IEC 60870-5-104/101 DCA is enabled.

IEC 104 with MCP as Master – DCA Level – Digital Output Points

Table 8-44: IEC 104 with MCP as Master – DCA Level – Digital Output Points

Pseudo Point Name	Description
DisableAllDevices	This control disables or enables communications with all Devices belonging to the IEC 60870-5-104/101 DCA.
IntegrityPollAllDevices	When a control request is received from this point, the IEC 60870-5-104/101 DCA sends one general interrogation to each IEC 60870-5-104/101 controlled station.
CounterIntegrityPollAllDevices	When a control request is received from this point, the DCA sends one counter interrogation to each device.
TimeSyncAllDevices	When a control request is received from this point, the IEC 60870-5-104/101 DCA issues time synchronization to each IEC 60870-5-104/101 controlled station.
DisableAllPolling	This control disables or enables scheduled polling of all IEC 60870-5-104/101 controlled stations.
ForceAllDevicesOffPrimaryChannel	When a control request is received from this point, the IEC 60870-5-104/101 DCA clears ALL IEC 60870-5-104/101 controlled stations off the requested Primary Channel or Secondary Channel. Applicable only to the IEC 60870-5-104 DCA.

IEC 60870-5-104 with MCP as Controlled Station Application

IEC 104 with MCP as Controlled Station – Accumulator Points

Table 8-45: IEC 104 with MCP as Controlled Station – Accumulator Points

Pseudo Point Name	Description
MasterMsgIn	Increments immediately after a data link frame has been successfully received from the master. The DPA increments this statistic for each LRU that shares the same link addresses.
MasterMsgOut	Increments immediately after a data link frame is sent to the master, including retries. The DPA increments this statistic for each LRU that shares the same link address.
RemMsgAckTimeouts	For Balanced, number of confirmed frames that did not receive an acknowledgement within the response timeout (calculated as Extra Response Timeout + Timeout from Annex 2 in 870-5-2). The DPA increments this statistic for each LRU that shares the same link address. For Unbalanced, not incremented. For 104, number of unacknowledged frames that were outstanding at the time the connection was dropped due to a timeout.
RemOperationRequests	Number of commands received from the master.
RemOperationsFailed	Number of commands that the Server either rejected or could not execute due to an error.

Pseudo Point Name	Description
ASDUDataRequestsReceived	Number of ASDU data requests received
ASDUDataRequestsRejected	Number of ASDU data requests rejected
ASDUDataResponsesSent	Number of ASDU data responses sent
SpontaneousASDUDataMessagesSent	Number of spontaneous ASDU data messages sent
SpontaneousASDUDataMessagesNoACK	Number of spontaneous ASDU data messages that did not receive ACK from Master. Not applicable to 101 Unbalanced.
ASDUControlResponsesSent	Number of ASDU control responses sent
ChangeEventsReceivedFromRtDB	Number of RtDB Data, Quality, or Data and Quality change events received.
BufferOverflows	Number of Event buffer overflows detected either in an RtDB FIFO or within the DPA's internal buffers.
RtDBReadRequests	Number of RtDB read requests
RtDBReadFailures	Number of RtDB read failures
RtDBWriteRequests	Number of RtDB write requests
DOAndAOCommandFailures	Number of DO and AO command failures
DOAndAOCommandFailuresDueToSBOTimeout	Number of DO and AO command failures due to SBO timeout
CommandFailuresDueToControlLockout	Number of command failures due to control lockout
AccumulatorCommandsSent	Number of accumulator command requests
AccumulatorCommandsFailed	Number of accumulator command failures
FileTransfersAttempted	Number of file transfers attempted
FileTransfersFailed	Number of file transfers failed

IEC 104 with MCP as Controlled Station – Analog Input Points

Table 8-46: IEC 104 with MCP as Controlled Station – Analog Input Points

Pseudo Point Name	Description
DPAProcessID	Indicates the ID of the DPA Process thread.
Application Identifier	Unique Application Identifier of the DPA application auto defined in the configuration.

IEC 104 with MCP as Controlled Station – Digital Input Points

Pseudo Point Name	Description
CommStatus	Indicates when a master station request has not been received for a configurable period, or transmission failure is detected by the communication transport.
DPAStatus	The Server sets the DPA Status to DISABLED upon creating the pseudo point. The Server sets the DPA Status to ENABLED immediately after all initialization is complete (i.e., after DB Initialized Event is received for all the Server's mapped points).
EventBufferOverflow	Toggled when the DPA detects an event buffer overflow.
EventBufferLow	Indicates whether an internal DPA event buffer low condition exists.

Pseudo Point Name	Description
PriPortStatus	Indicates the status of the configured Primary port for communicating with Master. Set while communication is active on the Primary port. Reset while there are no communications on the Primary port.
BackPortStatus	Indicates the status of the configured Backup port for communication. Set while communication is active on the Backup port. Reset while there are no communications on the Backup port.

IEC 104 with MCP as Controlled Station – Digital Output Point

Pseudo Point Name	Description
ForceControlsLockout	This control enables or disables the Server acceptance of digital output or analog output command requests from the master station. Range: - Latch On, Pulse On, and Close for a Disabled (1) point status - Latch off, Pulse Off, and Trip for an Enabled (0) point status Default value: - Value retained in NVRAM if DOs are retained in NVRAM; otherwise Enabled (0)

IEC 60870-5-103 with MCP as Master Application

IEC 103 with MCP as Master - Device Level

IEC 103 with MCP as Master – Device Level - Accumulator Points

Pseudo Point Name	Description
UpdateCount	The number of data change events reported to the RtDB for a Device.
MsgSent	The number of messages sent by the DCA to the device. It is incremented immediately after a data link frame is sent to the device. The DCA increments this statistic for each Device that shares the same link address.
MsgReceived	The number of messages received by the DCA from the device. It is incremented immediately after a data link frame has been successfully received from the device. The DCA increments this statistic for each Device that shares the same link address if the link address of the message is known. If the link address is unknown, the DCA does not increment this statistic for any Device.
MsgTimeOuts	The number of message timeouts detected by the DCA for the device. It is incremented every time the device has failed to respond to a confirmed data link frame (i.e., any Primary frame but function code 4 – Send No Reply) within the allowed timeout. The DCA increments this statistic for each Device that shares the same link address.
MsgError	The number of frames received in error (e.g., checksum failure). Does not include Respond NACK (function code 4) or Confirm NACK (function code 1) frames, as those would be incremented under MsgReceived. The DCA increments this statistic for each Device that shares the same link address if the link address of the message is known. If the link address is unknown, the DCA does not increment this statistic for any Device.
NewEventsReceived	The number of new events received by the DCA from the device. Incremented immediately after a previously unrecorded event has been reported by the device.

Pseudo Point Name	Description
EventsReported	The number of events successfully reported to the RtDB for a Device.
CommandsReceived	The number of Output, Local, or Accumulator Commands received from the RtDB.
CommandsFailed	The number of negative command statuses sent to the RtDB.
RxBadTypeID	The number of invalid or unsupported Type Identification messages received from the Device. As a prerequisite to incrementing this statistic, the ASDU address of the message must be known.
RxBadQualifier	The number of invalid structure qualifier field messages received from the Device. As a prerequisite to incrementing this statistic, the ASDU address of the message must be known.
RxBadCOT	The number of invalid causes of transmission type field messages received from the Device. As a prerequisite to incrementing this statistic, the ASDU address of the message must be known.
RxBadASDUSize	The number of invalid ASDU size messages received from the Device. As a prerequisite to incrementing this statistic, the ASDU address of the message must be known.
RxBadObjectAddress	The number of invalid information object address messages received from the Device. Note this does not include messages with unknown object addresses since that is very common. An example of a bad object address is a non-zero object address for Type ID 70: End of Initialization. As a prerequisite to incrementing this statistic, the ASDU address of the message must be known.
RaACK	The number of ACK responses received from the Device. For IEC 60870-5-101/104, this means any response where the P/N bit of the COT is relevant and is set to 0. For IEC 60870-5-103, this means any response where the COT is 20 (positive acknowledgement of command).
RxNACK	The number of NACK responses received from the Device. For IEC 60870-5-101/104, this means any response where the P/N bit of the COT is relevant and is set to 1. For IEC 60870-5-103, this means any response where the COT is 21 (negative acknowledgement of command).

IEC 103 with MCP as Master – Device Level – Digital Input Points

Pseudo Point Name	Description
Device Online	Indicates if the communications with the Device is Active (1) or Inactive (0). The DCA sets this to ON after the initialization procedure with a device completes successfully. The DCA sets this to OFF after communications has been lost with the Device or when the Device is Disabled.
DeviceDisable	Indicates if the communications with the Device is disabled. Reflects the status of the DisableDevice Digital Output pseudo point or'ed with the DisableAllDevices Digital Output pseudo point.
PollingDisabled	Indicates if the scheduled polling of the Device is disabled. Reflects the status of the DisablePolling Digital Output pseudo point or'ed with the DisableAllPolling Digital Output pseudo point.
IntegrityPollExecution	Indicates the status of Integrity Poll. In progress (pending: 1) or completed (0). Integrity Poll can be manually triggered either by IntegrityPoll or IntegrityPollAllDevices Digital Output pseudo points
TimeSyncExecution	Indicates the status of Counter Integrity Poll. In progress (pending: 1) or completed (0).

Pseudo Point Name	Description
	The Counter Integrity Poll can be triggered by either the CounterIntegrityPoll or CounterIntegrityPollAllDevices Digital Output pseudo points
DeviceRestarted	Toggled when Restart or Power On indications are received from the device. Restarted (1) and Running (0) Applicable only to the IEC 60870-5-103 Client.

IEC 103 with MCP as Master – Device Level – Digital Output Points

Pseudo Point Name	Description
DisableDevice	This control enables or disables communications with the Device.
DisablePolling	This control disables or enables scheduled polling of the device.
IntegrityPoll	When a control request is received from this point, the DCA sends one general interrogation to the device.
TimeSync	When a control request is received from this point, the DCA issues time synchronization to the device.

IEC 103 with MCP as Master – DCA Level

IEC 103 with MCP as Master – DCA Level - Accumulator Points

Pseudo Point Name	Description
MsgSent	The total of the “MsgSent” accumulator values for all devices managed by the DCA.
MsgReceived	The total of the “MsgReceived” accumulator values for all devices managed by the DCA.
MsgTimeOuts	The total of the “MsgTimeouts” accumulator values for all devices managed by the DCA.
RxUnknownASDUAddress	The number of unknown ASDU address messages received on the channel managed by the DCA.
RxUnKnownLinkAddress	The number of unknown link address messages received on the channel managed by the DCA.
RxFrameErrors	The number of messages with frame errors received on the channel managed by the DCA.

IEC 103 with MCP as Master – DCA Level - Digital Input Points

Pseudo Point Name	Description
DCAStatus	Indicates the status of the IEC 60870-5-104/101 DCA application. Set if IEC 60870-5-104/101 DCA is running. Reset if IEC 60870-5-104/101 DCA is not running.
AllDevicesDisabled	Indicates if all the configured IEC 60870-5-104/101 DCA is disabled. Set if all the IEC 60870-5-104/101 DCA is disabled. Reset if all the IEC 60870-5-104/101 DCA is enabled.
AllPollingDisabled	Indicates if the scheduled polling of all Devices is disabled. Set if polling of all IEC 60870-5-104/101 DCA is disabled. Reset if polling of all IEC 60870-5-104/101 DCA is enabled.

IEC 103 with MCP as Master – DCA Level - Digital Output Points

Pseudo Point Name	Description
DisableAllDevices	This control disables or enables communications with all Devices belonging to the IEC 60870-5-104/101 DCA.
IntegrityPollAllDevices	When a control request is received from this point, the IEC 60870-5-104/101 DCA sends one general interrogation to each IEC 60870-5-104/101 controlled station.
TimeSyncAllDevices	When a control request is received from this point, the IEC 60870-5-104/101 DCA issues time synchronization to each IEC 60870-5-104/101 controlled station.
DisableAllPolling	This control disables or enables scheduled polling of all IEC 60870-5-104/101 controlled stations.

IEC 61850 with MCP as Master Application

IEC 61850 with MCP as Master - Accumulator Points

Pseudo Point Name	Description
MMS Calling Initiates Req Sent	Number of Initiate requests sent by the DCA. In MMS, the node that initiated the association is the calling node. In addition, the MMS Initiate service is used to establish an association.
MMS Calling Initiates Failed	Number of DCA-initiated Initiate requests that the IED responded to with error.
MMS Concludes Sent	Number of DCA-initiated Conclude requests. Note that the MMS Conclude service is used to gracefully close an association.
MMS Concludes Failed	Number of DCA-initiated Conclude requests that the IED responded to with error.
MMS Concludes Indications	Number of Conclude indications received from the IED.
MMS Concludes Indications Failed	Number of failed Conclude indications received from the IED.
User Abort Indications	Number of non-recoverable errors detected within the DCA (including application, presentation, session, and RFC1006 transport layers) that caused an association to drop. An example of such an error is receiving a malformed packet at the application layer.
Provider Abort Indications	Number of non-recoverable errors detected outside of the DCA that caused an association to drop. This includes IED-initiated rejects and connection drops reported by the Linux TCP/IP stack.
MMS Rejects Sent	Number of MMS Rejects sent by the DCA.
MMS Rejects Received	Number of MMS Rejects received by the DCA.
MMS Requests Sent	Number of MMS requests sent by the DCA.
MMS Requests Failed	Number of DCA-initiated MMS requests that the IED responded to with error.
MMS Request Indications Received	Number of MMS request indications received from the IED.
MMS Request Indications Failed	Number of MMS request indications that the DCA responded to with error.
MMS Information Reports Received	Number of MMS information reports received.

Pseudo Point Name	Description
MMS Information Reports Failed	Number of MMS information reports that the DCA discarded due to an error.
TCP Connection Attempts	Number of TCP connections initiated by the DCA.
TCP Connection Attempts Failed	Number of TCP connection attempts that failed.
TCP Connections Closed Locally	Number of TCP connections closed by the DCA.
TCP Connections Closed Remotely	Number of graceful connection closes initiated by the IED.
TCP Connection Drops	Number of TCP connections dropped as reported by the TCP/IP stack
Alternate Channel Checks	Number of alternate channel check operations performed by the DCA.
Alternate Channel Checks Failed	Number of alternate channel check operations that failed.
Current Channel Checks	Number of current channel check operations performed by the DCA
Update Count	Accumulation for the total number of points the RTDB has been updated for this IEC61850 IED.
MsgSent	Accumulation for the total number of requests sent by the DCA to this IEC61850 IED.
MsgReceived	Accumulation for the total number of responses received by the DCA from this IEC61850 IED.
MsgError	Accumulation for the total number of responses received in error from this IEC61850 IED.
MsgTimeOuts	Accumulation for the number of message timeouts detected by the DCA for this IEC61850 IED.
Controls Received	Accumulations for the number of control requests received by the DCA via the RTDB that was directed to this IEC61850 IED.
Controls Failed	Accumulations of the number of control operation failures detected for this IEC61850 IED.

IEC 61850 with MCP as Master– Digital Input Points

Pseudo Point Name	Description
Primary Channel Health	Indicates the health of the Primary Channel configured. Set if healthy.
Secondary Channel Health	Indicates the health of the Secondary Channel configured. Set if healthy.
Primary Channel Status	Indicates the Primary Channel Status. Set if the Configured Primary Channel is being used. Reset if it is not in use.
Secondary Channel Status	Indicates the Secondary Channel Status. Set if the Configured Secondary Channel is being used. Reset if it is not in use.
Report Buffer Overflow	Indicates if IED has reported a buffer overflow condition in one of its buffered report control blocks. Set if IED reports a buffer overflow condition. Reset if No Overflow id observed.

Pseudo Point Name	Description
Retrieve All Data Sets From IED Status	Indicates the completion status of all the data set retrieval from the IED. Set if the Retrieval of all Data Sets is Pending. Reset if the Retrieval of all Data Sets is Completed.
DeviceDisable	Set if the communication to the IED is disabled. Unset if disabled.
Polling Of IED Status	Set if data set retrieval from the IED is enabled. Unset if disabled.
Configuration Comparison Status	Indicates whether the most recent configuration comparison for this IED failed. The DCA compares the composition of the IED's Data Sets with what it has configured locally.
Device Online	Indicates if the Configured IEC61850 IED is Online (1) or Offline (0).

IEC 61850 with MCP as Master– Digital Output Points

Pseudo Point Name	Description
Retrieve All Data Sets	This control queues a poll request for every locally configured Data Set on the IED.
DisableDevice	This control disables or enables communications to the IED. If disabled, the DCA does not have an open association with the IED, nor accept user requests for the IED.
Enable Polling Of IED	This control disables or enables data set retrieval from the IED but leaves the association up and does not prevent other controls such as “Retrieve all Data Sets” or “Force to Alternate Channel”. The DCA also disables all Report Control Blocks when this control is disabled.
Force IED to Alternate Channel	This control forces the IED to the alternate communications channel.

IEC 61850 Application – Global Points

The following sets of global pseudo points are available for the IEC 61850 application:

IEC 61850 Application - Global, Digital Output Points

Pseudo Point Name	Description	DO state set to
Retrieve All Data Sets from All IEDs	This control queues an integrity request for every data set on every device.	Completed (0)
		Pending (1)
Global “DisableDevice”	This control disables communications to all devices belonging to the application. If disabled, the application does not have an open association with any of its devices or send user requests to any device. When it is set to Enabled, the application sets the device state to its previous state.	Disabled (1)
		Enabled (0)
Enable Polling of All IEDs	This control disables or enables data set retrieval from all devices belonging to the application but leaves the associations up and does not prevent other controls such as “Retrieve All Data Sets from IED” or “Force to Alternate Channel”. The application stops polling all devices and disable all Report Control Blocks.	Disabled (0)
		Enabled (1)
Force All IEDs Off Primary Channel	This control clears all devices off the requested channel	Clear Primary Channel (1)
		Clear Secondary Channel (0)

IEC 61850 Application - Global, Digital Input Points

Pseudo Point Name	Description	DO state set to
Global "DeviceDisable"	Communications is disabled to all devices owned by the application. Reflects the status of the Global "DisableDevice" Digital Output pseudo point.	Disabled (1)
		Enabled (0)
Polling of IED Status	Automatic data retrieval from devices is globally disabled. Reflects the status of the "Enable Polling of All IEDs" Digital Output pseudo point.	Disabled (0)
		Enabled (1)
DCA Status	Indicates if the application is running.	Enabled (1)
		Disabled (0)

IEC 61850 Application – Per-Device Points

IEC 61850 Application, Per-Device - Digital Output Points

Pseudo Point Name	Description	DO status set to
Retrieve all Data Sets	This control queues a poll request for every locally configured Data Set on the device.	Completed (0)
		Pending (1)
DisableDevice	This control disables or enables communications to the IED. If disabled, the application does not have an open association with the device, nor accept user requests for the device.	Disabled (1)
		Enabled (0)
Enable Polling of IED	This control disables or enables data set retrieval from the device but leaves the association up and does not prevent other controls such as "Retrieve all Data Sets" or "Force to Alternate Channel". The application also disables all Report Control Blocks when this control is disabled.	Disabled (0)
		Enabled (1)
Force IED to Alternate Channel	This control forces the device to the alternate communications channel.	Completed (0)
		Pending (1)
Enable Test Flag in Controls	This flag enables Test Mode for controls that go to the devices.	Disabled (0)
		Enabled (1)

IEC 61850 Application, Per-Device - Digital Input Points

Pseudo Point Name	Description	DO status set to
Primary Channel Health	Indicates health of Primary communications channel. If Primary channel is in use, Normal health means the association is up. If Primary channel is not in use, Normal health means an association is possible on this channel. Failed health means the last association attempt failed.	Failed (0)
		Normal (1)
	Indicates health of Secondary communications channel. If Secondary channel is in use, Normal health means the association is up. If	Failed (0)

Pseudo Point Name	Description	DO status set to
Secondary Channel Health	Secondary channel is not in use, Normal health means an association is possible on this channel. Failed health means the last association attempt failed.	Normal (1)
Primary Channel Status	Indicates if Primary channel is In Use or Not In use. In use status means this channel is the active channel and the association is up on this channel.	Not In Use (0)
		In Use (1)
Secondary Channel Status	Indicates if Secondary channel is In Use or Not In Use. In use status means this channel is the active channel and the association is up on this channel.	Not In Use (0)
		In Use (1)
		Overflow (1)
Report Buffer Overflow	Indicates if the device has reported a buffer overflow condition in one of its buffered report control blocks.	No Overflow (0)
		Overflow (1)
Retrieve All Data Sets from IED Status	Operation to retrieve All Data Sets from device that was triggered by either the "Retrieve All Data Sets from All IEDs" or the "Retrieve All Data Sets from IED" pseudo Digital Output is either completed or under way.	Completed (0)
		Pending (1)
DeviceDisable	Device is enabled or disabled as controlled by the DisableDevice Digital Output or the Global "DisableDevice" Digital Output.	Disabled (1)
		Enabled (0)
Polling of IED Status	Polling is enabled or disabled as controlled by the "Enable Polling to IED" Digital Output or the "Enable Polling of All IEDs to IED" Digital Output.	Disabled (0)
		Enabled (1)
Configuration Comparison Status	Indicates whether the most recent configuration comparison for this device failed. The application compares the composition of the device's Data Sets with what it has configured locally.	Failed (0) The DCA logged the discrepancies it detected.
		OK (1) There were no discrepancies in the most recent comparison.
Device Online	Indicates whether communications with the device is Active (Online) or Inactive (Offline)	ON (1)
		OFF (0)

IEC 61850 Application, Per-Device - Analog Input Points

Pseudo Point Name	Description	DO status set to
"AddCause for ..."	This point is created for each field DO and AO point. The name of the pseudo point includes the point name of the associated DO or AO field point.	See note below.

NOTE: The value of this field indicates the result of the last AO or DO operation on an IEC 61850 enhanced security control (see the following table). For IEC 61850 normal security controls, the values are 0 for commands that are successfully sent and -255 for commands that fail to send.

For enhanced security controls, a non-zero value indicates failure; a zero value indicates success. A positive value indicates one of the IEC 61850 Additional Causes was reported by the device. A negative value larger than -255 indicates a low-level MMS error was reported by the device. A value of -255 indicates another error condition not specifically listed has occurred.

Error Class	Error Description	Value of AI
Unknown Error	Unknown error.	-255
DataAccessError	object-non-existent	-10
DataAccessError	object-access-unsupported	-9
DataAccessError	object-attribute-inconsistent	-8
DataAccessError	type-inconsistent	-7
DataAccessError	type-unsupported	-6
DataAccessError	invalid-address	-5
DataAccessError	object-undefined	-4
DataAccessError	object-access-denied	-3
DataAccessError	temporarily-unavailable	-2
DataAccessError	hardware-fault	-1
Success	Success	0
Additional Cause	Blocked-by-switching-hierarchy	2
Additional Cause	Select-failed	3
Additional Cause	Invalid-position	4
Additional Cause	Position-reached	5
Additional Cause	Parameter-change-in-execution	6
Additional Cause	Step-limit	7
Additional Cause	Blocked-by-Mode	8
Additional Cause	Blocked-by-process	9
Additional Cause	Blocked-by-interlocking	10
Additional Cause	Blocked-by-synchrocheck	11
Additional Cause	Command-already-in-execution	12
Additional Cause	Blocked-by-health	13
Additional Cause	1-of-n-control	14
Additional Cause	Abortion-by-cancel	15
Additional Cause	Time-limit-over	16
Additional Cause	Abortion-by-trip	17
Additional Cause	Object-not-selected	18

Tejas V with MCP as LRU Application

Tejas V with MCP as LRU – Accumulator Points

Table 8-47: Tejas V with MCP as LRU – Accumulator Points

Pseudo Point Name	Description
MasterMsgIn	Indicates the number of response messages sent by the Tejas V Master to the Tejas V DPA. Incremented immediately after a message has been successfully received from the Tejas V Master.
MasterMsgOut	Indicates the number of request messages received by the Tejas V Master from the Tejas V DPA. Incremented immediately after a message is sent to the Tejas V Master.
RemOperationRequests	Indicates the number of control operation requests received by Tejas V DPA from Tejas V Master.
RemOperationsFailed	Indicates number of control operations that the LRU either rejected or could not execute due to an error.

Tejas V with MCP as LRU – Analog Input Points

Table 8-48: Tejas V with MCP as LRU – Analog Input Points

Pseudo Point Name	Description
DPAProcessID	Indicates Tejas V DPA child process ID.
Application Identifier	Unique application identifier of the Tejas V DPA application auto defined in the configuration

Tejas V with MCP as LRU – Digital Input Points

Table 8-49: Tejas V with MCP as LRU – Digital Input Points

Pseudo Point Name	Description
CommStatus	Indicates the communication status of the Tejas V DPA with the configured Tejas V Master. Set if the Tejas V DPA is actively communicating with the Tejas V Master. Reset if the Tejas V DPA is not communicating with the Tejas V Master.
DPASStatus	Indicates the status of the Tejas V DPA application. Set if the Tejas V DPA is currently running. Reset if the Tejas V DPA is not running.
PriPortStatus	Indicates the status of the configured primary port for communicating with the Tejas V Master. Set while communication is active on the primary port. Reset while there is no communication on the primary port.
BackPortStatus	Indicates the status of the configured backup port for communication with the Tejas V Master. Set while communication is active on the backup port. Reset while there is no communication on the backup port.

Load Shed

LoadShed – Accumulator Points

Pseudo Point Name	Description
Controls Received	Indicates the total number of controls received.
Controls Failed	Indicates the total number of controls failed.
Controls Sent	Indicates the total number of controls sent.

LoadShed – Analog Input Points

Pseudo Point Name	Description
Fdr<nnn>	Indicates the zone number to which the configured feeder belongs.

LoadShed – Digital Input Points

Pseudo Point Name	Description
Fdr<nnn>	Provides an option to change the zone of feeder.

LoadShed – Digital Output Points

Pseudo Point Name	Description
DisableDevice	Provides an option to disable/enable the LoadShed application (DTA). - Set to 1 to disable the LoadShed application. - Set to 0 to enable the LoadShed application.
Control Disable	Provides an option to disable all controls.
Zone1	Provides an option to control the zone.

LogicLinx

LogicLinx – Accumulator Points

Pseudo Point Name	Description
Controls Received	Indicates the total number of controls received on the LogicLinx owned Analog Output and Digital Output points.
Controls Failed	Indicates the total number of failed control operations.
Controls Sent	Indicates the total number of the controls sent from the LogicLinx application.

LogicLinx – Analog Input Points

Pseudo Point Name	Description
TotalLLPoints	Indicates the total number of the LogicLinx-owned points configured.

LogicLinx – Digital Input Points

Pseudo Point Name	Description
Device Disable	Indicates if the LogicLinx application is disabled or enabled: - Indicates 1 if the LogicLinx application is disabled. - Indicates 0 if the LogicLinx application is enabled (running). NOTE: The LogicLinx application can be disabled or enabled through the “Disable Device” Digital Output pseudo point.

LogicLinx – Digital Output Points

Pseudo Point Name	Description
Disable	Provides an option to disable/enable the LogicLinx application (DTA): - Set to 1 to disable the LogicLinx application; that is, to stop executing logical cycles. This sets all the LogicLinx points to the OFFLINE state. - Set to 0 to enable the LogicLinx application; that is, to execute the user-programmed logic. This sets all the LogicLinx points to the ONLINE state.

ARRM Pseudo Points

The ARRM application makes the following pseudo points available.

Per-Application

Table 8-50: ARRM Pseudo Points - Per Application

Pseudo Point Name	Description
Current Disk Use of ARRM as a Percentage of Total	This analog input pseudo point reports the current disk usage of ARRM on the MCP as a percentage of the total disk space available in the <i>/mnt/datalog/</i> partition.

Per-File Set

Table 8-51: ARRM Pseudo Points - Per File Set

Pseudo Point Name	Description
Automatic Retrieval Disabled	This digital input pseudo point is set to 1 when automatic retrieval is disabled and is set to 0 when automatic retrieval is enabled. Automatic retrieval can be enabled or disabled using the <i>Disable Automatic Retrieval</i> digital output pseudo point.
Clear Recorder Memory	This control triggers ARRM to operate the configured digital output point that is mapped to the <i>MemRs</i> command. In addition, if the control is successful and the file retrieval method is set to Fault Number, ARRM clears the last reported fault number.

Pseudo Point Name	Description
Disable Automatic Retrieval	This digital output pseudo point can be used to disable or enable automatic retrieval of the associated file set. Latch On, Pulse On, or Close to disable automatic retrieval and Latch Off, Pulse Off, or Trip to enable automatic retrieval. The status of automatic retrieval is reported with the <i>Automatic Retrieval Disabled</i> digital input pseudo point.
Retrieval State	This analog input pseudo point reports the status of the associated file set with the following status numbers: ➤ 0 - Not Available. This is the initial state of a file set after creation. ➤ 1 - Available. This is the state reported when ARRM detects the file set is available for retrieval, but automated file set retrieval is disabled. ➤ 2 - Queued. File retrieval has been postponed. This may occur if ARRM is at the maximum number of configured retrievals. ➤ 3 - In Progress. ARRM is in the process of retrieving the associated file set. ➤ 4 - Complete. The last file transfer has been completed successfully. ➤ 5 - Failed. The last file retrieval operation has failed and a retry attempt has been scheduled.
Retrieve File Set	Any control on this digital output point triggers a manual retrieval of the associated file set.
Enable Connection Polling	The digital output pseudo point can be used to disable or enable inclusion of the file set into connection polling. The Latch On, Pulse On, or Close states enable inclusion of file set into connection polling. The Latch Off, Pulse Off, or Trip states disable inclusion of file set into connection polling. The status of file set inclusion into connection polling is reported with the Connection Polling Enabled digital input pseudo point.
Connection Polling Enabled	This digital input pseudo point is set to: ➤ 1 when file set inclusion into connection polling is enabled ➤ 0 when file set inclusion into connection polling is disabled. File set inclusion into connection polling can be enabled or disabled using the Enable Connection Polling digital output pseudo point.

ARRM Pseudo Points - File Set

Table 8-52: ARRM Pseudo Points - File Set

Field	Description
Reference	A user-defined name that can be used for quick indexing and filtering. Maximum 66 characters, ASCII only.
Description	A user-defined block of text that provides a detailed and localized description of the group. Maximum 128 characters.

Modbus with MCP as Master Application

Note: This section applies to both **Serial** and **Ethernet** connection.

Modbus with MCP as Master – Accumulator Points (Serial / Ethernet)

Pseudo Point Name	Description
Update Count	Accumulation for the total number of points the RTDB has been updated by the Modbus DCA for this Modbus LRU.
MsgSent	Accumulation for the total number of requests sent by the Modbus DCA to this Modbus LRU.
MsgReceived	Accumulation for the total number of responses received by the Modbus DCA from this Modbus LRU.
MsgTimeouts	Accumulation for the number of message timeouts detected by the Modbus DCA for this Modbus LRU.
Events Received	Accumulations for the total number of events received by the Modbus DCA for this Modbus LRU.
Events Logged	Accumulations for the total number of events logged to the RTDB by the Modbus DCA for this Modbus LRU.
Controls Received	Accumulations for the number of control requests received by the Modbus DCA via the RTDB that was directed to this Modbus LRU.
Control Failed	Accumulations of the number of control operation failures detected for this Modbus LRU.

Modbus with MCP as Master – Digital Input Points (Serial / Ethernet)

Pseudo Point Name	Description
Primary Port Status	Indicates the usage of configured Primary Port. Set if Primary port is in use. Reset if not in use.
Secondary Port Status	Indicates the usage of configured Secondary Port. Set if Secondary port is in use. Reset if not configured.
Device Online	Indicates if the Configured Modbus LRU is Online (1) or Offline (0).
Device Disable	Indicates if the Modbus DCA Application is disabled. Set if Modbus DCA application is disabled. Reset if Modbus DCA application is enabled.

Modbus with MCP as Master – Digital Output Point (Serial / Ethernet)

Pseudo Point Name	Description
Disable Device	Set if Modbus DCA Application is disabled. Do not set if enabled.

Modbus with MCP as Master – Analog Input Point (Serial / Ethernet)

Pseudo Point Name	Description
Secure Connection State	State of unit when Modbus TCP/SSH Master is configured. This pseudo point state is offline or invalid for ModbusTCP and Modbus Multidrop Master configurations. State is one of the Secure Connection States defined in the Secure Connection States table. State is presented as an enumerated text both in the Point Details or IED Connections.

Modbus with MCP as LRU Application

Note: This section applies to both **Serial** and **Ethernet** connection.

Modbus with MCP as LRU – Accumulator Points (Serial / Ethernet)

Pseudo Point Name	Description
UpdateCount	Accumulation of number of times the Modbus DPA Application updated the RTDB.
MasterMsgIn	Accumulation of number of request messages received by the Modbus DPA from the Master.
MasterMsgOut	Accumulation of number of response messages sent by the Modbus DPA to the Master.
RemMsgAckTimeouts	Number of confirmed frames that did not receive an acknowledgement within the response timeout (calculated as Extra Response Timeout + Timeout from Annex 2 in 870-5-2). The DPA increments this statistic for each LRU that shares the same link address.
RemOperationRequests	Accumulation of number of Control requests received by the Modbus DPA from the Master.
RemOperationsFailed	Accumulation of number of failed control operations. Generated once every time an exception is produced by the Modbus DPA
MissedUpdates	Accumulation of number of failures occurred while updating the RTDB.
LockAtproducerconsumerdpaptrtsFailed	Not in use

Modbus with MCP as LRU – Analog Input Point (Serial / Ethernet)

Pseudo Point Name	Description
DPAProcessID	Indicates the ID of the Modbus DPA child Process.
ApplicationIdentifier	Unique Application Identifier of the Modbus Serial DPA application auto defined in the configuration

Modbus with MCP as LRU – Digital Input Points (Serial / Ethernet)

Pseudo Point Name	Description
PrimaryportStatus	Indicates the status of the configured Primary port for communicating with Modbus Master. Set while communication is active on the Primary port. Reset while there are no communications on the Primary port.
BackupPortStatus	Indicates the status of the configured Backup port for comm. Set while communication is active on the Backup port. Reset while there are no communications on the Backup port.
CommStatus	Indicates the Communication status of the Modbus DPA with the configured Modbus Master. Set if the Modbus DPA is actively communicating with the Master. Reset if the Modbus DPA is not communicating with the Master.
DPASatus	Indicates the status of the Modbus DPA application. Set if the Modbus DPA is currently running. Reset is the Modbus DPA is not running.

Modbus with MCP as LRU – Digital Output Points (Serial / Ethernet)

Pseudo Point Name	Description
ForceControlsLockout	Set if the Modbus DPA refuses the control requests sent by the configured Modbus Master Reset if the Modbus DPA accepts the control requests and performs the respective operation.

Modbus TCP/SSH Client - SSH Tunnel Interface

The MCP Modbus Client also supports TCP/SSH mode to establish an SSH secure tunnel with the UR7.6 IEDs that supports SSHv2 protocol through Machine-To-Machine (M2M) access role.

SSH Key Pair

The MCP provides an option in the IED Comm Summary GUI for copying the MCP's public key into a UR 7.6.

» To copy the MCP key into a UR7.6:

1. Log into the MCP with administrator rights.
2. Navigate tot the IED communications summary in the HMI.
3. Select the Modbus TCP/SSH IED that you want to pair from the IED comm summary
4. Click the **Pair** button.

Result: The following dialog window appears.

- Enter UR 7.6's Administrator Username & Password to copy the MCP's public key into UR 7.6.

Result: This file is saved by default as "m2m_user.pk2" and available in the folder "/ata0a/pkey_ssh/" in UR 7.6.

Result: Upon success, MCP will get one M2M user from UR for all Key based authentications.

Result: The possible states of the Pair button are described in the [Secure Connection States](#) table.

NOTICE

The Pair button in the HMI is only available to Administrator users. This button is only applicable to Modbus TCP/SSH Clients.

SSH Key Rotate:

The MCP provides an option in the IED Comm Summary HMI for rotating the MCP's public key into UR 7.6 on an on-demand basis.

» To rotate the MCP key into a UR7.6 on an on-demand basis:

- Log into the MCP with administrator rights.
- Navigate tot the IED communications summary in the HMI.
- Select the Modbus TCP/SSH IED from the IED comm summary that you want to pair
- Click the **Rotate** button.

Result: The SSHv2 keys are transferred on-demand into the default location in the UR7.6.

Result: The possible states of the Rotate button are described in the [Secure Connection States](#) table.

NOTICE

The Rotate button in the HMI is only available to Administrator users. This button is only applicable to Modbus TCP/SSH Clients. The Key Rotate button is enabled when the IED is paired successfully using SSH Key Pair.

Secure Connection States

State	Description	Status of Pair & Rotate Buttons in IED Comm Summary
-1	This state is not applicable to TCP and Serial connections and only available for Modbus TCP/SSH client connections.	Both Pair & Rotate Buttons are greyed out.
0	Pairing is not done yet.	Pair button is enabled, and Rotate button is greyed out. Pair button state shows "Pair" and Rotate button is disabled.
1	Pairing is failed.	Pair button is enabled, and Rotate button is greyed out. Pair button state shows "Failed" and Rotate button is disabled.
2	Pairing is Successful and Rotate is yet to be done.	Both Pair & Rotate buttons are enabled. Pair button state shows "Paired" and Rotate button shows "Rotate".
3	Pairing and Rotating are successful.	Both Pair & Rotate buttons are enabled. Pair button state shows "Paired" and Rotate button shows "Rotated".
4	Pairing is successful, and Rotating is in-progress.	Pair button is enabled, and Rotate button is greyed out. Pair button state shows "Paired" and Rotate button shows "Rotating".

State	Description	Status of Pair & Rotate Buttons in IED Comm Summary
5	Pairing is successful and previous rotating state is failed.	Pair and Rotate buttons are enabled. Pair button state shows "Paired" and Rotate button shows "Failed".
6	Pairing is in-progress and Rotate is yet to be done.	Pair button is greyed out and Rotate buttons is enabled. Pair button state shows "Pairing" and Rotate button shows "Rotate".
7	Pairing is in-progress and previous rotate state is successful.	Pair button is greyed out and Rotate buttons is enabled. Pair button state shows "Pairing" and Rotate button shows "Rotated".
8	Pairing is in-progress and previous rotate state is failed.	Pair button is greyed out and Rotate buttons is enabled. Pair button state shows "Pairing" and Rotate button shows "Failed".
9	Previous Pairing is Failed and Rotate is yet to be done.	Pair and Rotate buttons are enabled. Pair button state shows "Failed" and Rotate button shows "Rotate".
10	Previous pairing state is failed, and current rotate state is successful.	Pair and Rotate buttons are enabled. Pair button state shows "Failed" and Rotate button shows "Rotated".
11	Previous pairing state is failed, and current rotate state is in-progress.	Pair button is enabled, and Rotate buttons is greyed out. Pair button state shows "Failed" and Rotate button shows "Rotating".
12	Previous pairing state is failed, and current rotate state is failed.	Pair and Rotate buttons are enabled. Pair button state shows "Failed" and Rotate button shows "Failed".
13	Not applicable	Not applicable

Redundancy Manager

Redundancy Manager – Analog Input Points

Pseudo Point Name	Description
State of this Gateway	State of unit where point summary is open. State is one of the Operational States (see Operational States). State is presented in enumerated text.
State of PEER Gateway	State of the other unit. State is one of the Operational States (see Operational States). State is presented in enumerated text.
A/B designation of the Gateway	Designation of the current Gateway
Redundancy Type	Indicates the redundancy type configured in the MCP

Redundancy Manager – Digital Input Points

Pseudo Point Name	Description
SystemRedundant	TRUE if the MCP is configured to be redundant FALSE if the MCP is not redundant
StandbyGatewayCommFail	TRUE if communications with the redundant MCP unit have failed FALSE if communications with the redundant MCP unit have not failed OFFLINE and INVALID if the MCP is in non-redundant mode
StandbyGatewayInService Mode	TRUE if the standby MCP is in service mode FALSE if the standby MCP is not in-service mode OFFLINE and INVALID if the MCP is in non-redundant mode
Standby Gateway Not Available	TRUE if the standby MCP is in failed mode or Standby initialization with Active is not completed in Hot-Hot / Hot-Standby modes. False if the standby MCP is not in failed mode or Standby initialization with Active is completed in Hot-Hot / Hot-Standby modes. OFFLINE and INVALID if the MCP is in non-redundant mode
GatewayA Active	TRUE if the MCP has been designated as unit “A” (See note) OFFLINE and INVALID if the MCP is in non-redundant mode
GatewayB Active	TRUE if the MCP has been designated as unit “B” OFFLINE and INVALID if the MCP is in non-redundant mode
Config Sync In Progress	TRUE if configuration synchronization is currently in progress FALSE if configuration synchronization is not currently in progress OFFLINE and INVALID if the MCP is in non-redundant mode
Standby Config Out Of Sync	TRUE if the configurations on the active and standby MCPs do not match FALSE if the configurations on the active and standby MCPs do match OFFLINE and INVALID if the MCP is in non-redundant mode, or when: “Redundant with both SERIAL and LAN, and the SERIAL connection recovered while the LAN connection between MCP units is down”.
HotstandbyDisabled	TRUE if Hot Standby redundancy is disabled, i.e., Warm Standby / Hot-Hot redundancy is enabled. FALSE if Hot Standby redundancy is enabled. OFFLINE and INVALID if the MCP is in non-redundant mode
Standby Code Out of Sync	FALSE when the firmware on the Primary device is the same as that on the backup device TRUE when the firmware on the Primary device is not the same as that on the backup device OFFLINE and INVALID if the MCP is in non-redundant mode, or when: “Redundant with both SERIAL and LAN, and the SERIAL connection recovered while the LAN connection between MCP units is down”.

Redundancy Manager – Digital Output Points

Pseudo Point Name	Description
StartChangeOver	Triggers a change-over – the active MCP moves to standby mode while the standby MCP takes over the active mode. If you are logged into the online GUI of the active MCP when a changeover occurs, the browser window closes, and you are required to log in again. OFFLINE and INVALID if the MCP is in non-redundant mode.
RestartActive	Requests a restart of all software on the active MCP. NOTE: This operation does not cause fail-over. The active MCP comes back as active after restart of all applications.
RestartStandby	Requests a restart of all software on the standby MCP. OFFLINE and INVALID if the MCP is in non-redundant mode.
RebootActive	Requests a reboot of the active MCP. NOTE: This operation causes fail-over. The active MCP comes back as standby after reboot operation.
RebootStandby	Requests a reboot of the standby MCP. OFFLINE and INVALID if the MCP is in non-redundant mode.
SyncConfig	Requests that the configuration of the standby MCP be synchronized with that of the active unit. OFFLINE and INVALID if the MCP is in non-redundant mode. NOTE: This operation automatically restarts software (applications) on the standby MCP to allow applications to take new configuration. If a change to system configuration is synchronized to the standby MCP, a manual reboot of standby unit is required. This operation can be performed using the “RebootStandby” point after SyncConfig operation is over. (see Changeover or Failover during Standby Start-up. Standby takes time to initialize and sync initialized data either during start-up or after changeover. During this time, changeover is not allowed, and a message is logged when a changeover command is issued. Changeover can be issued only after 180 seconds in case of standby start-up. A second changeover can be issued only after 30 seconds of the first changeover.
ShutdownActive	Requests shutdown of active MCP. NOTE: This DO should be used to shutdown active MCP gracefully before powering it off. This prevents data corruption on SSD.
ShutdownStandby	Requests shutdown of standby MCP. OFFLINE and INVALID if the MCP is in non-redundant mode. NOTE: This DO should be used to shutdown standby MCP gracefully before powering it off. This prevents data corruption on SSD.

SEL Binary Serial with MCP as Master Application

Accumulators

Pseudo Point Name	Description
UpdateCount	Accumulation for the total number of points in the RTDB that have been updated for this SEL device.
MsgSent	Accumulation for the total number of messages sent by the SEL Binary Client to the SEL device.
MsgReceived	Accumulation for the total number of messages received by the SEL Binary Client from the device. It is incremented immediately after a message has been successfully received from the device.
MsgTimeOuts	Accumulation for the total number of message timeouts detected by the SEL Binary Client for the device. It is incremented every time the device has failed to respond to a Request within the allowed timeout.
MsgError	Accumulation for the total number of frames received in error from this SEL device.

Analog Input

Pseudo Point Name	Description
LF_YEAR	Indicates the year of the Last Fault Report.
LF_MONTH	Indicates the month of the Last Fault Report.
LF_DAY	Indicates the day of the Last Fault Report.
LF_HOUR	Indicates the hour of the Last Fault Report.
LF_MIN	Indicates the minute of the Last Fault Report.
LF_SEC	Indicates the second of the Last Fault Report.
LF_MSEC	Indicates the millisecond of the Last Fault Report.
LF_DISTANCE	Indicates the Fault Distance reported in the Latest Fault Report.
LF_CURRENT	Indicates the Fault Current reported in the Latest Fault Report.
LF_DURATION	Indicates the Fault Duration reported in the Latest Fault Report.
LF_FREQUENCY	Indicates the Fault Frequency reported in the Latest Fault Report.
Configuration Status	Indicates configuration status with values defined as follows: 0: Not Retrieved 1: Retrieval In Progress 2: Matched 4: Unsupported* 6: Mismatched *: The Unsupported value means the SEL device is using DOUBLE precision math, which is not supported.

Digital Input

Pseudo Point Name	Description
Device Online	Indicates if the Configured SEL device is: • ONLINE (1) or • OFFLINE (0).

Pseudo Point Name	Description
DeviceDisable	Indicates the disabled status of SEL Binary Client Application NOTE: If “DisableAllDevices” control is Disabled, the DeviceDisable DI Pseudo Point will be Disabled. If “DisableAllDevices” control is Enabled, the DeviceDisable DI Pseudo Point will be Enabled only if “DisableDevice” DO Pseudo Point is Enabled. Set to Enabled if the status of device is Enabled. Reset to Disabled if the status of device is Disabled.
Primary Port Status	Indicates the usage of configured Primary Port. Set to IN USE if Primary port is in use. Reset to NOT IN USE if not in use.
Backup Port Status	Indicates the usage of configured Secondary Port. Set to IN USE if backup port is in use. Reset to NOT IN USE if not configured.
IEDCommDevTrouble	This status point is set when the SEL Binary Client receives a DEVICE TROUBLE status from the relay. The status point is reset .otherwise.
LoginStatus	Indicates the login status for SEL device.
DIGLF_A	Indicates that phase A was involved in the Last Fault Reported.
DIGLF_B	Indicates that phase B was involved in the Last Fault Reported.
DIGLF_C	Indicates that Phase C was involved in the Last Fault Reported.
DIGLF_G	Indicates that ground was involved in the Last Fault Reported.
His_cmd_support	Indicates support for HIS command for SEL device.
Eve_cmd_support	Indicates support for EVE command for SEL device.
Cev_cmd_support	Indicates support for CEV command for SEL device
File Retrieval In-Progress	Value ‘1’ indicates that file retrieval from the SEL device is in-progress. Value ‘0’ indicates that file retrieval from the SEL device is not in-progress.
Pass Through In-Progress	Value ‘1’ indicates that data transfer through the Pass-Through connection with SEL device is in-progress. Value ‘0’ indicates that data transfer through the Pass-Through connection with SEL device is not in-progress.
Configuration Problem	Value ‘0’ indicates that the configuration is not retrieved, in progress or matched. This corresponds to Configuration Status AI value 0, 1 or 2. Value ‘1’ indicates that the configuration is either mismatched or unsupported. This corresponds to Configuration Status AI values 4 or 6.

Digital Output

Pseudo Point Name	Description
DisableDevice	This control enables or disables the running state of the device. When Set to Enabled, the device is enabled. When Reset to Disabled, the device is disabled and is declared as OFFLINE.
ClearStats	This control clears all the communication statistics (MsgSent, MsgReceived, MsgTimeouts and MsgErrors) Pseudo Points of the device.
Enable Polling Of IED	This control disables or enables polling to the device. If set to Disabled, the polling to the device is stopped. If reset to Enabled, the polling to the device resumes.

Text Points

Pseudo Point Name	Description
DEVICEINFO_LINEID	Indicates the Line id of the SEL device.
DEVICEINFO_DEVICEID	Indicates the Device id of the SEL device.
DEVICEINFO_BAYID	Indicates the Bay id of the SEL device.
DEVICEINFO_DEVICETYPE	Indicates the map file name of the SEL device
DEVICEINFO_DEVICEADDRESS	Indicates the SEL Device address
PRF_TEXT_POINT	Indicates the Protective Relay Faults (Supported in the SEL relays such as 487, 551, 734 & 651)
MapFile	Indicates the device type.
SEL Relay Firmware Identifier*	Indicates the SEL device model, revision, option codes, and firmware build date.
SEL Relay Configuration Identifier*	A CRC or checksum identifier that uniquely identifies the installed settings or calibration file. Used to detect setting changes.
SEL Relay Device Identifier*	The name the user programmed for the SEL device (like a tag name or station name). Helpful for SCADA or system identification.

NOTE *: Existing dynamic text points (DeviceID, FID and DeviceCode) will be retained for backwards compatibility, but go offline during map file / relay mismatches, exactly when users need to see their values. These pseudo points remain online under all conditions, making them fit for purpose for firmware / configuration / device identity display to assist users in troubleshooting configuration mismatches.

System Status Manager

System Status Manager – Analog Input Points

Indicates a value read from the NTP or SNTP time offset.

NOTE: This point is offline if the IRIG-B time sync is enabled.

Pseudo Point Name	Description
Session Uptime in Minutes	Indicates the time in minutes MCP runs after the reboot
Total Uptime in Minutes	Indicates the time in minutes MCP runs since first power on
Total System Memory in MB	Indicates total system memory in MB available in MCP
Free Memory Available in MB	Indicates the total free memory in MB available in system

System Status Manager – Digital Output Points

Pseudo Point Name	Description
DisableAllControls	If enabled, the MCP rejects all the controls sent to it. If disabled, the MCP accepts all the controls sent to it.
Disable Buzzer	If Enabled, the MCP buzzer functionality is disabled. If disabled, the MCP buzzer functionality is enabled
Buzzer sound ON	If Enabled, the MCP buzzer sound is muted If disabled, the MCP buzzer sound is ON.

System Status Manager – Digital Input Points

Pseudo Point Name	Description
AllControlsDisabled	This point indicates whether Global controls disabled is disabled or enabled
Buzzer Disabled	This point indicates whether the buzzer is enabled or disabled
Buzzer sound is ON	This point indicates whether the buzzer sound is ON or OFF
Configuration Access	This point is set if the configuration is accessed from DS Agile Studio, MCP Settings GUI or MCP Configuration Utility. This point will be reset if all the users who have accessed the configuration are logged off from the G500.
Configuration Change	This point is set if the configuration folder is modified from DS Agile Studio, MCP Settings GUI or MCP Configuration Utility. This point will be reset automatically after ~10secs once it is set to ON.

System Status Manager – Text Points

Pseudo Point Name	Description
Last boot date and time	This time when the system is up after the last reboot in YYYY-MM-DD HH:MM:SS format

D.20 Peripheral Link Client Pseudo Points

D.20 Peripheral Link Client: Per – Peripheral Pseudo Points

Data Type	Name	Description
Digital Input	Peripheral Online	ON when peripheral is restarted and not in TROUBLE state.
	Peripheral Communication Failed	ON when peripheral communication has failed. OFF when peripheral communication is normal.
	Peripheral Trouble Status	OFF when peripheral was successfully started, and peripheral device status word is NOT TROUBLE. ON when peripheral couldn't be started, or it started but reported it was in TROUBLE state.
	Peripheral in Local Mode	ON when digital outputs are in local mode. Set to offline and invalid if the peripheral does not have any digital outputs.
	AI Reference Calibration Required	ON when the peripheral reports that the analog input references need calibration. Set to offline and invalid if the peripheral does not have any analog inputs. OFF / OFFLINE /
	D.20 Channel 1 Retries Alarm Pseudo Point	For Channel 1: Set after consecutive TX failed attempts exceeds configured max retries. Cleared after consecutive successful TX attempts reaches configured max polls.
	D.20 Channel 2 Retries Alarm Pseudo Point	For Channel 2: Set after consecutive TX failed attempts exceeds configured max retries. Cleared after consecutive successful TX attempts reaches configured max polls.

Data Type	Name	Description
	D.20 Channel 1 Active	ON when the Channel 1 is being used for communications.
	D.20 Channel 2 Active	ON when the Channel 2 is being used for communications.
	D.20 Channel 1 Internal Health	ON when Channel 1 internal hardware is healthy and available.
	D.20 Channel 2 Internal Health	ON when Channel 2 internal hardware is healthy and available.
Accumulator	Total Transactions	Count of transactions on Channel 1 and Channel 2.
	Total Retries	Count of retries on Channel 1 and Channel 2.
	Total Failures	Count of failures on Channel 1 and Channel 2.
	D.20 Channel 1 Transactions	Count of transactions on Channel 1.
	D.20 Channel 2 Transactions	Count of transactions on Channel 2.
	D.20 Channel 1 Retries	Count of retried transactions on Channel 1.
	D.20 Channel 2 Retries	Count of retried transactions on Channel 2.
	D.20 Channel 1 Failures	Count of failed transactions on Channel 1.
	D.20 Channel 2 Failures	Count of failed transactions on Channel 2.

D.20 Peripheral Link Client – Global Pseudo points

Data Type	Name	Description
Analog Input	Alternate Link Devices	Count of number of devices only reachable through the Channel 2 communications path
	Total Number of Peripherals	Indicates the total number of peripherals configured in MCP
Accumulator	Total Number of Message Sent	Total Number of Messages sent on all Peripherals
	Total Number of Message Received	Total Number of Messages received on all Peripherals
	Total Number of Messages Retries	Total Number of Repeat Poll Messages sent on all the Peripherals in case if the answer was received incorrectly or not received on Channel 1 and Channel 2 from the Peripherals.
	Total Number of Message Failures	Total Number of Failure Messages on Peripherals
Digital Output	Disable Device	Disables D.20 Client if set to 1. The default is Enabled.
	ClearStats	When a control request is received from this point, the D.20 Peripheral Link client clears all the peripheral and global pseudo accumulator point values.

Data Type	Name	Description
Digital Input	DCA Status	Set to 1 if the D.20 Client Status is Ok or Reset to 0.
	Device Disabled	Indicates if the D.20 Peripheral Link Application is disabled. Set if application is disabled, Reset if application is enabled.

GPIO Client Pseudo Points

GPIO Client: Pseudo Points

Data Type	Name	Description
Digital Input	Device Online	Indicates if the Configured GPIO Client is Online (1) or Offline (0). Note: This is 1 under normal operation, and it exists in current version due to Client standard templates. Users should use the DCA Status below instead.
	DCA Status	Set to 1 if the GPIO Device is running normally.
Accumulator	Controls Received	Accumulations for the number of control requests received by the DCA via the RTDB that was directed to this Application.
	Controls Failed	Accumulations of the number of control operation failures detected for this Application.

Chapter 9 - EdgeManager and PETC

The Predix Edge Technician Console (PETC) is a web based interface intended for advanced maintenance functions.

For the MCP – only the following PETC functions are supported:

- **Device Setup > Network and Proxy** for PETC IP access setting. Default is Edge Host on Net0 (in G500) and Net1 (in G100) with 192.168.168.82/24. An additional EdgeManager interface can be added using **EdgeManager Connectivity Configuration** in *mcpcfg / Settings GUI*.
- **Device Setup > Host OS > Upload OS Update** for MCP firmware upgrade, see “TN0125 MCP Firmware Upgrade via PETC”
- **Applications Manager** for installation and management of GE Vernova MCP container applications or when specifically instructed by GE Vernova support
- **Signed Keys**, only when specifically instructed by GE Vernova support
- **Logs**, only when specifically instructed by GE Vernova support
- **Users** – this applies to PETC users only. There is only one default PETC username: *admin*. Additional PETC users can be added here. Note that PETC credentials can be reset using mcpcfg / Settings GUI – in which case only the default *admin* PETC user is retained.

PETC can be accessed according to below table:

- Via Edge Host Locally (**H**, default and always enabled), or
- via EdgeManager (**EM**, only one active instance, configurable). This is supported only in **single mode** Net settings.

PETC access	Net0	Net1	Net2	Net3	Net4	Net5	Net6
G100		H	EM	EM	EM		
G500	H	EM	EM			EM	EM

Note: PETC access is not controlled by the MCP firewall rules.

Refer to the following web site for more details about Predix Edge Technician Console (PETC):

<https://www.gevernova.com/software/documentation/edge-software/index.html>

Select the document format for viewing the content in pdf or HTML. This document is for a generic Predix Edge device or VM and contains references not applicable to MCP.

Downloading and Running Predix Edge Technician Console

In a generic Predix Edge device or VM, the default IP address is configured with DHCP. In an MCP device, the default IP address is static. The default IP address is 192.168.168.82 on Net1 of the G100 and Net0 of the G500.

Device Status

The MCP Edge device has the following additional parameters

Type	Description
Details	• Memory – Size of physical RAM • Storage – Size of disk drive

Other parameters shown in the generic Predix Edge documentation may not be available in the MCP device due to PETC version differences.

Configuring the Network and Proxy Settings

The following should be appended to the table in this section:

Setting	Description	Configurations
Network Adapters	MCP Specific settings	The interface intended for PETC local access is • For the G100: Net1. • For the G500: Net0. The term “LAN” in the online Predix documentation is taken to describe the interface used for “PETC local access” in an MCP device. The term “WAN” in the online Predix documentation is taken to describe the interface used for “Edge Manager connectivity” in an MCP device. An interface intended for Edge Manager connectivity must be configured using mcpcfg or MCP settings. The current configuration of such an interface can be viewed, but not changed, in PETC. The interface intended for PETC local access must be configured in PETC. The current configuration of such an interface can be viewed, but not changed, in mcpcfg or the MCP settings.

Appendix A - Secure Terminal Emulator

The Secure Terminal Emulator (is used as a replacement for the third-party tool like PuTTY®) is launched from the Windows start menu folder of the DS Agile Studio.

The Secure Terminal Emulator tool is recommended for all users.

Connect to MCP Secure Terminal Emulator through SSH

1. Launch the Application: *Windows Start Menu > DS Agile Studio x.x > Secure Terminal Emulator x.x* and click **Connect**.

2. Ensure the Protocol is set to SSH and enter the MCP credentials to connect (for example):
 - Host Name: 192.168.168.81
 - Port: 22
 - Login name: **defadmin**
 - Password: **defadmin**

Connection [X]

Protocol: SSH

Connection settings

Host name: 192.168.168.81 Port: 22

Login name: defadmin

Private key: [] ...

Proxy settings

Proxy: [] Port: 3128

Proxy type: Socks4 ☐ Use proxy

Login name: [] Password: []

Leave login/password fields empty when not needed.

Connect

Connect to MCP Secure Terminal Emulator through Serial Port

1. Launch the Application: *Windows Start Menu > DS Agile Studio x.x > Secure Terminal Emulator x.x* and click **Connect**.

2. Ensure the Protocol is set to Serial Port and confirm the settings before selecting Connect:
 - Serial Port: Select the serial port used by your PC for the MCP serial maintenance connection
 - Baud rate: **115200**
3. At the MCP command shell login prompt, enter the credentials (e.g., defadmin):
 - Username: **defadmin**
 - Password: **defadmin**

Appendix B - Secure File Browser

The Secure File Browser (is used as a replacement for the third-party tool like WINSCP®)

The Secure File Browser is launched from the Windows start menu folder of DS Agile Studio Computer:

The Secure File Browser tool is recommended over third-party tools like WINSCP® because the Secure File Browser is implemented with a session timeout.

If other third-party file browser tools must be used, close the session as soon as possible after use and disable the cached password option if supported by the tool.

Follow the steps:

1. Launch the Application: *Windows Start Menu > DS Agile Studio x.x > Secure File Browser x.x* and click on *Connect*.

2. Enter the Host name / IP address, port and user/password, for example:

Appendix C - GenASCII Client - Time Sequence Diagrams & Sample Configuration for FEP Devices

Time Sequence of Message Transactions

NOTE: All devices are verified for polling in round robin fashion.

Time Sequence of Message Transaction with Support for delayed message processing as False

NOTE: When a response is not received within the Transaction timeout period for all the configured number of retries, the device is put OFFLINE along with all respective points.

A response received after the device is put OFFLINE is ignored.

An OFFLINE device resumes communication only after the Reconnect Interval duration.

When the OFFLINE device communication resumes, it always resets and starts with the first transaction.

Time Sequence of Message Transaction with Support for delayed message processing as True

Delayed Response received within Device Response Timeout

NOTE: When responses are not received within the transaction timeout period for all the configured number of retries, but are received within the Device response timeout, responses are accepted and processed.

Delayed Response not received within Device Response Timeout

NOTE: When a response is not received within the transaction timeout period for all the configured number of retries, and within Device response timeout period, the Device is put OFFLINE along with all respective points.

NOTE: An OFFLINE device resumes communication only after the Reconnect Interval duration.

When an OFFLINE device communication resumes, it always resets and starts with the first transaction.

Sample Configuration where response is expected within definite period

Consider configuring an IED with a transaction message having IED Address within transaction message.

IED Device 1:

Message to be sent: 1231241,I01241<CR>

Expected Response: 1FF12414F#

Response is expected within definite period of 100ms

The Message to be sent is to be configured as follows:

Application Parameters:

- Allow Delayed Message Processing: Disabled
- Inter Device Delay: Configure required delay between two consecutive IEDs

Connection Page:

- IED Address: 1241

Client Map File:

- Start of Message: 123
- End of Message: #
- Successful Login Prompt: #
- Transaction Timeout: 100
- Login Required: false (if login is not supported)
- Default Retries: 0 or any required number

Transaction Definition:

- Message OUT: This will be configured in following two ways.

Method 1: 1241,I01241

Method 2: {\$ADDR\$},I0{\$ADDR\$}

- Invalid Pattern: None

NOTE: If device supports the detection of an invalid configuration by responding with predefined response for a mis-configuration, the predefined invalid pattern is to be defined for Invalid Pattern field. If the response matches with the Invalid Pattern defined, the Pseudo Point MsgError and ConfigError are incremented.

Valid Response Pattern:

- This is to be configured to detect the valid response reliably.

I..1241 => this signifies that I is the starting character and 1241 is from 4th character position in the response.

I..{\$ADDR\$} => this signifies that I is the starting character and 1241 is derived at runtime from variable using Address field defined in connection page and expected from 4th character position in the response.

I..{\$ADDR\$}{\$CHKSUM16\$} => this signifies that I is the starting character and 1241 is from 4th character position and checksum is available from 3rd character position from end of response.

Depending on the configuration of the valid response pattern, the response is validated and if all the criteria defined in valid response pattern is met, the response is considered valid.

If, except for the checksum, the rest of the defined valid response pattern criteria is met, then the response is considered a MsgError and the Message is resent based on the configured number of retries.

If all defined valid response pattern criteria are met, the response is further processed as per the token / position based parsing policy defined in the transaction definition in the client map file for updating the points. If response fields are not correct (that is, the encoding format selected for processing the data response fields), the points are put offline with the old data quality attribute.

If all defined valid response pattern criteria are met and the data response fields are valid as per encoding format selected, the points are updated in the database.

Appendix D - Configuring a Linux-based Enterprise Server

SSH Server

Almost all Linux distributions typically come with an SSH server pre-installed on them.

Rsync utility

The rsync package is open-source software that enables the rsync utility on a Linux-based computer.

The rsync utility/software synchronizes files and directories from one location to another while minimizing data transfer using delta encoding when appropriate. An important feature of rsync not found in most similar programs/protocols is that the mirroring takes place with only one transmission in each direction. Since rsync does not provide any security while transferring data it is recommended that you use rsync over an SSH session. This allows a secure remote connection.

Installation Steps

Use any one of the following commands to install rsync. If you are using Debian or Ubuntu Linux, type the following command:

```
# apt-get install rsync
```

or

```
$ sudo apt-get install rsync
```

If you are using Red Hat Enterprise Linux (RHEL) / CentOS 4.x or older version, type the following command:

```
# up2date rsync
```

If you are a RHEL / CentOS 5.x or newer (or Fedora Linux) user, type the following command:

```
# yum install rsync
```

NOTE: Since rsync does not provide any security while transferring data it is recommended that you use rsync over ssh session. This allows a secure remote connection.

Appendix E - Running Cron Jobs on the MCP

Scheduling background jobs in MCP using Cron utility

Using the MCP Cron utility is an effective way to schedule a routine background job at a specific time and/or day on an on-going basis.

In the MCP the **/etc/crontab** configuration file controls the background jobs that are to be scheduled. The format of the file is described in the table below.

```
/etc/crontab: system-wide crontab
# Unlike any other crontab you don't have to run the `crontab'
# command to install the new version when you edit this file.
# This file also has a username field, that none of the other crontabs do.

SHELL=/bin/sh
PATH=/usr/local/sbin:/usr/local/bin:/sbin:/bin:/usr/sbin:/usr/bin

# m h dom mon dow user  command
42 6 * * * root    run-parts /etc/cron.daily
47 6 * * 7 root    run-parts /etc/cron.weekly
52 6 1 * * root    run-parts /etc/cron.monthly
30-59 * * * * root    /etc/test.sh
```

Field	Description	Allowed Values
Min (m)	Minute field	0 to 59
Hour (h)	Hour Field	0 to 23
DOM	Day of Month	1 to 31
MON	Month of Year	1 to 12
DOW	Day of week	0 to 6
User	MCP user	
Command	Command to run	This can either be a direct shell command or a script.

For example:

In the below line from the **crontab** file, the **test.sh** script runs every minute on the second half of every hour.

```
30-59 * * * * root /etc/test.sh
```

where **30-59** is specified in the Minute field and the remaining fields specified with '*'.

NOTE 1: The control file **/etc/crontab**:

- Needs to be copied to **/mnt/usr/MCP_SysConfig/etc/** so that the changes done are persisted across reboots.
- Can only be modified by root users or users with elevated root permissions.

NOTE 2: If you are running a script, the script should:

- Have executable permissions.
- Be copied to persistent storage to retain them across reboots.

NOTICE

GE Vernova is not responsible for the Cron jobs written by users.

Appendix F - Shell commands

The customer support bundle tool is developed mainly for customer service team to collect system information when issues happen on customers MCP units. This tool also can be used internally for validation and bug report/analysis purpose.

This tool can only be run from the firmware container and have several conditions:

1. The user who wants to run this tool should be in root group;
2. The MCP unit should already have MCP core license installed;

Once the root group user logs into the firmware container, simply type the “mcpcsb” in the command line and then follow the instructions that the command shows as below:

mcpcsb

```
root@G500:/home/administrators# mcpcsb

CST support information collection request has been sent.

It may take a while to create the CST support information archive file.

Please check the READY file under /mnt/datalog/supportinfo/ directory.

Once the READY file is created, the .tgz archive file under the same diretory is ready.

Please retrieve this file and email it to the person helping with your case.

root@G500:/home/administrators# ls -l /mnt/datalog/supportinfo/
total 19128
-rw-r--r-- 1 root root      20 May 27 08:46 READY
-rw-r--r-- 1 root root 19555478 May 27 08:46 SupportInfo-2019-05-27-08-46-52-10.tgz
root@G500:/home/administrators#
```

The result will be saved as /mnt/datalog/supportinfo/SupportInfo-YYYY-MM-DD-HH-MM-SS-N.tgz, where YYYY-MM-DD-HH-MM-SS is the date/timestamp of the capture, and N is the number of files in the top directory in the archive. For now, N will be less than 10.

If there is already one archive file in the /mnt/datalog/supportinfo before create a new one, the current one will be saved into the /mnt/datalog/supportinfo/.history/. But only the latest old one will be kept in the .history folder and all other old ones will be deleted.

The mcpcsb also supports two command options (--exclude-logs and --exclude-config) to exclude the logs and/or configurations which might include sensitive information.

The full usage for this command is as below:

```
mcpcsb [--exclude-logs | -l ] [ --exclude-config | -c ]
```

mcpsi

```

admin@G500:~$ mcpsi

Retrieving the GE Multilin MCP system information, please wait ...

musb: USB Mount command

The USB must be formatted with FAT32 and must have a partition table.

Good USB

```
root@G500:/home/administrators# musb
Proceeding with interactive mode...

Will retry for 15 seconds (in case the USB drive(s) is(are) not yet initialized)
Press Ctrl+C if you want to exit
Retrying... Please wait .
Successfully mounted the following USB device(s):
sdb1 in /mnt/usb/usb1
```

Corrupted USB

```
root@G500:/home/administrators# musb
Proceeding with interactive mode...

Will retry for 15 seconds (in case the USB drive(s) is(are) not yet initialized)
Press Ctrl+C if you want to exit
Retrying... Please wait .
Could not mount the following USB device(s):
sdb1
Possible reasons:
1. No USB drive inserted into one of the available slots.
2. The inserted USB drive is malfunctioning.
3. The inserted USB drive is not compatible with D400 drivers.
4. Device(s) busy (some other process is using the device(s)).
```

No USB

```
root@G500:/home/administrators# musb
Proceeding with interactive mode...

Will retry for 15 seconds (in case the USB drive(s) is(are) not yet initialized)
Press Ctrl+C if you want to exit
Retrying... Please wait .
```

musb unmount: USB unmount command

```
root@G500:/home/administrators# musb unmount
success
root@G500:/home/administrators# ls -l /mnt/usb/
total 0
```

Appendix G - Security Certificates Creation for MCP

Overview

This chapter describes how to create and deploy security certificates for secure communication using HTTPS protocol between the DSAS and MCP Runtime HMI Viewer and MCP web server. The secure channel is implemented using an SSL (Secure Sockets Layer)/TLS (Transport Layer Security) connection and certificate-based server authentication.

Certificates are issued by a Certification Authority (CA). The MCP does not come with a CA so you must make use of an existing CA or create your own. There are many third-party commercial and open source CAs available. This chapter describes one open source CA package: X Certificate and Key Management (XCA).

Setting up a Certification Authority

Before you can configure a secure channel between a client device and the MCP you need a Certification Authority (CA). In case you don't already have a CA, this section describes how to set up the XCA certification authority.

Once your CA is up and running, export the CA certificate so that you can install it on the MCP.

NOTICE

A CA that is planned for field use should be protected with strong security measures. Such measures include dedicating a machine for the CA, physically securing the machine, ensuring the machine is accessible only by authorized users, and not connecting the machine to a network. Such measures are required because a security breach of a CA would impact all devices that used certificates generated by the authority.

Setting up the XCA Certification Authority

XCA runs on Linux or Microsoft Windows. The following steps detail how to setup and initialize an XCA certification authority.

Install XCA

1. Download the latest version of XCA from here: <http://sourceforge.net/projects/xca>
2. Run the installation wizard to install XCA.

Create a Database and Initialize the CA

1. From XCA, select **File > New Database**.
2. Choose a protected location to save the database and then enter a strong password to encrypt the database.
3. Under the **Certificates** tab, choose **New Certificate**.
4. Under the **Source** tab, select the checkbox next to the label **Create a self-signed certificate with the serial**. Leave the dropdown named **Signature Algorithm** as "SHA 256" and leave the dropdown named **Template for the new certificate** as "[default] CA".
5. Under the **Source** tab, click **Apply All**.
6. Under the **Subject** tab, click the button labeled **Generate a new key**.

7. In the dialog that appears, enter the name of the CA (e.g., "MyCA") in the **Name** field. Choose the **Keytype** as RSA Change the **Keysize** to 2048.
8. Under the **Subject** tab, enter the distinguished name of the CA certificate. The following table provides example distinguished name components.

Note: You must enter all components of the distinguished name, including the email Address.

Table 9-1: Example Distinguished Name Components

Distinguished Name Component	Example
Internal name	MyCA
countryName	US
stateOrProvinceName	MyState
localityName	MyCity
organizationName	MyCompany
organizationalUnitName	MyDivision
commonName	MyCA
emailAddress	mail@my.domain

9. Under the **Extensions** tab, if necessary, change the **Time Range** that the CA certificate is valid for and click **Apply**. The default is 10 years. Certificates generated with this CA certificate after this period are no longer valid.
10. Under the **Key usage** tab, do not change the defaults.
11. Under the **Netscape** tab, remove the value in the **Comment** field.
12. Under the **Advanced** tab, the following messages are expected except the value of the X509v3 Subject Key Identifier, which differs from key to key:

Other Tabs
X509v3 Basic Constraints critical: CA: TRUE X509v3 Subject Key Identifier: 52:06:E3:16:88:6F:E8:0E:1D:5F:E0:F4:12:45:1A:48:98:B2:0C:FC X509v3 Key Usage: Certificate Sign, CRL Sign Netscape Cert Type: SSL CA, S/MIME CA, Object Signing CA

If above message is not displayed, click **Validate** to see the message.

13. Click **OK**. You now have a CA certificate to sign your MCP web server certificates.
14. Under the **Certificates** tab of the main view of XCA, select the new Certification Authority and click on **Export**.
15. Ensure the **Export Format** is set to PEM.
16. Browse to a protected directory (e.g., My Documents->MyXCAFiles) and click **Save**. Finally click **OK**. The file is named based upon the internal name of your CA with a .crt extension.

Certificate Generation

This section describes how to generate private keys and certificates for the MCP https web server. These certificates allow the MCP to authenticate itself to the Client.

Creating a CA-Signed Server Certificate

1. Click the **Certificates** tab.
2. Click the **New Certificate** button.
3. Make sure the **Source** tab is showing, clicking it if necessary.
 - At the bottom of the panel, select the template "[default] HTTPS_server" (or another suitable template, if you have created your own) and click the **Apply** button. This will fill in appropriate values under the **Extensions**, **Key Usage**, and **Netscape** tabs.
 - In the Signing section, select the certificate that will be used to sign the new certificate. Select the radio button next to the label **Use this Certificate for signing**. On the dropdown to the right of this checkbox, select the CA you created in section Create a Database and Initialize the CA (e.g., MyCA).
4. Click the **Subject** tab.
 - Enter the Distinguished name of the MCP server certificate.

Note: You must enter all components of the distinguished name, including the email Address.

Table 9-2: Example Distinguished Name Components

Distinguished Name Component	Example
Internal name	MyMCP
countryName	US
stateOrProvinceName	MyState
localityName	MyCity
organizationName	MyCompany
organizationalUnitName	MyDivision
commonName	MyMCP
emailAddress	mail@my.domain

5. Under the **Subject** tab, click the **Generate a new key** button.
 - In the dialog that appears, enter a name that uniquely identifies the MCP in your network (for this example, that is "MyMCP"). Choose **Keytype** as RSA and change the **Keysize** to 2048. Click **OK**.

6. Click the **Extensions** tab.
 - Under the **Extensions** tab, if necessary, change the **Time Range** that the server certificate is valid for and click **Apply**. The default is one year. The shorter the Time Range the more secure the certificate. The longer the Time Range, the more often you need to regenerate MCP Server certificates and deploy them into your MCP.
7. Under the **Key usage** tab, leave the defaults.
8. Under the Netscape tab, remove the comment.
9. Under the **Advanced** tab, click **Validate**. The following messages are expected except the value of the X509v3 Subject Key Identifier, which differs from key to key:

If above message is not displayed, click **Validate** to see the message.

10. Click the OK button at the bottom. You now have a MCP certificate.
11. In the tree view under the **Certificates** tab, open the branch labeled after your Certificate Authority, and select the new Server certificate.
12. Click **Export**.
13. In the dialog that appears, ensure the **Export Format** field is set to "PEM Cert". Browse to a protected location (e.g., **My Documents->MyXCAFiles**) and click **Save**. Finally click **OK**. The certificate will be in a file named with your MCP's Internal Name with the extension .crt (e.g., MyMCP.crt).
14. Now go to **Private Keys** tab and select Private key with Internal name MyMCP.
15. Click **Export**.
16. In the dialog that appears, ensure the **Export Format** field is set to "PEM private". Browse to a protected location (e.g., **My Documents->MyXCAFiles**) and click **Save**. Finally click **OK**. The certificate will be in a file with the extension .pem (e.g., MyMCP.pem).

NOTICE

This file is sensitive so keep it protected always. Remove the file after it has been installed on the MCP.

Installing Certificates

This chapter describes how the CA Certificate, Server Certificate, Server key is installed on your Windows PC and MCP respectively. The following table summarizes where to get the files containing the CA certificate, Server certificates and key.

Table 9-3: Location of Files Exported by Certification Authorities

Files	Location
CA Certificate	The CA certificate is in a file downloaded to a location of your choice as described in Section Create a Database and Initialize the CA. The file is named with a .crt extension (e.g., MyCA.crt).
Server Certificate	Server certificate is in the file under the location of your choice as described in Section Creating a CA-Signed Server Certificate. The file is named with a .crt extension (e.g., MyMCP.crt).
Server Private Key	Server private key is in the file under the location of your choice as described in Section Creating a CA-Signed Server Certificate. The file is named with a .pem extension (e.g., MyMCP.pem).

Installing Server Certificate and Private Key on the MCP

- Referring to Table 400 for file names and locations, copy the files containing the Server certificate, and server private key to following locations:
 - Copy Server Certificate to the folder /home/MCP_SysConfig/Certificate as **server.crt** on the MCP. In this case, use an SFTP/SCP file transfer program such as WinSCP.
 - Copy Server Private Key to the folder /home/MCP_SysConfig/Certificate as **server.key** on the MCP. In this case, use an SFTP/SCP file transfer program such as WinSCP.

NOTICE

Private key file is sensitive so keep it protected always.

- If you are using WinSCP to transfer the files, you may get the following warning message:

The reason for this warning is that the MCP file system does not support per-file permissions, so when WinSCP tries to set the permissions on a file, it is unable to do so. However, there is no security risk because the file takes on the default permissions of the files system which are correct. Therefore, this warning can be safely ignored by clicking **Skip**. To prevent this warning from appearing in the future, in WinSCP go to **Options > Preferences**. Then select **Transfer** and click **Edit** button and select **Ignore permission errors in upload options**.

3. Now reboot your MCP so that new certificates can be loaded.
4. Now launch mcpcfg from the MCP console or SSH terminal window.
5. Select **Configure Secure Access > Configure Web Mode**. If the current Web Mode is HTTP, please change it to HTTPS.

Installing CA Certificate for use by the MCP Runtime HMI Viewer

Note: This section is only required for the MCP Runtime HMI Viewer. The DSAS HMI Viewer will prompt you to confirm the server certificate on first connection to the MCP and therefore doesn't use a CA certificate to validate the server certificate.

1. Copy the CA certificate to client Windows PC to a directory of your choice (e.g., CA.crt).

2. Double click on this file. Following dialog will open.

3. Click **Install Certificate** button. Following dialog will open. Click **Next**.

- Click Next and in Certificate Import Wizard select Place all certificates in the following store option.

- Click Browse and in Select Certificate Store Dialog Select Trusted Root Certification Authorities and click OK.

6. Click **Next** in following dialog

7. Now click **finish** to complete installation.

After this step you may use the MCP Runtime HMI Viewer for secure communication with the MCP device.

Appendix H - List of Factory Default Open Ports (TCP and UDP)

Overview

This chapter describes the complete list of TCP/UDP ports opened for inbound and outbound traffic on interfaces of the indicated network zone. Factory default open ports are indicated by a “Yes” in the “Enabled by default?” column of the following two tables:

List of Factory Default Open Ports for Inbound TCP/UDP Traffic

Port Numbers	TCP / UDP	Allowed Interfaces*	Enabled by default ?	Used for...
443	TCP	Internal	Yes	Sync to/from and Online Editor for versions <250. PETC, Remote runtime HMI.
22	TCP	Internal	Yes	Snapshot save/restore, shell access to gateway, file transfer with Gateway.
922	TCP	Internal	No	Emergency administrator access, open only when remote authentication configured.
80, 8081	TCP	Internal	Yes	Settings GUI.
8082	TCP	Internal	Yes	Sync to/from, Online Editor
123	UDP	Internal	No	NTP, if configured.
Configurable, default 502	TCP	Internal	No	MODBUS, if configured.
Configurable, default 2404	TCP	Internal	No	IEC 60870-5-104, if configured.
Configurable, default 102	TCP	Internal	No	IEC 61850 MMS Server, if configured.
514	UDP	Internal	No	Rsyslog, if configured.
10514	TCP	Internal	No	Rsyslog, if configured.
Configurable, default 20000	TCP/UDP	Internal	No	DNP3, if configured.
Configurable, default 8001 – 8020	TCP	Internal	No	Pass-through or terminal server, if configured.
Configurable, default 50000+X (X is serial port number)	TCP	External or Internal	No	Telnet tunnel, TLS tunnel for pass through, terminal server or secure connection relay, if configured.

Port Numbers	TCP / UDP	Allowed Interfaces*	Enabled by default ?	Used for...
50922	TCP	Internal	No	MCP-D2x LogicLinx secure access, if configured
54000	TCP	Internal	No	MCP LogicLinx secure access, if configured.
162	UDP	Internal	No	SNMP, if configured.
Configurable, default 1194	UDP	External or Internal	No	OpenVPN, if configured.
51003	TCP	Internal	No	Standby pointing to active tunnel, if configured.
51194, 51195	TCP	Internal	No	Secure Tunnel ports for Hot-Hot, Hot-Standby & Warm-Standby redundancy modes.
53389	TCP	Internal	No	Remote Desktop SSH tunnel, if Remote Desktop is enabled.

***This is the default “Allowed Interfaces” for the indicated port(s). The “Allowed Interfaces” is configurable from the firewall settings.**

List of Factory Default Open Ports for Outbound TCP/UDP Traffic

Port Numbers	TCP / UDP	Allowed Interfaces*	Enabled by default?	Used for...
All	TCP / UDP	Internal	Yes	Any outbound traffic on interfaces assigned to internal zone.
22	TCP	External	Yes	Sync manager and ssh/sftp access to remote servers.
922	TCP	External	Yes	Alternate port for ssh/sftp access to remote servers.
389	TCP	External	Yes	Remote authentication requests to LDAP server.

***This is the default “Allowed Interfaces” for the indicated port(s). The “Allowed Interfaces” is configurable from the firewall settings.**

List of Factory Default Open Ports for Inbound TCP/UDP Traffic on Predix Edge OS Interfaces

Port Numbers	TCP / UDP	Allowed Interfaces*	Enabled by default?	Used for...
22	TCP	Host Net 0 and Edge Manager Interface*	Yes	Predix EdgeOS host shell
80	TCP	Host Net 0 Host and Edge Manager Interface*	Yes	Predix Edge Technician Console (PETC)
443	TCP	Host Net 0 and Edge Manager Interface*	Yes	Predix Edge Technician Console (PETC)
4789	UDP	Host Net 0 and Edge Manager Interface*	Yes	Not Used.

***The Edge Manager Interface is not enabled by default, but can be enabled on any one of the interfaces Net 1, Net 2, Net 5 or Net 6. The Host Net 0 interface is always enabled.**

Appendix I – Modbus Protocol Support

Read Coils Status (Function Code 1)

This function code is used to read the status of the coils, contiguous from 1 to 2000, in an IED. The DCA shall transmit configured READ COILS STATUS Modbus Command to the IED.

The response message contains coils status packed as one coil per bit. Status is indicated as 1=ON and 0=OFF. The DCA shall read multiple coils from the IED.

The Coil status read from the IED shall be represented as a 1 BIT DIGITAL INPUT in the MCP's system points real-time database (RTDB).

Read Input Status (Function Code 2)

This function code is used to read from 1 to 2000 contiguous status of discrete inputs in an IED. The DCA shall transmit configured READ INPUT STATUS Modbus Commands to the IED.

The discrete inputs in the response message are packed as one input per bit of the data field. Status is indicated as 1=ON and 0=OFF. The DCA shall read multiple input status from the IED.

The Input status read from the IED shall be represented as a 1 BIT DIGITAL INPUT in the MCP's system points real-time database (RTDB).

Read Holding Registers (Function Code 3)

This function code is used to read the contents of a contiguous block of 1 to 125 holding registers in an IED. The DCA shall transmit configured READ HOLDING REGISTERS Modbus Commands to the IED.

The register data in the response are packed as two bytes per register. The DCA shall process the received register data by performing the following:

- Apply the byte ordering interpretation as specified by the Endian configuration in the IED MAP FILE
- Parse the values of the registers as specified by the Data Type configured in IED MAP
- Apply a scaling factors as specified in the IED MAP FILE

The DCA shall represent the values calculated from above as an ANALOG INPUT and storing in the MCP's system points real-time database (RTDB).

Read Input Registers (Function Code 4)

This function code is used to read the contents of a contiguous block of 1 to 125 Input registers in an IED. The DCA shall transmit configured READ INPUT REGISTERS Modbus Commands to the IED.

The register data in the response are packed as two bytes per register. The DCA shall process the received register data by performing the following:

- Apply the byte ordering interpretation as specified by the Endian configuration in the IED MAP FILE
- Parse the values of the registers as specified by the Data Type configured in IED MAP
- Apply a scaling factors as specified in the IED MAP FILE

The DCA shall represent the values calculated from above as an ANALOG INPUT and storing in the MCP's system points real-time database (RTDB).

This function code is used to read from 1 to approximately 125 input registers in an IED. The DCA shall transmit configured READ INPUT REGISTERS Modbus Commands to the IED.

Write Single Coil (Function Code 5)

This function code is used to write a single output to either ON or OFF in an IED. The requested state ON/OFF is specified by a constant in the request data field.

As specified in the Modbus Protocol Specifications, a value of 0xFF00 request the output to be ON; a value of 0x0000 requests the output to be OFF. All other values are illegal or invalid. The Modbus DCA shall transmit a Write Single Coil command with a value of 0xFF00 or 0x0000.

The value to be transmitted for the Write Single Coil command is user configurable in the IED MAP FILE. These values are defaulted per the Modbus protocol specification, but the user has the capability of modifying the default values via the Modbus Config Applet. The configurable value allows the Modbus DCA to provide greater flexibility to better interoperate with non-standard MODBUS protocol implementations in third party vendor products.

The configured points in the IED MAP FILE shall be represented as a DIGITAL OUTPUT in the MCP's system point database. When a DIGITAL OUTPUT control is requested on the coil, the DCA shall transmit the WRITE SINGLE COIL command to the IED. The value configured in the IED MAP FILE shall be used in the transmit request command.

As specified in the Modbus Protocol Specifications, a normal response is an echo of the request. The DCA shall utilize this echo message to determine FAILURE or SUCCESS of the DIGITAL OUTPUT control request in the MCP's system point database.

Write Single Register (Function Code 6)

This function code is used to write a single holding register in an IED. As specified in the Modbus Protocol Specifications, the value of 0xFF00 and 0x0000 are permitted to be the transmitted register value. All other values are illegal or invalid. The Modbus DCA shall transmit a Write Single Register command with a value of 0xFF00 or 0x0000 as configured in the IED MAP FILE.

These values are defaulted per the Modbus protocol specification, but the user has the capability of modifying the default values via the Modbus Config Applet. The configurable value allows the Modbus DCA to provide greater flexibility to better interoperate with non-standard MODBUS protocol implementations in third party vendor products.

The configured points in the IED MAP FILE shall be represented as a DIGITAL OUTPUT in the MCP's system point database. When a DIGITAL OUTPUT control is requested on the coil, the DCA shall transmit the WRITE SINGLE COIL command to the IED. The value configured in the IED MAP FILE shall be used in the transmit request command.

As specified in the Modbus Protocol Specifications, a normal response is an echo of the request. The DCA shall utilize this echo message to determine FAILURE or SUCCESS of the DIGITAL OUTPUT control request in the MCP's system point database.

Data Representation for Write Single Register

The WRITE SINGLE REGISTER shall be configured as either 0x6A or 0x6B in the IED MAP FILE. If a register is configured as 6A, the user shall be required to specify a value (0xFF00 or 0x0000) to be sent to the IED. If a register is configured as 6B, the user shall not be required to configure a value.

Registers shall be represented in the MCP's system database as either DIGITAL OUTPUTS or ANALOG OUTPUTS based on its configuration in the IED MAP FILE, as follows:

- Registers mapped as 0x6A are represented as DIGITAL OUTPUTS in the system point database. When a control is queued to the point, the DCA shall transmit a WRITE SINGLE REGISTER command to the IED with the value specified in the IED MAP FILE.
- Registers mapped as 0x6B are represented as ANALOG OUTPUTS in the system point database. When a control is queued to this point, the DCA shall transmit a WRITE SINGLE REGISTER command to the IED with the value specified in the ANALOG OUTPUT REQUEST.

Appendix J - List of supported qualities in MCP applications

RTDB Quality Name	Client (DCA) WRITE Quality Capability											
	D.20	GPIO (G100)	DNP3 Quality Name	IEC 61850 Quality name	IEC 101/104	IEC 103	MODBUS	SEL	ASCII	SNMP	HAMA	ARRM
Offline/Failure O	W (Note 2)		ONLINE W (Note 4)	failure W (Note 4)	IV (Invalid Flag) W (Note 4)	IV (Invalid quality)	W (Note 2)	W (Note 2)	W (Note 2)	W (Note 2)	W (Note 2)

Appendix K - List of MCP Logs in Runtime HMI

Overview

This chapter describes the details of MCP logs available to the user through Runtime HMI.

Log entries are stored in files under: **/mnt/datalog/Logs /<logtype>.log**.

The maximum allowed size for each log file is **256KB** after which the log files are compressed in the format: **<logtype>.<count>.gz** to a size of approximately **14KB**.

All the compressed files are placed in the location: **/mnt/datalog/Logs**.

Below table shows the maximum number of allowed compressed log files for different log types before overwriting:

	Control Log	Diagnostic Log	System Event Log	User Activity Log	Analog Report Log (not available after and including MCP V2.60)	VPN Server
Max. no. of allowed compressed log files	20	20	20	20	10	10

Note: Outdated log files are discarded when the logs reach its maximum number of allowed compressed log files.

Control Log

File Name : control.log

Delimiter: pipe

Format:

< Msg ID>|<Calendar Time> <TimeZone>|< Epoch Time>|<Msecs>|<Cmd Type>|<Operation Type (OR) Local Command Type >| <Control Type OR Set Point Value>|<Pulse On>| <Pulse Off>|<Repeat Count>|<Command Direction>|<Command Status>|<Global ID> |<Target Home Directory>|<Point ID>|<Point Reference>|<Source Home Directory OR Session ID>|<User Txt>

Example:

2|2015-05-08 10:11:28.828 UTC|

 | |DirectionType_Producer_Send_Response|Status_Success|3927509509269880832|CA00000|-
 2001|DisableDevice|844446cf99ebaf093eff3cf00705dc97|NONE

Description:

Field Name	Field Description	Example
Msg ID	Unique Identifier for the Command Log messages	2
Calendar Time (AND) TimeZone	Calendar Time < yyyy-mm-dd hh:mm:ss.msec UTC >	2015-05-03 22:10:24.440 UTC
Epoch Time	Epoch Time of the D400	1431079888
Msec	Milli Seconds Time	826
Cmd Type	Type of the command e.g., Set Point, Control, Counter, Local Command.	CommandType_Control
Operation Type (OR) Local Command Type	Type of the operation e.g., Select Before Operate, Direct Operate, Freeze and Clear, or Scan Inhibit etc.	OperType_Direct_Operate (OR) LocalCmdType_Scan_Inhibit
Control Type (OR) Set Point Value	DO control type e.g., Trip, Pulse On, or Latch Off etc. (OR) Setpoint value for AO commands.	ControlType_Pulse_On (OR) 100
Pulse On	Pulse On period for DO control type operations	1000
Pulse Off	Pulse Off period for DO control type operations	1000
Repeat Count	Repeat count for DO control type operations	2

Field Name	Field Description	Example
Command Direction	Command direction type consists of one of the following IDs. - Received by MCP - i.e., Consumer (DPA/DTA) writes the command to Real Time Database (RTDB) - Received by DCA/DTA - i.e., Producer (DCA/DTA) receives the command from Real Time Database (RTDB) - Command result - i.e., Producer (DCA/DTA) writes command response to Real Time Database (RTDB)	DirectionType_Consumer_Write_Command
Command Status	Status of the Command.	Status_Success
Global ID	This field represents unique identifier generated by the RTDB for each command	4246965461599649792
Target Home Directory	Home Directory of the target point	DM00000
Point ID	Target Point ID	-2040
Point Reference	Target Point Reference	Acknowledge Orphan Alarms
Source Home Directory (OR) Session ID	Home directory of the source point (OR) Session ID if the command is originated from HMI.	CA00000 (OR) 84446cf99ebaf093eff3cf00705dc97
User Text	Optional ASCII text for the user to log additional information	NONE

Diagnostic Log

File Name: diagnostic.log

Delimiter: comma, colon

Format:

<Calendar Time> <TimeZone>, <Epoch Time>|<Msecs>, <Home Directory OR Application Name,<Appl Number>,<Connection Type> <Exec Instance>:<Msg Class> <Msg Class Number>:<Custom Txt>,<Error Message>

Example:

2015-05-03 10:45:56.787 UTC,1430649956,787,DBSERVER,B042:00:INFO 0:Boot timer is Started with the duration -1 mintues,Not Known

2015-05-03 10:45:56.789 UTC,1430649956,789,Sys Library,L002-0:L : INFO 0: 'dbserver' PARENT => INIT heartbeat received from CHILD indicating that its INIT is successfully completed ,<none>

Description:

Field Name	Field Description	Example
Calendar Time (AND) TimeZone	Calendar time < yyyy-mm-dd hh:mm:ss.msec UTC >	2015-05-03 22:10:24.440 UTC
Epoch Time	Epoch time format of the D400.	1431036624
Msec	Milli seconds time	826
Home Directory (OR) Application Name	Homedirectory or Name of the application	DBSERVER (OR) Sys Library (OR) 0000002
Appl Number	Unique Identification Number of the application	B042/L002 Note: Refer to table "List of Applications Numbers & Names" for the details.
Connection Type (AND) Exec Instance	Connection type or Communication type shall consist of one of the following types. 1. Serial Connection 2. Network Connection 3. Automatic Connection 4. Library 5. Others Execution Instance is the execution instance of the application.	N 1
Msg Class (AND) Msg Instance	Message class consists of one of the following key words: "ERROR", "WARN", "INFO", or "NOTICE".	INFO 0
Custom Txt	This is a custom text of the message to log additional information	dbserver' PARENT => INIT heartbeat received from CHILD indicating that its INIT is successfully completed
Error Message	Text to indicate the reason for the error	Not Known

System Event Log

File Name: systemevent.log

Delimiter: pipe

Format:

<MsgID>|<Calendar Time> <TimeZone>|<Epoch Time>|<Msecs>|<Msg Class>|<Msg Text>|<Appl Number>|<Home Directory>|<Connection Type>|<Exec Instance>|< Home Directory>|<User Txt>

Example:

3|2015-05-08 10:06:49.251 UTC|1431079609|251|MsgClass_INFO|MsgText_Child_Starts|NTEK-B050-0|SyncServer|ConnType_Network|0|D400 Sync Connection Server
1|2015-05-08 10:06:49.259 UTC|1431079609|259|MsgClass_INFO|MsgText_Application_Starts|NTEK-B034-0|RM00000|ConnType_Automatic|0|Redundancy Manager Application

Description:

Field Name	Field Description	Example
MsgID	Unique Identifier for the System Event Log messages	3
Calendar Time (AND) TimeZone	Calendar time < yyyy-mm-dd hh:mm:ss.msec UTC >	2015-05-03 22:10:24.440 UTC
Epoch Time	Epoch time format of the MCP.	1431036624
Msec	Milli seconds time	826
Msg Class	Message Class consists of one of the following key words: "ERROR", "WARN", or "INFO".	MsgClass_INFO
Msg Text	This field represents information about the status of the application. Some of the most used Message texts are: 1. "CHILD Starts" 2. "CHILD Re starts" 3. "Application Starts" 4. "Application Re starts " And so on....	MsgText_Application_Starts
Appl Number	Unique Identification Number of the application	NTEK-A037-0 Note: Refer to table "List of Applications Numbers & Names" for the details.
Home Directory	Home Directory of the application	CA00000
Connection Type	Connection type or Communication type shall consist of one of the following types. 1. Serial Connection	ConnType_Automatic

Field Name	Field Description	Example
	2. Network Connection 3. Automatic Connection	
Exec Instance	Execution Instance is the execution instance of the application.	1
User Txt	This is an optional ASCII text for the user to log additional information	No Heartbeat, Declared Standby D400 as Failed

User Activity Log

File: useractivity.log

Delimiter: semi-colon

Format:

<Application Name>;<Calendar Time> <TimeZone>; <Epoch Time>;<Msecs>;|<User Name> ; <IP Address> ; <Subnet> ; <Privilege Level > ; <User Message>

Example:

```
sshd;2015-06-06 17:24:58:561 UTC;1433611498;561;;;; Connection closed by 127.0.0.1 [preauth]
sshd;2015-06-06 17:25:00:625 UTC;1433611500;625;;;; pam_succeed_if(sshd:account): requirement
"user ingroup root" was met by user "root"
sshd;2015-06-06 17:25:00:727 UTC;1433611500;727;;;; Accepted keyboard-interactive/pam for root
from 3.188.0.65 port 54753 ssh2
HMI_Access_Mngr;2015-6-6 17:50:44:50
UTC;1433613047;50;supervisor;3.188.0.65;3.188.0.65;supervisor;Successful Login of HMI user :
supervisor
```

Description:

Field Name	Field Description	Example
Application Name	Name of the application that logs the User Activity Log	HMI_Access_Mngr
Calendar Time (AND) TimeZone	Calendar time < yyyy-mm-dd hh:mm:ss.msec UTC >	2015-6-6 17:50:44:50 UTC
Epoch Time	Epoch time format of the MCP	1433613047
Msec	Milli-seconds time	50
User Name	Name of the user that logs User Activity Log	supervisor
IP Address	Source IP address	3.188.0.65
Subnet	Subnet address	3.188.0.65
Privilege Level	The privilege level of the user	supervisor
User Message	User defined message	Accepted keyboard-interactive/pam for Successful Login of HMI user : supervisor root from 3.188.0.65 port 54753 ssh2

Analog Report Log

Not available after and including MCP V2.60.

File: analog_report.log

Delimiter: comma, colon

Format:

<Calendar Time> <TimeZone>, <Epoch Time>, <Msecs>, <Home Directory>:<Appl Number>:<Msg Class>:<Msg ID>:< Offline Reports File Name>:<Msg Text>:<Custom Text>,<Error Message>

Example:

2022-04-04 03:45:00.976 UTC,1649043900,976,RG00000:A044:INFO :8004:

/mnt/datalog/report/1/1_S_4-Apr-2022_1649030400.xml : new report file generated:<N/A>,NONE

Description:

Field Name	Field Description	Example
Calendar Time (AND) TimeZone	Calendar time < yyyy-mm-dd hh:mm:ss.msec UTC >	2022-04-04 03:45:00.976 UTC
Epoch Time	Epoch time format of the D400.	1649043900
Msec	Milli seconds time	976
Home Directory	Homedirectory or Name of the application	RG00000
Appl Number	Unique Identification Number of the application	A044 Note: Refer to table "List of Applications Numbers & Names" for the details.
Msg Class	Message class consists of one of the following key words: "EMERG ", "ALERT ", "CRIT ", "ERROR ", "WARN ", "NOTICE ", "INFO ", "DEBUG "	INFO
Msg ID	ID of the Message e.g., 8002 (File Auto Deleted) 8004 (New File Added)	8002
Report File Name	File name of the offline analog report	/mnt/datalog/report/1/1_S_4-Apr-2022_1649030400.xml
Message Text	Text to indicate the reason for the error	new report file generated
Custom Txt	This is a custom text of the message to log additional information	N/A
Error Message	Text to indicate the reason for the error	NONE

Note: MCP supports the Analog Reports functionality for the below versions.

- G100 <= v2.30
- G500 <= v2.50

And, the newer versions of MCP do not include this functionality.

VPN Server Log

File: openvpn.log

Delimiter: comma, colon, equal to

Format:

<Calendar Time> = <Micro sec> <Client IP Address(Optional)>: <Port Number(Optional)> <Custom Message>

Example:

```
Tue Mar 29 07:54:35 2022 us=887305 IFCONFIG POOL: base=10.255.255.226 size=4, ipv6=0
Tue Mar 29 07:54:51 2022 us=766469 172.12.238.69:39291 Expected Remote Options String: 'V4,dev-
type tun,link-mtu 1570,tun-mtu 1500,proto UDPv4,comp-lzo,keydir 1,cipher AES-256-CBC,auth
SHA256,keysize 256,tls-auth,key-method 2,tls-client'
Tue Mar 29 07:54:52 2022 us=191776 Client/172.12.238.69:39291 MULTI_sva: pool returned
IPv4=10.255.255.226, IPv6=(Not enabled)
```

Field Name	Field Description	Example
Calendar Time	Calendar time < Day Month Date hh:mm:ss Year >	Tue Mar 29 07:54:35 2022
Micro Secs	Micro seconds time	191776
IP Address of the connected client	An optional field and denotes the IP address of the connected VPN client	172.12.238.69 (Or) Client/172.12.238.69
Port number of connected client	An optional field and denotes the port number of the connected VPN client	39291
Custom Text	Custom message logged by the VPN Server.	Expected Remote Options String: 'V4,dev-type tun,link-mtu 1570,tun-mtu 1500,proto UDPv4,comp-lzo,keydir 1,cipher AES-256-CBC,auth SHA256,keysize 256,tls-auth,key-method 2,tls-client'

Note: VPN Server Log is available to “administrator” class/role users only in the Runtime HMI.

List of Applications Numbers & Names

Below table presents mapping between the application number and its corresponding name.

Application Number	Application Name
NTEK-A004-0	Calculator
NTEK-A006-0	MODBUS Multi-Drop® Client
NTEK-A006-0	MODBUS TCP ® Client
NTEK-A006-0	MODBUS TCP/SSH® Client
NTEK-A009-0	SEL Binary Client
NTEK-A013-0	HMI Access Manager
NTEK-A016-0	Data Logger
NTEK-A018-0	Generic ASCII Client
NTEK-A021-0	MODBUS® Server
NTEK-A022-0	DNP3 Server
NTEK-A023-0	DNP3 Client
NTEK-A024-0	IEC 60870-5-101+104 Server
NTEK-A025-0	IEC 60870-5-103 Client
NTEK-A027-0	IEC 61850 Client
NTEK-A028-0	Runtime HMI
NTEK-A028-0	User Management
NTEK-A029-0	One-Line Designer & Viewer
NTEK-A031-0	IEC® 60870-5-101+104 Client
NTEK-A033-1	Alarm/SOE Event Manager
NTEK-A034-0	System Point Manager
NTEK-A035-0	Load Shed and Curtailment
NTEK-A036-0	SNMP Client
NTEK-A036-1	HAMA (Hardware Asset Manager Application)
NTEK-A037-0	ARRM (Automated Record Retrieval Manager)
NTEK-A038-0	D.20 Client
NTEK-A044-0	Analog Reports • G100 <= v2.30 • G500 <= v2.50 Newer versions of MCP do not include Analog Reports functionality.
NTEK-A047-0	IEC 61850 Server
NTEK-A049-0	Tejas V Server
NTEK-B025-0	VPN Server
NTEK-B025-0	Genconn (INIT process for SCADA applications)

Application Number	Application Name
NTEK-B027-0	Event Logger(Quality/PRF Database Manager)
NTEK-B032-0	System Point Database
NTEK-B033-0	LogicLinx®
NTEK-B034-0	Redundancy Manager
NTEK-B035-0	Software Watchdog
NTEK-B042-1	Database Manager for Active Alarm HMI
NTEK-L002-0	System Library(Parent-Child Model)
NTEK-L005-0	Connection Parser
NTEK-L006-1	Alarm/SOE Database Wrapper Library
NTEK-L011-0	Hot-Hot/Hot-Standby Library
NTEK-P005-0	Secure Enterprise Connectivity
NTEK-P026-0	MCP Configuration Tool
NTEK-P026-0	Terminal Server
NTEK-P047-0	System Utilities
NTEK-P048-0	Online Configuration Tool
NTEK-P048-0	Offline Configuration Tool
NTEK-P065-0	Firewall Manager

Note: Applications displays the application number with full format or part of the format. For example, DNP3 client application shows NTEK-A023-0 as an application number in the systemevent.log where as it shows as A023 in the diagnostic.log.

Glossary

AD: Active Directory	A	HSV: hue/saturation/value (color palette)	
BG: Background	B	HTTP: HyperText Transfer Protocol	
	C	HTTPS: Designated the use of HTTP but with a different default port and an additional encryption/authentication layer between HTTP and TCP	
CHP: Combined Heat and Power. A CHP unit is a cogeneration system.			I
CMYK: Cyan/Magenta/Yellow/Black (color palette)		IED: Intelligent Electronic Device	
CR: carriage return		IP: Internet Protocol	
CRL: Certificate Revocation Lists		IRIG-B: Inter Range Instrumentation Group (IRIG) - an American standardized network time code format	
	D		J
DAN: Double Attached Node		JRE: JAVA Runtime Environment	
DCA: Data Collection Application. Also referred to as client application			L
DNP: Distributed Network Protocol		LAN: Local Area Network	
DPA: Data Processing Application. Also referred to as server application.		LDAP: Lightweight Directory Access Protocol	
DPMS: Display Power Management Signaling		LF: linefeed	M
DST: Daylight Saving Time		MAC: Media Access Control	
DTA: Data Translation Application. Also referred to as automation application.	F	MCP: Multifunction Controller Platform	
FG: foreground	G	MPC: Model predictive control	
GUI: Graphical User Interface (also called Human Machine Interface – HMI)		mSQL: Mini Sequential Query Language - provides fast access to stored data with low memory requirements	
GTW / GW: Gateway	H	MST: Multi-Stream Transport	N
HMI: Human Machine Interface (also called Graphical User Interface – GUI)		NIC: Network Interface Card	
HMI Client: Client-side functionality that resides in the user's browser		NTP: Network Time Protocol	
HMI Server: Server-side functionality that resides on the MCP and provides services to the client-side browsers		NVRAM: Non-Volatile Random Access Memory	O
HSL: hue/saturation/lightness (color palette)		OLV: One-Line Viewer	P
		P: Active Power	
		PRF: Protective Relay Fault	
		PRP: Parallel Redundancy Protocol	

Q

Q: Reactive Power

R

RBAC: *Role Based Access Control*

RGB: Red/Green/Blue (color palette)

RGE: ratio for gas-to-electricity

RGH: ratio for gas-to-heat

RTC: Real-time clock

RTDB: Real-time database

S

S: Apparent Power

Secure SCADA: Secure SCADA is a term used to refer to a number of features built into the MCP Substation Gateway to facilitate encrypted communications and identity verification.

sFTP: Secure File Transfer Protocol

SNTP: Simple Network Time Protocol

SOE: Sequence of Events

SSH: Secure Shell

SSL: Secure Socket Layer

Modification Record

Version	Revision	Date	Change Description
1.00	0	25 th March, 2019	Document Created.
1.10	0	14 th February, 2020	Updated for G500 v1.1 release.
2.00	0	29 th May, 2020	Updated for G500 v2.0 release.
2.10	0	10 th December, 2020	Updated for G500 v2.1 release.
	1	27 th January, 2021	Updated LDAP Server software configuration guide references (SWM0111/12/13).
3.00	0	18 th May, 2021	Updated for MCP family.
	1	26 th July, 2021	Updated DN components requirements.
3.10	0	26 th October, 2021	Updated for G500 v2.5 release.
3.11	0	09 th December, 2021	Updated for G500 v2.6 release.
	1	17 th December, 2021	Updated Table 4-8 and Appendix H “List of factory default open ports - TCP and UDP”.
3.12	0	30 th June, 2022	Updated for G500 v2.8 release.
	1	13 th July, 2022	Added “List of Factory Default Open Ports for Inbound TCP/UDP Traffic on Predix Edge OS Interfaces” section in Appendix H.
3.20	0	28 th April, 2023	Updated for MCP v3.0 release.
	1	18 th July, 2023	Corrected G100 redundancy statements, incorrect reference to DTE serial cards and D.20 Peripheral Parameters.
3.21	0	16 th August, 2023	Updated terminology throughout the document in line with the new recommended norms (Server, Outstation and LRU). In Chapter 1, - Updated the SCADA Time Synchronization Applications section In Chapter 3, - Removed the table - Standard Pseudo Points available for each device, in the section Detailed Communication Statistics – IED and Detailed Communication Statistics – Master Station In Chapter 6, - Updated DNP3 and OLD sections for new functionality - Updated IEC 60870-5-101 and 104 Master Station tables - Updated IEC 60870-5-103 Device Properties and Application Parameters tables

Version	Revision	Date	Change Description
			- Removed 110 Baud rate In Chapter 7 , - Updated DNP3 Pseudo Points for new functionality - Updated Modbus Pseudo Points for new functionality
	1	12 th February, 2024	In Chapter 4 , - Added an action statement under the Reset Database Tables section In Chapter 5 , - Added an action statement under the Reset Database Tables section - Added a statement under the Configure Alarms section In Chapter 6 , - Updated the Analog Inputs values for Point IDs 501 and 502 in Hardware Asset Management Application (HAMA) section
4.00	0	04 th April, 2024	GE Vernova Logo is added on the first page. In Chapter 1 , - Added a new section G500 as D2x RTU - Added a new section MCP and D2x Model Number for G100 and G500 devices - Added new sections As-Built model number digits and As is model number - Updated MCP License Types table - Added D2x License Types table for G500 device - Added a Note under the MCP Runtime HMI section - Updated Remote Runtime HMI section with new screenshots - RD Licensing section is updated to show Tejas V Server License and Container Licenses status Note is added describing the redundancy mode available for v4.0 in the MCP Applications section In Chapter 5 , - Added a new section D2x Configured LAN ports In Chapter 6 , - Added a Note under the Online Editor workflow and Offline Editor workflow sections - Added a Note under the Offline Editor workflow section stating the MCP device will "restart" whenever there is a Sync To or hardware (ports – Serial / Lan for MCP and D2x) is changed

Version	Revision	Date	Change Description
			- Added a new section Create a new MCP device in DS Agile MCP Studio - Updated IEC 60870-5-103 Device Properties and IEC 60870-5-103 Application Parameters tables - Updated DSAS based workflow section - A new section Software Licensing Tools for D2X is added - For G100 device, Note is added A new Chapter 7 - D2x Configuration and Operation is added. Note: With the addition of new Chapter 7 in the document, previous Chapter 7 and 8 numbers are now changed to Chapter 8 and 9.
4.01	0	10 th May, 2024	In Chapter 1 and Chapter 7, Added information about upgrade to SMXA0.401
	1	18 th February, 2025	Removed instruction to restart MCP-D2x device from MCP Shell commands for D2x section in Chapter 7.
4.10	0	26 th September, 2024	Updated Company name, Copyright Notice and Trademark Notice. In Chapter 1, - Clarified MCP Runtime HMI characteristics and limitations - Remote Desktop HMI functionality and license are no longer available In Chapter 4 and 5, - Added Redundant LAN support for G100 - Updated Settings Menu screenshots In Chapter 6, - Added SQ option in IEC 60870-5-101+104 Server Map - Added SQ check in IEC 60870-5-101 and 104 Master Station Application Parameters - Updated Binary Input Event Variation same as Queued Variation and Offline Sets Local IIN in DNP3 Server Communication Settings – Advanced - Added new functionality for Input Point Suppression - Moved IEC 101/104 global settings from mcpcfg / Settings GUI to Systemwide - Added to Systemwide > GUI: Runtime HMI settings for connection monitoring In Chapter 7, - Clarified MCP D2x characteristics and limitations

Version	Revision	Date	Change Description
	1	18 th February, 2025	Removed instruction to restart MCP-D2x device from MCP Shell commands for D2x section in Chapter 7.
5.00	0	14 th November, 2024	Updated Additional Documentation section. In Chapter 1 , - Added support for Dynamic Runtime HMI (having a single application for G100 and G500) In Chapter 6 , - Added clarification for CALC conversion of TEXT to Analog Input In Chapter 8 , - Updated DNP3 Pseudo Points for new functionality (for Analog and Digital Inputs)
	1	18 th February, 2025	Removed instruction to restart MCP-D2x device from MCP Shell commands for D2x section in Chapter 7.
5.10	0	18 th December, 2024	In Chapter 6 , - In Modbus Server updated Read Only and Read Write Registers tables and added BITSTRING16/32 support In Chapter 7 , - Added support for 20 serial ports in MCP-D2X
5.20	0	28 th May, 2025	In Product Support , Updated GE Vernova email addresses and phone numbers in Contact Technical Support section. In Chapter 1, 3 and 6 , updated GE Vernova in applicable MCP HMI screens. In Chapter 3 , - Updated section File Explorer - Updated section Trends In Chapter 6 , - Updated Emergency Access screenshot for HMI (Local, Remote and MCP Dynamic Remote HMI) - Updated Alarm Reference - maximum characters to 32 in Deviation Alarms, On Update Alarms and Double Point Alarms tables - Added a new section Alarms Bulk Editor - Added limitations and clarification for email reporting - Fixed B100HOST addresses mismatch - Added clarification for user to choose not to decrement subsequent addresses in Modbus Server section - Updated ARRM - General, Global TFTP and File Server tables

Version	Revision	Date	Change Description
			- Updated Alarm Settings - Global table to clarify that Alarm Pseudo Points controls SOE for ALL DI Pseudo Points - Added <Port Type> to SEL auto-discovery filename In Chapter 9 , - Updated PETC website hyperlink with screenshot
	1	16 th June, 2025	Updated List of Factory Default Open Ports for Inbound TCP/UDP Traffic table in Appendix H.
5.40	0	03 rd February, 2026	In Chapter 1 , - Clarified MST monitor settings in Local HMI using KVM section In Chapter 3 , - Added a new section Dress Device State Interface in Execute Commands section Changed Configure SSH Service settings in Configure Secure Access section in Chapter 4 and Chapter 5. In Chapter 4 , - Clarified interface selection in firewall rules when G500 Net are configured as PRP or Redundant In Chapter 5 , - Updated Default Gateway section with screenshot - Clarified interface selection in firewall rules when G500 Net are configured as PRP or Redundant In Chapter 6 , - Clarified the use of RTS protocol in RTS, CTS and DCD values section - Updated SEL DCA Workflow at startup with the Auto Discovery File section - Updated not supported OpenVPN authentication algorithms in the VPN Server section - Clarified 'Not supported in G100' Point IDs in HAMA section - Updated Control Lockout section - Updated One-Line Designer – Overview section - Updated Object Configuration Settings section - Added new runtime Display options for AI values - Clarified supported versions for Utilities Log In section In Chapter 8 , Added pseudo-points for new functionality of SEL Binary Application

Integration of MCP devices with OpenVPN Client

Installation and Configuration Guide

SWM0103

Version 5.40 Revision 0

Associated Software Release: Version 5.40

About this Document

Purpose of this Document

This document describes how to establish a VPN (Virtual Private Network) channel between a MCP and an OpenVPN client running on a remote computer running Windows® Server 2012 R2 or Windows 7 for accessing one or more protected services in the substation. This document provides the procedures to:

- Implement a simple Certification Authority using XCA Certification Authority (Open-Source tool).
- Install certificates on the MCP and a Windows® Server 2012 running with OpenVPN client software.
- Configure OpenVPN server in MCP to communicate to OpenVPN client.
- Configure OpenVPN client to communicate to the MCP over virtual private network.

NOTE: This document applies to the MCP family (G100/G500) unless otherwise indicated. Screen captures may show G500 in some areas, however the workflow applies to products in the MCP family (G100/G500).

Intended Audience

This document serves as a reference for utility personal and systems integrators who wish to setup a VPN (Virtual Private Network) channel between a client device (Windows® Server 2012 R2 or Windows 7) and a MCP for the purposes of accessing one or more protected services in the substation.

Additional Documentation

For further information about the Integration of MCP devices with OpenVPN Client, refer to the following documents:

- MCP Substation Gateway Software Configuration Guide (SWM0101)
- MCP Substation Gateway HMI Online Help

Safety words and definitions

Before attempting to install or use the device, review all safety indicators in this document to help prevent injury, equipment damage or downtime.

The following safety and equipment symbols are used in this document:

Indicates a hazardous situation which, if not avoided, will result in death or serious injury.

Indicates a hazardous situation which, if not avoided, could result in death or serious injury.

Indicates a hazardous situation which, if not avoided, could result in minor or moderate injury.

Indicates practices that are not related to personal injury.

Product Support

If you need help with any other module or aspect of your GE Vernova Grid Solutions product, you can:

- Access the GE Vernova Grid Solutions Web site
- Search the GE Vernova Technical Support library
- Contact Technical Support

Access GE Vernova Grid Solutions Web Site

The GE Vernova Grid Solutions Web site provides fast access to technical information, such as manuals, release notes and knowledge base topics.

Visit us on the Web at: <https://www.gevernova.com/grid-solutions/>

Search GE Vernova Grid Solutions Technical Support Library

This site serves as a document repository for post-sales requests. To get access to the Technical Support Web site, go to:

<https://www.gevernova.com/grid-solutions/events/signup.asp?sid=208>

Contact Technical Support

For help with any aspect of your GE Vernova Grid Solutions product, please contact our support team, 24/7, as follows:

Region	E-mail	Telephone

1. Overview

A VPN (Virtual Private Network) channel is available between the MCP and an OpenVPN client running on a remote computer running Windows® Server 2012 R2 or Windows 7; this VPN channel allows access to one or more protected services in the substation. The VPN channel is implemented using OpenVPN, which uses a custom protocol based on TLS (Transport Layer Security), and certificate-based mutual authentication.

Certificates are issued by a Certification Authority (CA). Since the MCP is not delivered with a CA, you must make use of an existing CA or create your own. There are many third-party commercial and open-source CAs available. This document describes one open-source CA package:

- X Certificate and Key Management (XCA).

1.1 Supported Client Devices

This document describes how to install and configure the OpenVPN client in the following Devices.

- Windows® Server 2012 R2
- Windows 7

NOTICE

This document refers to installation of OpenVPN Client in Windows Server 2012 R2 and Windows 7, but the procedure should be similar for other Windows Operating Systems.

1.2 Setup Procedure

To establish a secure channel between an OpenVPN client and the MCP:

1. Set up your CA; see section 2.1.2 .
2. Generate Diffie Hellman (DH) parameters; see Chapter 2.
3. Generate private key and certificate for your MCP; see section 3.1.1 .
4. Generate client certificate + private key in .pk12 format for OpenVPN client running in Windows® Server 2012 R2 and Windows 7 PC; see section 3.1.2 .
5. Install the CA's Certificate on your MCP; see section 4.1.
6. Install the private keys, certificates and Diffie Hellman parameters on your MCP; see section 4.1.
7. Install .pk12 client certificate + private key into client device (Windows® Server 2012 R2 and Windows 7 PC) -see section 4.2.
8. Using the MCP HMI, configure the parameters for the OpenVPN Server; see section 5.1.
9. Using the “Export VPN Client File” option in the Utilities tab under Settings option, export the OpenVPN client configuration (*.ovpn) into a desired location; see section 5.3.
Note: Export VPN Client File Option is available in Utilities Tab under Settings option from Local HMI or from the Connected Mode in DS Agile MCP Studio only.
10. Securely copy the OpenVPN client configuration into the client device (Windows® Server 2012 R2 and Windows 7 PC).
11. Run the OpenVPN client software as a service or as a process in the client device (Windows® Server 2012 R2 and Windows 7 PC).
12. Test access to the protected service or device through the MCP OpenVPN server.

Figure 1 shows the sequence of steps involved in setting up an OpenVPN connection between a MCP and OpenVPN Clients. The figure shows G500, but the workflow applies to MCP Family (G500/G100).

Figure 1: MCP OpenVPN Configuration & Installation Flow Diagram

2. Setting up a Certification Authority

Before you can configure a VPN connection between a client device and the MCP you need a Certification Authority (CA). In case you do not already have a CA, this chapter describes how to set up the XCA certification authority.

Once your CA is up and running, export the CA certificate so that you can install it on the client devices and the MCP.

NOTICE

A CA that is planned for field use should be protected with strong security measures. Such measures include dedicating a computer for the CA, physically securing the computer, ensuring the computer is accessible only by authorized users, and not connecting the computer to a network. Such measures are required because a security breach of a CA would impact all devices that used certificates generated by the CA.

2.1 Setting up the XCA Certification Authority

XCA runs on Linux or Microsoft Windows. Below procedure explains the setting up of XCA Certification Authority for Windows.

The tasks performed to setup and initialize an XCA certification authority are:

1. Install XCA; see section 2.1.1
2. Create a database and initialize the CA; see section 2.1.2 .
3. Generate Diffie Hellman (DH) Parameters; see section 2.1.3 .

2.1.1 Install XCA

1. Download the latest version of XCA from: <http://sourceforge.net/projects/xca>.
2. Run the installation wizard to install XCA.

2.1.2 Create a Database and Initialize the CA

1. From XCA, select **File > New Database**.
2. Choose a protected location to save the database and then type in a strong password to encrypt the database.
3. Under the **Certificates** tab, choose **New Certificate**.
4. Under the **Source** tab, select the checkbox next to the label **Create a self signed certificate with the serial**. Change the dropdown named **Signature Algorithm** to "SHA 256" and leave the dropdown named **Template for the new certificate** as "[default] CA".
5. Under the **Source** tab, click **Apply All**.
6. Under the **Subject** tab, click the **Generate a new key** button.
7. In the dialog that appears, type in the name of the CA (e.g., "MyCA") in the **Name** field. Choose the **Keytype** as RSA. Change the **Keysize** to 2048.

8. Under the **Subject** tab, type in the distinguished name of the CA certificate. Table 1 provides example distinguished name components.

Note: You must enter all components of the distinguished name, including the emailAddress.

Table 1 Example Distinguished Name Components

Distinguished Name Component	Example
Internal name	MyCA
countryName	US
stateOrProvinceName	MyState
localityName	MyCity
organizationName	MyCompany
organizationalUnitName	MyDivision
commonName	MyCA
emailAddress	mail@my.domain

9. Under the **Extensions** tab, if necessary, change the **Time Range** that the CA certificate is valid for and click **Apply**. The default is 10 years. Certificates generated with this CA certificate after this period are no longer valid.
10. Under the **Key usage** tab, do not change the defaults.
11. Under the **Netscape** tab, remove the value in the **Netscape Comment** field.

12. Under the Netscape Cert Type, de-select **SSL CA**, **S/MIME CA**, **Object Signing CA** options.

Result: Under the **Advanced** tab, the following messages appear, except the value of the X509v3 Subject Key Identifier, which differs from key to key:

If above message does not appear, click **Validate** to view the message.

13. Click **OK**.

Result: You now have a CA certificate to sign your MCP (Server) and Client certificates.

14. Under the **Certificates** tab of the main view of XCA, select the new Certification Authority and click on **Export**.
15. Ensure the **Export Format** is set to **PEM**.
16. Browse to a protected directory (e.g., **My Documents** > **MyXCAFiles**) and click **Save**.
17. Click **OK**.

Result: The file is named based upon the internal name of your CA with a .crt extension.

2.1.3 Generate Diffie Hellman (DH) Parameters

1. From XCA, select **Extra > Generate DH parameter**.
2. Enter a key size of 2048 and click **OK**.

Result: It may take a few minutes for the parameters to be generated and XCA may appear to be non-responsive. Be patient and allow XCA to complete.

3. When prompted, save the generated DH parameters file in a protected location (e.g., My Documents->MyXCAFiles) and leave the name as dh2048.pem.

3. Server & Client Certificate Generation

This chapter describes how to generate private keys and certificates for both the Client computer and the MCP. These certificates allow the Client to authenticate itself to the MCP and the MCP to authenticate itself to the Client.

There are two types of certificates you can generate:

- The server certificates.
The server certificate identifies a MCP.
- The client certificate in .pk12 format.
The client certificate identifies a particular user or a computer that is connected to the MCP.

3.1 Generating Certificates Using XCA

3.1.1 Generating a MCP Server Certificate

A MCP Server certificate allows the MCP to authenticate itself to a Client. The MCP Server certificate contains a **commonName** field. This field should uniquely identify the MCP in your network.

To generate a MCP Server Certificate:

1. Launch XCA from the Windows Programs menu.
2. In the tree view of the **Certificates** tab, select the branch containing your Certification Authority.
3. Under the **Certificates** tab, click the **New Certificate** button.
4. Under the **Source** tab:
 - a. Select the checkbox next to the label **Use this Certificate for signing**. On the dropdown to the right of this checkbox, select the CA you created in section 2.1.2 (e.g., MyCA).
 - b. Change the dropdown **Signature Algorithm** to **SHA 256**.
 - c. Change the dropdown **Template for the new certificate** to “[default] HTTPS_server”.
 - d. Click **Apply all**.
5. Under the **Subject** tab, click **Generate a new key** button.
6. In the dialog that appears, type in a name that uniquely identifies the MCP in your network (for this example, “MyMCP”). Choose **Keytype** to RSA. Change the **Keysize** to 2048.
7. Click **OK**.

8. Go back to the **Subject** tab and type in the Distinguished name of the MCP server certificate. The most important component is the **commonName**. This is the name that your Clients is configured to accept. Any difference between the commonName of the certificate and the name configured in the Client results in a failed connection. Choose other name components that are appropriate for your company.

Table 2 provides example distinguished name components.

Note: You must enter all components of the distinguished name, including the emailAddress.

Table 2 Example Distinguished Name Components

Distinguished Name Component	Example
Internal name	MyMCP
countryName	US
stateOrProvinceName	MyState
localityName	MyCity
organizationName	MyCompany
organizationalUnitName	MyDivision
commonName	MyMCP
emailAddress	mail@my.domain

9. Under the **Extensions** tab, if necessary, change the **Time Range** that the CA certificate is valid for and click **Apply**. The default is one year.

The shorter the Time Range the more secure the certificate, but the more often you need to regenerate MCP Server certificates and deploy them into your MCPs.

10. Under the **Key usage** tab, under X509v3 Key Usage select **Digital Signature** and **Key Encipherment** and under X509v3 Extended Key Usage select **TLS Web Server Authentication** as shown below.

11. Under the **Netscape** tab, remove the **Netscape comment** and under the **Netscape Cert Type**, if **SSL Server** is selected then deselect it from the list.

12. Under the **Advanced** tab, click **Validate**. The following messages are expected except the value of the X509v3 Subject Key Identifier, which differs from key to key:

If above message is not displayed, click **Validate** to see the message.

13. Click **OK**. You now have a MCP Server certificate.
14. In the tree view under the **Certificates** tab, open the branch labeled according to your Certificate Authority, and select the new Server certificate.
15. Click **Export**.

16. In the dialog that appears, ensure the **Export Format** field is set to "PEM Cert + key". Browse to a protected location (e.g., My Documents->MyXCAFiles) and click **Save**. Finally click **OK**. The certificate and private key will be in a file named with your MCP's Internal Name with the extension .pem (e.g., MyMCP.pem).

NOTICE

This file is sensitive so keep it protected at all times. Delete all copies of the file after it has been installed on the MCP. The file can be exported again from XCA if necessary.

3.1.2 Generating a Client Certificate

A Client certificate allows the Client to authenticate itself to a MCP. The Client certificate contains a **commonName** field.

To generate a Client certificate:

1. Launch XCA from the Windows Programs menu.
2. In the tree view of the **Certificates** tab, select the branch containing your Certification Authority.
3. Under the **Certificates** tab, click the **New Certificate** button.
4. Under the **Source** tab,
 - a. Select **Use this Certificate for signing** checkbox. On the dropdown to the right of this checkbox, select the CA you created in section 2.1.2 (e.g., MyCA).
 - b. Change the dropdown **Signature Algorithm** to **SHA 256**.
 - c. Change the dropdown **Template for the new certificate** to "[default] HTTPS_client".
 - d. Click **Apply all**.
5. Under the **Subject** tab, click the **Generate a new key** button.
6. In the dialog that appears:
 - a. Type in a name that uniquely identifies the Client (for this example, that is **MyCA_client1**).
 - b. Choose **Keytype - RSA**.
 - c. Change the **Keysize** to 2048.
 - d. Click **OK**.
7. Go back to the **Subject** tab and type in the Distinguished name of the Client certificate. The most important component is the **commonName**. This is the name that the MCP is configured to accept. Any difference between the commonName of the Client certificate and the name configured in the MCP results in a failed connection.
8. Choose other name components that are appropriate for your company. Table 7 provides example distinguished name components.

Note: You must enter all components of the distinguished name, including the emailAddress.

Table 3 Example Distinguished Name Components

Distinguished Name Component	Example
Internal name	MyCA_client1
countryName	US
stateOrProvinceName	MyState
localityName	MyCity
organizationName	MyCompany
organizationalUnitName	MyDivision
commonName	MyCA_client1
emailAddress	mail@my.domain

9. Under the **Extensions** tab, if necessary, change the **Time Range** that the CA certificate is valid for and click **Apply**. The default is one year. The shorter the Time Range the more secure the certificate, but the more often you need to regenerate Client certificates and deploy them into Clients.
10. Under the **Key usage** tab, under X509v3 Key Usage select **Digital Signature** and **Key Agreement** and under X509v3 Extended Key Usage select **TLS Web Client Authentication** as shown below.

11. Under the **Netscape** tab, remove the **Netscape comment** and under the **Netscape Cert Type**. And, if **SSL Client** and **S/MIME** is selected then deselect them from the list.

12. Under the **Advanced** tab, click **Validate**. The following messages are expected except the value of the X509v3 Subject Key Identifier, which differs from key to key:

If above message does not appear, click **Validate** to view the message.

13. Click **OK**.

Result: You now have a Client certificate.

14. In the tree view of the **Certificates** tab, open the branch labeled with your Certification Authority and select the new Client certificate.

15. Click **Export**.

16. In the dialog that appears, ensure the **Export Format** field is set to "PKCS #12(*. p12)". Browse to a protected location (**e.g., My Documents->MyXCAFiles**) and click **Save**. Finally click **OK**. **A Password dialog will be prompted to enter the Password to encrypt the PKCS#12 file.** The client certificate and its private key are encrypted and stored in a file named with the Internal Name of your client certificate and the(*.p12) extension (e.g., MyName.p12).

17. The same password will need to be used to import "*. p12" file in the Windows Server/Windows PC in which VPN Client will be running.

NOTICE

This file is sensitive so keep it protected at all times. Delete all copies of the file after it has been installed on the client.

4. Installing Certificates

This chapter describes how the CA Certificate, Server Certificate, Client Certificates and DH Parameters are installed. Table 4 summarizes where to get the files containing the CA certificate, Server certificates, Client Certificates and DH parameters.

Table 4 Location of Files Exported by Certification Authorities

Files	Location
CA Certificate	The CA certificate is in a file downloaded to a location of your choice as described in Section 2.1.2 . The file is named with a .crt extension (e.g., MyCA.crt).
Server Certificate and Key	Server certificate and key are in the same file under the location of your choice as described in Section 3.1.1 . The file is named with a .pem extension (e.g., MyMCP.pem).
DH Parameters	DH parameters are in the file named dh2048.pem under the location of your choice as described in Section 2.1.3 .

4.1 Installing CA Certificate, Server Certificate and Diffie Hellman Parameters on the MCP

- Referring to Table 4 for file names and locations, copy the files containing the CA certificate, Server certificate, and DH parameters to one of two locations:
 - The folder /mnt/usr/SecureScadaTransfer on the MCP. In this case, use an SFTP/SCP file transfer program such as WinSCP or Secure File Browser from DS Agile MCP Studio (refer to Appendix B in *GE Vernova Part Number SWM0101* for details).
 - The directory \SecureScadaTransfer on a USB drive.

Note: Do not install client certificates on the MCP.

NOTICE

These files are sensitive, so keep them protected at all times. Delete these files from the USB drive after they have been installed on the MCP.

- If you are using WinSCP or Secure File Browser from DS Agile MCP Studio (refer to Appendix B in *GE Vernova Part Number SWM0101* for details) to transfer the files, you may get the following warning message:

The reason for this warning is that the MCP file system does not support per-file permissions, so when WinSCP or Secure File Browser from DS Agile MCP Studio (refer to Appendix B in *GE Vernova Part Number SWM0101* for details) tries to set the permissions on a file, it is unable to do so. However, there is no security risk because the

file takes on the default permissions of the files system which are correct. Therefore, this warning can be safely ignored by clicking **Skip**.

3. To prevent this warning from appearing in the future, in WinSCP or Secure File Browser from DS Agile MCP Studio (refer to Appendix B in *GE Vernova Part Number SWM0101* for details) go to **Options > Preferences**. Then select **Transfer** and click **Ignore permission errors**.

4. If you are using the USB drive method of transferring the files, insert the drive into any USB slot on the MCP.
5. Connect to the MCP with a browser and click the Utilities tab under Settings option from the power bar.

Note: This Option is available in Utilities Tab under Settings option from Local HMI or from the Connected Mode in DS Agile MCP Studio only.

6. Click the **Import** button.
Result: A dialog box appears indicating that 1 Local Certificate and 1 Issuer Certificate was successfully imported. Click **OK** to dismiss the dialog.
7. Click the **Manage** button, and then click the **Local** tab.
Result: A dialog box appears showing the Local certificate details in the Staged Local Certificates area.
8. Select the certificate and click **Install**.
Result: The certificate moves into the Installed Local Certificate area. This also installs the DH parameters file.
9. Click the **Issuer** tab.
Result: The CA certificate appears in the Staged Issuer Certificates area.
10. Select the row containing the CA certificate and click **Install**.
Result: The certificate moves into the Installed Issuer Certificates area.

11. Close the dialog and log out of the MCP.

Note: If the MCP is part of a redundant system, follow the steps below.

1. Switchover to the Standby MCP.
2. Repeat steps 1 to 11.
3. Switchover back to the Original MCP.
4. Ensure the standby configuration is in sync with the active configuration (i.e., Standby Config Out of Sync DI = Config In Sync)
5. Reboot the standby MCP.

4.2 Installing Client Certificate in Windows Server 2012 R2

To import the “*. p12” file (encrypted PKCS#12 file that has Client Certificate + Private Key) into the Local Machine Store or Current User of Windows 2012 Server:

1. Securely Copy the “*. p12” (e.g., MyName.p12) file to the Windows 2012 R2 Server where VPN client will run.
2. Right-click on the” *. p12” file and select option: **Open with -> Crypto Shell Extensions.**
3. If you are running OpenVPN as a service, select **Local Machine**. Otherwise, select **Current User**.

4. Click **Next > Next**.

5. Enter the same password that was used to encrypt the “*.p12” file as part of Client Certificate + Private Key creation using XCA tool (Refer to Section 3.1.2).
6. It is recommended that you do not select **Mark this key as exportable** as shown below.
7. Select option Include all extended properties as shown below.
8. If you are running OpenVPN as a service, the option **Enable strong private key protection** is not available as shown below. If you are running OpenVPN as a user, select option **Enable strong private key protection** for added protection.

9. Click **Next**.

10. Select option: Automatically select the certificate store based on the type of certificate.

11. Click **Next**

Result: An operation summary appears.

12. Click **Finish**.

Result: A message appears, indicating that the import was successful.

13. Click **OK**.

Result: The client certificate should now be in the local machine store.

NOTICE

Delete the “*. p12” file on the file system because it is sensitive and no longer required to be on the file system.

4.3 Installing Client Certificate in Windows 7 PC

To import the “*. p12” file (encrypted PKCS#12 file that has Client Certificate + Private Key) into a Windows 7 PC:

1. Securely Copy the “*. p12” (e.g., MyName.p12) file using SCP/SFTP or USB into Windows 7 PC where VPN client will run.
2. Double-click on the “*. p12” file.

Result: The Certificate Import Wizard window appears.

3. Click **Next > Next**.
4. Enter the same password that was used to encrypt the “*.p12” file as part of Client Certificate + Private Key creation using XCA tool (Refer to Section 3.1.2).
5. It is recommended that you do not select option: **Mark this key as exportable** as shown below.
6. Select option: Include all extended properties.
7. Select option: **Enable strong private key protection** for added protection.

8. Click **Next**.

9. Select option: Automatically select the certificate store based on the type of certificate.

10. Click **Next**.

Result: A summary of the operation appears.

11. Click **Finish**.

Result: The following window appears.

12. Click **OK**.

Result: A message appears, indicating that the import was successful.

13. Click **OK**.

Result: The client certificate should now be in the local machine store.

NOTICE

Delete the "*. p12" file on the file system because it is sensitive and no longer required to be on the file system.

4.4 Installing Chain of CA Certificates on the MCP

1. Referring to Table 4 for file names and locations, copy the files containing the CA certificate, Server certificate, and DH parameters to one of two locations:
 - The folder /mnt/user/SecureScadaTransfer on the MCP. In this case, use an SFTP/SCP file transfer program such as WinSCP or Secure File Browser (Refer to Appendix B in *GE Vernova Part Number SWM0101* for details).
 - The directory \SecureScadaTransfer on a USB drive.

Note: Do not install client certificates on the MCP.

NOTICE

These files are sensitive, so keep them protected at all times. Delete these files from the USB drive after they have been installed on the MCP.

- If you are using WinSCP or Secure File Browser from DS Agile MCP Studio (refer to Appendix B in *GE Vernova Part Number SWM0101* for details) to transfer the files, the following warning message may appear:

The reason for this warning is that the MCP file system does not support per-file permissions, so when WinSCP or Secure File Browser from DS Agile MCP Studio (refer to Appendix B in *GE Vernova Part Number SWM0101* for details) tries to set the permissions on a file, it is unable to do so. However, there is no security risk because the file takes on the default permissions of the files system which are correct. Therefore, this warning can be safely ignored by clicking **Skip**.

- To prevent this warning from appearing in the future, in WinSCP go to **Options > Preferences**. Then select **Transfer** and click **Ignore permission errors**.

- If you are using WinSCP or Secure File Browser from DS Agile MCP Studio (refer to Appendix B in *GE Vernova Part Number SWM0101* for details) then copy all the CA certificates files in the chain, Server certificate, and DH parameters to folder `/mnt/usr/SecureScadaTransfer` on the MCP.
- If you are using the USB drive method of transferring the files, insert the drive into any USB slot on the MCP.

6. Connect to the MCP with a browser and click the Utilities tab under Settings option from the power bar.

Note: This is available in Utilities Tab under Settings option from Local HMI or from the Connected Mode in DS Agile MCP Studio only.

7. Click the **Import** button.

Result: A dialog box appears indicating that 1 Local Certificate and a list of all Issuer Certificates in the chain will be successfully imported. Click **OK** to dismiss the dialog.

8. Click the **Manage** button, and then click the **Local** tab.

Result: A dialog box appears showing the Local certificate details in the Staged Local Certificates area.

9. Select the certificate and click **Install**.

Result: The certificate moves into the Installed Local Certificate area. This also installs the DH parameters file.

10. Click the **Issuer** tab.

Result: All the CA certificates in the chain appear in the Staged Issuer Certificates area.

11. Select all the CA certificates in the chain and click **Install**.

Result: The certificates move into the Installed Issuer Certificates area.

12. Close the dialog box and log out of the MCP.

NOTICE

If a chain of certificates is being used, all the certificates in the chain must be installed.

Note: In a redundant system (not supported in MCP):

1. Switchover to the Standby MCP.
2. Repeat steps 1 to 12.
3. Switchover back to the Original MCP.
4. Ensure the standby configuration is in sync with the active configuration (i.e. Standby Config Out of Sync DI = Config In Sync)
5. Reboot the standby MCP.

5. Configuring VPN in MCP

5.1 Configuring VPN Server

1. Login to MCP Online GUI as an Administrator user. Only users with administrator rights can configure and view OpenVPN configuration as shown below.
2. Go to Utilities tab under Settings option and install CA and Server Certificates – refer to Section 4.1
3. Go to the **Configuration** tab in DS Agile MCP Studio and then select **Network Connection** and Network Connection Type: **VPN Server**.

4. Configure the VPN Server settings as shown below.

VPN Server Settings

Name		VPN Server		☒ Auto Start
Network IP Address	Port	Concurrent Connections	Transport Layer	
10.200.0.0/24	1,194	1	UDP	
Encryption Algorithm	Authentication Algorithm			
AES-256-CBC	SHA-256			
Custom Option				
				Edit

Enter any options to add to the VPN Server Configuration.
Custom options that overlap the standard options will take precedence. All options appear in this field, separated by semicolons. For example: renegotiate 900; keepalive 90.

Note: Refer to Table 5 for a description of each setting in the VPN Server configuration.

Table 5 VPN Server Configuration Parameters

Setting	Description	Range	Default
Name	Unique name for the VPN Server.	Text string 32 characters are allowed	VPN Server
Auto Start	Indicates if the application automatically starts when the configuration is changed and reloaded or when the MCP re-boots.	Disabled Enabled	Enabled
Network IP Address	IP address of the device. Must be unique from other configured devices.	Valid IPv4 address and subnet mask. The supported subnet mask range is from 16 to 31 only.	10.200.0.0/24
Port	The port number on which the device communicates.	0 to 65535	1,194
Concurrent Connections	The number of allowed concurrent connections.	1, 2, 3	1
Transport Layer	The transport layer protocol; either: - Transmission Control Protocol (TCP), or - User Datagram Protocol (UDP)	TCP UDP	UDP
Encryption Algorithm	Mathematical formula used in encryption and decryption of the VPN communication.	List of encryption algorithms. AES-256-CBC AES-256-CFB1 AES-256-CFB8 AES-256-OFB AES-192-CBC AES-192-CFB1 AES-192-CFB8 AES-192-OFB CAMELLIA-256-CBC CAMELLIA-256-CFB CAMELLIA-256-CFB1 CAMELLIA-256-CFB8 CAMELLIA-256-OFB CAMELLIA-192-CBC CAMELLIA-192-CFB CAMELLIA-192-CFB1 CAMELLIA-192-CFB8 CAMELLIA-192-OFB	AES-256-CBC

Setting	Description	Range	Default
Authentication Algorithm	Authentication is the process of verifying the encrypted data was sent by the sender and was not altered.	List of authentication algorithms. SHA1-160 RIPEMD160-160 SHA-224 SHA-256 SHA-384 SHA-512	SHA-256
Custom Option	Enter any options to be added to the VPN Server Configuration. All options appear in this field, separated by semicolons. To edit this field: 1. Click the Edit button. Result: The Configure Custom Option window appears. 2. Click the Add button. Result: A line appears as a Custom Option. 3. Type in the option text. 4. Click Save. NOTICE Custom Options are advanced options and take precedence over the standard configuration options. The standard options are secure by default. Implementing custom options can impact the security strength (e.g. using weak ciphers such as DES*, RC2-*, and BF-*). The customer assumes risk of weakened security when implementing custom options. Consult the online OpenVPN literature for guidance.	Text string For example: • reneg-sec 900 • tun-mtu 1500 ; mssfix 1300 • fragment 1400; • mssfix • tls-cipher TLS-DHE-RSA-WITH-CAMELLIA-256-CBC-SHA • socket-flags TCP_NODELAY • push "socket-flags TCP_NODELAY	blank

5. Save the VPN Server configuration and apply configuration commit to apply these changes.

Result: VPN Server files are saved in the directory “/etc/openvpn/”.

5.2 Configuring VPN Client Parameters

1. Connect as Administrator to the MCP device through Online Editor (i.e. Connect mode) in DS Agile MCP studio, navigate to the **Access** tab and then select **VPN Client List tab** to configure the VPN client, Routing and White list as shown below.

Note: VPN Client Configuration can also be done by an Administrator through MCP Runtime HMI (Remote or Local) by navigating to the Access tab and then select the VPN Client Configuration tab.

Name	Enabled	Routing List And White List
MyCA_Client1	☒	Configure
MyCA_Client2	☒	Configure
MyCA_Client3	☒	Configure
MyCA_Client4	☒	Configure
MyCA_Client5	☒	Configure
MyCA_Client6	☒	Configure
MyCA_Client7	☒	Configure
MyCA_Client8	☒	Configure

Note: Refer to Table 6 for a description of each setting in the VPN Client Configuration.

Table 6 VPN Client Configuration Parameters

Setting	Description	Format	Example
Client Name	The client's common name. Note: This name must match the Common Name of the client certificate.	Text string 32 characters are allowed	Client1
Enabled	Selected if the Client is enabled. Not selected if the Client is disabled	Enabled Disabled	Enabled
Routing List and White List:	Click Configure to access the Configure Routing List and the White List.		

2. Configure Routing List and White List as shown below:

Note: Refer to the Table 7 for description of each of the Routing List and White List parameters.

Table 7 Routing List and White List

Setting	Description	Format	Example
Routing List	Drop down list of Route IP address & Subnet Mask in CIDR notation. Note: Routing List consist of list of configured networks (including VLANs & PRP) in MCP. This list can't be edited by the User.	Valid IP4 Address/Netmask	172.12.232.0/16
White List	"IP/Port/Protocol Whitelist" for each VPN client to allow the incoming connections based on the combination of destination IP address, protocol and Port number through VPN tunnel. The MCP device needs to be restarted after changing the White List.	IP Address: Valid IP4 Address Port No: Valid TCP/UDP Port Number Protocol: From the below drop-down list: • TCP • UDP • TCP+UDP • Any ICMP • Useful ICMP • Useful ICMP+ Ping ICMP Type/Code allowed combinations are described in Table 8 ICMP White List Options.	IP Address: 172.12.232.106 Port: 22 Protocol: TCP

Note: Port Number is available for TCP, UDP and TCP+UDP protocols only in White List configuration.

Table 8 ICMP White List Options

ICMP White List Option	Type	Code
Any ICMP	All	All
Useful ICMP and Useful ICMP + Ping	3 (Destination Unreachable)	All
	0 (Echo reply)	0
	11 (Time Exceeded)	0 (TTL expired in transit)
	11 (Time Exceeded)	1 (Fragment reassembly time expired)
Useful ICMP + Ping	8 (Echo request)	0

3. Save the VPN Client configuration parameters by applying Save button.

Result: All VPN Client configuration files are saved in the directory “/etc/openvpn/”.

Notes: A static network route must be configured in each unique destination device referenced in all of the configured whitelists.

The route must be specified as follows:

Route Destination: The Network IP Address of the MCP’s VPN Server Configuration.

Route Network Mask: The network mask of the Network IP Address of the MCP’s VPN Server Configuration.

Route Gateway: The IP address of the MCP interface that is reachable by the destination device. In the case of Redundant system (not supported in MCP), it would be Active IP address of the device interface that is reachable by the destination device.

5.3 VPN Server Log

MCP HMI provides support for VPN Server Log available to Administrator Users. This Log is available under System Logs button and can be used for diagnostic purposes.

This log is also available from the MCP command prompt for Administrator or Root Users and can be accessible using command:

```
sudo tail -f /var/log/D400/openvpn.log
```

Refer to [Appendix B](#) for troubleshooting guide based on messages in this log.

6. Exporting VPN Client Configuration

The VPN client configuration file is generated by MCP. This client configuration is archived with password protection into a file and exported into a PC or a shared location using option Export VPN Client File from the Utilities tab under Settings options as described below.

To export a VPN Client file:

1. Go to Export VPN Client File option and click the **Export** button.

2. Select the Client from configured drop-down list of configured Clients.

3. Select the Local Gateway IP address to which VPN Client will need to connect from the list of Configured IP address of MCP.

4. Enter the Password to save the Client Configuration file in protected & compressed format. You need to use the same password to uncompress the Client configuration file using 7Zip or WinRAR software.

5. Securely save the file into a PC/Shared Location/USB.

Note: Exporting VPN Client Configuration options is also available through File Explorer functionality in Local HMI. The compressed Client Configuration file is available in the USB.

NOTICE If exporting of a VPN client configuration file fails due to certificate errors, refer to **Appendix A: Certificate Error Messages Logged by OpenVPN Configuration** for details about these error messages.

7. Configuring OpenVPN Client

1. Download OpenVPN Client software from the link below:
<https://openvpn.net/index.php/open-source/downloads.html>
2. Install OpenVPN client software on Windows 7 PC or Windows 2012R2 Server.
3. After installation, the OpenVPN Client Configuration is present at the below folder.
C:\Program Files\OpenVPN\config.
4. Download 7zip or WINRAR software from the below links and install on Windows 7 PC or Windows 2012R2 Server.
www.7-zip.org/download.html
www.win-rar.com/download.html
5. Use either 7zip or WINRAR software uncompressing the password protected zip file generated in step 5 of Chapter 6. and copy the contents of the uncompressed file into this configuration folder:

C:\Program Files\OpenVPN\config\

NOTICE

It is important to install “.pk12” (Client Certificate + Private Key) before importing VPN Client Configuration into a Windows® Server 2012 or a Windows 7 PC.

6. You can start OpenVPN client as a Service on system startup in Windows 2012 R2 Server or Windows 7 PC as follows:
 - a. Run the Windows Service administrative tool:
 - b. Press Windows Key + R
 - c. Type **services.msc** and press **Enter**.
 - d. Find the OpenVPN service and set its Startup Type to "automatic."
 - e. Optionally, start the service now.

OR

If OpenVPN client could not start automatically on system startup in Windows 2012R2 Server or Windows 7 PC, then use NSSM (Non-Sucking Service Manager) Utility to start the OpenVPN client at system startup. Refer to Chapter 8.

7. OpenVPN client can run from GUI manually in Windows 2012R2 or Windows 7 PC.
Refer to instructions in the below link to start OpenVPN Client from OpenVPN GUI.
<https://community.openvpn.net/openvpn/wiki/OpenVPN-GUI>

The contents of the Client VPN Configuration file for Windows® Server 2012 or Windows 7 PC appears similar to the example shown below:

```
# Automatically generated OpenVPN client config file
# Note: this config file contains inline private keys
#       and therefore should be kept confidential!
client
proto udp
remote 172.12.232.72
port 1194
nobind
dev tun
persist-key
persist-tun
keepalive 10 60
comp-lzo no
auth SHA1
cipher AES-256-CBC

-----END OpenVPN Static key V1-----
</tls-auth>
cryptoapicert "SUBJ:MyClient1"
```

Note: If <tls-auth> key is missing in the client configuration file then it is likely because the Netscape Cert Type is used in the MCP Server Certificate. Refer to step 11 section 3.1.1 Generating a MCP Server Certificate on page 17 for how to remove Netscape Cert Type from the MCP Server Certificate. Server & Client Certificate Generation You also would need to remove the Netscape Cert Type from the Client Certificate. Refer to step 11 in section 3.1.2 on page 23 for how to remove Netscape Cert Type from the Client Certificate.

8. Revoking a Client Certificate

All certificates are issued for a restricted time period of validity. However, it can happen that a certificate should not be used or has become invalid before its expiry date. In this case, the issuing CA should revoke this certificate by putting it on the list of revoked certificates (CRL) and publishing it.

Together with a private key and a certificate, a client device can prove its identity to the MCP. If a malicious user ever discovered your private key, the malicious user would be able to access the MCP masquerading as you. The moment you are aware of a security breach that may involve the private key, you should revoke the associated certificate. If a certificate is revoked, the MCP does not accept any connections that use a revoked certificate.

Another reason for revoking a certificate may be that the owner of the certificate has left the company and no longer needs to connect to the MCP. Revoking the certificate prevents that person from accessing the MCP even if the person retained his or her private key.

To revoke a certificate:

1. Revoke the certificate on the CA 8.1.
2. Generate a new Certificate Revocation List (CRL) – See section 8.2.
3. Install the CRL on the MCP – See section 8.3.
4. OpenVPN server configuration, Save and Commit changes to reflect new CRL changes.

8.1 Revoking the Certificate in XCA

To revoke the certificate in XCA:

1. Launch XCA from the Windows Programs menu.
2. In the tree view under the **Certificates** tab, open the branch containing your Certificate Authority.
3. Select and right-click the Client certificate to be removed (e.g., MyName).
4. Click **Revoke** option from the right-click menu.
5. Provide the date of revocation under field **Invalid Since** and reason for revocation from the dropdown list **Revocation Reason**.
6. Click **OK**.

8.2 Exporting the CRL in XCA

To export the CRL in XCA:

1. In the tree view under the **Certificates** tab, right-click the branch containing your Certificate Authority (e.g., MyCA).
2. Select the **CA** option in the right-click menu, and then option **Generate CRL**.
3. Under the **Dates** section, leave the **last update** as today's date.

4. Choose a date for **next update** when you want to update CRL next time to the MCPs. If there is no planned date for next update, you can choose the expiry date of CA certificate as date for **next update**.
Note: You can optionally use **Year/Month/Day** field and **Apply** to quickly change next update date.
5. Change the dropdown **Hashing Algorithm** to **SHA 256**.
6. Under the **Extensions**, leave the fields **CRL Number** and **Revocation reasons** checked. Leave the field **Authority key identifier** unchecked.
7. Click **OK**.
8. Under the **Revocation List** tab, select the CRL labelled as your Certificate Authority (e.g., MyCA). Verify that **Next update** field is set to what you have chosen in step 4.
9. Click **Export**.
10. In the dialog that appears, ensure the **Export Format** field is set to PEM. Browse to a protected location (e.g., My Documents->MyXCAFiles) and click **Save**. The file is named based upon the internal name of your CA with a “.pem” extension. Append “_CRL” to filename to indicate that this file is a CRL (e.g., MyCA_CRL.pem). Finally click **OK**.

8.3 Installing the CRL in the MCP

To install the CRL in the MCP:

1. Copy the CRL file generated in section 8.2 to one of two locations:
 - The folder /mnt/user/SecureScadaTransfer on the MCP. In this case, use an SFTP/SCP file transfer program such as WinSCP or Secure File Browser from DS Agile MCP Studio (Refer to Appendix B in SWM0101 for details).
 - The directory \SecureScadaTransfer on a USB drive.
2. If you are using the USB drive method of transferring the files, insert the drive into any USB slot on the MCP.
3. Connect to the MCP with a browser and click the Utilities tab under Settings options from the power bar.
Note: This Option is available in Utilities Tab under Settings option from Local HMI or from the Connected Mode in DS Agile MCP Studio only.
4. Click the **Import** button. You should see a dialog indicating that 1 CRL was successfully imported. Click **OK** to dismiss the dialog.
5. Click the **Manage** button, and then click the **CRL** tab.
Result: A dialog appears showing the CRL details in the Staged CRLs area.
6. Select the CRL and click **Install**.
Result: The CRL moves into the Installed CRLs area.
7. Close the dialog and log out of the MCP.

9. Running OpenVPN Client as Windows Service using NSSM

Download the latest version of NSSM (Non-Sucking Service Manager) from link:

<http://nssm.cc/download>

NOTICE

The following procedure is reproduced with permission from Peter Senft at <http://www.rfc3092.net/>. Peter's original blog can be found at <http://www.rfc3092.net/2015/08/openvpn-windows-service-foo/>.

9.1 How to install NSSM

NSSM does not come with a Windows Server 2012 R2 installer.

To install NSSM:

1. Create a folder; for instance, in your "Program Files" directory (or whatever directory name %PROGRAMFILES% represents).
2. Depending on your operating system, copy the win32 or win64 version of <nssm.exe> into the Program Files directory.
3. Open a console window with administrator rights.
4. Navigate to the newly created folder.
5. Execute NSSM install file. For example:
C:\Program Files\NSSM>nssm.exe
NSSM: The non-sucking service manager
Version 2.24 64-bit, 2014-08-31

9.2 How to Use NSSM

Usage: nssm [<args> ...]

- To show service installation GUI:
nssm install [<servicename>]
- To install a service without confirmation:
nssm install <servicename> <app> [<args> ...]
- To show service editing GUI:
nssm edit <servicename>
- To retrieve or edit service parameters directly:
nssm get <servicename> <parameter> [<subparameter>]
nssm set <servicename> <parameter> [<subparameter>]
nssm reset <servicename> <parameter> [<subparameter>]

- To show service removal GUI:
nssm remove [<servicename>]
- To remove a service without confirmation:
nssm remove <servicename> confirm
- To manage a service:
nssm start <servicename>
nssm stop <servicename>
nssm restart <servicename>
nssm status <servicename>
nssm rotate <servicename>

9.3 Running OpenVPN as Windows Service Using NSSM

To run OpenVPN as a Windows service using NSSM:

1. Go to the NSSM folder using the Windows Command Line with administrator access:
C:\Program Files\NSSM>
2. Run the OpenVPN client as Service, execute the following command:
nssm install "My OpenVPN Service"

The NSSM service installer window Application tab appears.

9.4 Setting Up OpenVPN as a Service

9.4.1 To set up OpenVPN as a service:

1. Complete the **Application** tab fields.

Path: This is the path to the OpenVPN binary and should usually be C:\Program Files\OpenVPN\bin\openvpn.exe.

Startup directory: This is the path to the directory where you store your OpenVPN configuration files. Usually that is C:\Program Files\OpenVPN\config. But if you want to run the OpenVPN UI with manual started tunnels in parallel, then create a separate folder, e.g., C:\Program Files\OpenVPN\config-nssm. Otherwise, it is easy to confuse manual tunnels with service tunnels.

In this example, since manual tunnels are being used, use the default values.

Arguments: This is the configuration file for the tunnel, that should reside in the above defined startup directory.

2. Complete the **Details** tab fields.

Display name: This is the name that is basically visible everywhere. The name is editable, but most of the time this is the same as the service name.

Description: This is the description that can be viewed later in the services area.

Start-up type: This is the standard service start up type setting for a window. Most likely choose Automatic here. But here user have the choice between Automatic, Automatic (Delayed Start), Manual and Disabled.

3. Complete the **Log On** tab fields.

Define how this service needs to run. Unless you are doing something unusual here, you can leave the default settings unchanged (that is, **Local System account**).

4. Complete the **Update** tab fields.

If running Windows 10, this tab can be important. Using the system account, you are able to install the service, but when starting the service, you might see an error. In the event log, the following message appears:

Program C:\Program Files\OpenVPN\bin\openvpn.exe for service OpenVPN siteopsvpn (NSSM) exited with return code 3221225794.

This means that you used an account that has no rights to execute OpenVPN. This can be resolved by running the service as a user that has administrative rights on that computer.

5. Complete the **Dependencies** tab fields.

Add the services that OpenVPN is depending on (DHCP and Tap0901).

6. Complete the **Process** tab fields.

In this tab, you can control how the service is handled by the processor. For instance, if it should only run on a specific processor or as a higher priority. For the normal use case this can remain unchanged.

7. Complete the **Shutdown** tab fields.

Under normal circumstances, no changes are required for this tab.

8. Complete the **Exit Actions** tab fields.

Under normal circumstances, no changes are required for this tab.

9. Complete the **I/O** tab fields.

With the OpenVPN UI you can view the log files. However, with services you cannot view the logs, unless you define them here. Log files are usually located in:

C:\Program Files\OpenVPN\log.

10. Complete the **File Rotation** tab fields.

This tab is an extension of the I/O tab, as it configures the log rotation.

11. Complete the **Environment** tab fields.

This last tab can usually be ignored. However, it can be useful if you want to add or even replace the environment.

12. Click **Install service**.

Result: NSSM installs OpenVPN as a service that can survive standby and sluggish network connections.

13. Start the newly created service with the:

- **net** command,
- **nssm** command, or
- Services in the control panel.

If you want to change anything, this can be done by calling NSSM with the edit parameter.

nssm edit "My OpenVPN Service"

And, as previously stated, you can perform changes from the command line. The command sequence is:

```
nssm install "My OpenVPN Service" C:\Program  
Files\OpenVPN\bin\openvpn.exe  
nssm set "My OpenVPN Service" AppDirectory "C:\Program  
Files\OpenVPN\config"  
nssm set "My OpenVPN Service" AppParameters myvpnconfig.ovpn  
nssm set "My OpenVPN Service" AppStdin "C:\Program  
Files\OpenVPN\log\myservice-stdin.log"  
nssm set "My OpenVPN Service" AppStdout "C:\Program  
Files\OpenVPN\log\myservice-stdout.log"  
nssm set "My OpenVPN Service" AppStderr "C:\Program  
Files\OpenVPN\log\myservice-sterr.log"  
nssm set "My OpenVPN Service" AppRotateFiles 1  
nssm set "My OpenVPN Service" DependOnService Dhcp tap0901
```

A. Certificate Error Messages Logged by OpenVPN Configuration

This appendix describes possible error messages logged by the OpenVPN configuration HMI for errors in certificates.

Example Error Message:

List of Error Codes from OpenSSL.org:

Error Code	Description
0 X509_V_OK: ok	The operation was successful.
2 X509_V_ERR_UNABLE_TO_GET_ISSUER_CERT: unable to get issuer certificate	The issuer certificate of a looked-up certificate could not be found. This normally means the list of trusted certificates is not complete. Ensure that Issuer Certificate for the Installed Local Certificate exists. Also ensure that all certificates in the Issuer Certificate chain are installed in the MCP.
3 X509_V_ERR_UNABLE_TO_GET_CRL: unable to get certificate CRL	The CRL of a certificate could not be found.

Error Code	Description
4 X509_V_ERR_UNABLE_TO_DECRYPT_CERT_SIGNATURE: unable to decrypt certificate's signature	The certificate signature could not be decrypted. This means that the actual signature value could not be determined rather than it not matching the expected value, this is only meaningful for RSA keys.
5 X509_V_ERR_UNABLE_TO_DECRYPT_CRL_SIGNATURE: unable to decrypt CRL's signature	The CRL signature could not be decrypted: this means that the actual signature value could not be determined rather than it not matching the expected value. Unused.
6 X509_V_ERR_UNABLE_TO_DECODE_ISSUER_PUBLIC_KEY: unable to decode issuer public key	The public key in the certificate SubjectPublicKeyInfo could not be read.
7 X509_V_ERR_CERT_SIGNATURE_FAILURE: certificate signature failure	The signature of the certificate is invalid.
8 X509_V_ERR_CRL_SIGNATURE_FAILURE: CRL signature failure	The signature of the certificate is invalid.
9 X509_V_ERR_CERT_NOT_YET_VALID: certificate is not yet valid	The certificate is not yet valid: the not-Before date is after the current time. This issue could be caused by an incorrect time on the MCP. Ensure that the MCP time is correct. An incorrect time could occur if the MCP is configured for the UTC timezone but its time is set to a non-UTC local time. It is recommended that the MCP timezone be set to the correct local timezone and time corrected in this case.

Error Code	Description
10 X509_V_ERR_CERT_HAS_EXPIRED: certificate has expired	The certificate has expired: that is the notAfter date is before the current time.
11 X509_V_ERR_CRL_NOT_YET_VALID: CRL is not yet valid	The CRL is not yet valid.
12 X509_V_ERR_CRL_HAS_EXPIRED: CRL has expired	The CRL has expired.
13 X509_V_ERR_ERROR_IN_CERT_NOT_BEFORE_FIELD: format error in certificate's notBefore field	The certificate notBefore field contains an invalid time.
14 X509_V_ERR_ERROR_IN_CERT_NOT_AFTER_FIELD: format error in certificate's notAfter field	The certificate notAfter field contains an invalid time.
15 X509_V_ERR_ERROR_IN_CRL_LAST_UPDATE_FIELD: format error in CRL's lastUpdate field	The CRL lastUpdate field contains an invalid time.
16 X509_V_ERR_ERROR_IN_CRL_NEXT_UPDATE_FIELD: format error in CRL's nextUpdate field	The CRL nextUpdate field contains an invalid time.
17 X509_V_ERR_OUT_OF_MEM: out of memory	An error occurred trying to allocate memory. This should never happen.
18 X509_V_ERR_DEPTH_ZERO_SELF_SIGNED_CERT: self-signed certificate	The passed certificate is self-signed, and the same certificate cannot be found in the list of trusted certificates.
19 X509_V_ERR_SELF_SIGNED_CERT_IN_CHAIN: self-signed certificate in certificate chain	The certificate chain could be built up using the untrusted certificates, but the root could not be found locally.

Error Code	Description
20 X509_V_ERR_UNABLE_TO_GET_ISSUER_CERT_LOCALLY: unable to get local issuer certificate	The issuer certificate could not be found: this occurs if the issuer certificate of an untrusted certificate cannot be found. Ensure that Issuer Certificate for the Installed Local Certificate exists. Also ensure that all certificates in the Issuer Certificate chain are installed in the MCP.
21 X509_V_ERR_UNABLE_TO_VERIFY_LEAF_SIGNATURE: unable to verify the first certificate	No signatures could be verified because the chain contains only one certificate and it is not self-signed.
22 X509_V_ERR_CERT_CHAIN_TOO_LONG: certificate chain too long	The certificate chain length is greater than the supplied maximum depth. Unused.
23 X509_V_ERR_CERT_REVOKED: certificate revoked	The certificate has been revoked.
24 X509_V_ERR_INVALID_CA: invalid CA certificate	A CA certificate is invalid. Either it is not a CA, or its extensions are not consistent with the supplied purpose.
25 X509_V_ERR_PATH_LENGTH_EXCEEDED: path length constraint exceeded	The basic Constraints path length parameter has been exceeded.
26 X509_V_ERR_INVALID_PURPOSE: unsupported certificate purpose	The supplied certificate cannot be used for the specified purpose.
27 X509_V_ERR_CERT_UNTRUSTED: certificate not trusted	The root CA is not marked as trusted for the specified purpose.
28 X509_V_ERR_CERT_REJECTED: certificate rejected	The root CA is marked to reject the specified purpose.

Error Code	Description
29 X509_V_ERR_SUBJECT_ISSUER_MISMATCH: subject issuer mismatch	The current candidate issuer certificate was rejected because its subject name did not match the issuer name of the current certificate. Only displayed when the - issuer_checks option is set.
30 X509_V_ERR_AKID_SKID_MISMATCH: authority and subject key identifier mismatch	The current candidate issuer certificate was rejected because its subject key identifier was present and did not match the authority key identifier current certificate. Only displayed when the - issuer_checks option is set.
31 X509_V_ERR_AKID_ISSUER_SERIAL_MISMATCH: authority and issuer serial number mismatch	The current candidate issuer certificate was rejected because its issuer name and serial number was present and did not match the authority key identifier of the current certificate. Only displayed when the - issuer_checks option is set.
32 X509_V_ERR_KEYUSAGE_NO_CERTSIGN:key usage does not include certificate signing	The current candidate issuer certificate was rejected because its keyUsage extension does not permit certificate signing.
50 X509_V_ERR_APPLICATION_VERIFICATION: application verification failure	An application specific error. Unused.

B. OpenVPN Server Log Messages

This appendix describes common error or info messages logged by OpenVPN server log that can be used to troubleshoot the connectivity issues between VPN server and client.

VPN Server Log Message(s)	Cause of the issue and recommended actions
2017-05-07T08:33:36.597083+00:00,00000000,597, None,openvpn:N9219:ERR -: Cannot load CA certificate file [[INLINE]] (no entries were read),	Check INLINE CA entry(ies) are not properly embedded into either VPN Server (/etc/openvpn/ovpn-server.conf) or Client configuration files. Following is an example of a correctly embedded INLINE ca entry: <pre><ca> -----BEGIN CERTIFICATE----- MIIDxTCCAq2gAwIBAgIBATANBgkqhkiG9w0BAQ UFADB8MQswCQYDVQQGEwJDQTEL ... PG0MFqakCdoorEfVtsI73wSd5z+76fiOUcQF+JsXP BgYO2IY7TcCSNAf592tZC1w y22boL1ndWIC -----END CERTIFICATE----- </ca></pre> Following is an example of an invalid (empty) entry: <pre><ca> </ca></pre> If an invalid or empty INLINE CA entry exists, contact GE Vernova Grid Solutions Technical Support for further assistance.
2017-05-07T08:41:25.710242+00:00,00000000,710, None,openvpn:N13694:ERR -: Insufficient key material or header text not found in file '[[INLINE]]' (0/128/256 bytes found/min/max),	Check INLINE <tls-auth> key is not properly embedded into either VPN Server (/etc/openvpn/ovpn-server.conf) or Client configuration files. Following is an example of correctly embedded INLINE <tls-auth> key entry. <pre><tls-auth> # # 2048 bit OpenVPN static key # -----BEGIN OpenVPN Static key V1----- ddd5343a60c7313f2e0c1e0531533047 f1578505715790cdb02e3548d4353fd0 -----END OpenVPN Static key V1----- </tls-auth></pre> Following is an example of an invalid (empty) entry: <pre><tls-auth> </tls-auth></pre> If an invalid or empty <tls-auth> key exists, contact GE Vernova Grid Solutions Technical Support for further assistance.

VPN Server Log Message(s)	Cause of the issue and recommended actions
2017-05-07T08:55:45.750417+00:00,00000000,750, None,openvpn:N20901:ERR -: Cannot load CA certificate file [[INLINE]] (no entries were read),	Check if INLINE CA entry(ies) embedded in the VPN Server (/etc/openvpn/ovpn-server.conf) and Client configuration files are the same. If not, try exporting the Client configuration again from the MCP Utilities tab under Settings option.
2017-05-07T09:01:11.621226+00:00,00000000,621, None,openvpn:N24633:ERR -: INLINE tls-auth file lacks the requisite 2 keys,	Check INLINE <tls-auth> key embedded in the VPN Server (/etc/openvpn/ovpn-server.conf) or Client configuration files are same. If different, try exporting the Client configuration again from the MCP Utilities tab under Settings option.
2017-05-07T01:21:23.203099+00:00,00000000,203, None,openvpn:N15234:NOTICE -: 172.12.233.68:63308 TLS: Initial packet from [AF_INET]172.12.233.68:63308, sid=2ee6fb0d a06dc8a0,	Check if the client certificate is revoked. In this case you would need to create a new client certificate with the same common name. (Or) Check if the Client (.p12) certificate is not properly created (e.g., different CA than used by MCP Server certificate, mismatched common name etc..) or not properly installed in the client. Generate a new client certificate with the same common name and then install in the client.
2017-05-07T09:07:07.298309+00:00,00000000,298, None,openvpn:N28913:NOTICE -: 172.12.233.68:57360 SENT CONTROL [MyClient]: 'AUTH_FAILED' (status=1),	Check the Client is Disabled in configuration for openvpn server in MCP. If so, enable the Client. (Or) Check the common name of Client certificate is the same as the client name in the configuration for the OpenVPN server in the MCP. If not, correct the Client name in the OpenVPN server configuration.

C. VPN Client from Ubuntu PC

To integrate the OpenVPN client running in Ubuntu 16.04LTS with the MCP:

1. Setup your CA – see section 2.1.2 .
2. Generate Diffie Hellman (DH) parameters; see Chapter 2.
3. Generate private keys and certificates for your MCP; see section 3.1.1 .
4. Generate client certificate + private key in. pem format for OpenVPN client that runs in Ubuntu 16.04LTS PC.
5. Install the CA's Certificate on your MCP; see section 4.1.
6. Install the private keys, certificates and optional Diffie Hellman parameters on your MCP; see section 4.1.
7. Copy the .pem client certificate + private key into “/etc/openvpn/” folder or any other location to which openvpn client can have administrator privileges.
8. Using the “Export VPN Client File” option in Utilities tab under Settings option page, export the OpenVPN client configuration (*. ovpn) into a desired location; see section 5.3.
9. Securely copy the OpenVPN client configuration into “/etc/openvpn/” folder or any other location to which openvpn client can have administrator privileges.
10. Open the VPN Client configuration file using “vi” or any other editor and do the below steps.
 - Comment the line starts with “cryptoapicert” with “#” as shown below.
`#cryptoapicert "SUBJ:MyCA_Client1"`
 - And, add the below two lines to the bottom of the file as shown below.
`cert <Patch of MyCA_Client1.pem>/MyCA_Client1.pem`
`key <Patch of MyCA_Client1.pem>/MyCA_Client1.pem`
e.g.:
`cert </etc/openvpn/MyCA_Client1.pem`
`key </etc/openvpn/MyCA_Client1.pem`
11. Save the Configuration file and Run the OpenVPN client software from Ubuntu 16.04LTS PC using the below command from the terminal.
`sudo openvpn --config <path of the Client Config File>/ MyCA_Client1.ovpn file.`
For example:
`sudo openvpn --config /etc/openvpn/ MyCA_Client1.ovpn file.`
12. Verify in MCP VPN Server Log that VPN channel is established between OpenVPN Client running in Ubuntu 16.04 LTS and MCP.

D. Application Example – Remote access to Protected Cyber Assets using OpenVPN

In this example, we have a substation, containing **Protected Cyber Assets (PCA)** which are inside an **Electronic Security Perimeter (ESP)**. The MCP is the **Electronic Access Point (EAP)**. The need is for a user to interactively access **PCAs** from a remote computer, via the **EAP**. A VPN tunnel is established between the MCP (G500 in this example) and an OpenVPN client running on a Windows PC. This tunnel allows secure access to the protected **PCAs** (UR Relay in this example) within the Substation **ESP** from remote computers.

Below shows the block diagram of the application example and the IP addresses of the devices. The remote computer #1 and remote computer #2 that run the OpenVPN client and G500's Net2 has IP: 172.20.236.119/16, 172.20.236.120/16 and 172.20.236.125/16 respectively. Those protected devices are connected to G500's Net1 using 172.12.0.0/16 subnet. The G500's Net1 and UR Relay's Port 1 has IP: 172.12.200.85/16 and 172.12.240.137/16 respectively.

To establish a secure channel between the OpenVPN client and the G500:

Step 1: Set up a CA from a Workstation inside the Substation ESP

See section 2.1.2 for the details.

Step 2: Generate Diffie Hellman (DH) parameters

See Chapter 2. for the details.

Step 3: Generate private key and certificate for the G500

See section 3.1.1 for the details.

Step 4: Generate client certificate + private key in .pk12 format for OpenVPN client

See section 3.1.2 for the details.

Step 5: Install the CA's Certificate on the G500

See section 4.1 for the details.

Step 6: Install the private keys, certificates and Diffie Hellman parameters on the G500

See section 4.1 for the details.

Step 7: Install .pk12 client certificate + private key into Remote PC#1 and PC#2

See section 4.2 and 4.3 for the details.

Step 8: Add an OpenVPN Server connection and configure the parameters

1. From the Workstation, open **DSAS** and connect to the G500 device through **Online Editor**.
2. On Connections page, add a new network connection - **VPN Server**
3. Keep all the configuration parameters of VPN Server as default but increase number of concurrent connections from “1” to “2” and **Save** changes.

Note: The **VPN Server** connection can also be added through **Offline Editor** with “Sync to” afterwards, however the next steps will require **Online Editor**.

4. Navigate to **Access** tab then **VPN Client List** subtab and add two new client lists.
5. Name the first client as *MyClient1*, which will be exported and used by remote PC#1 then configure the Routing List and the White List as follows:

Name	Enabled	Routing List And White List
MyClient1	☒	Configure

Edit the Routing List

1

Add

Delete

Routing List
172.12.0.0/16

Edit the White List

1

Add

Delete

IP Address	Port	Protocol
172.12.240.137	502	TCP
172.12.240.137	102	TCP
172.12.240.137	22	TCP

Save

Cancel

The above White List allows the protected device - UR Relay to be accessed from the OpenVPN client#1 (remote PC#1) via **Modbus/TCP (Port 502)**, **MMS (Port 102)**, **SSH (Port 22)** but no **ICMP** protocol.

6. Name the second client as *MyClient2*, which will be exported to and used by remote PC#2 then configure the Routing List and the White List as follows:

The screenshot shows the 'VPN Client List' tab in a software interface. At the top, there are several tabs: 'Connections', 'Client Maps', 'Server Map', 'System Point Manager', and 'Alarm'. Below these are sub-tabs: 'Calculator', 'Data Logger', 'Load Shed', 'Systemwide', 'ARRM', 'AI Text Enumeration', 'Online Designer', 'Access', and 'Utilities'. A 'Save' button is visible. Below the sub-tabs are icons for 'User Management', 'Authentication', 'Automatic Login', and 'VPN Client List'. The main area is titled 'Add/Remove Client Settings' with a note: 'Note: The Client Name must match the Common Name of the client certificate'. There are 'Add' and 'Delete' buttons. A table lists two clients:

Name	Enabled	Routing List And White List
MyClient1	☒	Configure
MyClient2	☒	Configure

The screenshot shows the 'Edit Routing List and White List' dialog box. It has two main sections: 'Edit the Routing List' and 'Edit the White List'. The 'Edit the Routing List' section has a text input field with '172.12.0.0/16' and 'Add' and 'Delete' buttons. The 'Edit the White List' section has a table with columns 'IP Address', 'Port', and 'Protocol'. The table contains one row: '172.12.240.137', an empty port field, and 'Any_ICMP'. There are 'Add', 'Delete', 'Print', and 'Import' buttons. At the bottom right are 'Save' and 'Cancel' buttons.

The above White List allows the protected device - UR Relay to be accessed from the OpenVPN client#2 (remote PC#2) only by **ICMP** protocol.

7. Perform **Save and Commit** changes.

Step 9: Export the OpenVPN client configuration

1. Navigate to **Utilities** tab and **Export VPN Client File** with *MyClient1* name and select *Net2: 172.20.236.125* as **Local Gateway IP Address**.

2. Give the password as *Test@123* for example while exporting the VPN Client File and save it locally and then copy to the remote PC#1's desktop.
3. Repeat the above steps to export VPN client file with *MyClient2* name and select *Net2: 172.20.236.125* as **Local Gateway IP Address**. And save it locally and then copy to the remote PC#2's desktop.

Step 10: Extract the OpenVPN Client File and copy to OpenVPN configuration folder

1. On remote PC#1, Extract the exported VPN Client File *MyClient1* and securely copy the OpenVPN client configuration to location *C:\Program Files\OpenVPN\config*.
2. Similarly on remote PC#2, Extract the exported VPN Client File *MyClient2* and securely copy the OpenVPN client configuration to location *C:\Program Files\OpenVPN\config*.

Step 11: Run the OpenVPN GUI Utility

1. Run the OpenVPN GUI Utility on both remote PCs and observe the utility starts running and a small icon appears on the task bar.
2. Right click on the icon and click **Connect**.
3. Observe the status and logs. Below figure shows the look and feel on remote PC#1. It will appear the same on the remote PC#2 but with *MyCleint2* as the client file.

Step 12: Add a static route on the protected device - UR Relay

The static route is specified as follows:

- **Route Destination:** The Network IP Address of the G500's VPN Server Configuration, which is 10.200.0.0
- **Route Netmask:** The network mask of the Network IP Address of the G500's VPN Server Configuration, which is 255.255.255.0
- **Route Gateway:** The IP address of the G500 interface that is reachable by the destination device, which is 172.12.200.85

VIEW ALL mode			
SETTING	PARAMETER		
Default Gateway	10.12.35.243		
PARAMETER	Static Network Route 1	Static Network Route 2	Static Net
Destination	10.200.0.0	127.0.0.1	127.0
Netmask	255.255.255.0	255.0.0.0	255.0
Gateway	172.12.200.85	127.0.0.1	127.0

UR.urs | Product Setup: Communications

Step 13: Test access to the protected device – UR Relay through the OpenVPN server.

1. From OpenVPN client#1 (remote PC#1)

- Run EnerVista UR Setup

Expected Result: Can access to the UR Relay with success.

Actual Result: Worked as expected.

- Ping Test

Expected Result: Unable to ping the UR Relay.

Actual Result: Worked as expected.

[illegible]

2. From OpenVPN client#2 (remote PC#2)

- Run EnerVista UR Setup

Expected Result: Access to the UR Relay is denied.

Actual Result: Worked as expected.

- Ping Test

Expected Result: Positive ping response is received.

Actual Result: Worked as expected.

E. List of Acronyms

Table 9 List of Acronyms

Abbreviation	Description
CA	Certification Authority
CN	Common Name
CRL	Certificate Revocation List
DCA	Data Collection Application
DHE	Diffie Hellman Ephemeral
DSAS	Digital Substation Agile Studio
DPA	Data Presentation Application
DTA	Data Translation Application
EAP	Electronic Access Point
ESP	Electronic Security Perimeter
FQDN	Full Qualify Distinguished Name
HMAC	Hash-based Message Authentication Code
HMI	Human Machine Interface
IED	Intelligent Electronic Device
JVM	Java Virtual Machine
LAN	Local Area Network
NSSM	Non-Sucking Service Manager
OU	Organizational Unit
PCA	Protected Cyber Assets
PEM	Privacy Enhanced Mail
PKCS	Public Key Cryptography
PKI	Public Key Infrastructure
PRF	Protective Relay Fault
RTDB	Real Time Data Base
RTU	Remote Terminal Unit
SDD	Software Design Document
SOE	Sequence of Event
SPT	Secure Pass-Through
SSDD	Software Subsystem Design Document
SSH	Secure Shell
TLS	Transport Layer Security
VPN	Virtual Private Network
WAN	Wide Area Network
XCA	X Certificate and Key Management

10. Modification Record

Version	Revision	Date	Change Description
1.00	0	26 th March, 2019	Document Created.
2.00	0	23 rd April, 2021	Updated for MCP family.
	1	26 th April, 2021	Updated Technical Support Contacts.
	2	29 th July 2021	Updated VPN Client Configuration, clarified DN requirements and updated notes about certificate error messages.
	3	18 th July, 2023	Updated content in Copyright and Trademark section. Added a new section Appendix D: Application Example – Remote access to Protected Cyber Assets using OpenVPN.
	4	15 th May, 2025	GE Vernova Logo is added on the first page. Updated Company name, Copyright Notice and Trademark Notice. Updated GE Vernova email addresses and phone numbers in Contact Technical Support section.
	5	13 th June, 2025	Updated to GE Vernova styles.
5.40	0	02 nd February, 2026	Updated the list of supported OpenVPN authentication algorithms in Table 5: VPN Server Configuration Parameters.

About this Document

Purpose

This document describes how to setup an enterprise server on a Windows-based computer to synchronize files from MCP device(s) that use the Sync Manager application (RSYNC/SSH protocol). This document outlines and details the procedures regarding:

- Installation and setup of CopSSH and cwRsyncServer tools on the computer. These are 3rd party software applications that have been tested with the MCP Sync Manager.
- Configuration of MCP Sync Manager Application to synchronize files to the enterprise server. The example is for ARRM files, but other user related files / folders may be synchronized too (e.g. Logs).

Once the data is present in the Windows Enterprise computer, the sharing of folders and files from this computer to Enterprise users is outside of scope of this document and can be achieved using any IT / Windows standard sharing methods.

NOTICE

This document applies to the MCP family (G100/G500) unless otherwise indicated.

Screen captures may show G500 in some areas, however the workflow applies to products in the MCP family (G100/G500).

Depending on the versions of the CopSSH and cwRsyncServer 3rd party tools – the exact presented workflow and dialogues may change according to changes made by the supplier. The 3rd party supplier may support newer versions of Windows Operating System. Workflow remains similar, screen captures may look different.

Intended Audience

This document serves as a reference for systems integrators who wish to setup enterprise server on Windows-based computer to synchronize files from MCP Sync Manager device(s).

Additional Documentation

For further information about the Enterprise File Synchronization from MCP Sync Manager, refer to the following documents:

- MCP Substation Gateway Software Configuration Guide (SWM0101)
- MCP Substation Gateway HMI Online Help

Product Support

If you need help with any aspect of your GE Vernova Grid Solutions product, you can:

- Access the GE Vernova Grid Solutions Web site
- Search the GE Vernova Grid Solutions Technical Support library
- Contact Technical Support

1. Overview

1.1 MCP Sync Manager

The Sync Manager is a MCP application that can be used to copy files securely and automatically from a location on your MCP device to a specified directory on a remote device. The application monitors the specified local directory for changed or added files. To reduce bandwidth demands on your network, only files found to have been changed or created since the last synchronization will be transferred. This utility employs the *rsync* protocol to perform this function, secured by an SSH layer.

Multiple file sets can be configured for synchronization in the MCP, to send data to one or multiple target remote devices, using one or multiple user authentications.

1.2 Copssh software

Copssh is a 3rd party Windows-based software that enables SSH server on Windows-based computer.

1.3 cwRsyncServer software

cwRsyncServer is a 3rd party Windows-based software that enables rsync utility on Windows-based computer.

1.4 Installation Steps

1. Install cwRsyncServer and Copssh softwares on Windows-based computer acting as Enterprise Server (Refer chapter 2. Installation of copssh and cwRsyncServer)
2. Configure MCP Sync Manager Application (Refer to chapter 3. Configuring MCP Sync Manager)
3. Setup public key authentication between MCP (client) and enterprise server (Refer to chapter 4. Setting up Public Key Authentication).

2. Installation of copssh and cwRsyncServer

This chapter describes how to install Copssh and cwRsyncServer software on Windows-based Enterprise Server.

2.1 Software

- Obtain the commercial version of cwRsyncServer software from: <https://www.itefix.net/cwrsync>

Note: obtain the server version of cwRsync, i.e., cwRsyncServer.

- Obtain the commercial version of Copssh software from: <https://www.itefix.net/copssh>

Note: GE Vernova Grid Solutions / Grid Automation has no commercial / reseller agreements in place with ITeFix

2.2 Installation

cwRsyncServer software must be installed before Copssh.

Note: Before starting the installation, ensure that any previous installation of cwRsyncServer and Copssh is completely uninstalled.

Follow [Appendix A](#) to completely uninstall cwRsyncServer and Copssh before proceeding with below steps.

2.2.1 cwRsyncServer

1. Start installation of cwRsyncServer by running its setup program. Follow the steps below to complete the installation.

Note: The cwRsyncServer setup program must be run as administrator by Right click on the program and selecting “Run as administrator” (Windows 7).

2. cwRsyncServer Setup dialog appears. Click “Next”.

3. Click “I Agree” on the “License Agreement” window.

- On the “Choose Install Location” window, click “Next” to select the default location.

Note: Ensure that destination folder is “C:\Program Files\ICW” on a 32-bit operating system or “C:\Program Files (x86)\ICW” on a 64-bit operating system. If not, manually update the installation location.

- On the “Service Account” window, click “Install” to select default service account name and password.

6. On the “Installation Complete” window, click “Close” to complete the installation.

2.2.2 Copssh

1. Start installation of Copssh by running its setup program. Follow the steps below to complete the installation.

Note: The Copssh setup program must be run as administrator by Right click on the program, and selecting “Run as administrator”.

2. On the “Copssh Setup” window, select “Next”.

- Click “I Agree” on the “License Agreement” window.

- On the “Choose Install Location” window, click “Next” to select the default location.

Note: Ensure that destination folder is “**C:\Program Files\ICW**” on a 32-bit operating system or “**C:\Program Files (x86)\ICW**” on a 64-bit operating system. If not, manually update the installation location to match the installation location of the cwRsyncServer installation folder.

5. On the “Service Account” window, click “Install” to select default service account name and password.

6. Since cwRsyncServer is already installed, installer will warn that ICW Base is already installed, and upgrade/repair will be performed. Click “OK”.

- At the end of installation, Setup program will notify to activate user(s) that are allowed to use OpenSSH server. Click “OK” to complete the installation.

- On the “Installation Complete” window, click “Close” to complete the installation.

9. Open Services Microsoft Management Console (MMC), from Control Panel → Administrative Tools → Services.
10. Double click on “Openssh SSHD” service to open its properties.

Ensure that its Startup type is set to “Automatic”, and service is already in Started state.

2.2.3 Create Users in Windows computer

1. The users intended to be configured in MCP Sync Manager sync sets must exist in the Windows computer.
2. Use the Windows Control Panel / User management interface to add all users as needed. They should be “user” class, with password set to “user cannot change” and “no expire”. The password used here will not be used for MCP Sync Manager actions (Windows account only). These users have no need to login into the Windows computer account, and these credentials should be used only for establishing sessions between the MCP and the Enterprise server.

2.2.4 Activate Users

A Windows computer existing user must be activated before it can use OpenSSH service. This user will be used to sync files on this Windows-based computer from the MCP Rsync Manager. The user name must match the one configured in the MCP Sync Manager (each sync set has an option for a user name, they can be either common or distinct).

Depending on the software version, the dialog to activate users may be different.

2.2.4.1 Method 1

1. Start “Copssh Control Panel” from Start Menu → All Programs → Copssh → Copssh Control Panel → Go to User tab.

Note: The “Copssh Control Panel” program must be run as administrator.

2. Click “Add” to activate a user: “Copssh User Activation” wizard opens.

3. Click “Forward”: User selection interface opens. A local or domain user can be utilized on Windows-based computer for Copssh access.

Local User: Select a local user from the “User” drop down list.

Activate a user for Copssh access

Select a user

Domain: es-d3bz7bs

User: geenergy
domain_user

Last Back Forward Cancel

Domain User: Enter domain name and user name in respective fields.

Activate a user for Copssh access

Select a user

Domain: domain_name

User: domain_user

Back Forward Cancel

- Click “Forward”: Select options interface opens.

- Ensure that “Home directory” is set to “C:\Users\

Note: This is typical home directory on Windows 7 computer.

- Deselect “Allow TCP forwarding” option.
- Click “Forward”: Confirm activation interface appears.

- Verify details and click “Apply” to activate user.

2.2.4.2 Method 2

1. Use the direct entry under Start Menu → All Programs → Copssh → Activate User.
2. Select the user name from the drop down list, and the other options as in the following figure.
3. Ensure you don't select the option to create keys; these will be created by the MCP.
4. Click on Next.

A confirmation dialog will be presented, click on OK.

3. Configuring MCP Sync Manager

You can configure the settings of the MCP Sync Manager through the **Sync Manager** menu under MCP Config Tool (mcpcfg). MCP applications must be restarted after changes to the configuration of Sync Manager.

3.1 Enable Sync Manager

Enable Sync Manager Application using option “Enable Sync Manager” under “Configure Sync Manager” menu, in the MCP Config Tool (mcpcfg). When Sync Manager is enabled, a private/public key pair is generated.

Note: Files from the MCP are securely copied to the remote device over an SSH connection. To facilitate authentication on this link, a private/public key pair are used.

When a key set is generated, the files are stored in the MCP under **/mnt/datalog/SSHKeys/SyncMgr/**. You should copy the public key file (*id_rsa.pub*) from this location and store it in the appropriate location on the remote device. Refer to chapter 4. Setting up Public Key Authentication for details.

3.2 Configure Sync Sets

Up to 8 sync sets can be created at any time. The following settings can be configured for each set:

Table 1 Configure Sync Sets - Settings

Setting	Description	Range
Sync Set ID	A unique number used by the system to identify the sync set. Not editable; automatically assigned.	Auto-incremented from 1. Once a number has been assigned, it is never reused.
Destination IP Address	The IP address of the enterprise server where the files are to be copied.	Valid IPv4 address belonging to the Windows computer server
Destination User Name	The username used for SSH authentication on the enterprise server.	1 to 128 ASCII characters These are user names activated in section 2.2.3 Create Users in Windows computer
Source Path Name	The absolute directory pathname that will be synced to the remote device. Note: ARRM files are kept in /mnt/datalog/armm folder in MCP. You can specify this folder or a device specific sub-folder.	2 to 120 ASCII characters pointing to a valid location on the MCP file system

Setting	Description	Range
Destination Path Name	The absolute directory pathname that the files will be copied to. Note: If destination folder is C:\ARRM\MCP_1\ on enterprise server, specify destination path name as /cygdrive/c/ARRM/MCP_1	2 to 120 ASCII characters pointing to a valid location on the remote device's file system
Check and rsync Interval	The amount of time, in seconds, that the Sync Manager waits before checking the source path for changes. If changed or created files are detected, an rsync operation is triggered. Typical value: 60 seconds	60 to 86400 seconds
Forced rsync Interval	The amount of time, in seconds, that the Sync Manager waits before a forced rsync operation is triggered, regardless of detected changes. This will recreate files that have been deleted from the remote device as well as forcing the transfer of files whose changes may not have been detected due to MD5 collision, an extremely rare occurrence. Typical value: 300 seconds	60 to 86400 seconds

Notes:

- The Sync Manager will only copy files to the remote Windows-based computer. Files are not deleted from the remote system if these are deleted from the MCP after synchronization. If files are deleted from the remote system, it will be recreated during the next sync operation.
- A forced rsync will be performed upon each startup of your MCP device.
- The path equivalence between the Windows computer file system and the MCP destination path name is as following:

Windows file system:

<drive_letter>:\<path1>\<path2>\

MCP Sync Manager destination path:

/cygdrive/<drive_letter>/<path1>/<path2>

(the drive letter must be lower case, and path strings same case as seen in Windows file system)

For e.g.:

Windows path:

C:\ARRM\Sub_01\

Corresponds to the following in MCP Sync Manager:

/cygdrive/c/ARRM/Sub_01

4. Setting up Public Key Authentication

MCP uses public key authentication to authenticate itself to Enterprise Server. When Sync Manager application is enabled in MCP, it creates a public key (**id_rsa.pub**). This public key is required to be transferred to Enterprise Server.

4.1 Update Permissions to SyncMgr Folder

When a key set is generated, the files are stored in `/mnt/data log/SSHKeys/SyncMgr/`.

To copy the key from this folder to the computer, the permissions of this folder need to be updated after the Sync Manager is enabled (this must be performed every time a new set is generated or after MCP restarts or re-logins).

Upon exiting the MCP Config Tool (`mcpcfg`), execute the following command at the MCP prompt:

```
sudo chmod ug+x /mnt/data log/SSHKeys/SyncMgr
```

(if prompted for a password, enter the password associated with the root account).

4.2 Copy key from MCP to the Windows computer

1. On the MCP the Sync Manager's public key **id_rsa.pub** is available in `/mnt/data log/SSHKeys/SyncMgr/` folder.

This key must be transferred to the Windows computer. Depending on the copSSH software version and Windows OS version, the target location of the key file may be different.

2. `<C:\Users\<user name>\.ssh>` folder is present
 - If an `\.ssh\` folder exists in the `C:\Users\<user name>`, the public key shall be transferred to that `\.ssh\` folder on the Enterprise Server.
3. `<C:\Users\<user name>\.ssh>` folder is NOT present
 - If an `\.ssh\` folder does not exist in the `C:\Users\<user name>`, the public key shall be transferred to the installation path of the software, typically:
`"c:\Program Files\ICW\home\<user name>\.ssh"` on a 32-bit operating system or
`"c:\Program Files (x86)\ICW\home\<user name>\.ssh"` on a 64-bit operating system.

- The public key file in the Windows `\.ssh` folder must have the name **authorized_keys**

There can be only one such file per user.

First time a MCP is added to a user, rename the copied `id_rsa.pub` to **authorized_keys**

If configuring multiple MCP units to sync files to an Enterprise Server, using the same user name, the public key content (one text line) from the `id_rsa.pub` of each MCP shall be appended to the already existent **authorized_keys** file on Enterprise Server using a text editor. Each public key is a single line entry in **authorized_keys** file; ensure that it is not broken in multiple lines while copying and pasting.

- Ensure the user permissions are updated as shown in 4.1
- Transfer Sync Manager's public key to Enterprise Server using WinSCP program or USB pen drive.

Note: The WinSCP program must be run as administrator by Right click on the program and selecting "Run as administrator".

- If this is the first MCP-user, rename `id_rsa.pub` to **authorized_keys**

(In the left-side window of WinSCP, right click on file → Rename), or use a text editor to append the new key to an existing file "authorized_keys".

- Repeat this for every user and MCP station.

- Reboot the MCP and the Windows computer.

The system is now ready to operate.

Appendix A. Uninstalling cwRsyncServer and Copssh

This chapter describes how to uninstall cwRsyncServer and Copssh softwares.

1. All active users must be deactivated first. To deactivate a user, use “copSSH User Activation Wizard”. Start “copSSH User Activation Wizard” from Start Menu → All Programs → Copssh → Deactivate Users.
2. Open Services Microsoft Management Console (MMC), from Control Panel → Administrative Tools → Services. Right click on service “Openssh SSHD” and select “Stop” to stop it.
3. Uninstall Copssh software from Start Menu → All Programs → Copssh → Uninstall COPSSH.
4. Uninstall cwRsyncServer software from Start Menu → All Programs → cwRsyncServer → Uninstall cwRsyncServer Server.
5. Delete Copssh service user from Control Panel → User Accounts → Manage User Accounts → Select SvcCOPSSH user → Click “Remove”.
6. Delete cwRsync service user from Control Panel → User Accounts → Manage User Accounts → Select SvcCWRSYNC user → Click “Remove”.

Appendix B. Diagnostics

MCP Diagnostic Logs

- Connect to MCP HMI
- Click on “System Logs” button on the power bar
- Select “Diagnostic Log” tab
- Filter Application field for “B048”
- Export logs to CSV file using “Export data” button
- If rsync command error is reported, check destination IP, user name, destination folder details mentioned in the message.
- If error message “Check destination server connectivity and SSH public key authentication with it” is reported, check:
 - o IP connectivity to Enterprise Server
 - o Correct installation of cwRwyncServer and Copssh softwares
 - o Configuration of SSH keys in Enterprise Server

Copssh Event Log on Enterprise Server

Depending on the copSSH software application version, the following log may not be available.

- Start “Copssh Control Panel” from Start Menu → All Programs → Copssh → Copssh Control Panel → Go to Status tab.
- Check status of Copssh service
- Open “Copssh events” log; check whether access requests from MCP IP are reaching and successful to Enterprise Server.

Appendix C. List of Acronyms

Table 2 List of Acronyms

Abbreviation	Description
SSH	Secure Shell
ARRM	Automatic Record Retrieval Manager
DCA	Data Collection Application
DPA	Data Presentation Application
DTA	Data Translation Application
HMI	Human Machine Interface
IED	Intelligent Electronic Device
RTDB	Real Time Data Base
RTU	Remote Terminal Unit

MODIFICATION RECORD

VERSION	REV.	DATE	CHANGE DESCRIPTION
1.00	0	26 th March, 2019	Document created.
2.00	0	22 nd April, 2021	Updated for MCP family.
	1	26 th April, 2021	Updated Technical Support Contacts.
	2	27 th July, 2021	Added clarification about 3 rd party tools.
	3	15 th May, 2025	GE Vernova Logo is added on the first page. Updated Company name, Copyright Notice and Trademark Notice. Updated GE Vernova email addresses and phone numbers in Contact Technical Support section.
	4	12 th June, 2025	Updated to GE Vernova style.

About this Document

This document describes the **Initial Hardening setup** and **Secure Configuration of the G500**.

Purpose

This document provides guidelines on how to enable and configure the various cyber security features on the G500.

This document applies to G500 v5.20 and subsequent unless superseded by future new document versions.

Please refer to previous versions of this document for previous G500 releases.

Intended Audience

This document is a helpful resource for utility personnel who are responsible for deploying the G500 in a secure manner.

Additional Documentation

For more information, refer to the following documents:

- SWM0101 MCP Software Configuration Guide
- 994-0152 G500 Substation Gateway Instruction Manual
- G500 Substation Gateway, HMI Online Help
- SWM0103 Integration of MCP with OpenVPN Client
- SWM0104 Enterprise File Synchronization of MCP Sync Manager
- SWM0106 G500 Substation Gateway Quick Start Guide
- SWM0109 Secure Integration of SCADA Third Party Equipment with MCP
- SWM0110 Configuring UEFI Settings on G500 User Guide
- SWM0125 Configuring UEFI Settings on G500 with Intel Hardware User Guide

Cyber Security Disclaimer

The MCP family of products are digital devices designed to be installed and operated in industrial and power sub-station environments and connected to secure private networks. The MCP family of products should not be connected to the public internet.

GE Vernova strongly recommend users to protect their digital devices using a defense-in-depth strategy to protect their products, their network, its systems and interfaces against cyber security threats. This includes, but is not limited to, placing digital devices inside the control system network security perimeter, deploy and maintain access controls, monitoring of Intrusion Detection, security awareness training, security policies, network segmentation and firewalls, strong and active password management, data encryption, antivirus and other mitigating applicable technologies.

For additional details and recommendations on how to protect The MCP family of products, please see this Secure Deployment Guide. GE Vernova Grid Solutions may also provide additional instructions and recommendations to users from time to time relating to The MCP family of products and cyber security threats or vulnerabilities.

It is the users' sole responsibility to make sure that The MCP family of products are installed and operated considering its cyber security capabilities, security context, and the instructions and recommendations provided to the user relating to The MCP family of products. Users assume all risks and liability associated with damages or losses incurred in connection with any and all cyber security incidences.

Product Support

If you need help with any aspect of your GE Vernova Grid Solutions product, you can:

- Access the GE Vernova Grid Solutions Web site
- Search the GE Vernova Technical Support library
- Contact Technical Support

Access GE Vernova Grid Solutions Web Site

The GE Vernova Grid Solutions Web site provides fast access to technical information, such as manuals, release notes and knowledge base topics.

Visit us on the Web at: <https://www.gevernova.com/grid-solutions/>

Search GE Vernova Grid Solutions Technical Support Library

This site serves as a document repository for post-sales requests. To get access to the Technical Support Web site, go to:

<https://www.gevernova.com/grid-solutions/events/signup.asp?sid=208>

Contact Technical Support

For help with any aspect of your GE Vernova Grid Solutions product, please contact our support team, 24/7, as follows:

1. Initial Hardening Setup

Upon receiving the G500, do the following:

- Change passwords and/or usernames for all default users
- Create users with restricted access
- Setup firewall
- Make sure the chassis intrusion has the value expected
- Setup SED password
- Disable unused USB ports and access to SSD Drive
- When updating from v1.0 to v1.1, all passwords should be updated
- It is recommended to place the G500 in the Demilitarized Zone (DMZ) of the network
- For the MCP PETC functionality, only the functions listed under **EdgeManager and PETC** section in **SWM0101 MCP Software Configuration Guide** are supported. It is not recommended to enable any other functionalities than the listed ones
- Physically secure the G500 device

1.1 Default Usernames and Passwords

Upon receiving the G500, all default usernames and password must be changed. It's crucial to change all the usernames and passwords for the default users, as most of them have administrator privileges and allow the user to create new administrator users.

It is strongly recommended to periodically change the passwords for all users and follow a password management process for all local accounts.

Here is a list of the default users that must be updated:

- Front serial port, command line interface of local HMI and remote SSH access to the device: defadmin / defadmin
- Front serial port access: root/ geroot
- Predix Edge Technician Console PETC: admin/admin

To know more on default users and passwords, see **SWM0101 MCP Software Configuration Guide** under **Administrators User Management → Default Users** section and in the same document, under **EdgeManager and PETC** section.

If D2x functionality is enabled, the D2x users are managed in the B014 WESMAINT application.

For G500 v4.0, it is strongly advised that no user is configured to use a WESMAINT back serial port as access. By configuring a back serial port as a WESMAINT access port, it will cause a cyber security risk because that user will bypass the MCP administration credentials that otherwise have to be used to access the D2x functionality.

For G500 v4.1 or higher, D2x user passwords are securely hashed and are required to meet the same complexity conditions as MCP user passwords. This reduces the risk of unauthorized access for back serial ports configured as WESMAINT access ports. Therefore, it is no longer advised against allowing a user to be configured to use a back serial port as a WESMAINT access port.

The default user and password for WESMAINT access in a D2x device configuration that must be updated is the following:

admin/ChangeMe1#

If application A098-0 COURIER DCA is enabled in D2x, then requirement IEC 62443-4-2 “no password can be in clear text” can’t be met due to the legacy implementation of this application.

For more information about the D2x users, see **SWM0101 MCP Software Configuration Guide** under **D2x Configuration and Operation → D2x Users and Credentials Management** section.

NOTICE If you want to upgrade the G500 firmware from v1.0 to 1.1 or higher, you need to regenerate all the passwords manually as the password encryption method has been changed to use a SHA512 hash.

1.2 Role Based Access Control

1.2.1 HMI User Roles

To control access to the DSAS Online Configuration, G500 Runtime HMI and G500 Local HMI, the following types of access users can be created:

- Observer** : View only privileges for all runtime screens.
- Operator** : Substation operator privileges to operate controls, force points and perform maintenance tagging.
- Supervisor** : Full privileges to access and modify all non-security configuration settings and some security configuration settings, runtime, operation, and system administration screens. This user can add new HMI users.
- Administrator** : Supervisor-level access to all configuration, runtime, operation, and system screens in the G500 Online/Runtime HMI. In addition, administrator-level users have access to run commands at the G500 command line interface.

Table 1.1 indicates the system privileges for each access level.

Table 1.1: User Level Permissions

HMI Function	Administrator	Supervisor	Operator	Observer
Access built-in TELNET/SSH client	Yes	Yes	Yes	No
Acknowledge Alarms	Yes	Yes	Yes	No
Enable/Disable Device	Yes	Yes	Yes	No
Add/Delete Operator Notes	Yes	Yes	Yes	No
Execute Digital/Analog Controls	Yes	Yes	Yes	No
Place/Remove Alarm Inhibit	Yes	Yes	Yes	No
Place/Remove Control Inhibit	Yes	Yes	Yes	No
Place/Remove Local force	Yes	Yes	Yes	No
Place/Remove Scan Inhibit	Yes	Yes	Yes	No
Place/Remove Tags	Yes	Yes	Yes	No
Enable/Disable Unsolicited Responses	Yes	Yes	Yes	No
View Alarms	Yes	Yes	Yes	Yes
View Events	Yes	Yes	Yes	Yes
View I/O Traffic	Yes	Yes	Yes	Yes
View Logs (Except OpenVPN Log)	Yes	Yes	Yes	Yes
View Operator Notes	Yes	Yes	Yes	Yes
View One-Line Diagrams	Yes	Yes	Yes	Yes
View Point Summary & Detail Pages	Yes	Yes	Yes	Yes
View Communication Statistics	Yes	Yes	Yes	Yes
View OpenVPN Log	Yes	No	No	No
View System Status	Yes	Yes	Yes	Yes
Edit/View Gateway Configuration	Yes	Yes	No	No
Edit/View HMI User Configuration	Yes	Yes	No	No
Edit/View Admin User Configuration	Yes	No	No	No
Sync To/Sync From	Yes	Yes	No	No
Commit/Discard Changes in Online Config	Yes	Yes	No	No
Save Configuration	Yes	Yes	No	No
Mount USB Device	Yes	Yes	Yes	No
Edit/View Authentication Mode Configuration	Yes	No	No	No
Extract/View SOE/Alarms/PRF/Datalogger Records	Yes	Yes	Yes	Yes
ARRM: Trigger FileSet Retrieval	Yes	Yes	Yes	No
ARRM: Clear Recording on IED	Yes	Yes	No	No
ARRM: Enable Auto Retrieval	Yes	Yes	No	No
ARRM: Enable Connection Polling	Yes	Yes	No	No
ARRM: View ARRM Log	Yes	Yes	Yes	Yes
View/Update/Import PKI Information	Yes	Yes	No	No
Generate SSH Key Pair for Rsync	Yes	Yes	No	No
Export VPN Client Configuration	Yes	Yes	No	No
Pair and Rotate Modbus/SSH Keys	Yes	Yes	No	No
Deploy HTTPS certificate and private key	Yes	Yes	No	No
Terminal Server/ Passthrough (Telnet)	Yes	Yes	Yes*	No

HMI Function	Administrator	Supervisor	Operator	Observer
Terminal Server/ Passthrough (SSH)	Yes	No	No	No
Terminal Server/ Passthrough (TLS/SSL)	Yes	Yes	Yes*	No

*When minimum privilege level is set to “Operator” in “Application Parameters” list in Terminal Server.

To learn how to add a new Supervisor, Operator and Observer users, see **SWM0101 MCP Software Configuration Guide** under **User Management** section.

1.2.2 Other User Roles

SSHPassThrough : The privilege level SSHPassThrough is not available to access the G500 HMI. Users configured under this privilege level or role are only allowed access for Pass-through and Terminal Server.

Rdtunnel : The privilege level Rdtunnel is not available to access the G500 HMI directly. Users configured under this privilege level or role are only allowed to setup a remote desktop tunnel with the G500. To know more on how to configure Rdtunnel role, see **SWM0101 MCP Software Configuration Guide** under **Remote Desktop (RD) Access** section.

NOTICE If you want to upgrade the G500 firmware from v1.0 to 1.1 or higher, you need to regenerate all the passwords manually as the password encryption method has been changed to use a SHA512 hash.

1.2.3 DSAS Offline User Roles

The G500 only allows users of administrator or supervisor role to send configurations created offline, using DSAS, to a G500.

It is strongly recommended that only users authorized as administrator or supervisor on the G500 should be permitted to use DSAS in a production environment. This means the customer should have controls in place to enforce user authentication and authorization on the engineering workstation on which DSAS is installed.

1.3 Firewall

G500 contains a firewall capable of stateful packet inspection to protect the device from unauthorized access. By default, the network interfaces on the G500 will drop packets that are determined to be invalidly routed or unsolicited.

Note that the G500 firewall is intended only to protect itself and does not extend protection to other devices on the network. As such, it does not replace the need for a network firewall which offers deep packet inspection and detailed configuration capabilities.

You can configure the settings of the firewall through the **Firewall** menu. The Secure Access settings are described in the Network interfaces that can operate in one of two modes:

- Internal** : The Internal mode permits traffic from known protocols and should only be enabled on interfaces connected to known devices only. The Internal mode is the default mode for Net 0 and Net1 and would typically be used when the interface is connected to the substation LAN.
- External** : The External mode offers a stricter set of rules and is the default mode for all interfaces except Net 0 and Net 1. The External mode would typically be used when the interface is connected to a WAN.

By default, the firewall allows outbound traffic on internal interfaces and blocks all outbound traffic except outbound SSH on external interfaces. If you want the firewall to allow outbound traffic for a protocol on an external interface, you must create a “custom” rule.

By default, the firewall blocks inbound traffic on both internal and external interfaces. The G500 automatically generates rules allowing inbound traffic on internal interfaces for all configured services. If you want the firewall to allow inbound traffic on an external interface, you may modify the associated “generated” rule to allow the traffic on ALL interfaces rather than only the “Internal” interface.

The default firewall rules should be enough for most users. However, the user may create a set of custom rules if desired, with more granular permissions for the protocols to be accessed.

Additional notes on the G500 firewall:

- In a redundant setup, the same firewall rules mentioned above are applied to both the active and standby devices.
- When the firewall is active, you cannot perform IP routing between an external and internal interface. The only way to pass through the firewall is by using a secure TLS connection or the proxy.

To change the interface zones (internal/external), go to each interface setup and you have the option to change it there.

The G500 firewall is configured by default to its most secure setting. The user assumes all responsibility for associated security risks if the firewall configuration is manually changed.

It is the user's responsibility to connect Internal zone interfaces to networks that are protected from any unauthorized use.

Also, if the firewall is disabled then all the ports that are internal to the G500 will be visible/available to the external scanner tools.

Table 1.2: Service Traffic through the Firewall

Service Name	Notes	External Mode	Internal Mode
Modbus/TCP Server (Inbound)		Deny	Allow
DNP/UDP Server (Inbound)		Deny	Allow
DNP/TCP Server (Inbound)		Deny	Allow
DNP/TCP Client (Inbound)	Dual Endpoint Enabled	Deny	Allow

Settings GUI (Inbound)		Deny	Allow
Emergency SSH Server (Inbound)		Deny	Allow
Emergency SSH Server (Outbound)		Allow	Allow
LDAP Client (Outbound)		Allow	Deny
Modbus/TCP Server (Inbound)		Deny	Allow
DNP/UDP Server (Inbound)		Deny	Allow
DNP/TCP Server (Inbound)		Deny	Allow

Service Name	Notes	External Mode	Internal Mode
IEC 61850 Server (Inbound)		Deny	Allow
Note: By default, HTTPS and SSH do not provide strong client authentication since only a password is required to access the system. Therefore, these protocols are not considered secure enough for use over external interfaces. They can be considered secure if you employ a remote authentication server that provides two-factor authentication. In that case, you may opt to modify the firewall rule and allow HTTPS and SSH on external interfaces.			

Additional notes on the G500 firewall:

- In a redundant setup, the same firewall rules mentioned above are applied to both the active and standby devices.
- When the firewall is active, you cannot perform IP routing between an external and internal interface. The only way to pass through the firewall is by using a secure TLS connection or the proxy.
- To configure the firewall and interface zones, see **SWM0101 MCP Software Configuration Guide** under **Configure System Security → Firewall Settings** section.

1.4 Chassis Intrusion

The G500 can detect hardware tampering, it generates an alarm every time the chassis has been opened. The chassis intrusion event can be detected at least 10 days while the device is powered off. Once the event is detected, it is stored indefinitely. The chassis intrusion status can be found in the SOE logs and the HAMA Digital Inputs and Analog Outputs. The chassis intrusion state can be cleared via `mcpcfg` or Settings GUI under “Clear Chassis Intrusion State”.

To know more, see **SWM0101 MCP Software Configuration Guide** under **Clear Chassis Intrusion State via mcpcfg** section and **Clear Chassis Intrusion State via Settings GUI** section.

1.5 Default SED Password

The SED user password is set by default and it is strongly advised to change this password upon receiving the G500. If the SED password is set, the SED cannot be used with any other devices except a G500 and only if the SED password is known. The SED user password can be changed in the UEFI settings.

The UEFI settings can be accessed and modified if a physical presence button is pressed.

To change the SED user default password:

1. Press the physical presence button on the front of the G500 until the Temperature and the CPU Status LEDs are flashing.
2. Reboot the G500. While rebooting keep pressing “Delete” on the connected keyboard to enter the UEFI settings.

- Go to **Security** tab, under **HDD Security Configuration**, choose the SED card you want to change the password for. Here, the administrator password can also be setup, which is also recommended.

Figure 1 - UEFI Security Settings

- Choose the **Set User Password** and enter the default password: **u123@MCPGE** when prompted. Note that the master password is not used.

G500 Units manufactured before 2025 were shipped with the default SSD user password applied in the UEFI.

G500 Units manufactured starting in 2025 have no default SSD password applied.

Figure 2 - SED User Password Setting

5. Choose a new password, press **F4** to save and exit.

NOTE: Using the same menus above, it is recommended to setup the administrator password. See **Step 3** above.

1.6 Disable Unused USB Ports and the Use of SSD Drives

All USB ports and access to SSD Drives are enabled by default. It is recommended to disable any physical ports that are not used.

To disable USB ports and access to SD-card, see **SWM0110 or SWM0125 Configuring UEFI Settings on Multifunction Control Platform's User Guide** under **How to Enable/Disable USB port(s)** section and **How to Enable/Disable the use of SD Card** section.

1.7 Physically Secure the G500 Device

It is strongly recommended that the G500 device is physically secured (e.g. inside a locked cabinet) to protect the IRIG-B ports, serial ports, internal-zone LAN ports, SD card, and USB ports that are in use or cannot be disabled.

2. Secure Configuration of the G500

2.1 Pass-through Secure Connectivity

A secure LAN connection can be established through the G500 to connect to a serial server device in the substation. The G500 support different types of secure pass-through connectivity options, available for the following G500 applications:

- IEC 60870-5-103 Multidrop
- Modbus RTU Multidrop
- Generic ASCII
- SEL DCA
- Terminal Server

By default, a username and a password are required to establish the pass-through connection. However, the user can disable this pass-through user authentication in the Settings GUI or the mcpcfg under Configure Authentication/ Pass-Through Authentication or when setting up the terminal server connection. It is strongly recommended to keep the pass-through authentication enabled, unless the TLS connection type is used, see below Table 2.1.

The SSHPassThrough user is created in the HMI under Settings/ Access/ User Management. Admin and root users are created in the Settings GUI or mcpcfg under Configure Authentication. Depending on the pass-through connection type configured, different users have different rules. The following table shows the different type of users and their authentication rules.

Table 2.1: Pass-through User Authentication Rules

Service	User Type						Additional Security Notes
	Admin User Types		HMI User Types			SSHPa-ss Throu-gh	
	root	Administr-ator	Supervi-sor	Operat-or	Observ-er		
Pass-through Connection (Telnet & TLS)	Not Allowed	Allowed	Allowed	Not Allowed	Not Allowed	Not Allowed	Pass-through for remote TCP clients is enabled using Pass Through Access in Security parameters under Configuration > Systemwide and select Secure Type under Configuration > Connection to Telnet or TLS . Pass-through is allowed without Login/Password if its Pass-through Authentication is disabled in G500 Config Tool (mcpcfg) > Configure Authentication .

Service	User Type						Additional Security Notes
	Admin User Types		HMI User Types			SSHPa-ss Throu-gh	
	root	Administr-ator	Supervi-sor	Operat-or	Observ-er		
Terminal Server Connecti-on (Telnet & TLS)	Not Allowed	Allowed	Allowed	Allowed	Not Allowed	Not Allowed	Terminal Server is allowed without Login/Password, if its application parameter Password Authentication is set to No. Terminal Server for remote TCP clients is enabled by selecting "Secure Type" under Configuration > Connection to Telnet or TLS . Terminal Server application parameter Minimum Privilege Level specifies if Operator user is allowed or not.
Pass-through Connecti-on (SSH Secure Tunnel)	Not Allowed	Allowed	Not Allowed	Not Allowed	Not Allowed	Allowed	Pass-through for remote SSH clients is enabled using Pass Through Access in Security parameters under Configuration > Systemwide and select Secure Type under Configuration > Connection to SSH Secure Tunnel . Pass-through for SSH Secure Tunnel is always allowed with Login/Password,
Terminal Server Connecti-on (SSH Secure Tunnel)	Not Allowed	Allowed	Not Allowed	Not Allowed	Not Allowed	Allowed	Terminal Server for remote TCP clients is enabled by selecting Secure Type under Configuration > Connection to SSH Secure Tunnel. Terminal Server for SSH Secure Tunnel is always allowed with Login/Password. The parameter Minimum Privilege Level for SSH Secure Tunnel is always SSHPassThrough only.

To know more on how to configure the pass-through connections, see **SWM0101 MCP Software Configuration Guide** under **Miscellaneous Utilities → Pass-Through Connections** section.

The user can use third party software to securely access terminal server or pass-through connection.

To know more on how to configure a secure connection with **Tactical Software Serial IP**, see **SWM0109 Secure Integration of SCADA Third Party Equipment with MCP** under **Configuring a Secure Connection with Tactical Software Serial IP** section.

For each client application the secure pass-through is configured using the G500 configuration tool, under Connection tab/ Secure Type. The following options are available:

2.1.1.1 SSH Security Tunnel

The G500 supports SSH tunnel connection for pass-through and terminal server connectivity, which allows an SSH client tool (e.g. Secure Terminal Emulator) to communicate to a device in the substation connected to a serial port of the G500. The SSH port opened for listening is calculated as: “base port number 8000” + “SPn” where SPn is the serial port number of the G500 serial port connected to the device in the substation. For example, if the device is connected to G500 serial port 1, the pass-through connection port is 8001.

To know more on how to configure this type of pass-through connection, see **SWM0101 MCP Software Configuration Guide** under **Miscellaneous Utilities → Pass-Through Connection → SSH Secure Tunnel Pass-Through Connections** section.

2.1.1.2 SSL/TLS

The G500 supports Transport Layer Security (TLS) cryptographic protocol versions 1.0, 1.1, and 1.2. It is recommended to choose version 1.2, which is set by default, as it has the latest and strongest ciphers. To use the SSL/TLS option, you need to setup certificate-based mutual authentication.

To know more on how to setup the certificates, see **SWM0109 Secure Integration of SCADA Third Party Equipment with MCP**.

2.1.1.3 Telnet

The G500 supports pass-through and terminal server access to the devices from PC-based configuration tools and, if necessary, COM port redirection software. These connections are accessible through a TCP port on the G500.

It is not recommended to use telnet pass-through and terminal server as it's less secure than SSH Secure Channel and TLS options.

NOTICE The following services are considered unsecure:

- IEC 60870-5-103 Multi-drop (Passthrough-Telnet)
- Modbus Multi-drop (Passthrough-Telnet)
- Generic ASCII (Passthrough-Telnet)
- SEL Binary with G500 as Master (Passthrough-Telnet)
- Terminal Server

It is strongly recommended to employ TLS tunnels or SSH Secure Tunnels to protect these services.

2.1.1.4 Disabled

The default pass-through and terminal server secure type is Disabled.

2.2 Secure Substation LAN Access

The user can setup a secure channel between a client device and the G500 for accessing a protected service in the substation. The secure channel is implemented using a TLS (Transport Layer Security) connection and certificate-based mutual authentication. A client device could be a PC with Tactical Software Serial/IP or Stunnel, SCADA master that supports TLS and mutual authentication using certificates.

Certificates are issued by a Certification Authority (CA). The G500 does not come with a CA, so you must make use of an existing CA or create your own.

2.2.1 Secure Connection Relay

A secure connection relay is used to apply security features to any existing ethernet connection. A secure TLS connection is established to connect an external client device to the G500 to access a protected service in the substation.

A client device could be a PC with Tactical Software Serial/IP or Stunnel, SCADA master that supports TLS and mutual authentication using certificates.

A master device could be a DNP3 master, IEC60870-5-104 master, or Modbus TCP master on the G500 or any other device connected to the G500 in the substation.

It is strongly recommended to setup a secure connection relay for every LAN connection on the G500.

NOTICE

It is strongly recommended that the user employ TLS tunnels to protect the following services:

- DNP3 Master
- IEC 60870-5-104 Master Station
- Modbus TCP Master

The user assumes all responsibility for associated security risks when enabling unsecured services onto an unprotected network.

2.2.1.1 Secure Tunnel for Redundancy Setup (OpenVPN)

A VPN (Virtual Private Network) channel is available between the G500 and an OpenVPN client running on a remote computer running Windows® Server 2012 R2 or Windows 7; this VPN channel allows access to one or more protected services in the substation. The VPN channel is implemented using OpenVPN, which uses a custom protocol based on TLS (Transport Layer Security), and certificate-based mutual authentication.

To know more on how to configure VPN server, see **SWM0101 MCP Software Configuration Guide**, under **Communications → Configure Network Communication → VPN Server** section and **SWM103 Integration of G500 with OpenVPN Client**.

2.3 MODBUS TCP/SSH

The G500 supports Modbus TCP/SSH protocol to establish a secure SSH connection with the UR7.6 IEDs that support SSHv2 protocol through Machine-to-Machine (M2M) access role. The G500 provides an option in the IED communication summary GUI.

The G500 provides an option for rotating the G500's public key into the UR7.6 on an on-demand basis.

Only administrator user can pair and rotate keys.

To know more on how to configure the Modbus TCP/SSH client, see **SWM0101 MCP Software Configuration Guide** under **Modbus Serial with G500 as Slave application** → **Modbus TCP/SSH Client – SSH Tunnel Interface** section.

2.4 File Transfer

It is strongly recommended to use SFTP instead of FTP or TFTP where possible due to the weak security in FTP and TFTP.

2.5 Remote Authentication

It is recommended to setup centralized remote authentication to manage users and their authentication remotely and securely.

At least one emergency user must be created when remote authentication is configured. Only emergency user can access the G500 in case the remote authentication server is down. The emergency user is added in the Settings GUI or `sudo mcpcfg` under **Configure Authentication / Emergency Group Users / Add User**.

The following remote authentication protocols are supported in the G500:

- Cisco® TACACS+
- LDAP

Note: Starting with MCP V520, Cisco® TACACS+ is no longer available.

2.5.1 TACACS+

Cisco® TACACS+ (Terminal Access Controller Access-Control System +) remote authentication is supported by the G500. To configure the TACACS+, see **SWM0101 MCP Software Configuration Guide** under **Configure System Security** → **User Accounts and Authentication** → **Remote Authentication** section.

Note: Starting with MCP V520, Cisco® TACACS+ is no longer available.

2.5.2 LDAP

LDAP (Lightweight Directory Access Protocol) remote authentication is supported by the G500. To configure LDAP, see **SWM0111/12/13 Configuring the MCP for Centralized LDAP Authentication using Windows AD/Open LDAP Server / 389 Directory Server documents** and **SWM0101 MCP Software Configuration Guide** under **Configure System Security → User Accounts and Authentication → Remote Authentication** section.

2.6 Remote Logging - Rsyslog Client

The G500 has a Rsyslog client that accepts system logs from any IED or substation equipment that support the syslog remote logging feature. G500 supports both UDP- and TCP- based connections, both TCP and UDP ports can be simultaneously open to listen on internal interface zones. The received logs are saved in a default file under a set path in the G500.

By default, the G500 saves all incoming logs being pushed from any of the IEDs connected to the network and configured with the G500 IP address and syslog port).

The G500 also allows you to configure filters:

- **Subnets-based binding filter:** By selecting a subnet from the displayed list or by specifying a subnet from the Custom Filters options, the G500 starts logging messages from IEDs whose IP addresses fall under the subnet's range).
- **Host-based binding filter:** By Specifying a Host's IP address, the G500 starts logging messages being pushed from the specified host.

Configuring Subnet address and Host IP address is beneficial when:

- An IED or substation equipment's IP address is not under any of the subnets available in the G500.
- The G500 is in redundant mode and the Standby's Ethernet Interface (Alias IP/Gateways etc.) are configured to be in different subnets from that of the Active's Ethernet Interface.

To configure Rsyslog, see **SWM0101 MCP Software Configuration Guide** under **Configure Rsyslog service via mcpcfg** section or under **MCP Settings GUI → Configure Secure Access → Configure Rsyslog service** section.

2.7 Logs

2.7.1 Predix Edge Technician Console Logs

Predix Edge Technician Console (PETC) implements full journal logging to allow the user to query and view logs in the console.

Logging is received from a variety of sources, such as kernel log messages, simple and structured log messages, and audit records. The logs can be filtered to be viewed by date and time, as well as pre-set units of time, for example, the last six hours, or the last five minutes. You can also filter logs by component and process or view only kernel messages. Additional options for viewing logs include by message priority, for example, Error or Debug.

To know more on how to view these logs, see **SWM0101 MCP Software Configuration Guide** under **EdgeManager and PETC → Logging → Viewing Logs** section.

2.7.2 G500 System Logs

The following logs are saved in the HMI view under Logs:

- Control Log
- Diagnostic Log
- System Event Log
- User Activity Log
- Analog report Log
- VPN Server Log (available only to administrator user)

Only administrator user can clear the logs in the Settings GUI or `sudo mcpcfg`.

To know more on how to view these logs, see **SWM0101 MCP Software Configuration Guide** under **MCP HMI Runtime → View Data → Logs** section.

3. Secured Connectivity to the G500

There are two types of secured connections for your G500:

- Secure Terminal Emulator
- Secure File Browser

3.1 Secure Terminal Emulator

Launch the Secure Terminal Emulator from the Windows start menu folder of DS Agile Studio.

The Secure Terminal Emulator tool is recommended and used as a replacement for third-party tools like PuTTY®.

To know more on how to launch the tool, see **SWM0101 MCP Software Configuration Guide** under **Secure Terminal Emulator** section.

3.2 Secure File Browser

Launch the Secure File Browser from the Windows start menu folder of DS Agile Studio.

The Secure File Browser tool is recommended for all users, as the tool is implemented with a session timeout and used as a replacement for third-party tools like WinSCP®.

If you want to use another tool, it is recommended to close the session as soon as you are done transferring the files. For tools like FileZilla®, you should disable the cached passwords option.

To know more on how to launch the tool, see **SWM0101 MCP Software Configuration Guide** under **Secure File Browser** section.

4. Maintaining Security

4.1 CID Tool

If the CID tool is used, it is strongly recommended that the Anaconda Distribution is periodically updated to the latest version.

4.2 Maintaining product security

Periodically check for product security bulletins published for the G500 under Product & Security Advisories in the following link:

<https://www.gevernova.com/grid-solutions/multilin/catalog/g500.htm>

5. Removing Configuration and Sensitive Data

For removal of configuration and sensitive data, follow the procedures mentioned in the document **TN0116 MCP Firmware Upgrade and Restore to Defaults Workflows** and in the document **994-0152 G500 Substation Gateway Instruction Manual** section *"Removing the G500 from Service"*.

6. Customer Support SSH Access

You may be asked to access the Predix EdgeOS host shell of the G500 for purposes of collecting customer support data while troubleshooting an issue. The access is granted for this shell through the Signed Keys option of the left navigation pane in PETC. Further documentation on how to generate, upload and revoke a signed SSH key will be provided by the GE Vernova customer support specialist when required to troubleshoot an issue.

7. List of Acronyms

Table 7.1: List of Acronyms

Abbreviation	Description
ARRM	Automatic Record Retrieval Manager
CA	Certification Authority
CID	Configured IED Description file
CN	Common Name
COM Port	Communication Port
CRL	Certificate Revocation List
DCA	Data Collection Application
DHCP	Dynamic Host Configuration Protocol
DNP3	Distributed Network Protocol 3
DPA	Data Presentation Application
DS Agile Studio (DSAS)	Digital Substation Agile Studio (configuration tool suite for MCP)
DTA	Data Translation Application
ESNET	EnterpriseServer.NET
FQDN	Full Qualify Distinguished Name
FTP	File Transfer Protocol
Generic ASCII	Generic American Standard Code for Information Interchange
GUI	Graphical User Interface
HAMA	Hardware Asset Management Application
HDD	Hard Disk Drive
HMAC	Hash-based Message Authentication Code
HMI	Human Machine Interface
HTTPS	Hypertext Transfer Protocol Secure
IED	Intelligent Electronic Device
IP	Internet Protocol
IRIG B	Inter-Range Instrumentation Group - Time Code Format B
JVM	Java Virtual Machine
LAN	Local Area Network
LDAP	Lightweight Directory Access Protocol
MCP	Multi-function Controller Platform
mcpcfg	Multi-function Controller Platform Configuration
NTP Server	Network Time Protocol Server
OU	Organizational Unit
PEM	Privacy Enhanced Mail
PETC	Predix Edge Technician Console
PKCS	Public Key Cryptography
PKI	Public Key Infrastructure
PRF	Protective Relay Fault
RTDB	Real Time Data Base
RTU	Remote Terminal Unit
SCADA	Supervisory Control and Data Acquisition
SCR	Secure Connection Relay

Abbreviation	Description
SD Card	Secure Digital Card
SDD	Software Design Document
SED	Self-Encrypting Drive
SFTP	Secure File Transfer Protocol
SHA512	Secure Hash Algorithm 512
SNMP	Simple Network Management Protocol
SOE	Sequence of Event
SPT	Secure Pass-Through
SSD	Solid-state drive
SSDD	Software Subsystem Design Document
SSH	Secure Shell
SSL	Secure Sockets Layer
ST	Secure Terminal Server
TACACS+	Terminal Access Controller Access-Control System +
TCP	Transmission Control Protocol
TELNET	Teletype Network Protocol
TFTP	Trivial File Transfer Protocol
TLS	Transport Layer Security
UDP	User Datagram Protocol
UEFI	Unified Extensible Firmware Interface
USB	Universal Serial Bus
VPN	Virtual Private Network.
WAN	Wide Area Network

8. Modification Record

VERSION	REVISION	DATE	CHANGE DESCRIPTION
1.00	0	30 th March, 2020	First Release.
2.50	0	27 th September, 2021	Updated GE logo. Included a new Chapter 3 - Secured Connectivity content. Included a new Chapter 5 - Customer Support SSH Access. Updated table - Service traffic through the firewall.
2.60	0	16 th November, 2021	Removed Secret Signature content.
	1	2 nd June, 2022	Included a new section 1.2.3 - DSAS Offline User Roles in Chapter 1.
2.80	0	29 th June, 2022	Included a new section 1.7 - Physically Secure the G500 Device in Chapter 1. Included a new section 2.4 - File Transfer in Chapter 2. Included a new Chapter 4 - Maintaining Security.
	1	27 th July, 2022	Updated section 1.3 to include the IEC 61850 Server.
3.00	0	10 th March, 2023	Added a Disclaimer in About this Document section. Updated the User Level Permissions table in Table 1.1. Added content for Rdtunnel in section 1.2.2. In Chapter 5, added a reference to TN0116 document.
4.00	0	03 rd April, 2024	GE Vernova Logo is added on the first page. Updated Initial Hardening Setup section. Updated Default Usernames and Passwords section and added clarification when D2x function is enabled.
4.10	0	23 rd September, 2024	Updated Company name, Copyright Notice and Trademark Notice. Updated section 1.1 – “Default Usernames and Passwords” for default D2x user credentials and reduced risk of unauthorized access in G500 v4.1.
	1	27 th January, 2025	Updated to GE Vernova style. Added clarification for D2x A098-0 application.

VERSION	REVISION	DATE	CHANGE DESCRIPTION
5.20	0	15 th May, 2025	Updated GE Vernova email addresses and phone numbers in Contact Technical Support section. Removed G500 SSD default password. Obsoleted Cisco® TACACS+ starting with V5.2.
	1	16 th September, 2025	Updated section 1.6 to include the SWM0125 document reference.

Multilin™ G100 Substation Gateway

Chapter 1: Introduction

This chapter outlines safety and technical support information.

1.1 About the document

1.1.1 Purpose

This document describes the Initial Hardening setup and Secure Configuration of G100 and provides guidelines on how to enable and configure the various cyber security features on the G100.

1.1.2 Intended Audience

This document is a helpful resource for utility personnel who are responsible for deploying the G100 in a secure manner.

1.1.3 Additional Documentation

For further information about G100 Substation Gateway, refer to the following documents:

- SWM0101 MCP Substation Gateway Software Configuration Guide
- 994-0155 G100 Substation Gateway Instruction Manual (994-0155)
- MCP Substation Gateway, HMI Online Help
- SWM0103 Integration of MCP with Open VPN Client
- SWM0104 Enterprise File Synchronization of MCP Sync Manager
- SWM0109 Secure Integration of SCADA Third Party Equipment with MCP
- SWM0116 G100 Substation Gateway Quick Start Guide
- SWM0122 Configuring UEFI Settings on G100 User Guide

1.2 Safety symbols and definitions

Before attempting to install or use the device, review all safety indicators in this document to help prevent injury, equipment damage, or downtime.

The following safety and equipment symbols are used in this document.

Indicates a hazardous situation which, if not avoided, will result in death or serious injury.

Indicates a hazardous situation which, if not avoided, could result in death or serious injury.

Indicates a hazardous situation which, if not avoided, could result in minor or moderate injury.

Indicates practices not related to personal injury.

1.3 Product Support

If you need help with any aspect of your GE Vernova Grid Solutions product, you can:

- Access the GE Vernova Grid Solutions Web site
- Search the GE Vernova Grid Solutions Technical Support library
- Contact Technical Support

1.3.1 Access the GE Vernova Grid Solutions web site

The G100 Web site provides fast access to technical information, such as manuals and knowledge base topics.

Visit us on the Web at: <https://www.gevernova.com/grid-solutions/>

1.3.2 Search GE Vernova Grid Solutions Technical Support library

This site serves as a document repository for post-sales requests. To get access to the Technical Support Web site, go to: <https://www.gevernova.com/grid-solutions/events/signup.asp?sid=208>

1.3.3 Contact Technical Support

GE Vernova Grid Solution Technical Support is open 24 hours a day, seven days a week for you to talk directly to a GE Vernova representative.

Region	E-mail	Telephone
Global Contact Centre	GA.support@GEVernova.com	+44 1785 250070

1.4 Cyber Security Disclaimer

The MCP family of products are digital devices designed to be installed and operated in industrial and power sub-station environments and connected to secure private networks. The MCP family of products should not be connected to the public internet.

GE Vernova strongly recommend users to protect their digital devices using a defense-in-depth strategy to protect their products, their network, its systems and interfaces against cyber security threats. This includes, but is not limited to, placing digital devices inside the control system network security perimeter, deploy and maintain access controls, monitoring of Intrusion Detection, security awareness training, security policies, network segmentation and firewalls, strong and active password management, data encryption, antivirus and other mitigating applicable technologies.

For additional details and recommendations on how to protect The MCP family of products, please see this Secure Deployment Guide. GE Vernova Grid Solution may also provide additional instructions and recommendations to users from time to time relating to The MCP family of products and cyber security threats or vulnerabilities.

It is the users' sole responsibility to make sure that The MCP family of products are installed and operated considering its cyber security capabilities, security context, and the instructions and recommendations provided to the user relating to The MCP family of products. Users assume all risks and liability associated with damages or losses incurred in connection with any and all cyber security incidences.

Multilin™ G100 Substation Gateway

Chapter 2: Initial Hardening Setup

Upon receiving the G100 the following is recommended to be done:

- Change password and/or usernames for all default users
- Create users with restricted access
- Change the web HMI secret signature
- Setup firewall
- Physical Security Measures

2.1 Default Usernames and Passwords

Upon receiving the G100, all default usernames and password must be changed. It's crucial to change all the usernames and passwords for the default users as most of them have administrator privileges and allow the user to create new administrator users.

Here is a list of the default users that must be updated:

- Front serial port, command line interface of local HMI and remote SSH access to the device: defadmin/defadmin
- Front serial port access: root/ geroot
- Predix Edge Technician Console PETC: admin/admin

To know more on default users and passwords, see **SWM0101 MCP Software Configuration Guide** under **Administrators User Management -> Default Users** section and in the same document, under **EdgeManager and PETC** section.

2.2 Role Based Access Control

2.2.1 HMI User Roles

To control access to the DSAS Online Configuration, G100 Runtime HMI and G100 Local HMI, the following types of access users can be created:

- Observer** : View only privileges for all runtime screens.
- Operator** : Substation operator privileges to operate controls, force points and perform maintenance tagging.
- Supervisor** : Full privileges to access and modify all non-security configuration settings and some security configuration settings, runtime, operation, and system administration screens. This user can add new HMI users.
- Administrator** : Supervisor-level access to all configuration, runtime, operation, and system screens in the G100 Online/Runtime HMI. In addition, administrator-level users have access to run commands at the G100 command line interface.

Table 2-1 indicates the system privileges for each access level.

Table 2-1: User Level Permissions

HMI Function	Administrator	Supervisor	Operator	Observer
Access built-in TELNET/SSH client	Yes	Yes	Yes	No
Acknowledge Alarms	Yes	Yes	Yes	No
Enable/Disable Device	Yes	Yes	Yes	No
Add/Delete Operator Notes	Yes	Yes	Yes	No
Execute Digital/Analog Controls	Yes	Yes	Yes	No
Place/Remove Alarm Inhibit	Yes	Yes	Yes	No
Place/Remove Control Inhibit	Yes	Yes	Yes	No
Place/Remove Local force	Yes	Yes	Yes	No
Place/Remove Scan Inhibit	Yes	Yes	Yes	No
Place/Remove Tags	Yes	Yes	Yes	No
Enable/Disable Unsolicited Responses	Yes	Yes	Yes	No
View Alarms	Yes	Yes	Yes	Yes
View Events	Yes	Yes	Yes	Yes
View I/O Traffic	Yes	Yes	Yes	Yes
View Logs (Except OpenVPN Log)	Yes	Yes	Yes	Yes
View Operator Notes	Yes	Yes	Yes	Yes
View One-Line Diagrams	Yes	Yes	Yes	Yes
View Point Summary & Detail Pages	Yes	Yes	Yes	Yes
View Communication Statistics	Yes	Yes	Yes	Yes
View OpenVPN Log	Yes	No	No	No
View System Status	Yes	Yes	Yes	Yes
Edit/View Gateway Configuration	Yes	Yes	No	No
Edit/View HMI User Configuration	Yes	Yes	No	No

HMI Function	Administrator	Supervisor	Operator	Observer
Edit/View Admin User Configuration	Yes	No	No	No
Sync To/Sync From	Yes	Yes	No	No
Commit/Discard Changes in Online Config	Yes	Yes	No	No
Save Configuration	Yes	Yes	No	No
Mount USB Device	Yes	Yes	Yes	No
Edit/View Authentication Mode Configuration	Yes	No	No	No
Extract/View SOE/Alarms/PRF/Datalogger Records	Yes	Yes	Yes	Yes
ARRM: Trigger FileSet Retrieval	Yes	Yes	Yes	No
ARRM: Clear Recording on IED	Yes	Yes	No	No
ARRM: Enable Auto Retrieval	Yes	Yes	No	No
ARRM: Enable Connection Polling	Yes	Yes	No	No
ARRM: View ARRM Log	Yes	Yes	Yes	Yes
View/Update/Import PKI Information	Yes	Yes	No	No
Generate SSH Key Pair for Rsync	Yes	Yes	No	No
Export VPN Client Configuration	Yes	Yes	No	No
Pair and Rotate Modbus/SSH Keys	Yes	Yes	No	No
Deploy HTTPS certificate and private key	Yes	Yes	No	No
Terminal Server/ Passthrough (Telnet)	Yes	Yes	Yes*	No
Terminal Server/ Passthrough (SSH)	Yes	No	No	No
Terminal Server/ Passthrough (TLS/SSL)	Yes	Yes	Yes*	No

*When minimum privilege level is set to "Operator" in "Application Parameters" list in Terminal Server.

To learn how to add a new Supervisor, Operator and Observer users, see **SWM0101 MCP Software Configuration Guide** under **User Management** section.

2.2.2 Other User Roles

SSHPassThrough : The privilege level SSHPassThrough is not available to access the G100 HMI. Users configured under this privilege level or role are only allowed access for Pass-through and Terminal Server.

Rdtunnel : The privilege level Rdtunnel is not available to access the G100 HMI directly. Users configured under this privilege level or role are only allowed to setup a remote desktop tunnel with the G100. For details on how to configure Rdtunnel role, see **SWM0101 MCP Software Configuration Guide** under **Remote Desktop (RD) Access**.

2.3 Firewall

The G100 contains a firewall capable of stateful packet inspection to protect the device from unauthorized access. By default, network interfaces on the G100 drop packets that are determined to be invalidly routed or unsolicited.

NOTE

The G100 firewall is intended only to protect itself and does not extend protection to other devices on the network. As such, it does not replace the need for a network firewall which offers deep packet inspection and detailed configuration capabilities.

Configure the settings of the firewall through the **Firewall** menu. The Secure Access settings are described in Network interfaces can operate in one of two modes:

- Internal** : The Internal mode permits traffic from known protocols and should only be enabled on interfaces connected to known devices only. The Internal mode is the default mode for Net 0 and Net 1 and would typically be used when the interface is connected to the substation LAN.
- External** : The External mode offers a stricter set of rules and is the default mode for all interfaces except Net 1 and Net 2. The External mode would typically be used when the interface is connected to a WAN.

By default, the firewall allows outbound traffic on internal interfaces and blocks all outbound traffic except outbound SSH on external interfaces. If you want the firewall to allow outbound traffic for a protocol on an external interface, you must create a “custom” rule.

By default, the firewall blocks inbound traffic on both internal and external interfaces. The G100 automatically generates rules allowing inbound traffic on internal interfaces for all configured services. If you want the firewall to allow inbound traffic on an external interface, you may modify the associated “generated” rule to allow the traffic on ALL interfaces rather than only the “Internal” interface.

The default firewall rules should be enough for most users. However, the user may create a set of custom rules if desired more granular permissions for the protocols you are accessing.

Additional notes on the G100 firewall:

- When the firewall is active, you cannot perform IP routing between an external and internal interface. The only way to pass through the firewall is by using a secure TLS connection or the proxy.

To change the interface zones (internal/external) go to each interface setup and you have the option to change it there.

The G100 firewall is configured by default to its most secure setting. The user assumes all responsibility for associated security risks if the firewall configuration is manually changed.

It is the user's responsibility to connect Internal zone interfaces to networks that are protected from unauthorized use.

Also, if the firewall is disabled then all the ports that are internal to the G100 will be visible/available to the external scanner tools.

Table 2-2: Service traffic through the firewall

Service Name	Notes	External Mode	Internal Mode
Modbus/TCP Server (Inbound)		Deny	Allow
DNP/UDP Server (Inbound)		Deny	Allow
DNP/TCP Server (Inbound)		Deny	Allow
DNP/TCP Client (Inbound)	Dual Endpoint Enabled	Deny	Allow
DNP/UDP Client (Inbound)			

Service Name	Notes	External Mode	Internal Mode
IEC 60870-5-104 Server (Inbound)		Deny	Allow
Terminal Server (Inbound)	TLS Disabled	Deny	Allow
DCA Pass-Through (Inbound)	TLS Disabled	Deny	Allow
Secure Connection Relay (Inbound)		Allow	Allow
Secure DCA Pass-Through (Inbound)	TLS Enabled	Allow	Allow
Secure Terminal Server (Inbound)	TLS Enabled	Allow	Allow
SNMP Client (Inbound)		Deny	Allow
LogicLinx Executor (Inbound)		Deny	Allow
HTTPS (Inbound)	When enabled in mcpcfg, see note below	Deny	Allow
DHCP Client (Inbound)	When enabled in mcpcfg	Deny	Allow
NTP Client (Inbound)	When enabled in mcpcfg	Deny	Allow
NTP Server (Inbound)	When enabled in mcpcfg	Deny	Allow
SSH/SFTP/SCP (Outbound)	When enabled in mcpcfg for SCP/SFTP.	Allow	Allow
Secure Tunnel -Redundancy (Inbound)	When enabled in mcpcfg	Deny	Allow
Standby Local HMI Redirection to Active (Inbound)	When enabled in mcpcfg	Deny	Allow
Settings GUI (Inbound)		Deny	Allow
Emergency SSH Server (Inbound)		Deny	Allow
Emergency SSH Serve (Outbound)		Allow	Allow
LDAP Client (Outbound)		Allow	Deny
Modbus/TCP Server (Inbound)		Deny	Allow
DNP/UDP Server (Inbound)		Deny	Allow
DNP/TCP Server (Inbound)		Deny	Allow
IEC 61850 Server (Inbound)		Deny	Allow

Note: By default, **HTTPS** and **SSH** do not provide strong client authentication since only a password is required to access the system. Therefore, these protocols are not considered secure enough for use over external interfaces. They can be considered secure if you employ a remote authentication server that provides two-factor authentication. In that case, you may opt to modify the firewall rule and allow HTTPS and SSH on external interfaces.

Additional notes on the G100 firewall:

- In a redundant setup, the same firewall rules above apply to both the active and standby device.
- When the firewall is active, you cannot perform IP routing between an external and internal interface. The only way to pass through the firewall is by using a secure TLS connection or the proxy.
- To configure the firewall and interface zones see **SWM0101 MCP Software Configuration Guide** under **Configure System Security -> Firewall Settings** section.

2.4 Disable Unused Serial Ports and USB Ports

To decrease attack surface on the G100, it is recommended to disable unused serial and USB ports in the UEFI settings. Unused serial ports can be disabled in the UEFI Settings under Advanced -> Super IO Configuration. All USB ports can be disabled in the UEFI Settings under **Chipset -> USB Configuration -> xHCI mode**. For detailed information on the UEFI Settings, refer to **G100 UEFI Settings Manual (SWM0122)**.

2

2.5 Physical Tamper Detection

As part of the physical security measures in the device environment, it is recommended to use tamper resistance/detection mechanisms such as a seal or a tape.

Applying a security tape is a simple and most cost-effective way to provide evidence that the device was physically tampered with.

For more efficiency the tape should be placed on one screw on each removable panel of the G100. The following two figures show suggested locations to place the seal.

This good practice is part of the IEC-62443-4-2 SL2 requirements (EDR 3.11 – Physical tamper resistance and detection).

GE Vernova does not recommend a particular brand or type of security tape; the choice of tape, as well as other physical security measures should be decided based on the customer risk analysis.

Figure 2-1: Front View of G100 with suggested security seal locations

Figure 2-2: Back view of G100 with suggested security seal location

Multilin™ G100 Substation Gateway

Chapter 3: Secure Configuration of the G100

3.1 Pass-through Secure Connectivity

A secure LAN connection can be established through the G100 to connect to a serial server device in the substation. The G100 support different types of secure pass-through connectivity options, available for the following G100 applications:

- IEC 60870-5-103 Multidrop
- Modbus RTU Multidrop
- Generic ASCII
- SEL DCA
- Terminal Server

By default, a username and a password are required to establish the pass-through connection. However, the user can disable this pass-through user authentication in the Settings GUI or the mcpcfg under Configure Authentication/ Pass-Through Authentication or when setting up the terminal server connection. It is strongly recommended to keep the pass-through authentication enabled, unless the TLS connection type is used, see below.

The ssh-passthrough user is created in the HMI under Settings/ Access/ User Management. Admin and root users are created in the Settings GUI or mcpcfg under Configure Authentication. Depending on the pass-through connection type configured, different users have different rules. The table below shows the different type of users and their authentication rules.

Table 3-1: Pass-through User Authentication Rules

Service	User Type						Additional Security Notes
	Admin User Types		HMI User Types			SSHPass Through	
	root	Administrator	Supervisor	Operator	Observer		
Pass-through Connection (Telnet & TLS)	Not Allowed	Allowed	Allowed	Not Allowed	Not Allowed	Not Allowed	Pass-through for remote TCP clients is enabled using Pass Through Access in Security parameters under Configuration > Systemwide and select Secure Type under Configuration > Connection to Telnet or TLS . Pass-through is allowed without Login/Password if its Pass-through Authentication is disabled in G100 Config Tool (mcpcfg) > Configure Authentication .
Terminal Server Connection (Telnet & TLS)	Not Allowed	Allowed	Allowed	Allowed	Not Allowed	Not Allowed	Terminal Server is allowed without Login/Password, if its application parameter Password Authentication is set to No. Terminal Server for remote TCP clients is enabled by selecting "Secure Type" under Configuration > Connection to Telnet or TLS . Terminal Server application parameter Minimum Privilege Level specifies if Operator user is allowed or not.
Pass-through Connection (SSH Secure Tunnel)	Not Allowed	Allowed	Not Allowed	Not Allowed	Not Allowed	Allowed	Pass-through for remote SSH clients is enabled using Pass Through Access in Security parameters under Configuration > Systemwide and select Secure Type under Configuration > Connection to SSH Secure Tunnel . Pass-through for SSH Secure Tunnel is always allowed with Login/Password,
Terminal Server Connection (SSH Secure Tunnel)	Not Allowed	Allowed	Not Allowed	Not Allowed	Not Allowed	Allowed	Terminal Server for remote TCP clients is enabled by selecting Secure Type under Configuration > Connection to SSH Secure Tunnel. Terminal Server for SSH Secure Tunnel is always allowed with Login/Password. The parameter Minimum Privilege Level for SSH Secure Tunnel is always SSHPassThrough only.

To know more on how to configure the pass-through connections, see **SWM0101 MCP Software Configuration Guide** under **Miscellaneous Utilities -> Pass-Through Connections** section.

The user can use third party software to securely access terminal server or pass-through connection,

To know more on how to configure a secure connection with **Tactical Software Serial IP**, see **SWM0109 Secure Integration of SCADA Third Party Equipment with MCP**, under **Configuring a Secure Connection with Tactical Software Serial IP** section.

For each client application the secure pass-through is configured using the G100 configuration tool, under Connection tab/ Secure Type. The following options are available:

3.1.0.1 SSH Security Tunnel

The G100 supports SSH tunnel connection for pass-through and terminal server connectivity. Once configured, an SSH client configuration tool, e.g. Secure Terminal Emulator from DS Agile Studio, is used to connect to a device in the substation. The SSH port used connect is automatically assigned port number 8000 + the serial port number the G100 client is using to communicate to the device in the substation. For example, if the client is configured to use serial port 1, the pass-through connection port is 8001.

To know more on how to configure this type of pass-through connection, see **SWM0101 MCP Software Configuration Guide** under **Miscellaneous Utilities -> Pass-Through Connection -> SSH Secure Tunnel Pass-Through Connections** section.

3.1.0.2 SSL/TLS

The G100 supports Transport Layer Security (TLS) cryptographic protocol versions 1.0, 1.1, and 1.2. It is recommended to choose version 1.2, which is set by default, as it has the latest and strongest ciphers. To use SSL/TLS option, you need to setup certificate-based mutual authentication.

To know more on how to setup the certificates, see **SWM0109 Secure Integration of SCADA Third Party Equipment with MCP**.

3.1.0.3 Telnet

The G100 supports pass-through and terminal server access to the devices from PC-based configuration tools and, if necessary, COM port redirection software. These connections are accessible through a TCP port on the G100.

It is not recommended to use telnet pass-through and terminal server as it's less secure than SSH Secure Channel and TLS options.

NOTICE

The following services are considered unsecure:

- IEC 60870-5-103 Multi-drop (Passthrough-Telnet)
- Modbus Multi-drop (Passthrough-Telnet)
- Generic ASCII (Passthrough-Telnet)
- SEL Binary with G100 as Master (Passthrough-Telnet)
- Terminal Server

It is strongly recommended to employ TLS tunnels or SSH Secure Tunnels to protect these services.

3.1.0.4 Disabled

The default pass-through and terminal server secure type is Disabled.

3.2 Secure Substation LAN Access

The user can setup a secure channel between a client device and the G100 for accessing a protected service in the substation. The secure channel is implemented using a TLS (Transport Layer Security) connection and certificate-based mutual authentication. A client device could be a PC with Tactical Software Serial/IP or Stunnel, SCADA master that supports TLS and mutual authentication using certificates.

Certificates are issued by a Certification Authority (CA). The G100 does not come with a CA so you must make use of an existing CA or create your own.

3.2.1 Secure Connection Relay

A secure connection relay is used to apply security features to any existing ethernet connection. A secure TLS connection is established to connect an external client device to the G100 to access a protected service in the substation.

A client device could be a PC with Tactical Software Serial/IP or Stunnel, SCADA master that supports TLS and mutual authentication using certificates.

A master device could be a DNP3 master, IEC60870-5-104 master, or Modbus TCP master on the G100 or any other device connected to the G100 in the substation.

It is strongly recommended to setup a secure connection relay for every LAN connection on the G100.

NOTICE

It is strongly recommended that the user employ TLS tunnels to protect the following services:

- DNP3 Master
- IEC 60870-5-104 Master Station
- Modbus TCP Master

The user assumes all responsibility for associated security risks when enabling unsecured services onto an unprotected network.

3.2.1.1 Secure Tunnel for redundancy setup (OpenVPN)

A VPN (Virtual Private Network) channel is available between the G100 and an OpenVPN client running on a remote computer running Windows® Server 2012 R2 or Windows 7; this VPN channel allows access to one or more protected services in the substation. The VPN channel is implemented using OpenVPN, which uses a custom protocol based on TLS (Transport Layer Security), and certificate-based mutual authentication.

For details on how to configure VPN server see **SWM0101 MCP Software Configuration Guide** under **Communications -> Configure Network Communications -> VPN Server** section and **SWM0103 Integration of MCP with OpenVPN Client**.

3.3 MODBUS TCP/SSH

The G100 supports Modbus TCP/SSH protocol to establish a secure SSH connection with the UR7.6 IEDs that support SSHv2 protocol through Machine-to-Machine (M2M) access role. The G100 provides an option in the IED communication summary GUI.

The G100 provides an option for rotating the G100's public key into the UR7.6 on an on-demand basis.

Only administrator user can pair and rotate keys.

For details on how to configure Modbus TCP/SSH client, go to **SWM0101 MCP Software Configuration Guide** under **Modbus Serial with MCP as Slave application -> Modbus TCP/SSH Client – SSH Tunnel Interface** section.

3.4 Remote Authentication

It is recommended to setup centralized remote authentication to manage users and their authentication remotely and securely.

At least one emergency user must be created when remote authentication is configured. Only emergency user can access the G100 in case the remote authentication server is down. The emergency user is added in the Settings GUI or `sudo mcpcfg` under **Configure Authentication / Emergency Group Users / Add User**.

The following remote authentication protocols are supported in the G100:

- TACACS+
- LDAP

3.4.1 TACACS+

Cisco TACACS+ (Terminal Access Controller Access-Control System +) remote authentication is supported by the G100. To configure TACACS+, see **SWM0101 MCP Software Configuration Guide** under **Configuration System Security -> User Accounts and Authentication -> Remote Authentication** section.

3.4.2 LDAP

LDAP (Lightweight Directory Access Protocol) remote authentication is supported by the G100. To configure LDAP, see **SWM0111/12/13 Configuring the MCP for Centralized LDAP Authentication using Windows AD/Open LDAP Server / 389 Directory Server** documents and **SWM0101 MCP Software Configuration Guide** under **Configure System Security -> User Accounts and Authentication -> Remote Authentication** section.

3.5 Remote Logging – Rsyslog Client

The G100 has a Rsyslog client that accepts system logs from any IED or substation equipment that support the syslog remote logging feature. G100 supports both UDP- and TCP- based connections, both TCP and UDP ports can be simultaneously open to listen on internal interface zones. The received logs are saved in a default file under a set path in the G100.

By default, the G100 saves all incoming logs being pushed from any of the IEDs connected to the network and configured with the G100 IP address and syslog port).

The G100 also allows you to configure the:

- **Subnets-based binding filter:** By selecting a subnet from the displayed list or by specifying a subnet from the Custom Filters options, the G100 starts logging messages from IEDs whose IP addresses fall under the subnet's range)
- **Host-based binding filter:** By Specifying a Host's IP address, the G100 starts logging messages being pushed from the specified host.

Configuring Subnet address and Host IP address is beneficial when:

- An IED or substation equipment's IP address is not under any of the subnets available in the G100.
- The G100 is in redundant mode and the Standby's Ethernet Interface (Alias IP/Gateways etc...) are configured to be in different subnets from that of the Active's Ethernet Interface.

To configure Rsyslog, see **SWM0101 MCP Software Configuration guide** under **Configure Rsyslog service via mcpcfg** section or **MCP Settings (GUI) -> Configure Secure Access -> Configure Rsyslog service** section.

3.6 Logs

3.6.1 Predix Edge Technician Console logs

Predix Edge Technician Console (PETC) implements full journal logging to allow the user to query and view logs in the console.

Logging is received from a variety of sources, such as kernel log messages, simple and structured log messages, and audit records. The logs can be filtered to be viewed by date and time, as well as pre-set units of time, for example, the last six hours, or the last five minutes. You can also filter logs by component and process or view only kernel messages. Additional options for viewing logs include by message priority, for example, Error or Debug.

To know more on how to view these logs, see **SWM0101 MCP Software Configuration guide** under **Edge Manager and PETC -> Logging -> Viewing Logs** section.

3.6.2 G100 System Logs

The following logs are saved in the HMI view under Logs:

- Control Log
- Diagnostic Log
- System Event Log
- User Activity Log
- Analog report Log
- VPN Server Log (available only to administrator user)

Only administrator user can clear the logs in the Settings GUI or `sudo mcpcfg`.

For details on how to view these logs, see **SWM0101 MCP Software Configuration guide** under **MCP HMI Runtime -> View Data -> Logs** section.

Multilin™ G100 Substation Gateway

Chapter 4: Secured Connectivity to the G100

There are two types of secured connections for your G100:

- Secure Terminal Emulator
- Secure File Browser

4.1 Secure Terminal Emulator

Launch the Secure Terminal Emulator from the Windows start menu folder of DS Agile Studio.

The Secure Terminal Emulator tool is recommended and used as a replacement for third-party tools like PuTTY®.

To know more on how to launch the tool, see **SWM0101 MCP Software Configuration Guide** under **Secure Terminal Emulator** section.

4.2 Secure File Browser

Launch the Secure File Browser from the Windows start menu folder of DS Agile Studio.

The Secure File Browser tool is recommended for all users, as the tool is implemented with a session timeout and used as a replacement for third-party tools like WinSCP®.

If you want to use another tool, it is recommended to close the session as soon as you are done transferring the files. For tools like FileZilla®, you should disable the cached passwords option.

To know more on how to launch the tool, see **SWM0101 MCP Software Configuration Guide** under **Secure File Browser** section.

Multilin™ G100 Substation Gateway

Chapter 5: Maintaining Security

5.1 CID Tool

If the CID tool is used, it is strongly recommended that the Anaconda Distribution is periodically updated to the latest version.

5.2 Maintaining product security

Periodically check for product security bulletins published for the G100 under Product & Security Advisories in <https://www.gevernova.com/grid-solutions/automation/protection-control-metering/gateways-rtus/multilintm-g100>

Multilin™ G100 Substation Gateway

Chapter 6: Removing Configuration and Sensitive Data

For removal of configuration and sensitive data, follow the procedure mentioned in the document **994-0155 G100 Instruction Manual** under **Removing the G100 from service -> Remove configuration data and sensitive information from the G100** section.

Multilin™ G100 Substation Gateway

Chapter 7: Customer Support SSH Access

You may be asked to access the Predix EdgeOS host shell of the G100 for purposes of collecting customer support data while troubleshooting an issue. The access is granted for this shell through the Signed Keys option of the left navigation pane in PETC. Further documentation on how to generate, upload and revoke a signed SSH key will be provided by the GE Vernova customer support specialist when required to troubleshoot an issue.

Multilin™ G100 Substation Gateway

Appendix A: List of Acronyms

Table A-1: List of Acronyms

Abbreviation	Description
CA	Certification Authority
CN	Common Name
CRL	Certificate Revocation List
DCA	Data Collection Application
DPA	Data Presentation Application
DTA	Data Translation Application
ESNET	EnterpriseServer.NET
FQDN	Full Qualify Distinguished Name
HMAC	Hash-based Message Authentication Code
HMI	Human Machine Interface
IED	Intelligent Electronic Device
JVM	Java Virtual Machine
LAN	Local Area Network
OU	Organizational Unit
PEM	Privacy Enhanced Mail
PKCS	Public Key Cryptography
PKI	Public Key Infrastructure
PRF	Protective Relay Fault
RTDB	Real Time Data Base
RTU	Remote Terminal Unit
SCR	Secure Connection Relay
SDD	Software Design Document
SOE	Sequence of Event
SPT	Secure Pass-Through
SSDD	Software Subsystem Design Document
ST	Secure Terminal Server
TLS	Transport Layer Security
WAN	Wide Area Network

Multilin™ G100 Substation Gateway

Appendix B: Miscellaneous

B.1 Revision History

Version	Revision	Date	Change Description
1.00	0	May 20, 2021	Document created.
3.00	0	Jan 30, 2023	Added a Disclaimer in Chapter 1. Updated the User Level Permissions table in Table 2-1. Added content for Rdtunnel in section 2.2.2. Added Chapter 4: Secured Connectivity to the G100. Added Chapter 5: Maintaining Security.
	1	May 15, 2025	GE Vernova Logo is added on the first page. Updated Company name, Copyright Notice and Trademark Notice. Updated GE Vernova email addresses and phone numbers in Contact Technical Support section.
	2	July 08, 2025	Updated to GE Vernova style.

G500 Substation Gateway

Quick Start Guide

This document applies to G500 v4.00.

Please refer to previous versions of this document for previous G500 releases.

What's in the Box?

Your kit includes the following:

- G500 Substation Gateway
- SFP and CD tray
- Hardware Compartment

Hardware Compartment

The hardware compartment is a single package which contains:

- Mounting Bracket Kit : Top filler plate
Bottom filler plate
Left bracket
Right bracket
- Bracket mounting hardware : M4 screws (quantity 10)
M3 screws (quantity 8)
- Connector set : Power supply connectors (quantity – 2)
IRIG-B connectors (quantity – 2)
Alarm connector (quantity – 1)

The rack mounting kit includes 4 metal pieces (left bracket, right bracket, top filler plate and the bottom filler plate) along with M4 (quantity 10) and M3 (quantity 8) screws. The M4 screws are used to attach the left and right bracket to the G500 chassis and the M3 screws are used to secure the top and bottom filler plates to the brackets.

The SFP's are inserted in the tray in the same order as the cages are labeled on the rear of the G500 chassis.

NOTE: The single notch in the tray corresponds to the SFP cage labeled 1.

The Hardware compartment also includes the Connector set which includes two power supply connectors, one Alarm connector, one IRIG-B input and output connectors.

NOTE: The IRIG-B input and output connectors are keyed and can only be installed in the corresponding position.

Missing Something?

Contact [GE Vernova Customer Service](#) right away and we'll figure it out. Be sure to include your order number and mail address associated with your order.

Prerequisites

- DS-Agile Studio's MCP Studio
- Minimum Windows 7 x64, 10 x64 and 8GB Memory required for DS Agile MCP Studio

G500 Interface Options

The following connection/interface options are available after G500 first powers up.

- Local KVM (Keyboard, Video, Mouse)
- Front Ethernet port – Default IP address 192.168.168.81
- Front USB Serial port with a baud rate 115200

Setup & Configuration Tools

The following setup & configuration tools are available for the G500.

1. **DS Agile MCP Studio** Offline & Online Editor : To configure the Gateway & SCADA Configuration.
2. **MCP Runtime HMI** (Remote/Local) : To view and control the runtime stats including One-line diagrams and to configure the G500 Settings (e.g. User Management, Automatic Login etc.).
3. **G500 Local Configuration Utility or Gateway Settings GUI** : To configure G500 system settings and perform the initial G500 setup (e.g. Users, network, serial, time sync etc.).

G500 Gateway Settings GUI

The local G500 settings, including Serial ports, Network configuration, Time settings, User management etc. are managed using the **Gateway Settings GUI**.

You can access MCP Settings Web Interface through Local or Remote G500 connection. Remote access must be completed using a supported web browser (Internet Explorer, Microsoft Edge, Mozilla Firefox, Google Chrome).

Initial Setup

NOTE: Initial Setup section is identical between Local/Remote access.

1. Enter the default **Username** (defadmin), default **Password** (defadmin) and click **Login**.

The image shows a login screen with a blue background. At the top center is the GE logo. Below it, the text "MCP Settings" is displayed. There are two input fields: the first is for the username, containing "defadmin", and the second is for the password, containing "defadmin". Below the password field is a green "Login" button.

2. If the **defadmin** account is used to login, you will be prompted to create an **Administrator** account to access the full Settings GUI menu. Click **OK**.

The image shows a dialog box titled "Operation Status". The text inside says "Please create an Administrator account in order to access the full mcpcfg menu." At the bottom of the dialog is a blue "Ok" button.

3. The **Gateway Settings** main menu appears.
Select the **Configure Authentication** tab from the main menu.

The image shows the "Gateway Settings" main menu. At the top left is the GE logo and the text "Gateway Settings". At the top right, it says "Logged in as: defadmin" with a green "Logout" button. Below this is a list of three menu items: "Configure Authentication", "Configure Network Interfaces", and "Reboot Device". The "Configure Authentication" item is highlighted with a red border.

4. Select the **Administrator Group Users** tab from the **Configure Authentication** menu.

This function is used to perform the following actions:

- List Users
 - Add User
 - Change Password
 - Remove User
5. Select the **Add User** tab to create administrator-level users.
- Enter the desired **Username**, conforming to the Username rules as listed below:
 - o Username must be between 2 and 31 characters
 - o Username must start with a lowercase alphabetical character
 - o Username must only contain [a-z] [0-9] [-, _] characters
 - Enter the **Full Name** of the User.
 - Enter the **Password**, conforming to the password security rules as listed below:
 - o Password must be between 8 and 199 characters in length
 - o Password must contain:
 - 1 character from [a-z]
 - 1 character from [A-Z]
 - 1 digit from [0-9]
 - 1 special character from the set [\$%@!&]

- **Re-enter Password** and click **Confirm**.

A user registration form with the following fields: Username (admin), Full Name (admin), Password (masked with dots), and Re-enter Password (masked with dots and a green checkmark). At the bottom are 'Confirm' and 'Cancel' buttons.

RESULT: Pop-up window appears showing the **Operation Status**, click **OK**.

NOTE: defadmin account will be removed the next time you login with the newly-created user and are signed out of all defadmin sessions.

An 'Operation Status' pop-up window with the text: 'New user successfully added. Your defadmin account will be removed the next time you log in with the newly created user and are signed out of all defadmin session(s).' and an 'Ok' button.

6. Navigate back to the main menu by clicking on the **HOME** link located at the upper left corner of the page.

A breadcrumb trail: [Home](#) > [Configure Authentication](#) > Administrator Group Users. Below it is a menu with options: Back, List Users, Add User, Change Password, and Remove User.

7. Select the **Configure Network Interfaces** tab from the main menu.

8. Select the desired network port (**default Net0/192.168.168.81**) which is connected to G500 device from the list.

9. Select the **Static IP Address** tab.

10. Select the **Configure Adapter IP Address** tab.

11. Enter **IP Address** and **Subnet Mask**. Click **Confirm**.

12. Click **Yes** to confirm the newly-configured static IP settings.

NOTE: Reboot the device for changes to take effect.

13. Navigate back to the main menu and select the **Reboot Device** tab.

14. Click **Yes** to confirm and the device is rebooted.

15. Type "YES" and click **Confirm**.

NOTE: Rebooting the device will cause it to disconnect from the network for a few minutes.

RESULT: The device reboot takes place. Click **OK**.

16. Upon G500 reconnect, you can access **MCP Web Interface** remotely via the newly-configured IP Address and a supported web browser. In the supported browser address bar, type in the new G500 device IP.

(ex.: **172.12.222.222**) as shown in figure below:

17. Press the **Enter key** and the **MCP Settings Login** page appears. Login using the newly-created admin username/password and click **Login**. Select the **Configure Time & Time Sync** tab.

18. Select the **Set System Time Zone** tab.

19. Select the **Set Time Zone** tab to configure the G500 to the same time zone as remote PC.

The screenshot shows the 'Gateway Settings' interface. At the top left is the GE logo. To its right is the text 'Gateway Settings'. In the top right corner, it says 'Logged in as: admin' with a green 'Logout' button below it. Below the header, there is a breadcrumb trail: 'Home > Configure Time & Time Sync > Set System Time Zone'. A list of options is displayed in a light gray box: 'Back', 'Show Current Time Zone', 'Set Time Zone' (which is highlighted with a red rectangle), and 'Search Time Zone'.

20. Select the applicable time zone. User can navigate the menu using the **Prev/Next** buttons.

The screenshot shows a dialog box titled 'Choose proper Time Zone File/Directory'. It contains two columns of time zone options. The left column includes: Africa*, Antarctica*, Asia*, Australia*, Canada* (highlighted with a red rectangle), Etc*, Indian*, Pacific*, US*, and right*. The right column includes: America*, Arctic*, Atlantic*, Brazil*, Chile*, Europe*, Mexico*, SystemV*, posix*, and CET. At the bottom right of the dialog are three buttons: 'Prev', 'Next', and 'Cancel'.

21. Select the applicable region within the selected time zone.

This screenshot shows the same 'Choose proper Time Zone File/Directory' dialog box, but with a different set of options. Above the list is the text 'Total number of entries [8] [*]-directories'. The left column of options now includes: Central, Mountain (highlighted with a red rectangle), Pacific, and Yukon. The right column includes: Eastern, Newfoundland, and Saskatchewan. The 'Prev', 'Next', and 'Cancel' buttons are still at the bottom right.

RESULT: The Operation Status dialog shows success message. Click **OK**.

22. Select the **Back** tab.

23. Select the **Set System Clock** tab.

24. A dialog is displayed informing the user to enter a date using the format **YYYY-MM-DD**. Enter **today's date** and select the **Confirm** button.

25. A dialog is displayed informing the user to enter time, using the **24 Hr Format hh:mm:ss**. Enter **remote PC time** and select the **Confirm** button.

A dialog box titled "Enter Time (24 Hr Format) [hh:mm:ss]:" with a text input field containing "06:45:22". Below the input field are two buttons: "Confirm" (blue) and "Cancel" (gray).

RESULT: The Operation Status dialog shows success message. Click **OK**.

An "Operation Status" dialog box showing a success message: "The System time is successfully updated to 2020-02-14 06:45:22.....". At the bottom is a blue "Ok" button.

Logout

To **logout**, click the **Logout** link located at the upper right corner of the page as shown in the figure below.

When you have successfully logged-out of the system, the screen below will be displayed.

NOTE: After 20 minutes of inactivity, the session is automatically timed out and a message will be displayed as shown in below figure. In such cases, either click **OK** and login again or click on any of the links to be redirected to the login page.

G500 Snapshot Compatibility

The below table shows the G500 Snapshot Compatibilities:

FULL "Clone" Snapshot compatibility Configuration+Settings (using DSAS 2.1 or later)		Restore snapshot (Configuration and Settings) <u>to target device:</u>				Restore snapshot (Only Configuration part) <u>to offline device:</u>			
Save snapshot <u>from device:</u>		D400	G500			D400	G500		
		Any version	1.00	1.10	2.00 or later	Any version	1.00	1.10	2.00 or later
D400	<= 5.20	YES ONLY same D400 and same version	N/A	N/A	N/A	YES Direct same version	N/A	N/A	N/A
	5.30 or later	YES ONLY same D400 and same version	N/A	N/A	N/A	YES Direct same version	Indirect Via Create G500	Indirect Via Create G500	Indirect Via Create G500
G500	1.00	N/A	YES ONLY same G500	N/A	YES ANY G500	N/A	YES Direct	Indirect Via Offline Upgrade	Indirect Via Offline Upgrade
	1.10	N/A	N/A	YES ANY G500	YES ANY G500	N/A	N/A	YES Direct	Indirect Via Offline Upgrade
	2.00 or later	N/A	N/A	N/A	YES ANY G500	N/A	N/A	N/A	YES Direct same version

G500 Snapshot Management

Snapshots are an archived image of the G500 configuration created using DS Agile MCP Studio, which include all settings required to completely recover a G500 device. This workflow greatly reduces time when replacing hardware, eliminating the need for additional manual configuration.

Using DS Agile MCP Studio, Snapshots can be restored to the G500 using the **defadmin** default credentials.

Restoring a Snapshot updates the new G500 with the following hardware and software settings as were defined in the original G500, at the time when the snapshot was taken:

1. User Authentication
2. Network Settings
3. Network Interfaces
4. Secure Access
5. Firewall settings
6. Host Names
7. Time settings and time synchronization
8. Local HMI settings - except number of displays and displays resolution which are specific to the G500 being restored
9. Synch Manager
10. Redundancy (except paired keys when the G500 target is already paired as redundant)
11. Emulation of D20 IEC101 DPA Unbalanced Mode and quality event suppression at startup
12. Serial port modes (RS232/485, 2/4 wires)
13. Configuration implemented in MCP Studio:
 - Connections
 - Client and Server Map files
 - System Point Manager
 - Alarms
 - Calculator
 - Data Logger (storage may need to be re-adjusted if the target G500 has different storage sizes)
 - Load Shed
 - Systemwide (storage may need to be re-adjusted if the target G500 has different storage sizes)
 - Access (Local users, Automatic HMI login settings, VPN Client List)
 - ARRM
 - AI Text Enumeration
 - Online Screens
 - Analog Reports
 - IEC61850 Client
 - LogicLinx

Cyber security related certificates are not included in snapshots, and therefore cannot be restored. All certificates must be imported again after the snapshot restore. All secure connections using certificates must be re-associated with the new imported certificates (e.g. Secure Connection Relay, VPN Server, etc.)

License file (key) is not restored with the snapshot.

G500 enrollment in Predix Edge Manager Cloud and associated settings are not restored with the snapshot.

Default Users

G500 from the factory has two default users.

1. **Default Root User – root** (root has all permissions to the G500 but only available via the serial maintenance port).
2. **Default Administrator user – defadmin** (restricted permissions - used for initial setup).

NOTE: There are no other default users on a from factory G500.

Default Root User - root

G500 unit that comes from factory has below default **root** user credentials.

Username: **root**

Password: **geroot**

The default root user is a super user in G500 which can access all the settings and files. The **root** user access is restricted via:

- Front serial maintenance port

NOTE: For Cyber Security reasons, you are required to change this default root password using G500 Local Configuration Utility (**MCP Settings GUI**).

Warning: The User is responsible for the new root password. There is no back door, if lost, a factory reset is required to recover a unit. Contact customer support for a Return Materials Authorization (RMA) estimate.

Default Administrator User – defadmin

G500 unit that comes from factory has below default administrator(**defadmin**) user credentials.

Username: **defadmin**

Password: **defadmin**

G500 supplies a temporary default administrator user with limited access for initial hardware configuration. This **defadmin** user can perform only limited set of operations.

The default administrator (defadmin) user cannot perform other settings or gateway configuration changes, any operational workflows and login to runtime HMI. The default administrator (defadmin) user is intended to perform only below operations.

- To change or configure IP address to front and rear ethernet ports
- To add a nominated administrator-level user(s)

- To restore G500 Snapshots

Warning: The default administrator (**defadmin**) user will be deleted automatically once a nominated administrator user is created successfully. The local root user is required to recover the new administrator user if the credentials are lost.

Getting Started

Refer to G500 Substation Gateway Instruction Manual (*GE Vernova Part Number 994-0152*) for details about powering up the G500. Once the G500 is powered up, use the below workflow(s) to prepare the G500 for operation.

1. Minimum setup for a new G500 without a pre-existing **Snapshot**:

- [Task 1: Connect to the G500](#)
- [Task 2: Create a New Administrator User](#)
- [Task 3: Set the IP Address](#)
- [Task 4: Change the Root Password](#)
- [Task 5: Download existing G500 Configuration](#)

2. To restore an existing G500 Snapshot:

- [Task 1: Connect to the G500](#)
- [Task 2: Restore Snapshot to the G500](#)

NOTE: In the following procedures/workflows, “**Enter**” indicates that the menu item number is typed in and then the Enter key is pressed.

Setup G500 - First Time Setup

Task 1: Connect to the G500

There are three methods to connect to a new G500:

- Local monitor and keyboard via Local KVM interface (Keyboard Video Mouse).
- Using a supported Web Browser, connect to the front maintenance LAN port - default IP address 192.168.168.81
- USB Serial connection via the front USB type B maintenance port.

Connect to G500 via Local KVM GUI

1. Connect the **Display Port** on the rear panel of the G500 to a monitor with a Display cable.
2. Connect a keyboard and mouse to any of the USB ports.
3. Once the G500 device is powered up and has a valid license installed, click on the **G500** name via the taskbar.
4. Click **System Settings**.
5. A default web browser will be opened showing **MCP Settings** Login screen.
Enter the default **Username** (defadmin) and default **Password** (defadmin) and click **Login**.

Connect to G500 via Front Maintenance LAN Port

1. Connect a LAN cable between your computer and the G500 front maintenance LAN port.
 - The PC's network settings will have to be configured to the same subnet as the G500 to establish communications.
2. Using a supported web browser, type the Net0 (default IP 192.168.168.81) into the address bar and press the **Enter key**.
 - The destination port number is 8081 if is required
3. User is required to **confirm security certificate** exception.
4. The **MCP Settings** Login screen is displayed.
Enter the default **Username** (defadmin) and default **Password** (defadmin) and click **Login**.

Connect to G500 via Front Serial USB Maintenance Port

1. Connect a USB 2.0 type B cable to your computer USB port and to the G500 front maintenance port.
NOTE: First time users will have to install all the required Windows USB serial drivers, obtained from GE.
2. Launch the **Secure Terminal Emulator** from the DS Agile Studio folder in the start menu.
3. Select **File** → **Connect** and ensure the Protocol is set to **Serial Port**.
4. Confirm the settings before selecting Connect:
 - Serial Port: Select the simulated G500 serial port
 - Baud rate: **115200**
5. At the G500 command shell login prompt, enter the default admin credentials:
 - Username: **defadmin**
 - Password: **defadmin**

Task 2: Create a New Administrator User

The default administrator (**defadmin**) is restricted to prevent setting or gateway configuration changes. This is to force the creation of a new nominated administrator-level user account to continue the G500 Setup. New administrator-level user account(s) are created using G500 Local Configuration Utility (MCP Settings GUI). After completing this task, the defadmin user is removed automatically.

To create a new administrator-level user account, follow the steps below using Settings GUI.

NOTE: This section is identical between Local and Remote Settings GUI access.

1. Enter the default **Username** (defadmin), default **Password** (defadmin) and click **Login**.

The image shows the MCP Settings login interface. It has a blue background with the GE logo at the top. Below the logo, the text "MCP Settings" is displayed. There are two input fields: the first is for the username, with "defadmin" entered, and the second is for the password, with "defadmin" entered and masked with dots. A green "Login" button is at the bottom.

2. If the defadmin account is used to login, you will be prompted to create an Administrator account to access the full Settings GUI menu. Click **OK**.

The image shows a dialog box titled "Operation Status". The text inside says "Please create an Administrator account in order to access the full mcpcfg menu." There is a blue "Ok" button at the bottom.

3. The **Gateway Settings** main menu appears.
Select the **Configure Authentication** tab from the main menu.

The image shows the Gateway Settings main menu. It has a light gray header with the GE logo and the text "Gateway Settings". In the top right corner, it says "Logged in as: defadmin" with a green "Logout" button. Below the header, there are three menu items: "Configure Authentication" (highlighted with a red box), "Configure Network Interfaces", and "Reboot Device" (highlighted with a red background).

4. Select the **Administrator Group Users** tab from the Configure Authentication menu.

This function is used to perform the following actions:

- List Users
 - Add User
 - Change Password
 - Remove User
5. Select the **Add User** tab to create administrator-level users.
- Enter the desired **Username**, conforming to the Username rules as listed below:
 - o Username must be between 2 and 31 characters.
 - o Username must start with a lowercase alphabetical character.
 - o Username must only contain [a-z][0-9][-,_] characters.
 - Enter the **Full Name** of the User.
 - Enter the **Password**, conforming to the password security rules as listed below:
 - o Password must be between 8 and 199 characters in length.
 - o Password must contain:
 - 1 character from [a-z]
 - 1 character from [A-Z]
 - 1 digit from [0-9]
 - 1 special character from the set [\$%@!&]

- **Re-enter Password** and click **Confirm**.

A user registration form with four input fields: Username (containing 'admin'), Full Name (containing 'admin'), Password (containing seven dots), and Re-enter Password (containing seven dots and a green checkmark on the right). At the bottom right are two buttons: 'Confirm' (blue) and 'Cancel' (grey).

Username
admin

Full Name
admin

Password
.....

Re-enter Password
..... ✓

Confirm Cancel

RESULT: Pop-up window appears showing the **Operation Status**, click **OK**.

NOTE: defadmin account will be removed the next time you login with the newly created user and are signed out of all defadmin sessions.

A pop-up window titled 'Operation Status'. The text inside reads: 'New user successfully added. Your defadmin account will be removed the next time you log in with the newly created user and are signed out of all defadmin session(s).' At the bottom is a blue button labeled 'Ok'.

Operation Status

New user successfully added.
Your defadmin account will be removed the next time you log in
with the newly created user and are signed out of all defadmin
session(s).

Ok

6. Navigate back to the main menu by clicking on the **HOME** link located at the upper left corner of the page.

NOTE:

- The defadmin user will be deleted automatically once nominated administrator-level user is logged in and all the defadmin opened sessions are logged/signed out.
- The root user is available to recover the new administrator password.

Task 3: Set the IP Address

G500 has the following Network Interfaces, which can be configured independently.

1. Front Network Maintenance Port (Net0).
2. Rear Network Maintenance Ports (Net1-Net6).

Follow the steps below using Settings GUI to set the IP Address of each required port.

Setting IP Address for Front Network Maintenance Port (Net0)

1. Go to the **Settings GUI** main menu by clicking on the **HOME** link located at the upper left corner of the page.

2. Select the **Configure Network Interfaces** tab from the main menu.

3. Select the Network port Net0 (**default IP 192.168.168.81**) which is connected to G500 device from the list.

4. Select the **Static IP Address** tab.

Home > Configure Network Interfaces > Net0

Back
Current Configuration
Static IP Address
Dynamic Address
Network Zone
VLAN
Remove Configuration

5. Select the **Configure Adapter IP Address** tab.

Home > Configure Network Interfaces > Net0 > Static IP Address

Back
Configure Adapter IP Address
Configure Active IP Address (optional for non redundant units, required for redundancy)
Configure Alias IP Address (optional, for IP on alternate subnet)

6. Enter **IP Address** and **Subnet Mask**. Click **Confirm**.

IP Address: 172.12.222.222

Subnet Mask: 255.255.0.0

Confirm Cancel

Click **Yes** to confirm the newly configured static IP settings.

NOTE: Reboot the device for changes to take effect.

Confirm

Newly configured static IP settings

IP Address is: 172.12.222.222

Netmask is: 255.255.0.0

Broadcast Address is: 172.12.255.255

For these settings to take effect, reboot

Do you wish to accept this?

7. Navigate back to the main menu and select the **Reboot Device** tab.

 Gateway Settings

Logged in as: defadmin

Configure Authentication

Configure Network Interfaces

Reboot Device

8. Click **Yes** to confirm and the device is rebooted.

Confirm

Do you want to reboot this device?

9. Type **"YES"** and click **Confirm**.

NOTE: Rebooting the device will cause it to disconnect from the network for a few minutes.

A confirmation dialog box titled "Confirm". It asks "Do you want to reboot this device?". Below the question is a yellow warning triangle icon and a red text message: "Rebooting this device will cause it to disconnect from the network for a few minutes." Below this is a text input field with the label "Type 'YES' to confirm:" and the text "YES" entered. At the bottom right are two buttons: "Confirm" (blue) and "No" (grey).

RESULT: The device reboot takes place. Click **OK**.

An "Operation Status" dialog box. It contains the text "The device is now rebooting. Please log in again in a few minutes." and a large blue "Ok" button at the bottom.

Setting IP Address for Rear Network Ports (Net1-Net6)

1. Go to the **Settings GUI** main menu by clicking on the **HOME** link located at the upper left corner of the page.

A screenshot of the Settings GUI showing a breadcrumb trail: "Home" (highlighted with a red box) > "Configure Authentication" > "Administrator Group Users". Below the breadcrumb is a menu with the following options: "Back", "List Users", "Add User", "Change Password", and "Remove User".

2. Select the **Configure Network Interfaces** tab from the main menu.

A screenshot of the "Gateway Settings" main menu. It features the GE logo and the text "Gateway Settings". In the top right corner, it says "Logged in as: defadmin" with a green "Logout" button. Below this is a list of menu items: "Configure Authentication", "Configure Network Interfaces" (highlighted with a red box), and "Reboot Device" (highlighted with a red background).

3. Select the network interfaces **Net1-Net2** or **Net3-Net4** or **Net5-Net6**.

4. Choose the network mode: **Single** or **Redundant** or **PRP**.
5. Select the specified option as per your requirement and enter the **IP Address** and **Subnet Mask** credentials and select the **Confirm** button to proceed.
6. Navigate back to main menu and select the **Reboot Device** tab.

7. Click **Yes** to confirm and the device is rebooted.

8. Type **"YES"** and click **Confirm**.

NOTE: Rebooting the device will cause it to disconnect from the network for a few minutes.

RESULT: The device reboot takes place. Click **OK**.

Task 4: Change the Root Password

1. Go to the **Settings GUI** main menu by clicking on the **HOME** link located at the upper left corner of the page.
2. Click **Root Administrator Settings** tab.

3. Click **Change Root Password** to change the password associated with the system root user account.

4. Change Password:
 - Password cannot contain the user's account name or parts of the user's full name that exceed two consecutive characters.
 - Password must be at least 8 characters in length.
 - Password must contain characters from all the following four categories:
 - o At least 1 character from [a-z]
 - o At least 1 character from [A-Z]
 - o At least 1 digit from [0-9]
 - o At least 1 special character from set [\$%@!&]

- **Re-enter** password.

**NOTICE**

The root user's password should be defined and securely stored by the system administrator; This is crucial information. **No method is available for recovery** outside the factory.

Task 5: Download existing G500 Configuration

Follow the steps below to download the G500 project in DS Agile Studio:

1. Launch **DS Agile MCP Studio**.

Connect to the G500 from the front ethernet port (default: 192.168.168.81). See [Task 3](#).

Login with the new nominated administrator user and password. See [Task 2](#).

2. Select the desired G500 configuration and select the **Sync To** button. Follow the steps as prompted on the screen.

Converting D400 configuration to G500

DS Agile MCP Studio can restore D400 archives created in **SGConfig**.

D400 devices with v530 configuration can be directly converted to G500. Previous D400 versions need to be first upgraded to v530 using the D400 Upgrade Manager. Launch DS Agile MCP Studio.

1. If you need to obtain the D400 configuration from an existing operational unit - connect to D400 device and use **Sync From** to upload the configuration.
Alternatively, select the existing D400 offline configuration to be converted.
2. With the D400 device selected, select the **Create G500** button in the menu. Follow the prompts.
3. When the conversion is complete, the new configuration can be saved and downloaded to the G500 using the **Sync To** option.

Setup G500 - With a Snapshot

Task 1: Connect to the G500

1. Connect a **LAN cable** between your computer and the G500 front maintenance LAN port.
2. Launch command prompt and use the command **ping 192.168.168.81** to ensure the G500 is connected.
 - The PC's network settings should be configured to the same subnet as the G500 to establish communications.

Task 2: Restore Snapshot to the G500

1. Launch the **DS Agile MCP Studio** on the local configuration PC.
2. Restore your G500 snapshot to a device in a project in DS Agile MCP Studio (**Archive > Restore Snapshot to Device**).
3. Edit the IP address in the projects device properties to match the default G500: 192.168.168.81
4. Select this device, initiate **Synch To Device > Restore Snapshot to Device**.
5. Select all Restore options
 - Restore Configuration Data
 - Restore Network Settings
 - Restore information required to clone a device
6. If used, enter the Optional Password - This is the password selected when saving the snapshot, not the password on the G500. This feature will verify the Snapshots authenticity, but not prevent the Snapshot sync if lost.
7. Login with the default admin user:
 - Username: defadmin
 - Password: defadmin

Refer to **DS Agile Studio User Manual** for more details. Follow the steps as prompted on the screen.

Result: After successfully restoring the snapshot, the G500 will restart and finish applying the changes. G500 runs with the same settings and configuration created for previous snapshot.

You can now change the Projects device properties IP address set in **Step 3** as desired.

Checking Licenses

G500 units are factory licensed.

To check the provided licenses, two workflows are provided:

1. [Shell access-based workflow \(read only\)](#)
2. [DSAS Based Workflow](#)

Shell access-based workflow (read only)

For G500,

1. Start a **terminal session** and log into the G500 with an Administrator-level or root user account.
2. At the G500 #>> prompt, enter the following commands:
 - `cd /home/MCP_APPS/`
 - `sudo ./swlic-report`

Result: The application output shows the G500 ownership information and a list of available features.

Each item under **Application License** represents an application or feature that can be licensed.

They are shown in the format: *Application ID number: Description of feature | License status*

If the G500 unit does not contain a license file, perform the following steps:

1. Start a **terminal session** and log into the G500 with an Administrator-level or root user account.
2. At the G500 #>> prompt, enter the following commands:
 - `cd /home/MCP_APPS/`
 - `sudo ./swlic-info`
3. Provide the information shown to GE Vernova Technical Support.

Refer to MCP Software Configuration Guide (*GE Vernova Part Number SWM0101*) for additional details.

For D2X function inside G500,

1. Start a **terminal session** and log into the G500 with an Administrator-level or root user account.
2. At the G500 #>> prompt, enter the following commands:
 - `cd /home/MCP_APPS/`
 - `sudo ./d2xswlic-report`

Result: The application output shows the D2X license information and a list of available features – if present.

Each item under **Application License** represents an application or feature that can be licensed.

They are shown in the format: Application ID number: Description of feature | License status

```

002 : Advanced Automation Applications	Unlocked

If the G500 unit does not contain a D2X license file and you wish to obtain one, perform the following steps:

1. Start a **terminal session** and log into the G500 with an Administrator-level or root user account.
2. At the G500 `#>>` prompt, enter the following commands:
 - `cd /home/MCP_APPS/`
 - `sudo ./d2xswlic-info`
3. Provide the information shown to GE Vernova Technical Support.

Refer to MCP Software Configuration Guide (*GE Vernova Part Number SWM0101*) for additional details.

DSAS Based Workflow

Users have the possibility to **read/extract/apply** licenses to G500 using the Licensing option available in the DSAS Configuration Tool. Same screen and workflow applies to both MCP and D2x Licenses.

To access these options:

1. Open **Device Properties** for your DSAS offline device in your project. If one was not created, follow the normal workflow to create one.
2. Go to the **Licensing** Tab.
3. Under **License Management**, there are the following buttons:
 - a. [Read License](#)
 - b. [Extract License](#)
 - c. [Apply License](#)
 - d. [Refresh License Information](#)
4. When the user clicks on any of the buttons, a login dialog is prompted to connect to G500 with **Administrator privileges** (this role is required to access any of the licensing information).
5. After successful authentication, the user is authorized to access the license information. If the user stays within this tab, subsequent button actions will not prompt again to login.

Read License

This option displays the license information of the live target unit (connected G500 device), for both MCP and D2x (if present) licenses, and regardless of the selected function.

Displayed information may be copied to the Windows Clipboard with regular actions (mouse click and drag or CTRL+A to select, right-click or CTRL+C to copy).

License Information Utility V01.000

=====

Target Unit : MCP-D
 Hardware Identifier :
 License File : Does not exist

OK Cancel

Extract License

This option allows user to extract the current license file from the live target unit to a specified PC location, for example to archive a copy.

The extracted license file is saved as a *.key file (default name is license but can be changed as desired).

This applies to both MCP and D2x licenses (if present).

Apply License

This option allows user to apply a compatible license key, from a location in the PC, to the live target unit.

NOTE: The live target unit is restarted at the end of this process, not immediately, and only if a hardware compatible license file was selected.

When browsing for the license files, user must select the folder containing one or more license files. The action does not include sub-folders of the selection.

In the resulting dialog only the license files (any filename) that match the Hardware Identifier of the live target unit are displayed for selection. This is the reason why users must first login to the live device as Administrators.

Both MCP and D2x license files are shown, the D2x ones typically end in -D (if present).

Maximum one MCP and one D2x license can be selected at same time.

If multiple licenses of same type are selected a dialog prompts the user to re-select.

Results in:

Or:

Results in:

If the selected folder has no license compatible with the connected live unit, an information dialog is presented to this effect:

If a valid license file has been selected, it will be applied and the device restarts.

The workflow to apply a license can be cancelled at any time before selecting a valid license and click **OK**.

Refresh License Information

Refresh License information should be used only when license.key file has been deployed to target device outside of DSAS and the device was not yet restarted - causing DSAS to not be able to read the license information.

MCP Runtime HMI

MCP Runtime Human Machine Interface (HMI) is available to view the real time information on G500. With the HMI, a user has the option to monitor the status of a substation network, view data, execute control commands and change the system set-up.

MCP Runtime HMI is available on a local monitor (via the display ports on the rear panel of the G500) and on remote PC's as a standalone application.

The remote MCP Runtime HMI runs as a standalone application.

Install MCP Runtime HMI

The remote MCP Runtime HMI requires **Windows x64** bit OS. This is available via GE Vernova support channels and consists of a single installation file named **SetupMCPHMI_x64_v.abc.exe** – where **abc** represents the version (this must match your G500 firmware version).

Note: Installation of Java/JRE on the Windows PC is not required.

To install the MCP Runtime HMI:

1. Run the **SetupMCPHMI_x64_vabc.exe** install file.
2. Select **OK** at the Windows security prompt.
3. Select **Next** in the installation wizard.
4. Select **Finish** to complete the install.
5. Launch the MCP HMI from the Start Menu or open from the install folder.

Install Location: C:\Program Files\MCP Runtime HMI\abc\MCPHMI_x64_vabc.exe

Refer to MCP Software Configuration Guide (*GE Vernova Part Number SWM0101*) for more details.

Accessing Remote HMI

1. Double-click the **MCPHMI_x64_v4.0.exe** file <shortcut> or launch from the start menu.
2. Enter the **IP address** of the G500 ([assigned in Task 3](#)).
 - The TCP port of the MCP HMI is always 443. If you need to use a different TCP port, due to the routing rules existing between the PC and G500, you may enter it in the form of IP: TCP, for e.g. 10.10.11.50:30500
3. Login with the user credentials created in [Task 2: Create a New Administrator User](#).
4. Click **Login**.

NOTE: Users can be assigned with different HMI access levels. Refer to MCP Software Configuration Guide (*GE Vernova Part Number SWM0101*) for additional details.

Remote HMI Auto Login

By customizing a MCP Runtime HMI shortcut, the user can predefine the Login User, IP Address, or Remote Port.

1. Locate the MCP Runtime HMI shortcut.
2. Copy the shortcut to the desktop, or a desired location, or pin it to Taskbar or Start Menu.
3. Right-click on the shortcut and select **Properties**.
4. Add the below parameters to the shortcut at the location **Target** as shown in the below table:

Target Parameters	Shortcut Target content
IP Address	C:\Program Files\MCP Runtime HMI\4.0\MCPHMI_x64_v4.0.exe - host 192.168.168.81
IP address & Port (e.g. for local port re-direct) Default port is 443	C:\Program Files\MCP Runtime HMI\4.0\MCPHMI_x64_v4.0.exe - host 127.0.0.1 -port 30500
Only Username	C:\Program Files\MCP Runtime HMI\4.0\MCPHMI_x64_v4.0.exe - username admin1
Shortcut with All Parameters	C:\Program Files\MCP Runtime HMI\4.0\MCPHMI_x64_v4.0.exe - host 192.168.168.81 -port 30500 -username admin1

Note: The shortcut properties will display the updated **Target** data that launches the HMI with the IP and pre-defined Username.

5. Double-click the newly created shortcut to launch the MCP Runtime HMI using the parameters configured in the Target.

Accessing Local HMI

1. Local HMI starts automatically when a monitor is connected to the MCP display port on startup.
If the G500 is configured for **Auto Login**, then the MCP Home Page is launched with the configured user privileges on startup.
2. When prompted, login with the user credentials created in [Task 2: Create a New Administrator User](#).
3. Click **Login**.

NOTICE

When you have finished your work, it is suggested to logout from the G500 Local HMI to secure the system. Logging out terminates the respective user session with the G500 and closes all G500 Local HMI displays and windows.

The internal G500 alarm buzzer or alarm audio output is active only when the Local HMI runs. Create a default auto logged on Observer user if the internal alarm buzzer is required to operate in an un-attended mode, and to ensure the Local HMI is not shut down.

Configure Screen Layout

1. Screen Layout and resolutions may be configured using the Screen Layout utility in the Local HMI.
2. The utility can be launched from the Local HMI start menu using **Start → System → ScreenLayout**.
3. The minimum resolution supported in the Local HMI is 1280 x 1024 and the recommended resolution is FHD (1920 x 1024) or higher.

Configuring Monitor Layout

Multiple monitors can be connected to MCP via display ports (G500 only).

When a single monitor is connected, the connected monitor becomes the Primary.

When 2 two monitors are connected to the G500, by default, the monitor connected to display port (labelled as DP 1, at the rear side of the device) becomes Primary. And the monitor connected to display port (labelled DP 2 at the rear side of the device) becomes extended monitor as shown below.

1. Monitor A - connected to DP 1 (shown as Display Port 1 on Screen Layout).
2. Monitor B - connected to DP 2 (shown as Display Port 0 on Screen Layout).

Refer to MCP Software Configuration Guide (*GE Vernova Part Number SWM0101*) for more details.

Runtime HMI User Preferences

HMI Runtime (Remote/Local) supports the following features. These features are available from the **User** tab of MCP the Power Bar.

Mode of Operation:

- Docked → All windows open within the parent frame.
- Single → A single window is opened at a time in the parent frame, new window replace the previous page.
- Floating → All windows open as independent windows in the desktop area (no parent frame).

Persistency

Windows Persistency is a default feature in Runtime HMI (Remote/Local) which maintains the following independently for each user:

- Persistence of sorting order of the columns, column filters, column width in all the tabular screens or windows.
- Vertical and horizontal re-sizing of all layout boundaries between screen areas of same screen.
- Size and position of all windows in floating mode, except location of child pop up dialogs.

NOTE: Use Reset Persistency option in the Runtime HMI Preferences to clear the persistency state of the windows for the current or all users, or when changing to a lower screen resolution and your persisted windows exceed the screen space. Refer to MCP Software Configuration Guide (*GE Vernova Part Number SWM0101*) for more details.

List of Factory Default Open Ports - TCP and UDP

For more details about the open port numbers and protocols, refer to **SWM0101 Appendix H**.

Additional Documentation

Modification Record

Version	Revision	Date	Change Description
1.00	0	25 th March, 2019	Created.
	1	11 th June, 2019	Updated the “Default Root User” section.
1.10	0	14 th February, 2020	Updated for G500 V1.10 release. Replaced Initial Setup using mcpcfg to Settings GUI.
	1	4 th March, 2020	Added “List of factory default open ports – TCP and UDP” section.
2.00	0	30 th March, 2020	Added G500 Snapshot Compatibility section.
2.50	0	20 th Sep, 2021	Replaced the GE logo on the first page. Changed the screen showing Maintenance IP to Adapter IP. Updated list of ports.
2.60	0	15 th Nov, 2021	Removed Secret Signature content.
	1	17 th Dec, 2021	Updated “List of factory default open ports – TCP and UDP” section.
3.00	0	30 th Jan, 2023	Added Refresh License Information content in the DSAS based workflow section. Added a reference for SWM0101 Appendix H and removed “List of factory default open ports – TCP and UDP” section.
4.00	0	28 th March, 2024	GE Vernova Logo is added on the first page. In Shell access-based workflow (read only) section: - D2x Legacy is changed to Tejas V Server - Added a sub-section “For D2X function inside G500” Updated DSAS Based Workflow section. Updated MCP Runtime HMI section.
	1	15 th May, 2025	Updated to GE Vernova style. Updated Additional Documentation section. Updated GE Vernova email addresses and phone numbers in Contact Technical Support section.

G100 Substation Gateway

Quick Start Guide

This document applies to G100 v4.00.

Please refer to previous versions of this document for previous G100 releases..

What's in the Box?

Your kit includes the following:

- G100 Substation Gateway
- Wall / Panel mount kit
 - o Wall / panel mounting bracket (quantity 2)

GE VERNOVA

GE Vernova Information

- DIN rail and hardware kit
 - o DIN Rail (quantity 1)
 - o Screws (quantity 6)
 - o Analog DC Input (AI) connector (quantity 1)
 - o Binary Input (DI) connector (quantity 1)
 - o Binary Output (DO) connector (quantity 1)
 - o Power input connector (quantity 1)
 - o IRIG-B input connector (quantity 1)

The Wall / Panel mount kit included in the G100 carton includes 2 wall/panel mount bracket. The 2 wall/panel mount brackets can be optionally attached to the G100 chassis for mounting the G100 to a wall or panel. The brackets are attached to the G100 chassis using the 2 lower M3 screws on the left and right side of the chassis. Refer to G100 Instruction Manual for full installation procedure.

The DIN rail and hardware kit included in the G100 carton includes a DIN rail bracket along with 6 mounting screws. The DIN rail bracket can be optionally attached to the back of the G100 chassis for DIN rail mounting applications. Refer to G100 Instruction Manual for full installation procedure.

Missing Something?

Contact [GE Vernova Customer Service](#) right away and we'll figure it out. Be sure to include your order number and mail address associated with your order.

Prerequisites

- DS-Agile Studio's MCP Studio
- Minimum Windows 7 x64, 10 x64 and 8GB Memory required for DS Agile MCP Studio

G100 Interface Options

The following connection/interface options are available after G100 first powers up.

- Local KVM (Keyboard, Video, Mouse)
- Ethernet port # 1 – Default IP address 192.168.168.81
- Serial port # 4 in RS232 mode, with a baud rate 115200

Setup & Configuration Tools

The following setup & configuration tools are available for the G100.

1. **DS Agile MCP Studio** Offline & Online Editor : To configure the Gateway & SCADA Configuration.
2. **G100 Runtime HMI** (Remote/Local) : To view and control the runtime stats including One-line diagrams and to configure the G100 Settings (e.g. User Management, Automatic Login etc.).
3. **G100 Gateway Settings GUI (or Shell based application)** : To configure G100 system settings and perform the initial G100 setup (e.g. Users, network, serial, time sync etc.).

NOTES:

- The G100 and G500 are part of the same **MCP** (Multifunction Controller Platform) family and share the same applications and workflows.
- Due to this, some options are available in G500 and not available in G100 and are marked as such where applicable (e.g. G500 has 6 Ethernet ports, G100 only 4, etc.). Attempting to configure settings marked as not available in G100 will not result in any changes.
- Sections and figures in this document, various prompts, and menus – refer to MCP, and are applicable to either G100 or G500, unless marked specifically otherwise.

Shell access-based Settings workflow

This document presents Settings workflows based on the Web based Settings GUI interface.

The same settings operations can be performed using a terminal emulator connected to the G100 Shell, either via the serial maintenance port #4 or using an SSH (port 22) connection.

1. Start a terminal session and log into the G100 with an Administrator-level or root user account.
2. At the G100 #>> prompt, enter the following commands:
 - **sudo mcpcfg**

Result: The shell-based settings application starts:

```
=====
Gateway (G500) Settings Menu
=====

0.  Back
1.  Configure Authentication
2.  Configure Network Settings
3.  Configure Network Interfaces
4.  Configure Secure Access
5.  Configure Firewall
6.  Configure Host Names
7.  Configure Time & Time Sync
8.  Reset System Logs
9.  Reset Database Tables
10. Reset File Persistence Data
11. Local HMI
12. Configure Sync Manager
13. Redundancy
14. ARRM
15. Suppress Forced Qualities To Masters
16. Configure Serial Ports

18. EdgeOS Host
19. Clear Chassis Intrusion State
20. Restore Clone Snapshot
21. Restore Factory Default
22. Reboot Device

Enter Your Choice : ( Between 0 and 22 ) : █
```

G100 Gateway Settings GUI

The local G100 settings, including Serial ports, Network configuration, Time settings, Administrators user management etc. are managed using the Gateway Settings GUI.

You can access MCP Settings Web Interface through Local (KVM) or Remote G100 connection. Remote access must be completed using a supported web browser (Internet Explorer, Microsoft Edge, Mozilla Firefox, Google Chrome).

Initial Setup

NOTE: Initial Setup section is identical between Local KVM/Remote access.

1. Enter the default **Username** (defadmin), default **Password** (defadmin) and click **Login**.

2. If the **defadmin** account is used to login, you will be prompted to create an **Administrator** account to access the full Settings GUI menu. Click **OK**.

3. The **Gateway Settings** main menu appears.
- Select the **Configure Authentication** tab from the main menu.

4. Select the **Administrator Group Users** tab from the **Configure Authentication** menu.

This function is used to perform the following actions:

- List Users
 - Add User
 - Change Password
 - Remove User
5. Select the **Add User** tab to create administrator-level users.
- Enter the desired **Username**, conforming to the Username rules as listed below:
 - o Username must be between 2 and 31 characters
 - o Username must start with a lowercase alphabetical character
 - o Username must only contain [a-z] [0-9] [-, _] characters
 - Enter the **Full Name** of the User.
 - Enter the **Password**, conforming to the password security rules as listed below:
 - o Password must be between 8 and 199 characters in length
 - o Password must contain:
 - 1 character from [a-z]
 - 1 character from [A-Z]
 - 1 digit from [0-9]
 - 1 special character from the set [\$%@!&]

- **Re-enter Password** and click **Confirm**.

A user registration form with the following fields: Username (admin), Full Name (admin), Password (masked with dots), and Re-enter Password (masked with dots and highlighted with a green border and a green checkmark). At the bottom are 'Confirm' and 'Cancel' buttons.

RESULT: Pop-up window appears showing the **Operation Status**, click **OK**.

NOTE: defadmin account will be removed the next time you login with the newly-created user and are signed out of all defadmin sessions.

An 'Operation Status' pop-up window with the message: 'New user successfully added. Your defadmin account will be removed the next time you log in with the newly created user and are signed out of all defadmin session(s).' and an 'Ok' button.

6. Navigate back to the main menu by clicking on the **HOME** link located at the upper left corner of the page.

A breadcrumb trail: [Home](#) > [Configure Authentication](#) > **Administrator Group Users**. Below it is a menu with the following items: Back, List Users, Add User, Change Password, and Remove User.

7. Select the **Configure Network Interfaces** tab from the main menu.

8. Select the desired Network port (**default Net1-Net2/192.168.168.81**) which is connected to G100 device from the list.

9. Select the **Current/Edit Configuration** tab.

10. Select the **Net1** tab.

Home > Configure Network Interfaces > Net1-Net2 > Current/Edit Configuration

Back
Net1
Net2

11. Select the **Static IP Address** tab.

Home > Configure Network Interfaces > Net1-Net2 > Current/Edit Configuration > Net1

Back
Current Configuration

Dynamic Address
Network Zone
VLAN
Remove Configuration

12. Select the **Configure Maintenance IP Address** tab.

Home > Configure Network Interfaces > Net1-Net2 > Current/Edit Configuration > Net1 > Static IP Address

Back
Configure Maintenance IP Address
Configure Active IP Address (for redundancy)
Configure Alias IP Address (alternate subnet)

13. Enter **IP Address** and **Subnet Mask**. Click **Confirm**.

IP Address	172.12.222.222
Subnet Mask	255.255.0.0

14. Click **Yes** to confirm the newly-configured static IP settings.

NOTE: Reboot the device for changes to take effect.

Confirm

Newly configured static IP settings

IP Address is: 172.12.222.222

Netmask is: 255.255.0.0

Broadcast Address is: 172.12.255.255

For these settings to take effect, reboot

Do you wish to accept this?

15. Navigate back to the main menu and select the **Reboot Device** tab.

 Gateway Settings Logged in as: defadmin

Configure Authentication

Configure Network Interfaces

Reboot Device

16. Click **Yes** to confirm and the device is rebooted.

Confirm

Do you want to reboot this device?

17. Type **“YES”** and click **Confirm**.

NOTE: Rebooting the device will cause it to disconnect from the network for a few minutes.

A web-based confirmation dialog box titled "Confirm". It asks "Do you want to reboot this device?". Below the question is a yellow warning triangle icon followed by red text: "Rebooting this device will cause it to disconnect from the network for a few minutes." Below this is a text input field with the label "Type 'YES' to confirm:" and the text "YES" entered. At the bottom right are two buttons: "Confirm" (blue) and "No" (grey).

RESULT: The device reboot takes place. Click **OK**.

A web-based status dialog box titled "Operation Status". It contains the text "The device is now rebooting. Please log in again in a few minutes." and a large blue "Ok" button at the bottom.

18. Upon G100 reconnect, you can access **MCP Web Interface** remotely via the newly configured IP Address and a supported web browser. In the supported browser address bar, type in the new G100 device IP (ex.: **172.12.222.222**) as shown in figure below:

19. Press the **Enter key** and the **MCP Settings Login** page appears.
Login using the newly created admin username/password and click **Login**.
Select **Configure Time & Time Sync** tab.

20. Select the **Set System Time Zone** tab.

21. Select the **Set Time Zone** tab to configure the G100 to the same time zone as remote PC.

22. Select the applicable time zone. User can navigate the menu using **Prev/Next** buttons.

Choose proper Time Zone File/Directory

Africa*	America*
Antarctica*	Arctic*
Asia*	Atlantic*
Australia*	Brazil*
Canada*	Chile*
Etc*	Europe*
Indian*	Mexico*
Pacific*	SystemV*
US*	posix*
right*	CET

Prev Next Cancel

23. Select the applicable region within the selected time zone.

Choose proper Time Zone File/Directory

Total number of entries [8] [*]-directories

Central	Eastern
Mountain	Newfoundland
Pacific	Saskatchewan
Yukon	

Prev Next Cancel

RESULT: The Operation Status dialog shows success message. Click **OK**.

Operation Status

Restarting the System Logger : Done
The System time zone is successfully set to
Canada/Mountain.
Please restart Local HMI if it is running

Ok

24. Select the **Back** tab.

The screenshot shows the 'Gateway Settings' interface. The top header includes the GE logo, the title 'Gateway Settings', and a 'Logout' button. The breadcrumb trail is 'Home > Configure Time & Time Sync > Set System Time Zone'. A list of tabs is displayed, with 'Back' highlighted by a red box. Other tabs include 'Show Current Time Zone', 'Set Time Zone', and 'Search Time Zone'.

25. Select the **Set System Clock** tab.

The screenshot shows the 'Gateway Settings' interface. The top header includes the GE logo, the title 'Gateway Settings', and a 'Logout' button. The breadcrumb trail is 'Home > Configure Time & Time Sync'. A list of tabs is displayed, with 'Set System Clock' highlighted by a red box. Other tabs include 'Back', 'Show Time and Current Settings', 'Set System Time Zone', 'Select Time Source', and 'Configure Time Output'.

26. A dialog is displayed informing the user to enter a date using the format **YYYY-MM-DD**. Enter **today's date** and select the **Confirm** button.

The screenshot shows a dialog box with the following content:

Note: The Gateway system time is automatically set to the firmware build time whenever the Gateway reboots and the system time is less than the firmware build time during boot time.

Enter Date[YYYY-MM-DD]:

2020-02-14

At the bottom of the dialog are two buttons: 'Confirm' and 'Cancel'.

27. A dialog is displayed informing the user to enter time, using the **24 Hr Format hh:mm:ss**. Enter **remote PC time** and select the **Confirm** button.

Enter Time (24 Hr Format) [hh:mm:ss]:

06:45:22

Confirm Cancel

A dialog box with a title bar. Inside, there is a text prompt 'Enter Time (24 Hr Format) [hh:mm:ss]:' followed by a text input field containing '06:45:22'. At the bottom right, there are two buttons: 'Confirm' (blue) and 'Cancel' (gray).

RESULT: The Operation Status dialog shows success message. Click **OK**.

Operation Status

The System time is successfully updated to 2020-02-14
06:45:22.....

Ok

A dialog box titled 'Operation Status'. The main text area contains the message 'The System time is successfully updated to 2020-02-14' followed by '06:45:22.....' on the next line. At the bottom, there is a single blue button labeled 'Ok'.

Logout

To **logout**, click the **Logout** link located at the upper right corner of the page as shown in the figure below.

When you have successfully logged-out of the system, the screen below will be displayed.

NOTE: After 20 minutes of inactivity, the session is automatically timed out and a message will be displayed as shown in below figure. In such cases, either click **OK** and login again or click on any of the links to be redirected to the login page.

G100 Snapshot Compatibility

The below table shows the G100 Snapshot Compatibilities, as well as available conversion paths from D400 or G500 to G100:

FULL "Clone" Snapshot compatibility Configuration+Settings (using DSAS 2.1 or later)		Restore snapshot (Configuration and Settings) to target device:				Restore snapshot (Only Configuration part) to offline device:			
Save snapshot from device:		D400	MCP (G500/G100 within same type)			D400	MCP (G500/G100 within same type)		
		Any version	1.00	1.10	2.00 or later	Any version	1.00	1.10	2.00 or later
D400	<= 5.20	YES ONLY same D400 and same version	N/A	N/A	N/A	YES Direct same version	N/A	N/A	N/A
	5.30 or later	YES ONLY same D400 and same version	N/A	N/A	N/A	YES Direct same version	Indirect Via Create MCP	Indirect Via Create MCP	Indirect Via Create MCP
MCP	1.00	N/A	YES ONLY same MCP	N/A	YES ANY MCP	N/A	YES Direct	Indirect Via Offline Upgrade	Indirect Via Offline Upgrade
	1.10	N/A	N/A	YES ANY MCP	YES ANY MCP	N/A	N/A	YES Direct	Indirect Via Offline Upgrade
	2.00 or later	N/A	N/A	N/A	YES ANY MCP	N/A	N/A	N/A	YES Direct same version

G100 Snapshot Management

“Snapshots” are an archived image of the G100 configuration created using DS Agile MCP Studio, which include all settings required to completely recover a G100 device. This workflow greatly reduces time when replacing hardware, eliminating the need for additional manual configuration.

Using DS Agile MCP Studio, Snapshots can be restored to the G100 using the “**defadmin**” default credentials.

Restoring a Snapshot updates the new G100 with the following hardware and software settings as were defined in the original G100, at the time when the snapshot was taken:

1. User Authentication
2. Network Settings
3. Network Interfaces
4. Secure Access
5. Firewall settings
6. Host Names
7. Time settings and time synchronization
8. Local HMI settings – except number of displays and displays resolution which are specific to the G100 being restored
9. Synch Manager
10. Redundancy (except paired keys when the G100 target is already paired as redundant)
11. Emulation of D20 IEC101 DPA Unbalanced Mode and quality event suppression at startup
12. Serial port modes (RS232/485, 2/4 wires)
13. Configuration implemented in MCP Studio:
 - Connections
 - Client and Server Map files
 - System Point Manager
 - Alarms
 - Calculator
 - Data Logger (storage may need to be re-adjusted if the target G100 has different storage sizes)
 - Load Shed
 - Systemwide (storage may need to be re-adjusted if the target G100 has different storage sizes)
 - Access (Local users, Automatic HMI login settings, VPN Client List)
 - ARRM
 - AI Text Enumeration
 - Online Screens
 - Analog Reports
 - IEC 61850 Client
 - LogicLinx

Cyber security related Certificates are not included in snapshots, and therefore cannot be restored. All certificates must be imported again after the snapshot restore. All secure connections using certificates must be re-associated with the new imported certificates (e.g. Secure Connection Relay, VPN Server, etc.).

License file (key) is not restored with the snapshot.

G100 enrollment in Predix Edge Manager Cloud and associated settings are not restored with the snapshot.

Default Users

G100 from the factory has two default users.

1. **Default Root User – root** (root has all permissions to the G100 but only available via the serial maintenance port).
2. **Default Administrator user – defadmin** (restricted permissions - used for initial setup).

NOTE: There are no other default users on a from factory G100.

Default Root User - root

G100 unit that comes from factory has below default **root** user credentials.

User Name: **root**

Password: **geroot**

The default root user is a super user in G100 which can access all the settings and files. The **root** user access is restricted via:

- serial maintenance port

NOTE: For Cyber Security reasons users are required to change this default root password using G100 Local Configuration Utility (**MCP Settings GUI**).

Warning: The User is responsible for the new root password. There is no back door, if lost a factory reset is required to recover a unit. Contact customer support for a Return Materials Authorization (RMA) estimate.

Default Administrator User – defadmin

G100 unit that comes from factory has below default administrator (**defadmin**) user credentials.

User Name: **defadmin**

Password: **defadmin**

G100 supplies a temporary default administrator user with limited access for initial hardware configuration. This **defadmin** user can perform only limited set of operations.

The default administrator (defadmin) user cannot perform other settings or gateway configuration changes, any operational workflows and login to runtime HMI. The default administrator (defadmin) user is intended to perform only below operations.

- To change or configure IP address to ethernet ports

- To add a nominated administrator-level user(s)
- To restore G100 Snapshots

Warning: The default administrator (**defadmin**) user will be deleted automatically once a nominated administrator user is created successfully. The local root user is required to recover the new administrator user if the credentials are lost.

Getting Started

Refer to G100 Substation Gateway Instruction Manual (*GE Vernova Part Number 994-0155*) for details about powering up the G100. Once the G100 is powered up use the below workflow(s) to prepare the G100 for operation.

1. Minimum setup for a new G100 without a pre-existing **Snapshot**:

- [Task 1: Connect to the G100](#)
- [Task 2: Create a New Administrator User](#)
- [Task 3: Set the Network Ports Parameters \(IP Address, SFP\)](#)
- [Task 4: Change the Root Password](#)
- [Task 5: Download existing G100 Configuration](#)

2. To restore an existing G100 Snapshot:

- [Task 1: Connect to the G100](#)
- [Task 2: Restore Snapshot to the G100](#)

NOTE: In the following procedures/workflows, “**Enter**” indicates that the menu item number is typed in and then the Enter key is pressed.

Setup G100 - First Time Setup

Task 1: Connect to the G100

There are three methods to connect to a new G100:

- Local monitor and keyboard via Local KVM interface (Keyboard Video Mouse).
- Using a supported Web Browser, connect to the front maintenance LAN port - default IP address 192.168.168.81
- USB Serial connection via the front USB type B maintenance port.

Connect to G100 via Local KVM GUI

1. Connect the Display Port on the rear panel of the G100 to a monitor with a Display cable.
2. Connect a keyboard and mouse to any of the USB ports.
3. Once the G100 device is powered up and has a valid license installed, click on the **G100** name via the taskbar.
4. Click **System Settings**.
5. A default web browser will be opened showing **MCP Settings Login** screen.
6. Enter the default **Username** (defadmin) and default **Password** (defadmin) and click **Login**.

Connect to G100 via LAN port

1. Connect a LAN cable between your computer and the G100 LAN port configured for maintenance (default is Net 1, but any configured LAN port allowed in the firewall can be used).
2. Using a supported web browser, type the Net 1 default IP 192.168.168.81 into the address bar and press the 'Enter key'.
 - The PC's network settings will have to be configured to the same subnet as the G100 to establish communications.
3. User is required to **confirm security certificate** exception.
4. The **MCP Settings Login** screen is displayed.
5. Enter the default **Username** (defadmin) and default **Password** (defadmin) and click **Login**.

Connect to G100 via Serial Maintenance Port

NOTES:

The default maintenance serial port is enabled, set as # 4, and configured as RS232 at 115,200 bps. Refer to the G100 Substation Gateway Instruction Manual (*GE Vernova Part Number 994-0155*) for RJ45 serial port pinout.

The serial maintenance port can be disabled as following:

- In UEFI for the POST access only. Make sure that UEFI is set to RS232.
- In Settings for Shell access and use by other runtime applications.

If the serial maintenance port is disabled, users can still access the device using either Local KVM or Ethernet ports.

If the serial maintenance port was disabled, and the IP addresses are not known – then access can be done using Local KVM.

Steps:

1. Connect an RS232 cable between your PC and the maintenance serial port of the G100.
2. Launch the **Secure Terminal Emulator** from the DS Agile Studio folder in the start menu.
3. Select **File > Connect** and ensure the Protocol is set to **Serial Port**.
4. Confirm the settings before selecting Connect.
 - Serial Port: Select the PC serial port for the connection to G100
 - Baud rate: **115200**
5. At the G100 command shell login prompt, enter the default admin credentials:
 - Username: **defadmin**
 - Password: **defadmin**

Task 2: Create a New Administrator User

The default administrator (**defadmin**) is restricted to prevent setting or gateway configuration changes. This is to force the creation of a new nominated administrator-level user account to continue the G100 Setup. New administrator-level user account(s) are created using G100 Local Configuration Utility (MCP Settings GUI). After completing this task, the defadmin user is removed automatically.

To create a new administrator-level user account, follow the steps below using Settings GUI.

NOTE: This section is identical between Local and Remote Settings GUI access.

1. Enter the default **Username** (defadmin), default **Password** (defadmin) and click **Login**.

2. If the defadmin account is used to login, you will be prompted to create an Administrator account in order to access the full Settings GUI menu. Click **OK**.

3. The Gateway Settings main menu appears.
Select **Configure Authentication** tab from main menu.

4. Select **Administrator Group Users** tab from the Configure Authentication menu.

This function is used to perform the following actions:

- List Users
- Add User
- Change Password
- Remove User

5. Select the **Add User** tab to create administrator-level users.

- Enter the desired **Username**, conforming to the Username rules as listed below:
 - o Username must be between 2 and 31 characters
 - o Username must start with a lowercase alphabetical character
 - o Username must only contain [a-z] [0-9] [-, _] characters
- Enter the **Full Name** of the User.
- Enter the **Password**, conforming to the password security rules as listed below:
 - o Password must be between 8 and 199 characters in length.
 - o Password must contain:
 - 1 character from [a-z]
 - 1 character from [A-Z]
 - 1 digit from [0-9]
 - 1 special character from the set [\$%@!&]

- **Re-enter Password** and click **Confirm**.

A user registration form with four input fields: Username (containing 'admin'), Full Name (containing 'admin'), Password (containing seven dots), and Re-enter Password (containing seven dots and a green checkmark on the right). Below the fields are two buttons: 'Confirm' (blue) and 'Cancel' (grey).

Username
admin

Full Name
admin

Password
.....

Re-enter Password
..... ✓

Confirm Cancel

RESULT: Pop-up window appears showing the **Operation Status**, click **OK**.

NOTE: defadmin account will be removed the next time you login with the newly-created user and are signed out of all defadmin sessions.

A pop-up window titled 'Operation Status'. It contains a message: 'New user successfully added. Your defadmin account will be removed the next time you log in with the newly created user and are signed out of all defadmin session(s).' At the bottom is a blue button labeled 'Ok'.

Operation Status

New user successfully added.
Your defadmin account will be removed the next time you log in
with the newly created user and are signed out of all defadmin
session(s).

Ok

6. Navigate back to the main menu by clicking on the **HOME** link located at the upper left corner of the page.

NOTE:

- The defadmin user will be deleted automatically once nominated administrator-level user is logged in and all the defadmin opened sessions are logged/signed out.
- The root user is available to recover the new administrator password.

Task 3: Set the Network Ports Parameters (IP Address, SFP)

Network Ports #1 and #2 are always available, #3 and #4 are pluggable SFP.

Each SFP adapter must be configured to match the inserted type.

The default enabled and configured Network port is #1, with 192.168.168.81/24 and can be used as such.

If is required to change the default IP Address, and/or to configure additional network ports, please follow the steps below using Settings GUI.

Setting Network Ports #1 and #2 (embedded ports)

1. If not already in **Home** screen, go the Settings GUI main menu by clicking on the **HOME** link located at the upper left corner of the page. See the screen below.

2. Select **Configure Network Interfaces** tab from the main menu.

Note: This screen will have additional options after a nominated administrator user was created and logged on.

3. Select the network interfaces **Net1-Net2**.

4. Only **Single** mode is supported in G100.
5. Select **Current/Edit Configuration** tab.

Back
Single
Redundant (not available in G100)
PRP (not available in G100)
Current/Edit Configuration

6. Select **Net1** tab (or **Net2** as desired).

Back
Net1
Net2

7. Select **Static IP Address** tab.

Back
Current Configuration
Static IP Address
Dynamic Address
Network Zone
VLAN
Remove Configuration

8. Select **Configure Maintenance IP Address** tab.

Back
Configure Adapter IP Address
Configure Active IP Address (for redundancy)
Configure Alias IP Address (optional, for IP on alternate subnet)

9. Enter **IP Address** and **Subnet Mask**. Click **Confirm**.

A screenshot of a web form for configuring static IP settings. It contains two input fields: 'IP Address' with the value '172.12.222.222' and 'Subnet Mask' with the value '255.255.0.0'. Below the fields are two buttons: 'Confirm' (blue) and 'Cancel' (grey).

Click **Yes** to confirm the newly configured static IP settings.

NOTE: Reboot the device for changes to take effect.

A screenshot of a 'Confirm' dialog box. It displays the newly configured static IP settings: IP Address is: 172.12.222.222, Netmask is: 255.255.0.0, and Broadcast Address is: 172.12.255.255. It also states 'For these settings to take effect, reboot' and asks 'Do you wish to accept this?'. At the bottom are 'Yes' (blue) and 'No' (grey) buttons.

10. Navigate back to main menu and select **Reboot Device** tab.

A screenshot of the 'Gateway Settings' main menu. It features the GE logo, the title 'Gateway Settings', and a 'Logout' button. A sidebar on the left contains three menu items: 'Configure Authentication', 'Configure Network Interfaces', and 'Reboot Device' (which is highlighted in red).

11. Click **Yes** to confirm Reboot the device.

A screenshot of a 'Confirm' dialog box asking 'Do you want to reboot this device?'. It has 'Yes' (blue) and 'No' (grey) buttons at the bottom.

12. Type **"YES"** and click **Confirm**.

NOTE: Rebooting the device will cause it to disconnect from the network for a few minutes.

The dialog box is titled "Confirm". It asks "Do you want to reboot this device?". Below the question is a yellow warning triangle icon and a red text message: "Rebooting this device will cause it to disconnect from the network for a few minutes." Below this is a text input field with the label "Type 'YES' to confirm:" and the text "YES" entered. At the bottom right are two buttons: "Confirm" (blue) and "No" (grey).

RESULT: The device reboot takes place. Click **OK**.

The dialog box is titled "Operation Status". It contains the text: "The device is now rebooting. Please log in again in a few minutes." Below the text is a single blue button labeled "Ok".

Setting Network Ports #3 and #4 (SFP)

The process to configure the IP Address is identical as for Network Ports #1 and #2, with the addition of the SFP selection for #3 and #4.

The G100 must be restarted after changing the SFP type(s).

1. If not already in **Home** screen, go the Settings GUI main menu by clicking on the **HOME** link located at the upper left corner of the page. See the screen below.

The screenshot shows a breadcrumb trail at the top: "Home" (highlighted with a red box), ">", "Configure Authentication", ">", and "Administrator Group Users". Below the breadcrumb is a menu with five items: "Back", "List Users", "Add User", "Change Password", and "Remove User".

2. Select **Configure Network Interfaces** tab from main menu.

Note: This screen will have additional options after a nominated administrator user was created and logged on.

3. Select the network interfaces **Net3-Net4**.

4. Only **Single** mode is supported in G100.
5. Select **Current/Edit Configuration** tab.

6. Select **Net3** tab (or **Net4** as desired).

7. Select **Static IP Address** tab.

Back
Current Configuration
Static IP Address
Dynamic Address
Network Zone
EdgeManager Connectivity Configuration
VLAN
Remove Configuration
SFP Configuration

INFORMATION NOTE: The option “EdgeManager Connectivity Configuration” is available for all network ports except #1 which is reserved for the Predix Edge Technician Console (PETC).

8. Select **Configure Maintenance IP Address** tab.

Back
Configure Adapter IP Address
Configure Active IP Address (for redundancy)
Configure Alias IP Address (optional, for IP on alternate subnet)

9. Enter **IP Address** and **Subnet Mask**. Click **Confirm**.

IP Address	192.168.113.100
Subnet Mask	255.255.255.0
Confirm Cancel	

Click **Yes** to confirm the newly configured static IP settings.

Confirm
Newly-configured static IP settings
IP Address is: 192.168.113.100
Netmask is: 255.255.255.0
Broadcast Address is: 192.168.113.255
For these settings to take effect, reboot
Do you wish to accept this?
Yes No

10. Navigate back to the network edit configuration and select **SFP Configuration**.

Back

Remove Configuration
SFP Configuration

11. Select the option corresponding to the SFP adapter type inserted in the SFP slot for this port.

Current Net3 Settings: Option U:Not Installed
Back
Option C:10/100BASE-TX
Option T:1000BASE-TX
Option F:100BASE-FX
Option S:1000BASE-SX
Option L:1000BASE-LX
Option U:Not Installed

Default option is **U** (not installed).

Select **OK** to acknowledge the selection.

Operation Status
New Net3 Settings: Option T:1000BASE-TX Reboot for these changes to take effect
Ok

12. Navigate back to main menu and select **Reboot Device** tab.

13. Click **Yes** to confirm Reboot the device.

14. Type **"YES"** and click **Confirm**.

NOTE: Rebooting the device will cause it to disconnect from the network for a few minutes.

RESULT: The device reboot takes place. Click **OK**.

Task 4: Change the Root Password

1. Go the Settings GUI main menu by clicking on the **HOME** link located at the upper left corner of the page.
2. Click the **Root Administrator Settings** tab.

3. Click the **Change Root Password** to change the password associated with the system root user account.

4. Change Root Password:
 - Password cannot contain the user's account name or parts of the user's full name that exceed two consecutive characters.
 - Password must be at least 8 characters in length.
 - Password must contain characters from all the following four categories:
 - o Should contain at least 1 character from [a-z]
 - o Should contain at least 1 character from [A-Z]
 - o Should contain at least 1 digit from [0-9]
 - o Should contain at least 1 special character from set [\$%@!&]

- Re-enter password.

NOTICE

The root user's password should be defined and securely stored by the system administrator; This is crucial information. **No method is available for recovery** outside the factory.

Task 5: Download existing G100 Configuration

Follow the below steps to download the G100 project in DS Agile Studio:

1. Launch the **DS Agile MCP Studio**.
2. Connect to the G100 from the ethernet port used for maintenance (default is #1 using 192.168.168.81/24).
See [Task 3](#).
3. Login with the new nominated administrator user and password.
See [Task 2](#).
4. Select the desired G100 configuration and select the **Synch To** button.
Follow the steps as prompted on the screen.

Converting D400 configuration to G100

DS Agile MCP Studio can restore D400 archives created in **SGConfig**.

D400 offline devices with v530 configuration or newer can be directly converted to G100. Previous D400 versions need to be first upgraded to v530 using the D400 Upgrade Manager.

Launch DS Agile MCP Studio.

1. If you need to obtain the D400 configuration from an existing operational unit - connect to D400 device and use **Sync From** to upload the configuration.
Alternatively, select the existing D400 offline configuration to be converted.
2. With the D400 device selected, select the **Create G100** button in the menu. Follow the prompts.
3. When the conversion is complete, the new configuration can be saved and downloaded to the G100 using the **Sync To** option.

Setup G100 - With a Snapshot

Task 1: Connect to the G100

1. Connect a **LAN cable** between your computer and the G100 maintenance LAN port.
The PC's network settings will have to be configured to the same subnet as the G100 to establish communications.

Task 2: Restore Snapshot to the G100

1. Launch the **DS Agile MCP Studio** on the local configuration PC.
2. Restore your G100 snapshot to a device in a project in DS Agile MCP Studio (**Archive > Restore Snapshot to Device**).
3. Edit the IP address in the device properties to match the default G100: 192.168.168.81
4. Select this device, initiate **Synch To Device > Restore Snapshot to Device**
5. Select all Restore options
 - Restore Configuration Data
 - Restore Network Settings
 - Restore information required to clone a device

6. If used, enter the Optional Password – This is the password selected when saving the snapshot, not the password on the G100. This feature will verify the Snapshots authenticity and allow restoration of confidential data from the snapshot image (if was saved when the snapshot was created).
7. Login with the default admin user:
 - Username: defadmin
 - Password: defadmin

Refer to **DS Agile Studio User Manual** for more details. Follow the steps as prompted on the screen.

Result: After successfully restoring the snapshot, the G100 will restart and finish applying the changes. G100 runs with the same settings and configuration created for previous snapshot.

You can now change the Projects device properties IP address set in **Step 3** as desired, to match the restored configuration running in G100.

Checking Licenses

G100 units are factory licensed.

To check the provided licenses, two workflows are provided:

1. [Shell access-based workflow \(read only\)](#)
2. [DSAS based workflow](#)

Shell access-based workflow (read only)

For G100:

1. Start a **terminal session** and log into the G100 with an Administrator-level or root user account.
2. At the G100 #>> prompt, enter the following commands:
 - `cd /home/MCP_APPS/`
 - `sudo ./swlic-report`

Result: The application output shows the G100 ownership information and a list of available features.

Each item under **Application License** represents an application or feature that can be licensed.

They are shown in the format: Application ID number: Description of feature | License status

Container License             Status
=====
No container licenses found

```

If the G100 unit does not contain a license file, perform the following steps:

1. Start a **terminal session** and log into the G100 with an Administrator-level or root user account.
2. At the G100 #>> prompt, enter the following commands:
 - cd /home/MCP_APPS/
 - sudo ./swlic-info
3. Provide the information shown to GE Vernova Technical Support.

Refer to MCP Software Configuration Guide (*GE Vernova Part Number SWM0101*) for more details.

For D2X function inside G100:

NOTICE

D2x License files can be deployed to G100 v4.00 – however the D2x functionality is not present in G100 v4.00.

DSAS based workflow

Users have the possibility to **read/extract/apply** licenses to G100 using the Licensing option available in the DSAS Configuration Tool. Same screen and workflow applies to both MCP and D2x Licenses.

To access these options:

1. Open **Device Properties** for your DSAS offline Device in your Project. If one was not created, please follow the normal workflow to create one.
2. Go to the **Licensing** tab.

3. Under License Management there are the following buttons:
 - a. [Read License](#)
 - b. [Extract License](#)
 - c. [Apply License](#)
 - d. [Refresh License Information](#)
4. When user clicks on any of the buttons, a login dialog is prompted to connect to G100 with **Administrator privileges** (this role is required to access any of the licensing information).
5. After successful authentication, user is authorized to access the license information. If the user stays within this tab, subsequent button actions will not prompt again to login.

For D2X function inside G100:

NOTICE

D2x License files can be deployed to G100 v4.00 – however the D2x functionality is not present in G100 v4.00.

Read License

This option displays the license information of the live target unit (connected G100 device), for both the MCP and D2x (if present) licenses, and regardless of the selected function.

Displayed information may be copied to the Windows Clipboard with regular actions (mouse click and drag or CTRL+A to select, right click or CTRL+C to copy).

The screenshot shows the 'MCP Properties' dialog box with the 'License Management' tab selected. The 'Model Number' is 'G100-AAL-DA-4TTUU-DUU-D0094-S-UUUUUUUU'. The 'MCP Licensed applications' section shows a list of applications with checkboxes, all of which are checked except for 'Remote Desktop HMI'. The 'License Management' section includes buttons for 'Read License', 'Extract License', 'Apply License', and 'Refresh License Information'. Below these buttons, the 'License Report Utility v01.000' displays the following information:

Target Unit : MCP
Hardware Identifier : [REDACTED]
License File : (Good)

License Information

Target Unit : MCP
Serial Number : [REDACTED]
Customer : [REDACTED]
License created from : License Utilities V1.0.4

Application License	Status
000 : MCP Core	Unlocked
001 : Remote Desktop HMI	Unlocked
002 : ARRM	Unlocked
004 : 61850 Client	Unlocked
008 : 61850 Server	Unlocked
016 : LogicLinx	Unlocked
064 : TEJAS V Server	Unlocked

Container License Status

No container licenses found

System Information

License Information Utility V01.000

Target Unit : MCP-D
Hardware Identifier : [REDACTED]
License File : (Good)

License Report Utility v01.000

OK Cancel

Extract License

This option allows user to extract the current license file from the live target unit to a specified PC location, for example to archive a copy.

The extracted license file is saved as a *.key file (default name is license but can be changed as desired).

This applies to both MCP and D2x licenses (if present).

Apply License

This option allows user to apply a compatible license key, from a location in the PC, to the live target unit.

NOTE: The live target unit is restarted at the end of this process, not immediately, and only if a hardware compatible license file was selected.

When browsing for license files, user must select the folder containing one or more license files. The action does not include sub-folders of the selection.

In the resulting dialog only license files (any filename) that match the Hardware Identifier of the live target unit are displayed for selection. This is the reason why users must first login to the live device as Administrators.

Both MCP and D2x license files are shown, the D2x ones typically end in -D (if present).

Maximum one MCP and one D2x license can be selected at same time.

If multiple licenses of same type are selected a dialog prompts the user to re-select.

Results in:

Or:

Results in:

If the selected folder has no license compatible with the connected live unit, an information dialog is presented to this effect:

If a valid license file has been selected it will be applied and the device restarts:

The workflow to apply a license can be cancelled at any time before selecting a valid license and click **OK**.

Refresh License Information

Refresh License Information should be used only when license.key file has been deployed to target device outside of DSAS and the device was not yet restarted - causing DSAS to not be able to read the license information.

Read the G100 Order Code

To know the Order Code of your G100, run **mcpsi** command through the Shell access.

“As-Built” is the order code at factory build time.

“As-Is” is the order code at the time when the user runs the command.

In the example below, after the unit was built in the factory, there were added and configured two Fiber Optic SFP (F) and a D.20 PCIe card (D), and the firmware version was upgraded to 4.00.

Starting with version 4.00 the G100 Order Code contains additional digits at the end for D2x tracking. Refer to MCP Software Configuration Guide (*GE Vernova Part Number SWM0101*) for more details.

```
admin@G100:~$ mcpsi
Retrieving the GE Multilin MCP system information, please wait ...
=====
                        GE Multilin MCP System Information
=====
Model Number:
    As-Built:      G100-AAL-DA-4TTUU-UUU-B2022-UU
    As-Is   :      G100-AAL-DA-4TTFF-DUU-D0070-S-UUUUUUU
```

G100 as D2x Function

This is not available in V4.00

Visit the online store for application licenses ordering codes. For latest configuration and options, please visit the online store and search for G100:

<https://store.gegridsolutions.com/Home.aspx>

UEFI Settings checks

Refer to Configuring UEFI Settings on G100 User Guide (*GE Vernova Part Number SWM0122*) for details.

G100 device has the following UEFI settings

These UEFI settings are applicable only while the G100 is starting.

After the applications started, these settings are over-written by the values configured in *MCP Local Configuration Utility (mcpcfg)* or *MCP Settings GUI*.

- Default Serial Maintenance Port used as UEFI (boot) console when KVM is not available (Advanced->Serial Port Console Redirection).
 - o Console Redirection is set to Disabled for COM1-COM3, please do not change these settings.
 - o Console Redirection for COM4 should be enabled/disabled and have the “Bits per second”, to be same as in the Serial Maintenance Port in MCP Studio (refer to MCP Software Configuration Guide (*GE Vernova Part Number SWM0101*) for more details.
- Default Serial Ports Modes (Advanced->Super IO Configuration)
 - o Ensure are enabled/disabled as required for secure hardening purposes and set to RS-232.

MCP Runtime HMI

MCP Runtime Human Machine Interface (HMI) is available to view real time information on G100. With the HMI a user has the option to monitor the status of a substation network, view data, execute control commands and change the system set-up.

The MCP Runtime HMI is available on a local monitor (via the display ports on the rear panel of the G100) and on remote PC's as a standalone application.

The Local Runtime HMI (KVM) is already installed in the G100.

The remote MCP Runtime HMI runs as a standalone application.

Install MCP Runtime HMI

The remote MCP Runtime HMI requires **Windows x64** bit OS. This is available via GE Vernova support channels and consists of a single installation file named **SetupMCPHMI_x64_v.abc.exe** – where **abc** represents the version (this must match the G100 firmware version).

Note: Installation of Java/JRE on the Windows PC is not required.

To install the MCP Runtime HMI:

1. Run the **SetupMCPHMI_x64_vabc.exe** install file.
2. Select **OK** at the Windows security prompt.
3. Select **Next** in the installation wizard.
4. Select **Finish** to complete the install.
5. Launch the MCP HMI from the Start Menu or open from the install folder.

Install Location: C:\Program Files\MCP Runtime HMI\abc\MCPHMI_x64_vabc.exe

Refer to MCP Software Configuration Guide (*GE Vernova Part Number SWM0101*) for more details.

Accessing Remote HMI

1. Double click the **MCPHMI_x64_v4.0.exe** file <shortcut> or launch from the start menu.
2. Enter the **IP address** of the G100 ([assigned in Task 3](#)).
 - The TCP port of the MCP HMI is always 443. If you need to use a different TCP port, due to routing rules existing between the PC and G100, you may enter it in the form of IP: TCP, for e.g. 10.10.11.50:30500
3. Login with the user credentials created in [Task 2: Create a New Administrator User](#).
4. Click **Login**.

NOTE: Users can be assigned with different HMI access levels. Refer to MCP Software Configuration Guide (*GE Vernova Part Number SWM0101*) for more details.

Remote HMI Auto Login

By customizing a MCP Runtime HMI shortcut the user can predefine the login User, IP Address, or Remote Port.

1. Locate the MCP Runtime HMI shortcut.
2. Copy the shortcut to the desktop, or a desired location, or pin it to Taskbar or Start Menu.
3. Right click on the shortcut and select **Properties**.

4. Add the below parameters to the shortcut at the location **Target** as shown in the below table:

Target Parameters	Shortcut Target content
IP Address	C:\Program Files\MCP Runtime HMI\4.0\MCPHMI_x64_v4.0.exe -host 192.168.168.81
IP address & Port (e.g. for local port re-direct)	C:\Program Files\MCP Runtime HMI\4.0\MCPHMI_x64_v4.0.exe -host 127.0.0.1 -port 30500
Only User Name	C:\Program Files\MCP Runtime HMI\4.0\MCPHMI_x64_v4.0.exe -username admin1
Shortcut with All Parameters	C:\Program Files\MCP Runtime HMI\4.0\MCPHMI_x64_v4.0.exe -host 192.168.168.81 -port 30500 -username admin1

Note: The shortcut properties will display the updated **Target** data launches the HMI with the IP and pre-defined Username.

5. Double click the newly created shortcut to launch the MCP Runtime HMI using the parameters configured in the Target.

Accessing Local HMI

1. Local HMI starts automatically when a monitor is connected to the MCP display port on startup.
If the G100 is configured for **Auto Logon**, then the MCP Home Page is launched with the configured user privileges on startup.
2. When prompted, login with the user credentials created in [Task 2: Create a New Administrator User](#).
3. Click **Login**.

NOTICE

When finished your work it is suggested to logout from the G100 Local HMI to secure the system. Logging out terminates the respective user session with the G100 and closes all G100 Local HMI displays and windows.

The internal G100 alarm buzzer is active only when the Local HMI runs. Create a default auto logged on Observer user if the internal alarm buzzer is required to operate in un-attended mode, and ensure the Local HMI is not shut down.

Configure Screen Layout

1. Screen Layout and resolutions may be configured using Screen Layout utility in the Local HMI.
2. The utility can be launched from Local HMI start menu using **Start > System > ScreenLayout**.
3. The minimum resolution supported in Local HMI is 1280x1024 and the recommended is FHD (1920x1080 or higher).

Configuring Monitor Layout

G100 Local HMI supports up to 1 monitor using its display port Display Port.

Refer to MCP Software Configuration Guide (*GE Vernova Part Number SWM0101*) for more details.

Runtime HMI User Preferences

HMI Runtime (Remote/Local) supports the following features. These features are available from the **User** tab of the Power Bar.

Mode of Operation

- Docked → all windows open within the parent frame.
- Single → A single window is opened at a time in the parent frame, new windows replace the previous page.
- Floating → All windows open as independent windows in the desktop area (no parent frame).

Persistency

Windows Persistency is a default feature in Runtime HMI (Remote/Local) which maintains the following independently for each user:

- Persistence of sorting order of the columns, column filters, column width in all the tabular screens or windows.
- Vertical and horizontal re-sizing of all layout boundaries between screen areas of same screen.
- Size and position of all windows in floating mode, except location of child pop up dialogs.

NOTE: Use Reset Persistency option in the Runtime HMI Preferences to clear the persistency state of the windows for the current or all users, or when changing to a lower screen resolution and your persisted windows exceed the screen space. Refer to MCP Software Configuration Guide (*GE Vernova Part Number SWM0101*) for more details.

List of factory default open ports – TCP and UDP

For more details about the open port numbers and protocols, refer to **SWM0101 Appendix H**.

Additional Documentation

For further information about the G100, refer to the following documents:

- *G100 Substation Gateway Instruction Manual (994-0155)*
 - *MCP Software Configuration Guide (SWM0101)*
 - *Configuring UEFI Settings on G100 User Guide (SWM0122)*

Modification Record

Version	Revision	Date	Change Description
1.00	0	11 th May, 2021	Created.
	1	18 th May, 2021	Added UEFI Settings checks
3.00	0	30 th March, 2023	Added Redundancy in G100 Snapshot Management Section. Modified a screenshot in Task 3 and Setting Network Ports #3 and #4 (SFP) sections. Added Refresh License Information content in the DSAS based workflow section. Added a table reference for SWM0101 Appendix H and removed “List of factory default open ports – TCP and UDP” section. Updated to reflect that UEFI settings are retained even after super cap discharges. Removed Secret Signature.
4.00	0	28 th March, 2024	GE Vernova Logo is added on the first page. In Shell access-based workflow (read only) section: - D2x Legacy is changed to Tejas V Server - Added a Notice for D2x Function inside G100. In DSAS Based Workflow section: - Updated the Read License and Apply License sections with screenshots to show the latest licenses for V4.00 Updated the Read the G100 Order Code section. Updated the MCP Runtime HMI section.
	1	15 th May, 2025	Updated to GE Vernova style. Updated GE Vernova email addresses and phone numbers in Contact Technical Support section.

LogicLinx on a Multilin MCP Gateway Device

Quick Start Guide

LogicLinx* is an automation tool that enables you to create applications that have traditionally been too costly or difficult to implement – without the need for hardwiring. Using any or all the IEC® 61131-3 programming languages, you can create automation routines that run on your Multilin™ MCP gateway device.

NOTE: This document applies to the MCP family (G100/G500) unless otherwise indicated.

Prerequisites

Before you can configure LogicLinx on your Multilin™ MCP gateway device, the following components must be present:

- An MCP gateway device connected to the configuration computer through a serial or Ethernet connection.
- MCP Studio™ V2.3 or higher with LogicLinx Wizard add-in installed on the configuration computer.
- LogicLinx editor installed on the configuration computer.

Differences between the 16-bit and the 32-bit versions of the LogicLinx editor

- The 16-bit version only runs on 32-bit versions of the Windows operating system while the 32-bit version runs on both 32-bit and 64-bit versions of the Windows operating system.
- The 16-bit version requires users to run as administrators while the 32-bit version does not have this constraint.
- The 32-bit version allows users to compare LogicLinx programs in two different devices.
- Instruction language (IL) programs cannot be created or modified in the 32-bit version. Existing programs can be compiled and modified using a text editor.
- Function chart (FC) programs cannot be created or modified in 32-bit version. Existing programs can be compiled.
- Most programs created and modified in the 32-bit version can be opened in the 16-bit version provided they do not exceed the maximums for names, descriptions, and other artefacts of the 16-bit version.
- The user-interface in the 32-bit version is based on Visual Studio. Most of the functions previously available through the toolbar and menus in the 16-bit version are now available using a combination of the Solution Explorer and Properties windows of the 32-bit version.
- The Dictionary in the 16-bit version is now called Global Variables in the 32-bit version.
- Compile and Make operations in the 16-bit version are called Build in the 32-bit version.
- To set the target in the 32-bit version, you need to click on the drop-down in the Solution Explorer.
- To do simulation in the 32-bit version, you need to explicitly select the Simulate target for a program, build it and then switch to Online mode.
- You need to choose 'Online' mode to start real-time debugging in the 32-bit version.

To configure LogicLinx on your MCP gateway device:

Before LogicLinx can run on your MCP gateway device, you must configure the automation application.

1. Launch MCP Studio™ and open a project containing the MCP gateway device you want to configure LogicLinx on.
2. Select the MCP gateway device.

3. On the **Configure** tab, click **Wizard**.
4. On the welcome page of the wizard, click **Next**.
5. On the **Select Task** page of the wizard, select **Proceed to Configuration** and click **Next**.
6. On the **Connection** page of the wizard, select either Serial Port or Ethernet as the connection type to your MCP gateway device. If Ethernet is selected, Secure Debugger option is required between debugger and MCP gateway device. Based on the option you chose, configure the connection parameters and click **Next**.

NOTICE

The Secure Debugger connection is only made available for users of the following groups: Admin and Supervisor.

7. On the **Define Owned Points** page of the wizard, create your LogicLinX-owned points. For information on owned points, refer to *Owned and Mapped Points* below.

» To create owned points:

- a) A tab is shown for each point type. Within each tab, click the **Add Point** button to insert a new row in the list.
- b) Click the cells in the new row to modify the default values.
- c) Once you have finished creating your LogicLinX owned points, click **Next**.

8. On the **Define Mapped Points** page of the wizard, select the MCP gateway device database points you want to give LogicLinX access to. For information on mapped points, refer to *Owned and Mapped Points* below.

» To map points:

- a) All available points within the MCP gateway device are shown as a tree list. Click the **+** next to each entry to expand the list and view the points contained within.
- b) To select a point, select the checkbox in the **Map?** field. The point will be added to the **Mapped Points**.
- c) On the **Mapped Points** screen, you can review the selected points and modify the LogicLinX tag name from the default value.

Tip: Internal transition counters can be added to digital input points. For more information, refer to *Internal Transition Counters* below.

- d) Mapped points shown with a red background have been invalidly mapped; these points do not exist within the Gateway device system point database. This can cause errors when running LogicLinX programs. To correct this, select the row and click **Delete invalid mapping**.
- e) Once you have finished mapping points from the Gateway device, click **Next**.

9. The LogicLinX editor is shown on the next page of the wizard. You can create and save your LogicLinX automation programs at this time. Once finished, click **Next**.

To allow your LogicLinX programs to execute on the MCP gateway device, you must ensure that the **target** setting is correctly configured.

» To ensure that the target setting is correctly configured:

- a) On the toolbar, select **Make > Compiler Options**.
- b) On the **Compiler Options** window, highlight *ISA86M: TIC code for Intel* and click **Select**. Once an arrow is added next to *ISA86M: TIC code for Intel*, click **OK**.
- c) On the program window, click **Make > Make Application**. The program is compiled.

10. On the completion page, click either:

- **Exit & Save Changes** to save the configuration, or
- **Exit & Discard Changes** to ignore the configuration.

11. Select the MCP gateway device. On the **Configure** tab, click **Sync To Device** to upload the configuration to your MCP gateway device. Once the synchronization is complete, the MCP gateway device restarts and loads LogicLinX.

Note: If the point mappings on your MCP gateway device are modified through the Online Configuration Tool after you have uploaded your configuration, you must synchronize the updated MCP gateway device configuration within MCP Studio to ensure that your LogicLinX mappings are still valid. To do this, select your MCP gateway device and click **Sync From Device** on the **Configure** tab. Once the synchronization is complete, click **Validate**. If any errors are reported, correct them by repeating the steps above.

Owned and Mapped Points

LogicLinx-owned points provide an interface between LogicLinx and other c device applications. From LogicLinx's perspective, the direction of these owned points is reversed compared to other mapped system points. Owned *input* points can be written to by LogicLinx to provide data to other applications. Owned *output* points can be used by external applications to send data into LogicLinx, allowing LogicLinx programs to read these values. LogicLinx documentation refers to these reverse-direction points as "conversion points".

Mapped points are those that are owned by applications external to LogicLinx. All system points in the MCP gateway device are available as mapped points, including LogicLinx-owned points. Each system point is assigned a unique tag name, with which the point is referenced as a LogicLinx variable in the Editor.

Internal Transition Counters

Since LogicLinx works on a cyclical basis, it may miss state changes on digital inputs that occur between input refresh cycles. To account for this, LogicLinx allows you to enable internal transition counters on digital inputs. The input point is monitored for changes between cycles and if a state change is detected, the associated internal transition counter is incremented. The internal transition counter variable reports the total number of state changes that occurred on the associated digital input during the previous cycle.

To add an internal transition counter to a digital input point, select the point and click **Add Internal Transition Counter**. A sub-row is added containing the default tag name for the counter.

Frequently Asked Questions

Q: Does LogicLinx on the MCP gateway device support files (that is, F_ROPEN, FX_READ, F_CLOSE, etc.)? If so, what paths do I have access to?

A: Yes, currently, all files and paths are available. Files can be stored in `/tmp` if they are small and do not need to be retained across a reboot. Otherwise, you may use `/mnt/data1log`, which is the largest partition on the user CompactFlash card.

Q: Does LogicLinx on the MCP gateway device support initial values for AO and DO, similar to the D20*/D200*?

A: Yes, initial values for AOs and DOs are supported in MCP family after firmware version 2.2.

Q: Does LogicLinx on the MCP gateway device support restore last value at startup for AO and DO similar to the D20*/D200*?

A: No, restoring of last values for AOs and DOs are not currently supported in MCP family.

Q: Does LogicLinx on the MCP gateway device support the OPERATE function (similar to the D20/D200)?

A: Yes, the OPERATE function is the same as on the D20/D200.

Q: Does LogicLinx on the MCP gateway device support multiple targets on a single MCP gateway device?

A: No, only one target is currently supported on the MCP gateway device.

Q: Does the MCP gateway device support a "Communications Watchdog" feature (similar to the D20/D200)?

A: The MCP gateway device supports watchdog-style monitoring via two methods:

- Every client application provides a digital input for every device that indicates when that device is online. There are also other points such as transaction counts and failure counts that can be used.
- The Calculator on the MCP gateway device allows you to create digital inputs that reflect a selected quality flag from a specific point, allowing you to monitor offline, loss of communications, scan inhibit, or any other quality flag that is reported. These points do not go offline when the point does, as other expressions would do.

By using these methods, you can monitor the health of an entire device (useful to reduce the number of pseudo points and the number of logic elements in a program) or to monitor selected points individually (separates the points from the device but requires more pseudo points). The first option is preferred when you have many points to monitor, while the second option allows for more granularity and is suggested for small numbers of points. You may also combine the two options by using Calculator to monitor the quality of a single representative point from a device.

Additional Documents

For further information about LogicLinx and the MCP gateway device, refer to the following documents:

- *LogicLinx IEC 61131-3 Soft Logic Getting Started* (SWM0018)
- *LogicLinx IEC 61131-3 Soft Logic User's Guide* (SWM0019)

About this Document

Purpose

This document describes how to establish a secure channel between a client device and the MCP for accessing a protected service in the substation. This document outlines and details the procedures regarding:

- The implementation of a simple Certification Authority using XCA Certification Authority (Open Source tool).
- The installation of certificates on the MCP and Windows PC running Tactical Software Serial/IP or Stunnel.
- The configuration of Tactical Software Serial/IP and Stunnel to communicate to the MCP over TLS sessions.

NOTICE This document applies to the MCP family (G100/G500) unless otherwise indicated.
Screen captures may show G500 in some areas, however the workflow applies to products in the MCP family (G100/G500).

Intended Audience

This document serves as a reference for systems integrators who wish to setup a secure channel using Tactical Software Serial/IP or Stunnel with a MCP for the purposes of accessing a protected service in the substation.

Additional Documentation

For further information about the Secure Integration of SCADA Third Party Equipment with the MCP, refer to the following documents:

- MCP Software Configuration Guide (SWM0101)
- MCP HMI Online Help

Safety words and definitions

Before attempting to install or use the device, review all safety indicators in this document to help prevent injury, equipment damage or downtime.

The following safety and equipment symbols are used in this document:

-  **DANGER** Indicates a hazardous situation which, if not avoided, will result in death or serious injury.
-  **WARNING** Indicates a hazardous situation which, if not avoided, could result in death or serious injury.
-  **CAUTION** Indicates a hazardous situation which, if not avoided, could result in minor or moderate injury.
-  **NOTICE** Indicates practices that are not related to personal injury.

Product Support

Full Support

If you need help with any aspect of your GE Vernova Grid Solutions product, you can:

- Access the GE Vernova Grid Solutions Web site
- Search the GE Vernova Technical Support library
- Contact Technical Support

Access GE Vernova Grid Solutions Web Site

The GE Vernova Grid Solutions Web site provides fast access to technical information, such as manuals, release notes and knowledge base topics.

Visit us on the Web at: <https://www.gevernova.com/grid-solutions/>

Search GE Vernova Grid Solutions Technical Support Library

This site serves as a document repository for post-sales requests. To get access to the Technical Support Web site visit us on the Web at:

1. Overview

This document describes how to establish a secure channel between a client device and the MCP for accessing a protected service in the substation. The secure channel is implemented using a TLS (Transport Layer Security) connection and certificate-based mutual authentication. A client device could be a PC with Tactical Software Serial/IP or Stunnel, SCADA master that supports TLS and mutual authentication using certificates.

Certificates are issued by a Certification Authority (CA). The MCP does not come with a CA so you must make use of an existing CA or create your own. There are many third-party commercial and open source CAs available. This document describes one open source CA packages: X Certificate and Key Management (XCA).

1.1 Supported Client Devices

1.1.1 Tactical Software Serial/IP with Encryption

Tactical Software Serial/IP is a virtual serial port package that can be installed on a Windows-based PC. Virtual serial port software allows programs that would normally communicate to an IED using the serial port on the local PC to communicate with the IED using the serial port on a remote MCP. It does this by relaying the serial traffic over a TCP connection to the MCP, which then relays the data over the serial port. Tactical Software Serial/IP can use an TLS channel to securely relay the serial traffic to the MCP. This document describes how to configure Tactical Software Serial/IP and the MCP for this purpose.

1.1.2 Stunnel

Stunnel is an open source package that can be installed on a Windows-based PC to relay a local TCP connection over an TLS tunnel to a remote MCP, which then relays data over a TCP connection to an IED on the substation LAN. Stunnel can be configured to provide an TLS channel for programs that would access IEDs over a TCP connection. This document describes how to configure Stunnel and the MCP for this purpose.

1.1.3 SCADA Master

The SCADA Master is any SCADA master that supports TLS and mutual authentication using certificates.

1.2 Setup Procedure

To establish a secure channel between a client device and the MCP:

1. Setup your CA – see section 2.
2. If you plan to use ciphers that use the Diffie Hellman Key Exchange Algorithm (indicated by the dhe prefix in the cipher name), generate Diffie Hellman (DH) parameters – see section 2.
3. Install the CA's Certificate on your MCP and client device – see section 2.
4. Generate private keys and certificates for your MCP and client device.
5. Install the private keys, certificates and optional Diffie Hellman parameters on your MCP and client device.
6. Using the MCP online configuration, configure the parameters for the TLS channels.
7. Using the client software, configure the parameters for the TLS channel.
8. Connect your client software with the MCP and test access to the protected service.

1.3 Certificate Revocation

Together with a private key and a certificate, a client device can prove its identity to the MCP. If a malicious user ever discovered your private key, the malicious user would be able to access the MCP masquerading as you. The moment you are aware of a security breach that may involve the private key, you should revoke the associated certificate. If a certificate is revoked, the MCP does not accept any connections that use a revoked certificate.

Another reason for revoking a certificate may be that the owner of the certificate has left the company and no longer needs to connect to the MCP. Revoking the certificate prevents that person from accessing the MCP even if the person retained his or her private key.

To revoke a certificate:

1. Revoke the certificate on the CA – See section 8.1.
2. Generate a new Certificate Revocation List (CRL) – See section 8.2.
3. Install the CRL on the MCP – See section 8.3.

For information on Connection Security, see [Appendix B: Connection Security](#).

2. Setting up a Certification Authority

Before you can configure a secure channel between a client device and the MCP you need a Certification Authority (CA). In case you don't already have a CA, this section describes how to set up the XCA certification authority.

Once your CA is up and running, export the CA certificate so that you can install it on the client devices and the MCP.

NOTICE

A CA that is planned for field use should be protected with strong security measures. Such measures include dedicating a machine for the CA, physically securing the machine, ensuring the machine is accessible only by authorized users, and not connecting the machine to a network. Such measures are required because a security breach of a CA would impact all devices that used certificates generated by the CA.

2.1 Cipher Suites

Before you choose XCA or any other Certification Authority, there are a few differences you should be aware of:

- The MCP supports a fixed set of cipher suites as shown in the Table 1: Cipher Suites Supported by the MCP.
- Depending on which ciphers you use, the CA may or may not be suitable. Diffie Hellman (DH) parameters are required if the Key Exchange Algorithm is Diffie Hellman Ephemeral (DHE). XCA generates DH parameters.
- A DSA certificate for MCP is required for a DSS Signature. An RSA certificate for MCP is required for an RSA signature. XCA generates both DSA and RSA certificates.

Table 1: Cipher Suites Supported by the MCP

Key Exchange		Encryption	Hash	Works with XCA ?
Algorithm	Signatur			
RSA		NULL	SHA	Yes
RSA		NULL	SHA256	Yes
RSA		WITH_3DES_EDE_CBC	SHA	Yes
RSA		WITH_AES128_CBC	SHA256	Yes
DHE		WITH_AES128_CBC	SHA256	Yes
DHE	DSS	WITH_3DES_EDE_CBC	SHA	Yes
DHE	RSA	WITH_3DES_EDE_CBC	SHA	Yes
DHE	RSA	WITH_AES_128_CBC	SHA	Yes

Key Exchange		Encryption	Hash	Works with XCA ?
Algorithm	Signatur			
DHE	DSS	WITH_AES_128_CBC	SHA	Yes
DHE	DSS	WITH_AES_256_CBC	SHA	Yes
DHE	RSA	WITH_AES128_GCM	SHA256	Yes
DHE	RSA	WITH_AES256_GCM	SHA384	Yes
ECDHE	RSA	WITH_AES128_GCM	SHA256	Yes
ECDHE	RSA	WITH_AES256_GCM	SHA384	Yes
ECDHE	ECDSA	WITH_AES128_GCM	SHA256	Yes
ECDHE	ECDSA	WITH_AES256_GCM	SHA384	Yes

2.2 Setting up the XCA Certification Authority

XCA runs on Linux or Microsoft Windows. The following steps detail how to setup and initialize an XCA certification authority.

2.2.1 Install XCA

1. Download the latest version of XCA from here:
<http://sourceforge.net/projects/xca>.
2. Run the installation wizard to install XCA.

2.2.2 Create a Database and Initialize the CA

1. From XCA, select **File > New Database**.
2. Choose a protected location to save the database and then enter a strong password to encrypt the database.
3. Under the **Certificates** tab, choose **New Certificate**.
4. Under the **Source** tab, select the checkbox next to the label **Create a self-signed certificate with the serial**. Leave the dropdown named **Signature Algorithm** as "SHA 256" and leave the dropdown named **Template for the new certificate** as "[default] CA".
5. Under the **Source** tab, click **Apply All**.
6. Under the **Subject** tab, click the button labeled **Generate a new key**.
7. In the dialog that appears, enter the name of the CA (e.g., "MyCA") in the **Name** field. Choose the **Keytype** as RSA or DSA to match the type of cipher suites you wish to use (see Table 1). Change the **Keysize** to 2048 and click **Create**.
8. Under the **Subject** tab, enter the distinguished name of the CA certificate. The following table provides example distinguished name components.

Table 2: Example Distinguished Name Components

Distinguished Name Component	Example
Internal name	MyCA
countryName	US
stateOrProvinceName	MyState
localityName	MyCity
organizationName	MyCompany
organizationalUnitName	MyDivision
commonName	MyCA
emailAddress	mail@my.domain

9. Under the **Extensions** tab, if necessary, change the **Time Range** that the CA certificate is valid for and click **Apply**. The default is 10 years. Certificates generated with this CA certificate after this period are no longer valid.
10. Under the **Key usage** tab, do not change the defaults.
11. Under the **Netscape** tab, remove the value in the **Comment** field.
12. Under the **Advanced** tab, the following messages are expected except the value of the X509v3 Subject Key Identifier, which differs from key to key:

Other Tabs

X509v3 Basic Constraints critical:
CA: TRUE

X509v3 Subject Key Identifier:
52:06:E3:16:88:6F:E8:0E:1D:5F:E0:F4:12:45:1A:48:98:B2:0C:FC

X509v3 Key Usage:
Certificate Sign, CRL Sign

Netscape Cert Type:
SSL CA, S/MIME CA, Object Signing CA

If above message is not displayed, click **Validate** to see the message.

13. Click **OK**. You now have a CA certificate to sign your MCP and Client certificates.
14. Under the **Certificates** tab of the main view of XCA, select the new Certification Authority and click on **Export**.
15. Ensure the **Export Format** is set to PEM.
16. Browse to a protected directory (e.g., My Documents->MyXCAFiles) and click **Save**. Finally click **OK**. The file is named based upon the internal name of your CA with a .crt extension.

2.2.3 Generate Diffie Hellman (DH) Parameters

1. From XCA, select **Extra > Generate DH parameter**.
2. Enter a key size of 2048 and click **OK**.
3. It may take a few minutes for the parameters to be generated and XCA may appear to be non-responsive. Be patient and allow XCA to complete.
4. When prompted, save the generated DH parameters file in a protected location (e.g., My Documents->MyXCAFiles) and leave the name as dh2048.pem.

3. Certificate Generation

This chapter describes how to generate private keys and certificates for both the Client computer and the MCP. These certificates allow the Client to authenticate itself to the MCP and the MCP to authenticate itself to the Client.

There are two types of certificates you can generate: a server certificate and a client certificate. The server certificate identifies an MCP. The client certificate identifies a user or a computer that is connected to the MCP.

If users are accessing the MCP directly from their own computers using programs such as Stunnel or Tactical Software Serial/IP to establish a secure channel, then you must generate separate certificates for each user.

If you are using a centralized access server such as ESNET, you have the option of creating only one computer certificate for the ESNET server. However, the centralized access computer must be locked down in such a way as to prevent users from getting direct access to the private key of this computer certificate. If a user could copy the private key, the user could access the MCP from any computer. This would allow the user to bypass any access controls that you put in place through the centralized access computer's security policy.

If you are accessing the MCP from SCADA master stations, then you must generate separate certificates for each master station.

NOTICE

It is important to keep the private keys associated with the Client and Server Certificates secure. For example, they should not be transmitted over the LAN unless you are using a strongly authenticated secure transport mechanism such as SSH with public/private key authentication or multi-factor authentication. Once the private keys reach their destination, they should be deleted from any devices used to transport them (e.g., a USB drive or laptop).

3.1 Generating Certificates Using XCA

3.1.1 Generating a MCP Server Certificate

A MCP Server certificate allows the MCP to authenticate itself to a Client. The MCP Server certificate contains a **commonName** field. This field should uniquely identify the MCP in your network. Follow these steps to generate a MCP Server Certificate.

1. Launch XCA from the Windows Programs menu.
2. In the tree view of the **Certificates** tab, select the branch containing your Certification Authority.
3. Under the **Certificates** tab, click the **New Certificate** button.

4. Under the **Source** tab:
 - a. Select the checkbox next to the label **Use this Certificate for signing**. On the dropdown to the right of this checkbox, select the CA you created in section 2.2.2 (e.g., MyCA).
 - b. Leave the dropdown **Signature Algorithm** as SHA 256.
 - c. Change the dropdown **Template for the new certificate** to “[default] HTTPS_server”.
 - d. Click **Apply all**.
5. Under the **Subject** tab, click the **Generate a new key** button.
6. In the dialog that appears, enter a name that uniquely identifies the MCP in your network (for this example, that is “MyMCP”). Choose **Keytype** as RSA or DSA to match the type of cipher suites you wish to use (see Table 1). Change the **Keysize** to 2048. Click **OK**.
7. Back in the **Subject** tab, enter the Distinguished name of the MCP server certificate. The most important component is the **commonName**. This is the name that your Clients is configured to accept. Any difference between the commonName of the certificate and the name configured in the Client results in a failed connection. Choose other name components that are appropriate for your company. The following table provides example distinguished name components.

Table 3: Example Distinguished Name Components

Distinguished Name Component	Example
Internal name	MyMCP
countryName	US
stateOrProvinceName	MyState
localityName	MyCity
organizationName	MyCompany
organizationalUnitName	MyDivision
commonName	MyMCP
emailAddress	mail@my.domain

8. Under the **Extensions** tab, if necessary, change the **Time Range** that the CA certificate is valid for and click **Apply**. The default is one year. The shorter the Time Range the more secure the certificate. The longer the Time Range, the more often you need to regenerate MCP Server certificates and deploy them into your MCPs.
9. Under the **Key usage** tab, leave the defaults.
10. Under the **Netscape** tab, remove the comment.

11. Under the **Advanced** tab, click **Validate**. The following messages are expected except the value of the X509v3 Subject Key Identifier, which differs from key to key:

If above message is not displayed, click **Validate** to see the message.

12. Click **OK**. You now have a MCP Server certificate.
13. In the tree view under the **Certificates** tab, open the branch labeled after your Certificate Authority, and select the new Server certificate.
14. Click **Export**.
15. In the dialog that appears, ensure the **Export Format** field is set to "PEM + key (*.pem)". Browse to a protected location (e.g., My Documents->MyXCAFiles) and click **Save**. Finally click **OK**. The certificate and private key will be in a file named with your MCP's Internal Name with the extension .pem (e.g., MyMCP.pem).

NOTICE This file is sensitive so keep it protected always. Remove the file after it has been installed on the MCP.

3.1.2 Generating a Client Certificate

A Client certificate allows the Client to authenticate itself to an MCP. The Client certificate contains a **commonName** field. If you are configuring a SCADA master to access the MCP, this name should identify a unique name for SCADA master. If users connect directly to the MCP from their own computers, this name should identify the user.

To generate a Client certificate:

1. Launch XCA from the Windows Programs menu.
2. In the tree view of the **Certificates** tab, select the branch containing your Certification Authority.
3. Under the **Certificates** tab, click the **New Certificate** button.
4. Under the **Source** tab,
 - a. Select **Use this Certificate for signing** checkbox. On the dropdown to the right of this checkbox, select the CA you created in section 2.2.2 (e.g., MyCA).
 - b. Leave the dropdown **Signature Algorithm** as "SHA 256".

- c. Change the dropdown **Template for the new certificate** to “[default] HTTPS_client”.
 - d. Click **Apply all**.
5. Under the **Subject** tab, click the **Generate a new key** button.
6. In the dialog that appears, enter a name that uniquely identifies the Client (for this example, that is “MyName”). Choose **Keytype** as RSA or DSA to match the type of cipher suites you wish to use (see Table 1). Change the **Keysize** to 2048. Click **OK**.
7. Back in the **Subject** tab, enter the Distinguished name of the Client certificate. The most important component is the **commonName**. This is the name that the MCP is configured to accept. Any difference between the commonName of the Client certificate and the name configured in the MCP results in a failed connection. Choose other name components that are appropriate for your company. The following table provides example distinguished name components.

Table 4: Example Distinguished Name Components

Distinguished Name Component	Example
Internal name	MyName
countryName	US
stateOrProvinceName	MyState
localityName	MyCity
organizationName	MyCompany
organizationalUnitName	MyDivision
commonName	MyName
emailAddress	mail@my.domain

8. Under the **Extensions** tab, if necessary, change the **Time Range** that the CA certificate is valid for and click **Apply**. The default is one year. The shorter the Time Range the more secure the certificate. The longer the Time Range, the more often you need to regenerate Client certificates and deploy them into Clients.
 9. Under the **Key usage** tab, leave the defaults.
 10. Under the **Netscape** tab, remove the comment.

11. Under the **Advanced** tab, click **Validate**. The following messages are expected except the value of the X509v3 Subject Key Identifier, which differs from key to key:

If above message is not displayed, click **Validate** to see the message.

12. Click **OK**. You now have a Client certificate.
13. In the tree view of the **Certificates** tab, open the branch labeled with your Certification Authority and select the new Client certificate.
14. Click **Export**.
15. In the dialog that appears, ensure the **Export Format** field is set to “PEM Cert + key”. Browse to a protected location (e.g., My Documents->MyXCAFiles) and click **Save**. Finally click **OK**. The client certificate and its private key are stored in a file named with the Internal Name of your client certificate and the .pem extension (e.g., MyName.pem).

NOTICE

This file is sensitive so keep it protected always. Remove the file after it has been installed on the client.

4. Installing Certificates

This chapter describes how the CA Certificate, Server Certificate, Client Certificates and DH Parameters are installed. The following table summarizes where to get the files containing the CA certificate, Server certificates, Client Certificates and DH parameters.

Table 5: Location of Files Exported by Certification Authorities

Files	Location
CA Certificate	The CA certificate is in a file downloaded to a location of your choice as described in Section 2.2.2 . The file is named with a .crt extension (e.g., MyCA.crt).
Server Certificate and Key	Server certificate and key are in the same file under the location of your choice as described in Section 3.1.1 . The file is named with a .pem extension (e.g., MyMCP.pem).
Client Certificate and Key	Client certificate and key are in the same file under the location of your choice as described in Section 0. The certificate is in a file named with a .pem extension (e.g., MyName.pem).
DH Parameters	DH parameters are in the file named dh2048.pem under the location of your choice as described in Section 2.2.3 .

4.1 Installing CA Certificate, Server Certificate and Diffie Hellman Parameters on the MCP

- Referring to Table 5 for file names and locations, copy the files containing the CA certificate, Server certificate, and DH parameters to one of two locations:
 - The folder /mnt/usr/SecureScadaTransfer on the MCP. In this case, use an SFTP/SCP file transfer program such as WinSCP or Secure File Browser (Refer to Appendix B in SWM0101/15 for details).
 - The directory \SecureScadaTransfer on a USB drive.

Note: Do not install client certificates on the MCP.

NOTICE

These files are sensitive so keep them protected always. Remove these files from USB drive after it has been installed on the MCP.

2. If you are using WinSCP or Secure File Browser (Refer to Appendix B in SWM0101/15 for details) to transfer the files, you may get the following warning message:

The reason for this warning is that the MCP file system does not support per-file permissions, so when WinSCP or Secure File Browser from DS Agile MCP Studio (Refer to Appendix B in SWM0101/15 for details) tries to set the permissions on a file, it is unable to do so. However, there is no security risk because the file takes on the default permissions of the files system which are correct. Therefore, this warning can be safely ignored by clicking **Skip**.

3. To prevent this warning from appearing in the future, in WinSCP or Secure File Browser from DS Agile MCP Studio (Refer to Appendix B in SWM0101 for details) go to **Options > Preferences**. Then select **Transfer** and click **Ignore permission errors**.

4. If you are using the USB drive method of transferring the files, insert the drive into any USB slot on the MCP.

5. Connect to the MCP with a browser and click the and click the Utilities tab under Settings option from the power bar.

Note: This Option is available in Utilities Tab under Settings option from Local HMI or from the Connected Mode in DS Agile MCP Studio only.

6. Click the **Import** button. You should see a dialog indicating that 1 Local Certificate and 1 Issuer Certificate was successfully imported. Click **OK** to dismiss the dialog.
7. Click the **Manage** button, and then click the **Local** tab. You should see a dialog showing the Local certificate details in the Staged Local Certificates area. Select the certificate and click **Install**. This causes the certificate to move into the Installed Local Certificate area. This also installs the DH parameters file.
8. Click the **Issuer** tab. You should see the CA certificate in the Staged Issuer Certificates area. Select the row containing the CA certificate and click **Install**. This causes the certificate to move into the Installed Issuer Certificates area.
9. Close the dialog and log out of the MCP.
10. If you are using redundancy(not supported in MCP), you need to install same CA certificate, Server certificate and DH parameters on both MCPs. Follow steps 1 to 9 above on both MCPs.

4.2 Installing CA Certificate and Client Certificate for use by a PC Client

1. Copy the CA certificate to client PC or SCADA master system in a directory of your choice (e.g., CA.crt).
2. Copy the PEM file containing client certificate and key to client PC or SCADA master system in a directory of your choice (e.g., MyName.pem).

NOTICE

This file is sensitive so keep it protected always. Remove this file from USB drive or any other temporary storage after it has been copied to the client.

5. Configuring Secure Connections on the MCP

There are three types of secure connections that you can configure on the MCP:

- Secure terminal server
- Secure pass-through
- Secure connection relay

The following sections describe how to create one of each type.

5.1 Configuring a Secure Terminal Server Connection

1. Login to the MCP.
2. Open the configuration screen.
3. Add a serial connection and select **Terminal Server**.
4. Click **OK**.

5. Click **Auto Start-Up** so that the terminal server connection is active.

6. Check the **Enable Security** button and in the **SSL/TLS Port** field, choose a TCP port that is not in use on the MCP.

The screenshot shows the MCP Configuration Guide interface. At the top, there are tabs for various functions: Data Logger, Load Shed, Systemwide, Access, ARRM, AI Text Enumeration, Online Designer, Analog Report, Utilities, Connections, Client Maps, Server Map, System Point Manager, Alarm, and Calculator. The 'Connections' tab is active. On the left, a tree view shows 'Serial Connections' with sub-items: 'Port 1 Single SEL Binary' (IED - Line 0, Device 0, Bay 0), 'Port 2 Generic ASCII' (IED - Line 0, Device 0, Bay 0), and 'Port 3 Terminal Server' (TERM0). The 'Port 3 Terminal Server' is selected. The main area shows the 'Serial Connection' configuration for 'TERM0'. The 'Port Settings' section includes fields for Primary Port (3), Backup Port, Baud Rate (9600), Parity (None), Data Bits (8), and Stop Bits (1). The 'Flow Control' is set to 'None'. The 'Configuration Parameters' section includes 'Device Name' (TERM0), 'Auto Start-Up' (checked), 'Application Parameters' (Use Default selected), 'Secure Type' (SSL/TLS), and 'SSL/TLS Port' (50,001). The 'File' field is empty. The 'Create' button is visible.

7. Click the **Create** button; the Secure Application Parameters dialog appears. Refer to Section 5.4 Secure Application Parameters Dialog for further steps.
8. Optionally, you may click **Use Custom** to open the Terminal Server Application Parameters dialog and specify **No** for **Password Authentication** and click **Save**. Because the TLS connection provides certificate-based authentication, password authentication may not be required. However, if the certificate is shared among many users, you may still want to enable password authentication.
9. Click **Save**.
10. Click **Commit Changes**.

5.2 Configuring a Secure Pass-through Connection

1. Login to the MCP.
2. Open the configuration screen.

- Click the **Systemwide** tab, select **Security**, and change **Pass Through Access** to **Allow network connections** if it is not already selected. The following figure shows the parameter and the correct setting.

The screenshot shows the MCP Configuration Guide interface. The 'Systemwide Settings' window is open, with the 'Security' tab selected. The 'Pass Through Access' parameter is set to 'Allow network connections'. The 'PassThrough Idle TimeOut' is set to 120, 'Local Commands Only' is set to false, 'SSH Security Banner' is set to 'UNAUTHORIZED ACCESS TO THIS DEVICE IS PROHIBITEDYou must ha...', 'Login Security Banner' is set to 'UNAUTHORIZED ACCESS TO THIS DEVICE IS PROHIBITEDYou must ha...', and 'CRL Check Interval (Hours)' is set to 12.

Name	Value
Pass Through Access	Allow network connections
PassThrough Idle TimeOut	120
Local Commands Only	false
SSH Security Banner	UNAUTHORIZED ACCESS TO THIS DEVICE IS PROHIBITEDYou must ha...
Login Security Banner	UNAUTHORIZED ACCESS TO THIS DEVICE IS PROHIBITEDYou must ha...
CRL Check Interval (Hours)	12

Pass Through Access
Enable/disable remote connection for pass through access. From command line only: Allow pass through connection through the command line. (Note: Only SEL Binary and Generic ASCII clients support command line access) Allow network connections: Allow pass through connection to remote network client.

- Click the **Connections** tab and select an existing connection that supports Pass-through (i.e., Hydran Multidrop, IEC 60870-5-103 Multidrop, Modbus RTU Multidrop, Single Generic ASCII, and Single SEL Binary). Alternatively, create a new connection that supports Pass-through.
- Check the **Enable Security** button and in the **TLS Port** field, choose a TCP port that is not in use on the MCP.
- Click the **Create** button; the Secure Application Parameters dialog appears. Refer to Section 5.4 for further steps.
- Click **Save**.
- Finally, click **Commit Changes**.
- Optionally, you may want to disable the global setting for Pass-Through Password authentication. To do so, launch `mcpcfg` from the MCP console or SSH terminal window. Select **Configure Authentication > Pass-through Authentication**. If the screen indicates Pass-through Authentication is *Enabled*, then type **Y** at the prompt for disabling Pass-through Authentication. If the screen indicates Pass-through Authentication is *Disabled*, then type **N** at the prompt for enabling Pass-through Authentication. Finally, select **Back > Quit**.

Because the TLS connection provides certificate-based authentication, password authentication may not be required. However, if the certificate is shared among many users, you may still want to enable password authentication.

Note: Because the Pass-through Password Authentication setting is global, be careful that you consider any Pass-through connections that are not protected by an TLS connection before disabling Pass-through Password Authentication.

5.3 Configuring a Secure Connection Relay

1. Login to the MCP.
2. Open the configuration screen.
3. Add a network connection and select **Secure Connection Relay**.

4. Click **OK**.
5. Ensure **Auto Start-Up** is selected so that the secure connection relay is active.
6. In the **Remote IP Address** field, enter the IP address of a device on the internal network or optionally the localhost IP address (127.0.0.1) if connecting to a service on the MCP itself.
7. In the **LAN Port** field, enter the TCP port number of the service you wish to connect to.
8. In the **TLS Port** field, enter a TCP port that is not in use on the MCP.
9. Click the **Create** button; the Secure Application Parameters dialog appears. Refer to Section 5.4 for further steps.
10. Click **Save**.
11. Click **Commit Changes**.

5.4 Secure Application Parameters Dialog

All secure connection types require a Secure Application Parameters File. This file can be reused with any secure connection, regardless of type. This section describes how to configure the file using the Secure Application Parameters Dialog.

1. Click the **Issuers** tab.

2. In the **Peer** column, type the *Common Name* of the client certificate that is to be used to authenticate and authorize the client for this connection. In the **Issuer** column, select the Issuer that signed the client certificate.
3. Repeat the previous step for other client certificates that may be used to authorize access for this connection.

[illegible]

4. Under the Ciphers tab, ensure **Secure Protocol** is set to **TLS1.2**.

5. Click **Close** and enter a suitable file name when prompted.

6. Configuring a Secure Connection with Tactical Software Serial IP

6.1 Configuring Tactical Software Serial IP with Encryption

Tactical Software Serial/IP with Encryption creates a virtual serial port that connects to a Secure Terminal Server Connection (Section 5.1) or Secure Pass-through Connection (Section 5.2) on the MCP. The following steps demonstrate how to generate a configuration with secured access.

1. Launch the Serial/IP Control Panel.

2. Under **Connection Protocol**, ensure **Raw TCP Connection** is selected.

- Click **Select Ports** to select the number of virtual COM ports to configure. In this example, COM 31 – 38 have been selected.

- For a secured connection, certificates must first be configured.
- If the connection configured on the MCP requires password authentication, click **Use Credentials From**, and select the appropriate setting.
- In the Serial/IP Control Panel, click **Advanced** -> **SSL Authentication**.... This tab specifies the information from the MCP server certificate.
- Select **Require Validated Certificate**. Under Validation Criteria, enter the Common Name of the MCP server certificate installed on the MCP.

8. Under Certificate Authority Keys, click **Use Specified certificate authority file**, and click **Choose File...** Choose the CA certificate file you copied as described in Section 4.2 (e.g., CA.crt).
9. Select the **SSL Certificate** tab. This tab configures location of the client certificate and key.
10. Click **Supply Certificate** and click **Choose File...** Choose the client PEM file you installed as described in Section 4.2. Note this file contains the Client Certificate and key.
11. With all the certificates in place, select a virtual com port and click **Configuration Wizard...**
12. Enter the IP address and port number for the MCP and ensure **Enable Encryption** is checked.

13. Enter the protocol as **TLS Version 1 (TLSv1)**. Also ensure the Secure Application Parameters settings on the MCP (see Section 5.4) are set as follows:
 - Secure Protocol is set to TLSv1,
 - Permit Null Encryption is checked or unchecked, and the Enable All button has been pressed.

14. Click **Start** and ensure the log does not show any error messages.

15. Click **Use Settings** to accept the configuration.

7. Configuring a Secure Connection with Stunnel

7.1 Configuring Stunnel

Stunnel is an open source program that can be used to secure TCP connections inside an TLS channel. Use Stunnel to connect to a Secure Connection Relay on the MCP. Configure the Secure Connection Relay on the MCP as described in Section 5.3. Generate the Stunnel configuration as follows:

1. Download and install the latest windows binary from <https://www.stunnel.org/downloads.html>
2. Click **Start > Programs > stunnel > Edit stunnel.conf**; the Stunnel configuration file appears in a text editor.
3. Change the value of the **cert** variable to the full path of the client PEM file installed in Section 4.2. Note this file contains the Client Certificate and key. For example:

```
; Certificate/key is needed in server mode and optional in client mode  
; The default certificate is provided only for testing and should not  
; be used in a production environment  
cert = C:\certs\MyName.pem
```
4. Delete the semicolon before the **CAfile** variable and change the value to refer to the full path of the PEM file containing the CA certificate installed in Section 4.2. For example:

```
; It's often easier to use CAfile  
CAfile=c:\certs\MyCA.crt
```
5. Delete the semicolon before the **client** variable to enable client mode:

```
; Use it for client mode  
client = yes
```
6. Now add the TCP service that you wish to tunnel in the **Service-level configuration** section of the file. For example:

```
; Service-level configuration  
; Create secure connection for Enervista UR Setup to connect to UR in  
substation  
[MYMCP-UR]  
accept=502  
connect=172.12.235.217:50000 (MCP IP and SSL/TLS Port Number)  
sslversion=TLSv1.2
```

7. Comment out or delete the lines describing other services that you don't need. For example:

```
;[pop3s]
;accept  = 995
;connect = 110

;[imaps]
;accept  = 993
;connect = 143

;[smtp]
;accept  = 465
;connect = 25

;[https]
;accept  = 443
;connect = 80
;TIMEOUTclose = 0
```

8. Save the file.
9. Click **Start > Programs > stunnel > Run stunnel**
10. Right-click the tray icon for stunnel and select **log**. You should see a log with something similar like stunnel started successfully:

```
2019.03.29 16:53:43 LOG5[main]: stunnel 5.50 on x64-pc-mingw32-gnu
platform
2019.03.29 16:53:43 LOG5[main]: Compiled/running with OpenSSL
1.1.1a 20 Nov 2018
2019.03.29 16:53:43 LOG5[main]: Threading:WIN32 Sockets:SELECT,IPv6
TLS:ENGINE,OCSP,PSK,SNI
2019.03.29 16:53:43 LOG5[main]: Reading configuration from file
stunnel.conf
2019.03.29 16:53:43 LOG5[main]: UTF-8 byte order mark detected
2019.03.29 16:53:43 LOG4[main]: Service [MYMCP-UR] needs authentication
to prevent MITM attacks
2019.03.29 16:53:43 LOG5[main]: Configuration successful
2019.03.29 16:53:56 LOG5[0]: Service [MYMCP-UR] accepted connection
from 127.0.0.1:64354
2019.03.29 16:53:56 LOG5[0]: s_connect: connected 172.12.235.217:50000
2019.03.29 16:53:56 LOG5[0]: Service [MYMCP-UR] connected remote server
from 172.12.232.232:64355
```

7.2 Configuring the Client Program

1. Configure the TCP-based client program to connect to localhost (i.e. ,127.0.0.1) with the port number you specified in the stunnel configuration. If the TCP based client is Enervista UR Setup, configure the Device Setup dialog as follows:

2. Launch the TCP based client and make a connection to the device.
3. Right-click the tray icon for stunnel and select **log**. You should see a log with something similar like stunnel was able to successfully connect to the device via the MCP:

8. Revoking a client certificate

All certificates are issued for a restricted time of validity. However, it can happen that a certificate should not be used or becomes invalid before its expiry date. In this case, the issuing CA should revoke this certificate by putting it on the list of revoked certificates (CRL) and publishing it.

8.1 Revoking the Certificate in XCA

1. Launch XCA from the Windows Programs menu.
2. In the tree view under the **Certificates** tab, open the branch containing your Certificate Authority.
3. Select and right-click the Client certificate to be removed (e.g., MyName).
4. Click **Revoke** option from the right-click menu.
5. Provide the date of revocation under field **Invalid Since** and reason for revocation from the dropdown list **Revocation Reason**.
6. Click **OK**.

8.2 Exporting the CRL in XCA

1. In the tree view under the **Certificates** tab, right-click the branch containing your Certificate Authority (e.g., MyCA).
2. Select the **CA** option in the right-click menu, and then option **Generate CRL**.
3. Under **Dates** section, leave the **last update** as today's date.
4. Choose a date for **next update** when you want to update CRL next time to the MCPs. If there is no planned date for next update, you can choose the expiry date of CA certificate as date for **next update**. Note: you can optionally use **Year/Month/Day** field and **Apply** to quickly change next update date.
5. Leave the dropdown **Hashing Algorithm** as SHA 256.
6. Under the **Extensions**, leave the fields **CRL Number** and **Revocation reasons** checked. Leave the field **Authority key identifier** unchecked.
7. Click **OK**.
8. Under the **Revocation List** tab, select the CRL labelled as your Certificate Authority (e.g., MyCA). Verify that **Next update** field is set to what you have chosen in step 4.

9. Click **Export**.

In the dialog that appears, ensure the **Export Format** field is set to PEM. Browse to a protected location (e.g., My Documents->MyXCAFiles) and click **Save**. The file is named based upon the internal name of your CA with a .pem extension. Append “_CRL” to filename to indicate that this file is a CRL (e.g., MyCA_CRL.pem). Finally click **OK**.

8.3 Installing the CRL in the MCP

1. Copy the CRL file generated in the previous section to one of two locations:
 - a. The folder /mnt/usr/SecureScadaTransfer on the MCP. In this case, use an SFTP/SCP file transfer program such as WinSCP or Secure File Browser from DS Agile MCP Studio (Refer to Appendix B in SWM0101/15 for details).
 - b. The directory \SecureScadaTransfer on a USB drive.

2. If you are using the USB drive method of transferring the files, insert the drive into any USB slot on the MCP.
3. Connect to the MCP with a browser and click the and click the Utilities tab under Settings option from the power bar.

Note: This Option is available in Utilities Tab under Settings option from Local HMI or from the Connected Mode in DS Agile MCP Studio only.

4. Click the **Import** button. You should see a dialog indicating that 1 CRL was successfully imported. Click **OK** to dismiss the dialog.
5. Click the **Manage** button, and then click the **CRL** tab. You should see a dialog showing the CRL details in the Staged CRLs area. Select the CRL and click **Install**. This causes the CRL to move into the Installed CRLs area.
6. Close the dialog and log out of the MCP.

A. Error Messages

This appendix describes common error message logged by Secure SCADA Utility in the diagnostic log. These diagnostic messages are logged under application “stunnel” and application interface “P005”.

Table 6: Error Messages

Error Message	Cause
SSL routines:SSL3_GET_CLIENT_HELLO:no shared cipher	All configured ciphers use DHE key exchange, but no DH parameters are installed
SSL_accept: 140890B2: error:140890B2:SSL routines:SSL3_GET_CLIENT_CERTIFICATE:no certificate returned	Client did not provide a certificate (It typically indicates certificate configuration error in the Client)
VERIFY ERROR: depth=0, error=certificate has expired	Peer Certificate expired
VERIFY ERROR: depth=2, error=certificate has expired	Issuer certificate expired
SSU exited because the issuer of the peer cert was not valid	Peer certificate is signed by an unsupported issuer
SSU exited because the issuer or subject of the peer cert was not valid	The common name does not match the connection
Certificate with serial 2 (0x2) revoked per CRL from issuer	Peer certificate is in the CRL
VERIFY ERROR: depth=1, error=certificate is not yet valid	Certificate validity period has not started yet. This error can also come if MCP time is set to a past date, which is earlier than certificate validity period start date.

B. Connection Security

The MCP supports **Transport Layer Security (TLS)** which are cryptographic protocol that provide security for communications over networks such as the Internet. TLS encrypt the segments of network connections at the Application Layer to ensure secure end-to-end transit at the Transport Layer.

This security feature is available on the following types of connections:

- Hydran Multidrop (serial, on pass-through)
- IEC 60870-5-103 Multidrop (serial, on pass-through)
- Modbus RTU Multidrop (serial, on pass-through)
- Single Generic ASCII (serial, on pass-through)
- Single SEL Binary (serial, on pass-through)
- Terminal Server (serial, on pass-through)
- Secure connection relay (Ethernet)

The TLS protocol allows client/server applications to communicate across a network in a way designed to prevent eavesdropping and tampering. TLS provides endpoint authentication and communications confidentiality over Ethernet connections using cryptography.

The process of securing an Ethernet connection is shown above:

1. A communications link is established between the MCP and a client device. This is shown in the diagram by the **purple** arrow between the devices. The two devices exchange a list of ciphers, or algorithms that are used to perform message encryption. If both devices are configured to use one or more of the same ciphers, the most secure one is selected and the communications link between the devices from that point on is encrypted using it. Ciphers are selected on the **Secure Application Parameters** window when configuring a serial or network connection.

If null encryption is enabled, the communications link between the devices is not encrypted and only identity verification is performed with security certificates (see the following steps). Not enabling encryption will leave data vulnerable to interception by third parties who have access to the network traffic. If a cipher that uses Diffie Hellman is selected (indicated by the **dhe** prefix on the cipher name), the MCP sends the Diffie Hellman parameters to the remote device. If these parameters are not contained within the local certificate of the MCP, the parameters file can be uploaded using the **Utilities > Certificate** Import window.

2. The local certificate of the MCP is provided to remote devices to allow them to verify the identity of the MCP device. This is shown in the diagram by the **red** arrows and certificate between the MCP and the client device. Remote devices must have access to the certificate from the certificate authority who issued the MCP local certificate to verify its integrity. The local certificate of the MCP is managed on the Local tab of the **Utilities > Certificate Management** window.
3. The remote device provides the MCP with its certificate. This is shown in the diagram by the **blue** arrow and certificate between the MCP and the client device. These certificates must then be compared against the issuer certificate provided by the certificate authority to verify its validity, which is shown by the **cyan** arrow and certificate. Issuer certificates are managed on the Issuer tab of the **Utilities > Certificate Management** window.

If any of these steps fail, the connection is rejected, and an error is logged to the MCP system log. Once a secure connection has been established, the devices will periodically ensure that the connection remains secure by regenerating the session key (a short sequence of data used to encrypt the contents of the messages).

Note that the serial and Ethernet links between the MCP and IEDs (shown by the **green** arrows) are not identity-verified or encrypted. Security features are provided to remote client devices through secure pass-through or secure connection relay links to these devices.

C. List of Acronyms

Table 7: List of Acronyms

Abbreviation	Description
CA	Certification Authority
CN	Common Name
CRL	Certificate Revocation List
DCA	Data Collection Application
DPA	Data Presentation Application
DTA	Data Translation Application
ESNET	EnterpriseServer.NET
FQDN	Full Qualify Distinguished Name
HMAC	Hash-based Message Authentication Code
HMI	Human Machine Interface
IED	Intelligent Electronic Device
JVM	Java Virtual Machine
LAN	Local Area Network
OU	Organizational Unit
PEM	Privacy Enhanced Mail
PKCS	Public Key Cryptography
PKI	Public Key Infrastructure
PRF	Protective Relay Fault
RTDB	Real Time Data Base
RTU	Remote Terminal Unit
SCR	Secure Connection Relay
SDD	Software Design Document
SOE	Sequence of Event
SPT	Secure Pass-Through
SSDD	Software Subsystem Design Document
SSL	Secure Sockets Layer
ST	Secure Terminal Server
TLS	Transport Layer Security
WAN	Wide Area Network

Modification Record

Version	Revision	Date	Change Description
1.00	0	28 th March, 2019	Created.
	1	12 th August, 2019	Updated.
1.10	0	9 th Sept, 2019	Added ciphers for TLS 1.2.
2.00	0	22 nd April, 2021	Updated for MCP family.
	1	26 th April, 2021	Updated Technical Support Contacts.
	2	26 th July, 2021	Updated DN components requirements, SHA 256 and TLSv1 references.
	3	13 th July, 2023	Updated the GE Logo, Copyright and Trademark Notices. In the section 7.1, updated the Stunnel download link.
	4	15 th May, 2025	Updated to GE Vernova style. Updated GE Vernova email addresses and phone numbers in Contact Technical Support section.

About this Document

Purpose

This document describes how to ACCESS AND USE THE Unified Extensible Firmware Interface (UEFI) that is embedded in the system ROM of G500 device. All options and available responses are defined.

Intended Audience

This document provides a reference for the person who installs, administers and troubleshoots G500 device.

Additional Documentation

For further information about UEFI, refer to the following documents:

- G500 Substation Gateway, Software Configuration Guide SWM0101
- G500 Substation Gateway, Instruction Manual (994-0152)

Safety Words and Definitions

Before attempting to install or use the device, review all safety indicators in this document to help prevent injury, equipment damage or downtime.

The following safety and equipment symbols are used in this document:

Indicates a hazardous situation which, if not avoided, will result in death or serious injury.

Indicates a hazardous situation which, if not avoided, could result in death or serious injury.

Indicates a hazardous situation which, if not avoided, could result in minor or moderate injury.

Indicates practices that are not related to personal injury.

Product Support

If you need help with any aspect of your GE Vernova Grid Solutions product, you can:

- Access the GE Vernova Grid Solutions Web site
- Search the GE Vernova Grid Solutions Technical Support library
- Contact Technical Support

Access GE Vernova Grid Solutions Web Site

The GE Vernova Grid Solutions Web site provides fast access to technical information, such as manuals, release notes and knowledge base topics.

Visit us on the Web at: <https://www.gevernova.com/grid-solutions/>

Search GE Vernova Grid Solutions Technical Support Library

This site serves as a document repository for post-sales requests. To get access to the Technical Support Web site, go to:

<https://www.gevernova.com/grid-solutions/events/signup.asp?sid=208>

Contact Technical Support

For help with any aspect of your GE Vernova Grid Solutions product, please contact our support team, 24/7, as follows:

Region	E-mail	Telephone
Global Contact Centre	GA.support@GEVernova.com	+44 1785 250070

Unified Extensible Firmware Interface (UEFI)

1.1 What is UEFI?

The UEFI (Unified Extensible Firmware Interface) specification defines an interface between operating systems and platform firmware during a boot, or start-up process. The interface consists of data tables that contain platform-related information, plus boot and runtime service calls that are available to the operating system and its loader. Together, these provide a standard, modern environment for securely booting an operating system and running pre-boot applications.

1.2 UEFI System Utilities

The UEFI System Utilities is embedded in the system ROM. Its features enable you to perform a wide range of configuration activities, including:

1. Configuring system devices and installed options.
2. Enabling and disabling system features.
3. Displaying system information.
4. Selecting the primary boot controller or partition.
5. Configuring memory options.
6. Launching other pre-boot environments.

The following are some of the features that UEFI enables and that the G500 device can support when configured for UEFI boot operation:

1. Secure Boot that allows the system firmware, option card firmware, operating systems, and software collaborate to enhance platform security.
2. Console Redirection that allows users to access the serial console of the G500 device when the operating system is being installed, and when the operating system is running.

1.3 UEFI Setup Program

G500 device comes with the factory installed Unified Extensible Firmware Interface (UEFI) Firmware. The UEFI acts as interface between operating system (OS) and platform Firmware. The interface contains data records with platform-related information and boot and runtime services that are available to the OS and its boot loader. The UEFI will be updated using USB flash drive.

To use the UEFI Set-up to configure its parameters, you can access UEFI Setup utility screens by using a USB keyboard, mouse and VGA monitor connected directly to the G500 device. The UEFI screen includes navigation keys and brief onscreen help to guide you in using the UEFI Set-up program.

Entering UEFI Setup at Startup

To enter UEFI Setup at startup,

- Power OFF the G500 device.
- Press the Physical Presence button on the G500 device with a paper clip.
- Power ON the G500 device without removing the paper clip.
- Wait until the CPU and Temp LEDs are flashing continuously.
- Remove the paper clip from the Physical Presence button then press the setup key <Delete> or <F2> repeatedly during the Power-On Self-Test (POST) until the UEFI Setup Utility Menu opens.
- Wait for your UEFI to load. After successfully hitting the setup key, the UEFI will load. This should only take a few moments. When the loading is complete, you will be taken to the UEFI settings menu.
- When UEFI is started, the main UEFI Setup utility top-level screen appears. This screen provides six menu options across the top of the screen.

Entering UEFI Setup after POST

If you missed the steps to enter UEFI Setup at startup,

- Press <Ctrl>+<Alt>+<Delete> simultaneously to reboot the G500 device.
- Press the Physical Presence button on the G500 device with a paper clip.
- Wait until the CPU and Temp LEDs are flashing continuously.
- Remove the paper clip from the Physical Presence button then press the setup key <Delete> or <F2> repeatedly until the UEFI Setup Utility Menu opens.
- Wait for your UEFI to load. After successfully hitting the setup key, the UEFI will load. This should only take a few moments. When the loading is complete, you will be taken to the UEFI settings menu.
- When UEFI is started, the main UEFI Setup utility top-level screen appears. This screen provides six menu options across the top of the screen.

⚠ CAUTION Information stored by the UEFI Setup Utility is essential. Use caution when making changes in the UEFI. A mistake might cause the device to not perform as expected.

Navigating UEFI Setup Utility Menus

Familiarize yourself with the UEFI controls. Since UEFI menus don't support mouse input, you'll need to use the arrow keys and other computer-specific keys to navigate the UEFI. You can usually find a list of controls in the bottom-right corner of the UEFI homepage.

The UEFI keyboard-based navigation can be accomplished using a combination of the keys, (F1/F2/F3/F4 Function keys, Left/Right Arrow keys, Up/Down Arrow keys, Plus/Minus keys, Enter key and ESC key).

```

→←: Select Screen
↑↓: Select Item
Enter: Select
+/-: Change Opt.
F1: General Help
F2: Previous Values
F3: Optimized Defaults
F4: Save & Exit
ESC: Exit

```

Key	Description
→←Left/Right	: The Left and Right <Arrow> keys are used to select a major Setup screen.
↑↓ Up/Down	: The Up and Down <Arrow> keys are used to select a menu item.
<Enter>	: The <Enter> key is used to execute a command or select a menu.
+ - Plus/Minus	: The Plus and Minus <Arrow> keys are used to change the field value.
<F1>	: The <F1> key is used to invoke the General Help window.
<F2>	: The <F2> key is used to restore the previous values.
<F3>	: The <F3> key is used to load the optimized defaults.
<F4>	: The <F4> key is used to save the current settings and exit.
<ESC>	: The <ESC> key is used to exit a menu/sub-menu or the UEFI Setup.

- Use the **left** and **right arrow** keys to select the different menu options. As you select each menu option, the top-level screen for that menu option appears.
- To select an option on a top-level screen, use the **up** and **down** arrow keys to scroll up and down the options presented.
- Only options that can be modified are highlighted when you press the **up** and **down** arrow keys.
- If a field can be modified, as you select the option, user instructions for modifying the option appear in the right column of the screen.
- If a field is a link to a sub-screen, instructions to press the **ENTER** key to access the sub screen appear in the right column.
- Modify the setup field and press the **Esc** key to save the changes and exit the screen.
- Some screens present a confirmation dialog box that enables unwanted changes to be retracted.
- On sub-screens that only provide configuration information and cannot be modified, press the **Esc** key to exit the screen.
- Follow the instructions on the Exit menu screen to save or discard your changes and exit the UEFI Setup utility.

NOTE: Change your settings carefully. When adjusting settings in your UEFI, be sure that you certain what the settings will affect. Changing settings incorrectly can lead to device or hardware failure.

NOTE: If you don't know what you want to change coming into the UEFI, you probably shouldn't change anything.

1.4 UEFI Setup Screens Overview

Table 1.1 contains summary descriptions of the top-level UEFI setup screens.

Table 1.1: UEFI Setup Screens Summary

SCREEN	DESCRIPTION	Menu Options
Main	General product information including UEFI Firmware, Board, Carrier, System information and Build date/time.	UEFI Main menu options
Advanced	Configuration information for the IDE, NVMe, SDIO, USB, WHEA, Module Embedded Controller, 092 CPLD/FPGA and other information.	UEFI Advanced menu options
Chipset	View the South Bridge and North Bridge Parameters	UEFI Chipset menu options
Security	Set the Administrator and User passwords	UEFI Security menu options
Boot	Boot configuration and Boot option priorities	UEFI Setup Utility: Boot Settings menu options
Save & Exit	Save/Discard options and Default options	UEFI Save & Exit menu options

See [UEFI Setup Utility Menu Screens](#) for examples of each of these screens.

2

UEFI Setup Utility Menu Screens

NOTE: The screens shown are examples. The version numbers, screen items and selections shown are subject to change over the life of the product.

The main UEFI Setup Utility top-level screen provides six menu options across the top of the screen.

- **UEFI Main Menu Options**
- **UEFI Advanced Menu Options**
- **UEFI Chipset Menu Options**
- **UEFI Security Menu Options**
- **UEFI Boot Menu Options**
- **UEFI Save & Exit Menu Options**

2.1 UEFI Main Menu Options

The main menu screen provides very basic system information, system language and open-source software license information as well as functions for setting the system time and date.

UEFI Firmware Information

Option	Description
UEFI Firmware Core Vendor	: It allows the user to view the information about the UEFI vendor.
Core Version	: It allows the user to view the core version.
Compliance	: It allows the user to view UEFI specification version.
UEFI Firmware Revision	: It allows the user to view UEFI revision.
Build Date and Time	: It allows the user to view the date and time of the build.
Access Level	: It allows the user to view the access level.

Board Information

Option	Description
Board Vendor	: It allows the user to view the information about board vendor.
Board Name	: It allows the user to view the board name.
HW Version	: It allows the user to view the board hardware version.
Serial Number	: It allows the user to view the board serial number.
Order Code	: It allows the user to view the board order code.

Carrier Information

Option	Description
Carrier Vendor	: It allows the user to view the information about carrier vendor.
Carrier Name	: It allows the user to view the carrier name.
HW Version	: It allows the user to view the carrier hardware version.
Serial Number	: It allows the user to view the carrier serial number.
Order Code	: It allows the user to view the carrier order code.

System Information

Option	Description
System ID	: It allows the user to view the system ID.
HW Version	: It allows the user to view the system hardware version.
Serial Number	: It allows the user to view the system serial number.
System UUID	: It allows the user to view the system UUID.

Memory Information

Option	Description
Total Memory	: It shows the amount of memory that is installed on the platform.

System Language

This option enables you to select a language to use in the G500 UEFI setup. English is the default language.

Open-Source Software License Information

The UEFI firmware of G500 contains open-source software. The user can find the license information in the sub-menu below.

Name	License Information
Base64 encoding / decoding	: Please find license information here: http://www.apache.org/licenses/LICENSE-2.0 Please find the project homepage here: https://tls.mbed.org/base64-source-code
EDK/EDK II	: Please find license information here: https://opensource.org/licenses/bsd-license.php Please find the project homepage here: http://www.tianocore.org/
UEFI Shell	: Please find license information here: https://opensource.org/licenses/bsd-license.php Please find the project homepage here: http://www.tianocore.org/
wpa_supplicant	: Please find license information here: http://hostap.epitest.fi/gitweb/gitweb.cgi?p=hostap.git;a=blob_plain;f=wpa_supplicant/README Please find the project homepage here: http://hostap.epitest.fi/wpa_supplicant/

System Date

This option allows the user to set the date on the system real-time clock RTC. Simply navigate to the month, day, or year and type in the correct numeric value.

- **Date (mm-dd-yyyy)** – Enter the date in a month – day – year (mm-dd-yyyy) format.

System Time

This option allows the user to set the time on the RTC. Simply navigate to the hour, minute, or second and type in the correct numeric value.

- **Time (hh:mm:ss)** – Enter the time in a 24-hour format (hh:mm:ss) format.

2.2 UEFI Advanced Menu Options

This UEFI Advanced screen provide detailed configuration information for the trusted computing, IDE, serial port console redirection, NVMe, SDIO, USB and other system information

UEFI Setup Utility: Advanced Settings

Advanced - Trusted Computing

	Default	Range	Description
TPM20 Device Found			
Vendor	IFX		
Firmware version	5.63		
Security Device Support	Enable	Enable, Disable	Enables or disables UEFI support for security device.
Active PCR banks	SHA-1, SHA256		
Available PCR banks	SHA-1, SHA256		
TPM 20 Interface Type	TIS		
*PH Randomization	Enabled	Enabled, Disabled	Enables or Disables Platform Hierarchy randomization

*PH Randomization: Don't disable it in production platforms! This is for special purpose only (e.g.: TPM firmware update). Don't forget to enable it after use (e.g.: after updating the TPM firmware).

Advanced - IDE Configuration

	Default	Range
IDE Configuration		
SATA Port0 (M.2 SATA0 Slot)	M.2 (S80) 3MG2 (126.4GB)	Auto Detect
SATA Port1 (M.2 SATA1 Slot)	Not Present	Auto Detect
SATA Port2 (Internal SATA conn.)	Not Present	Auto Detect
SATA Port3 (M.2 SATA2 Slot)	Not Present	Auto Detect
Onboard SSD	Not Present	Auto Detect

Serial Port Console Redirection

Console Redirection Settings

	Default	Range	Description
COM0			
Console Redirection	Enabled	Enabled, disabled	Enables or disables Console Redirection
Console Redirection Settings			These settings specify how the host computer and the remote computer (which the user is using) will exchange data. Both computers should have the same or compatible settings
Terminal Type	VT-UTF8	VT100, VT100+, VT-UTF8, ANSI	VT100: ASCII Char set. VT100+: Extends VT100 to support color, function keys, etc. VT-UTF8: Uses UTF8 encoding to map Unicode chars onto 1 or more bytes. ANSI: Extended char set.
Bits Per Second	115200	9600, 19200, 38400, 57600, 115200	Select serial port transmission speed. The speed must be matched on the other side. Long or noisy lines may require lower speed.
Data Bits	8	7, 8	Data Bits
Parity	None	None, Even, Odd, Mark, Space	A parity bit can be sent with the data bits to detect some transmission errors. None: No parity bit. Even: Parity bit is 0 if the num of 1's in the data bit is even. Odd: Parity bit is 0 if the num of 1's in the data bit is odd. Mark: Parity bit is always 1. Space: Parity bit is always 0. Mark and Space parity do not allow for error detection.
Stop Bits	1	1, 2	Stop bits indicate the end of a serial data packet. (A start bit indicates the beginning). The standard setting is stop bit. Communication with slow devices may require more than 1 stop bit.
Flow Control	None	None, Hardware RTS/CTS	Flow control can prevent data loss from buffer overflow. When sending data, if the receiving buffer are full, a 'stop' signal can be sent to stop the data flow. Once the buffers are empty, a 'start' signal can be sent to restart the flow. Hardware flow control uses two wires to send start/stop signals.

NVMe Configuration

SDIO Configuration

	Default	Range	Description
SDIO Configuration			
SD MODE	ADMA	Disabled, ADMA, DMA, PIO	SD MODE

USB Configuration

	Default	Range	Description
USB Configuration			
USB Module Version	19		
USB Controllers	1 OHCI, 2 EHCIs, 2 XHCIs		
USB Devices	1 Drive, 1 Keyboard, 1 Mouse		
Legacy USB Support	Enabled	Enabled, Disabled, Auto	Enable Legacy USB support. AUTO option disables legacy support if no USB devices are connected. DISABLE option will keep USB devices available only for EFI applications
XHCI Hand-off	Enabled	Enabled, Disabled	This is a workaround for OSes without XHCI hand-off support. The XHCI ownership change should be claimed by XHCI driver.
EHCI Hand-off	Disabled	Disabled, Enabled	This is a workaround for OSes without EHCI hand-off support. The EHCI ownership change should be claimed by EHCI driver.
USB Mass Storage Driver Support	Enabled	Disabled, Enabled	Enable/Disable USB Mass Storage Driver Support.

	Default	Range	Description
USB hardware delays and time-outs			
USB transfer time-out	20 sec	1 sec, 5 sec, 10 sec, 20 sec	The time-out value for Control, Bulk, and Interrupt transfers.
Device reset time-out	20 sec	10 sec, 20 sec, 30 sec, 40 sec	USB mass storage device Start Unit command time-out
Device power-up delay	Auto	Auto, Manual	Maximum time the device will take before it properly reports itself to the Host Controller. 'Auto' uses default value: for a Root port it is 100ms, for a Hub port the delay is taken from Hub descriptor.

WHEA Configuration

	Default	Range	Description
WHEA Support	Enabled	Disabled, Enabled	Enable or disable Windows Hardware Error Architecture.

Module Embedded Controller Configuration

	Value
Module Embedded Controller Configuration	
Firmware Version	1.4 Build 1
Firmware Build Date and Time	2018/10/31 13:34

ETI DS1682 Information

	Value
ETI DS1682 Information	
Number of S5 - > S0 transitions	824
Elapsed Time since first Power up	390d 12h 00m 28s

bC6L17 FPGA Configuration

	Value
bC6L17 FPGA Configuration	
bC6L17 FPGA Version	2.3.0

092 CPLD Configuration

	Value
092 CPLD Configuration	
092 CPLD Version	1.2.1

092 FPGA Configuration

	Value
092 FPGA Configuration	
092 FPGA Version	01.02.00
092 FPGA Type	0
092 FPGA Name	Standard
092 FPGA Build Date/Time	2018-10-05 14:55:56

2.3 UEFI Chipset Menu Options

The UEFI Chipset menu enable you to set the chipset parameters.

	Description
South Bridge	South Bridge Parameters
North Bridge	North Bridge Parameters

South Bridge

	Value	Description
AMD Reference code Version	PI version 1.1.0.9	
SB SATA Configuration		Options for SATA Configuration
SB USB Configuration		Options for SB USB Configuration

SB SATA Configuration

	Default	Range	Description
OnChip SATA Channel	Enabled	Disabled, Enabled	Enable / Disable Serial ATA
OnChip SATA Type	AHCI	Native IDE, RAID, AHCI, Legacy IDE, IDE->AHCI, AHCI as ID 7804, IDE->AHCI as ID 7804	SATA Type
OnChip IDE mode	Legacy mode	Legacy mode, Native mode	SATA IDE Controller Mode

SB USB Configuration

	Default	Range	Description
USB PORT 2 (SS)	Enabled	Disabled, Enabled	USB PORT 2 (SS) Enable /Disable Connected to first XHCI Controller
USB PORT 1 (SS)	Enabled	Disabled, Enabled	USB PORT 1 (SS) Enable /Disable Connected to first XHCI Controller
USB PORT 6	Enabled	Disabled, Enabled	USB PORT 6 Enable /Disable Connected to first XHCI Controller
USB PORT 4	Enabled	Disabled, Enabled	USB PORT 6 Enable /Disable Connected to first XHCI Controller
Internal USB PORT	Enabled	Disabled, Enabled	Internal USB PORT Enable /Disable
USB PORT 5	Enabled	Disabled, Enabled	USB PORT 5 Enable /Disable
USB PORT 3	Enabled	Disabled, Enabled	USB PORT 3 Enable /Disable

North Bridge

	Value	Description
Memory Information		
Total Memory	8176 MB (DD3)	
Socket 0 Information		View Information related to Socket 0

Socket 0 Information

	Value
Socket 0 Information	
Starting Address	0 KB
Ending Address	8388607 KB
Dimm0	Size=4096 MB, speed=1866 MHz
Dimm1	Size=4096 MB, speed=1866 MHz

2.4 UEFI Security Menu Options

The UEFI Security menu enable you to set or change the Administrator and User passwords.

	Description
Password Description	If ONLY the Administrator's password is set, then this only limit access to Setup and is only asked for when entering Setup. If ONLY the User's password is set, then this is a power on password and must be entered to boot or enter Setup. In Setup the User will have Administrator rights. The password length must be in the following range: Minimum length: 3, Maximum length: 20
Administrator Password	Set Administrator Password
User Password	Set User Password
HDD Security Configuration	
P0: M.2 (S80) 3MG2-P	Self-Encrypting Drive (SED)
Secure Boot Menu	Customizable Secure Boot settings

HDD Security Configuration - P0: M.2 (S80) 3MG2-P (SED)

	Value	Description
HDD Password Description		Allows Access to Set, Modify and Clear Hard Disk User Password and Master Password. User Password is mandatory to Enable HDD Security. If Master password is installed (optional), it can also be used to unlock the HDD. If the 'Set User Password' option is hidden, do power cycle to enable the option again.
HDD Password Configuration		
Security Supported	Yes	
Security Enabled	Yes	
Security Locked	No	
Security Frozen	No	
HDD User Pwd Status	Installed	
HDD Master Pwd Status	Not Installed	
Set User Password		Set HDD/SED User Password
Set Master password		Set HDD/SED Master Password

Set SED User Password

The SED user password is set by default and it is strongly advised to change this password upon receiving the G500. If the SED password is set, the SED cannot be used with any other devices except the G500 and only if the SED password is known.

To change User Password for SED, choose Set User Password and enter the default password: **u123@MCPGE** when prompted. Then enter a new password and confirm the password.

NOTE: The master password is not used for SED.

Secure Boot Menu Option

	Default	Range	Description
System Mode	User		
Secure Boot	Not Active		
Vendor Keys	Active		
Secure Boot	Disabled	Disabled, Enabled	Secure Boot can be enabled if 1. System running in User mode with enrolled Platform Key (PK) 2. CSM function is disabled
Secure Boot Mode	Custom	Standard, Custom	Secure Boot mode selector. 'Custom' Mode enables users to change Image Execution policy and manage Secure Boot Keys.
Key Management			Enables experienced users to modify Secure Boot variables.

Key Management

	Default	Range		Description
Provision Factory Default keys	Disabled	Disabled, Enabled		Install factory default Secure Boot keys when System us in Setup Mode
Delete all Secure Boot variables				Force System to Setup Mode – clear all Secure Boot Variables (PK, KEK, db, dbt, dbx). Change takes effect after reboot.
Save all Secure Boot variables				Save NVNAM content of all Secure Boot variables to the files (EFI_SIGNATURE_LIST data format) in root folder on a target file system device.
Secure Boot variables	Size	Key#	Key Source	
Platform Key (PK)	953	1	Custom	Enroll Factory Defaults or load the keys from a file with: 1. Public Key Certificate in: a) EFI_SIGNATURE_LIST b) EFI_CERT_X509 (DER encoded) c) EFI_CERT_RSA2048 (bin) d) EFI_CERT_SHA256 (bin) 2. Authenticated UEFI Variable
Key Exchange Keys	953	1	Custom	
Authorized Signatures	953	1	Custom	
Forbidden Signatures	0	0		
Authorized Timestamps	0	0		

2.5 UEFI Boot Menu Options

The UEFI Boot menu enables you to configure the boot device priority (storage drives). You can designate which device the system will attempt to boot from first. This is useful for booting from a flash drive to install or repair an operating system.

	Default	Range	Description
Boot Configuration			
Setup Prompt Timeout	1	0-65535	Number of seconds to wait for setup activation key. 65535 (0xFFFF) means indefinite waiting.
Bootup NumLock State	On	On, Off	Select the keyboard NumLock state
Quiet Boot	Enabled	Disabled, Enabled	Enables or disables Quiet Boot option
Boot Option Priorities			
Boot Option #1			Sets the system boot order
Boot Option #2			Sets the system boot order
Boot Option #3			Sets the system boot order
Fast Boot	Disabled	Disabled, Enabled	Enables or disables boot with initialization of a minimal set of devices required to launch active boot option. Has no effect for BBS boot options.
Hard Drive BBS Priorities			Set the order of the legacy devices in this group
Add New Boot Option			Add a new UFI boot option to the boot order
Delete Boot Option			Remove an EFI boot option from the boot order

Hard Drive BBS Priorities

	Value	Description
Boot Option #1		Sets the system boot order
Boot Option #2		Sets the system boot order

Add New Boot Option

	Description
Add New Boot Option	
Add boot option	Specify name for new boot option
Path for boot option	Enter the path to the boot option in the format
Boot option File Path	
Create	Creates the newly formed boot option

2.6 UEFI Save & Exit Menu Options

The UEFI Save & Exit options enable you to save changes / discard changes and exit, save changes / discard changes and reset, default options, restore defaults, boot override and other options.

To select and execute an option, follow these steps:

- Use the up and down arrow keys to scroll up and down the UEFI Exit options.
- Press Enter to select the option.
- A configuration dialog box appears that enables you to save or cancel the changes and exit the Setup utility.

NOTE: The configuration dialog box is only shown below for Save Changes and Exit option screen. The other configuration screens work in a similar way.

- When you are finished adjusting your settings, you will need to save and exit by using your UEFI “Save and Exit” key for your changes to take effect.
- When you save and reset, your device will reboot with new settings.

	Description
Save Options	
Save Changes and Exit	Exit system setup after saving the changes
Discard Changes and Exit	Exit system setup without saving any options
Save Changes and Reset	Reset the system after saving the changes
Discard Changes and Reset	Reset the system without saving the changes
Save Changes	Save changes done so far to any of the setup options

	Description
Discard Changes	Discard changes done so far to any of the setup options
Default Options	
Restore Defaults	Restore/Load Default values for all the setup options
Save as User Defaults	Save the changes done so far as User Defaults
Restore User Defaults	Restore the User Defaults to all the setup options
Boot Override	
G500 Predix EdgeOS (P0: M.2 (S80) 3MG2-P)	Boot Override is a way to override the normal boot sequence. It does this only on this boot and doesn't change the default boot sequence. It's just an alternative to the boot menu that you can access with a function key on bootup.
P0: M.2 (S80) 3MG2-P	
KingstonDataTraveler 3.0PMAP	
UEFI: Build-in EFI Shell	
UEFI: KingstonDataTraveler 3.0PMAP, Partition 2	

Restore Defaults

Restoring default settings lets you reset all UEFI configuration settings to their default values and delete all UEFI non-volatile variables, such as boot configuration. Previous changes that you have made are lost. To restore default settings:

- From the Save & Exit menu, select Restore Defaults and press **Enter**.
- Select one of the following options:
 - o No, cancel the restore procedure.
 - o Yes, load optimized default settings.
- Press **F4** to save & exit to reboot the device for changes to take effect. Press **ESC** if you need to cancel the procedure.

Save as User Defaults

You can configure default settings as necessary and then save the configuration as the custom default configuration. When the system loads the default settings, the custom default settings are used instead of the manufacturing defaults. To save custom default settings:

- From the Save & Exit menu, select Save as User Defaults and press **Enter**.
- Select one of the following options:
 - o No, cancel the procedure.
 - o Yes, save values as user default settings.
- Press **F4** to save & exit to reboot the device for changes to take effect. Press **ESC** if you need to cancel the procedure.

Restore User Defaults

You can reset all UEFI configuration settings to their default options. Previous changes that you have made are lost. To restore default system settings:

- From the Save & Exit menu, select Restore User Defaults and press **Enter**.
- Select one of the following options:
 - o No, cancel the restore procedure.
 - o Yes, restore the default settings.
- Press **F4** to save & exit to reboot the device for changes to take effect. Press **ESC** if you need to cancel the procedure.

3

How to Enable/Disable USB Port(s)

3.1 How to Identify USB Ports

USB Port 1 and Port 2

UEFI Item	Chassis Identification – Front
USB Port 1 (SS)	1
USB Port 2 (SS)	2

USB Port 3, 4, 5 and 6

UEFI Item	Chassis Identification – Rear
USB Port 3	3
USB Port 4	4
USB Port 5	5
USB Port 6	6

Internal USB

UEFI Item	Chassis Identification – Internal
Internal USB Port	Internal

3.2 To Enable/Disable USB Port(s)

1. Enter UEFI.
2. Navigate to **Chipset** menu and select **South Bridge** and then press **Enter** to access the sub-menu.

3. Scroll down to select **SB USB Configuration** and then press **Enter** to access the options.

4. Select **Enable** to enable the specific USB port or select **Disable** to disable the specific USB port.

NOTE: All USB Ports are enabled by default.

5. Press **F4** to save and exit.

4

How to Enable/Disable the Use of SD Card

4.1 To Enable/Disable USB Mass Storage Driver Support

1. Navigate to **Advanced** screen across the top.
2. Scroll down to **USB Configuration** item, press **Enter** to select.

3. Enable / Disable USB Mass Storage Driver Support

NOTE: USB Mass Storage Driver Support is enabled by default.

4.2 To Enable/Disable SD Mode

1. Navigate to **Advanced** screen across the top.
2. Scroll down to **SDIO Configuration** item, press **Enter** to select.

3. Select ADMA/DMA/PIO to enable use of SD card or select Disable to disable use of SD card.

NOTE: SD Mode is set to ADMA by default

- SD Mode – PIO** : PIO stands for Programmed Input/Output, which is a protocol for data transfer. Since it involves the CPU, the use of PIO mode for data transfer can slow a computer down considerably.
- SD Mode - DMA** : DMA stands for Direct Memory Access, which does not involve the CPU. Rather, the involved components move data directly to and from RAM, bypassing the CPU altogether. Therefore, DMA has better performance in data transfer than PIO.
- SD Mode - ADMA** : ADMA stands for Advanced Direct Memory Access, which adopts scatter gather DMA algorithm so that higher data transfer speed is available. Furthermore, ADMA can support not only 32-bit system memory addressing but also 64-bit system memory addressing.

4. Press **F4** to save and exit.

FAQs

Q: Find the current UEFI version

A: Open the UEFI Setup Utility Main menu, UEFI Firmware Information is displayed, showing the Core vendor, core version, compliancy, firmware revision, build date and time information.

Q: Reload default UEFI Setup settings

A: Use the UEFI Setup Utility to restore the factory installed UEFI settings.

- In the UEFI Setup utility, select the Save & Exit menu.
- Select Restore Defaults and press **Enter**.
- Select one of the following options:
 - o No, cancel the restore procedure.
 - o Yes, load optimized default settings.
- Press **F4** to save & exit to reboot the device for changes to take effect. Press **ESC** if you need to cancel the procedure.
- The UEFI setup closes and the device boots to load optimized defaults.

Q: How to update the UEFI

A: If you need to update the UEFI to resolve a specific issue, improve performance, or to support a new hardware component, contact

<https://www.gegridsolutions.com/events/signup.asp?sid=208>

Q: When a reboot is required?

A: For certain configuration changes to take effect, a reboot might be required.

Q: How do I select a boot device?

A: In the UEFI Setup Utility Boot menu, Boot Option Priorities shows the priorities of the boot options. Users can change the priorities by selecting the particular boot option. The boot option selected in Boot option #1 will be the first priority, followed by second, third and so on. To select a boot device, you can select an option and press Enter to change it, either to disable it or specify another boot device.

Q: How do I configure the date and time?

A: From the UEFI Setup Utility Main menu, select:

- **System Date**
 - o This option allows the user to set the date on the system real-time clock RTC. Simply navigate to the month, day, or year and type in the correct numeric value.
Date (mm-dd-yyyy) – Enter the date in a month – day – year (mm-dd-yyyy) format.
- **System Time**
 - o This option allows the user to set the time on the RTC. Simply navigate to the hour, minute, or second and type in the correct numeric value.
Time (hh:mm:ss) – Enter the time in a 24-hour format (hh:mm:ss) format.

Q: How do I save my configuration changes and reboot the system?

A: To save configuration changes and to reboot the system:

- When you are done making changes, if you do not see the prompt *Changes are pending. Do you want to save changes and exit?*, press **F4** to display it.
- Press **Y** to save your changes.
- Select Save changes and Exit option from the Save & Exit menu and press Enter- Exits the device and continues the normal boot process. The system continues through the boot order list and launches the first bootable option in the system.

Modification Record

VERSION	REVISION	DATE	CHANGE DESCRIPTION
1.00	0	14 th Feb, 2020	Document Created.
	1	31 st Mar, 2020	Added “Set SED User Password” section.
2.50	0	27 th Sep, 2021	Updated the GE logo. Replaced MCP references to G500.
	1	15 th May, 2025	GE Vernova Logo is added on the first page. Updated Company name, Copyright Notice and Trademark Notice. Updated GE Vernova email addresses and phone numbers in Contact Technical Support section.
	2	01 st July, 2025	Updated to GE Vernova style.

About this Document

Purpose

This document describes how to ACCESS AND USE the Unified Extensible Firmware Interface (UEFI) that is embedded in the system ROM of G100 device. All options and available responses are defined.

Intended Audience

This document provides a reference for the person who installs, administers, and troubleshoots G100 device.

Additional documentation

For further information about the UEFI, refer to the following documents.

- MCP Software Configuration Guide (SWM0101)
- G100 Substation Gateway Instruction Manual (994-0155)
- G100 Quick Start Guide (SWM0116)
- G100 Secure Deployment Guide (SWM0123)
- MCP Firmware Upgrade and Restore to Defaults Workflows (TN0116)

Safety words and definitions

Before attempting to install or use the device, review all safety indicators in this document to help prevent injury, equipment damage or downtime.

The following safety and equipment symbols are used in this document:

Indicates a hazardous situation which, if not avoided, will result in death or serious injury.

Indicates a hazardous situation which, if not avoided, could result in death or serious injury.

Indicates a hazardous situation which, if not avoided, could result in minor or moderate injury.

Indicates practices that are not related to personal injury.

Important information about the product, product handling which must be given attention.

Product Support

If you need help with any aspect of your G100 product, you can:

- Access the G100 Web site
- Search the GE Vernova Technical Support library
- Contact Technical Support

Access the GE Vernova Grid Solutions web site

The GE Vernova Grid Solutions Web site provides fast access to technical information, such as manuals, release notes and knowledge base topics.

Visit us on the Web at: <https://www.gevernova.com/grid-solutions/>

Search GE Vernova Grid Solutions Technical Support Library

This site serves as a document repository for post-sales requests. To get access to the Technical Support Web site, visit us on the Web at: <https://www.gevernova.com/grid-solutions/events/signup.asp?sid=208>

1. Unified Extensible Firmware Interface (UEFI) Overview

1.1 Introduction

Unified Extensible Firmware Interface (UEFI) is the program that controls the computer boot process. The purpose of the UEFI is to identify and initialize processor, memory, hard drives, optical drives, and other hardware.

2. UEFI Setup Information

2.1 Entering Setup

To enter the UEFI setup utility, simply follow the steps below:

Boot up the system.

Pressing the **<Tab>** or **** key immediately allows you to enter the Setup utility, then you will be directed to the UEFI main screen. The instructions for UEFI navigations are as below:

Control Keys	Description
→ ←	Select a setup screen
↑ ↓	Select an item/option on a setup screen
<Enter>	Select an item/option or enter a sub-menu
+/-	Adjust values for the selected setup item/option
F1	Display General Help screen
F2	Retrieve previous values
F3	Load optimized default values
F4	Save configurations and exit UEFI
<Esc>	Exit current screen

2.2 Main

Setup main page contains UEFI information and project version information.

Feature	Description
BIOS Information	BIOS Vendor: American Megatrends
	Core Version: AMI Kernel version, CRB code base, X64
	Compliance: UEFI version, PI version
	Project Version: BIOS release version
	Build Date and Time: MM/DD/YYYY
	Access Level: Administrator / User
System Date	To set the Date, use <Tab> to switch between Date elements. Default Range of Year: 2005-2099
	Default Range of Month: 1-12
	Days: dependent on Month.
System Time	To set the Date, use <Tab> to switch between Date elements.

2.3 Advanced

Select the **Advanced** menu item from the UEFI setup screen to enter the Advanced setup screen. Users can select any of the items in the left frame of the screen.

COM3 Console Redirection	Enabled Disabled (Default)	Console Redirection Enable or Disable.
COM4 Console Redirection	Enabled (Default) Disabled	Console Redirection Enable or Disable.

2.3.4.1 Console Redirection Setting

Feature	Options	Description
Terminal Type	VT100 VT100+ (Default) VT-UTF8 ANSI	ANSI: Extended ASCII char set. VT100: ASCII char set. VT100+: Extends VT100 to support color, function keys, etc. VT-UTF8: Uses UTF8 encoding to map Unicode.
Bits per second	9600 19200 38400 57600 115200 (Default)	Selects serial port transmission speed. The speed must be matched on the other side. Long or noisy lines may require lower speeds.
Data Bits	7 8 (Default)	Data Bits
Parity	None (Default) Even Odd Mark Space	A parity bit can be sent with the data bits to detect some transmission errors.
Stop Bits	1 (Default) 2	Stop bits indicate the end of a serial data packet.
Flow Control	None (Default) Hardware RTS/CTS	Flow control can prevent data loss from buffer overflow.
VT-UTF8 Combo Key Support	Disabled Enabled (Default)	Enable VT-UTF8 Combination Key Support for ANSI/VT100 terminals.
Recorder Mode	Disabled (Default) Enabled	With this mode enabled only text will be sent. This is to capture Terminal data.
Resolution 100x31	Disabled (Default) Enabled	Enables or disables extended terminal resolution.
Putty KeyPad	VT100 (Default) Intel LINUX XTERMR6 SCO ESCN VT400	Select FunctionKey and KeyPad on Putty.

2.3.5 CPU Configuration

Feature	Options	Description
Intel Virtualization Technology	Disabled Enabled (Default)	When enabled, a VMM can utilize the additional hardware capabilities provided by Vanderpool Technology.
VT-d	Disabled Enabled (Default)	Enable/Disable CPU VT-d
Bi-directional PROCHOT	Disabled Enabled (Default)	When a processor thermal sensor trips (either core), the PROCHOT# will be driven. If bi-direction is enabled, external agents can drive PROCHOT# to throttle.
Thermal Monitor	Disabled (Default) Enabled	Enable/Disable Thermal Monitor.
Monitor Mwait	Disabled (Default) Enabled	Enable/Disable Monitor Mwait.

Feature	Options	Description
Legacy USB Support	Enabled (Default) Disabled Auto	Enables Legacy USB support. Auto option disables legacy support if no USB devices are connected. Disabled option will keep USB devices available only for EFI applications.
XHCI Hand-off	Enabled (Default) Disabled	This is a workaround for OSeS without XHCI hand-off support. The XHCI ownership change should be claimed by XHCI driver.
USB Mass Storage Driver Support	Enabled (Default) Disabled	Enables or disables USB Mass Storage Driver Support.
USB transfer time-out	1 sec 5 sec 10 sec 20 sec (Default)	The time-out value for Control, Bulk, and Interrupt transfers.
Device reset time-out	1 sec 5 sec 10 sec 20 sec (Default)	USB mass storage device Start Unit command time-out.
Device power-up delay	Auto (Default) Manual	Maximum time the device will take before it properly reports itself to the Host Controller. Auto uses default value: for a Root port, it is 100 ms, for a Hub port the delay is taken from Hub descriptor.

2.4.1.1 USB Configuration

Feature	Options	Description
xHCI Mode	Enable (Default) Disable	Once disabled . XHCI controller would be function disabled, none of the USB devices are detect and usable during boot and in OS. Do not disable it unless for debug

2.4.1.2 Miscellaneous Configuration

Feature	Options	Description
Restore AC Power Loss (not editable)	Power On (Default) Power Off Last State	Specify what state to go to when power is re-applied after a power failure (G3 state). S0 State: System will boot directly as soon as power applied. S5 State: System keeps in power-off state until power button is pressed.
BIOS Lock	Disabled Enabled (Default)	Enable / Disable the SC BIOS Lock Enabled feature. Required to be enabled to ensure SMM protection of flash .
RTC Lock	Disabled Enabled (Default)	Enable will lock bytes 38h-3Fh in the lower/upper 128-byte bank of RAM.
GPIO Lock	Disabled Enabled (Default)	Enable to set GPIO Pad Configuration lock for security.

2.5 Security

Select the **Security** menu item from the UEFI setup screen to enter the Security Setup screen. Users can select any of the items in the left frame of the screen.

|                                                    |ESC: Exit          |
\-----/

Version 2.18.1263. Copyright (C) 2021 American Megatrends, Inc.

```

Feature	Description
Setup Administrator Password	If ONLY the Administrator's password is set, it only limits access to Setup and is only asked for when entering Setup.
User Password	If ONLY the User's password is set, it serves as a power-on password and must be entered to boot or enter Setup. In Setup, the User will have Administrator rights.

2.5.1 Setup Administrator Password

2.5.2 Secure Boot

Feature	Options	Description
Secure Boot	Disabled (Default) Enabled	Secure Boot is activated when: - Secured Boot is enabled - Platform Key(PK) is enrolled - System mode is User/Deployed, and CSM function is disabled. Note: G100 doesn't have a TPM, secure boot is always disabled.
Secure Boot Customization	Standard Custom (Default)	Customizable Secure Boot mode: In Custom mode, Secure Boot Policy variables can be configured by a physically present user without full authentication.
Restore Factory Keys	Yes No	Not used in G100. Force System to User Mode. Configure NVRAM to contain OEM-defined factory defaults Secure Boot Keys.

2.5.2.1 Key Management

Not used in G100.

2.6 Boot Menu

Select the **Boot** menu item from the UEFI setup screen to enter the Boot Setup screen. Users can select any of the items in the left frame of the screen.

Feature	Options	Description
Setup Prompt Timeout	5 (Default)	The number of seconds to wait for setup activation key. 65535 means indefinite waiting.
Bootup NumLock State	On (Default) Off	Select the keyboard NumLock state
Quiet Boot	Disabled Enabled (Default)	Enable or disables Quiet Boot option.
Fast Boot	Disable (Default) Enabled	Enable or Disable FastBoot features. Most probes are skipped to reduce time cost during boot.
Boot Options Priorities Boot Option #1	PART 1 : OS Bootloader (P0: InnoDisk Corp. - mSATA 3SE) Disabled	Sets the system boot order. This is the internal G100 drive.

- Choose boot priority from boot option group.
- Choose specifies boot device priority sequence from available Group device.

2.7 Save and Exit Menu

Select the **Save and Exit** menu item from the UEFI setup screen to enter the Save and Exit Setup screen. Users can select any of the items in the left frame of the screen.

Save Changes and Reset

When Users have completed the system configuration changes, select this option to save the changes and reset from UEFI Setup in order for the new system configuration parameters to take effect. The following window will appear after selecting the "Save Changes and Reset" option is selected. Select "Yes" to Save Changes and reset.

Discard Changes and Exit

Select this option to quit Setup without saving any modifications to the system configuration. The following window will appear after the “Discard Changes and Exit” option is selected. Select “Yes” to Discard changes and Exit Setup.

Restore Defaults

Restore default values for all setup options. Select “Yes” to load Optimized defaults.

Note: The items under Boot Override may differ and not be the same with the image above. It should depend on the USB devices connected to G100. This option is used to deploy new G100 firmware images, see TN0116 document.

Modification Record

About this Document

Purpose

This document describes how to ACCESS AND USE THE Unified Extensible Firmware Interface (UEFI) that is embedded in the system ROM of G500 device. All options and available responses are defined.

Intended Audience

This document provides a reference for the person who installs, administers and troubleshoots G500 device.

Additional Documentation

For further information about UEFI, refer to the following documents:

- MCP Software Configuration Guide (SWM0101)
- G500 Substation Gateway Instruction Manual (994-0152)

Safety Words and Definitions

Before attempting to install or use the device, review all safety indicators in this document to help prevent injury, equipment damage or downtime.

The following safety and equipment symbols are used in this document:

Indicates a hazardous situation which, if not avoided, will result in death or serious injury.

Indicates a hazardous situation which, if not avoided, could result in death or serious injury.

Indicates a hazardous situation which, if not avoided, could result in minor or moderate injury.

Indicates practices that are not related to personal injury.

Product Support

If you need help with any aspect of your GE Vernova Grid Solutions product, you can:

- Access the GE Vernova Grid Solutions Web site
- Search the GE Vernova Grid Solutions Technical Support library
- Contact Technical Support

Access GE Vernova Grid Solutions Web Site

The GE Vernova Grid Solutions Web site provides fast access to technical information, such as manuals, release notes and knowledge base topics.

Visit us on the Web at: <http://www.gevernova.com/grid-solutions/>

Search GE Vernova Grid Solutions Technical Support Library

This site serves as a document repository for post-sales requests. To get access to the Technical Support Web site, go to: <http://www.gevernova.com/grid-solutions/events/signup.asp?sid=208>

Contact Technical Support

For help with any aspect of your GE Vernova Grid Solutions product, please contact our support team, 24/7, as follows:

Unified Extensible Firmware Interface (UEFI)

1.1 What is UEFI?

The UEFI (Unified Extensible Firmware Interface) specification defines an interface between operating systems and platform firmware during a boot, or start-up process. The interface consists of data tables that contain platform-related information, plus boot and runtime service calls that are available to the operating system and its loader. Together, these provide a standard, modern environment for securely booting an operating system and running pre-boot applications.

1.2 UEFI System Utilities

The UEFI System Utilities is embedded in the system ROM. Its features enable you to perform a wide range of configuration activities, including:

1. Configuring system devices and installed options.
2. Enabling and disabling system features.
3. Displaying system information.
4. Selecting the primary boot controller or partition.
5. Configuring memory options.
6. Launching other pre-boot environments.

The following are some of the features that UEFI enables and that the G500 device can support when configured for UEFI boot operation:

1. Secure Boot that allows the system firmware, option card firmware, operating systems, and software collaborate to enhance platform security.
2. Console Redirection that allows users to access the serial console of the G500 device when the operating system is being installed, and when the operating system is running.

1.3 UEFI Setup Program

G500 device comes with the factory installed Unified Extensible Firmware Interface (UEFI) Firmware. The UEFI acts as interface between operating system (OS) and platform Firmware. The interface contains data records with platform-related information and boot and runtime services that are available to the OS and its boot loader. The UEFI will be updated using USB flash drive.

To use the UEFI Set-up to configure its parameters, you can access UEFI Setup utility screens by using a USB keyboard, mouse and VGA monitor connected directly to the G500 device. The UEFI screen includes navigation keys and brief onscreen help to guide you in using the UEFI Set-up program.

Entering UEFI Setup at Startup

To enter UEFI Setup at startup,

- Power OFF the G500 device.
- Press the Physical Presence button on the G500 device with a paper clip.
- Power ON the G500 device without removing the paper clip.
- Wait until the CPU and Temp LEDs are flashing continuously.
- Remove the paper clip from the Physical Presence button then press the setup key <Delete> or <F2> repeatedly during the Power-On Self-Test (POST) until the UEFI Setup Utility Menu opens.
- Wait for your UEFI to load. After successfully hitting the setup key, the UEFI will load. This should only take a few moments. When the loading is complete, you will be taken to the UEFI settings menu.
- When UEFI is started, the main UEFI Setup utility top-level screen appears. This screen provides four menu options across the top of the screen.

Entering UEFI Setup after POST

If you missed the steps to enter UEFI Setup at startup,

- Press <Ctrl>+<Alt>+<Delete> simultaneously to reboot the G500 device.
- Press the Physical Presence button on the G500 device with a paper clip.
- Wait until the CPU and Temp LEDs are flashing continuously.
- Remove the paper clip from the Physical Presence button then press the setup key <Delete> or <F2> repeatedly until the UEFI Setup Utility Menu opens.
- Wait for your UEFI to load. After successfully hitting the setup key, the UEFI will load. This should only take a few moments. When the loading is complete, you will be taken to the UEFI settings menu.
- When UEFI is started, the main UEFI Setup utility top-level screen appears. This screen provides four menu options across the top of the screen.

⚠ CAUTION Information stored by the UEFI Setup Utility is essential. Use caution when making changes in the UEFI. A mistake might cause the device to not perform as expected.

Navigating UEFI Setup Utility Menus

Familiarize yourself with the UEFI controls. Since UEFI menus don't support mouse input, you'll need to use the arrow keys and other computer-specific keys to navigate the UEFI. You can usually find a list of controls in the bottom-right corner of the UEFI homepage.

The UEFI keyboard-based navigation can be accomplished using a combination of the keys, (F1/F2/F3/F4 Function keys, Left/Right Arrow keys, Up/Down Arrow keys, Plus/Minus keys, Enter key and ESC key).

```

--: Select Screen
↑↓: Select Item
Enter: Select
+/-: Change Opt.
F1: General Help
F2: Previous Values
F3: Optimized Defaults
F4: Save & Exit
ESC: Exit

```

Key	Description
→← Left/Right	: The Left and Right <Arrow> keys are used to select a major Setup screen.
↑↓ Up/Down	: The Up and Down <Arrow> keys are used to select a menu item.
<Enter>	: The <Enter> key is used to execute a command or select a menu.
+ - Plus/Minus	: The Plus and Minus <Arrow> keys are used to change the field value.
<F1>	: The <F1> key is used to invoke the General Help window.
<F2>	: The <F2> key is used to restore the previous values.
<F3>	: The <F3> key is used to load the optimized defaults.
<F4>	: The <F4> key is used to save the current settings and exit.
<ESC>	: The <ESC> key is used to exit a menu/sub-menu or the UEFI Setup.

- Use the **left** and **right arrow** keys to select the different menu options. As you select each menu option, the top-level screen for that menu option appears.
- To select an option on a top-level screen, use the **up** and **down** arrow keys to scroll up and down the options presented.
- Only options that can be modified are highlighted when you press the **up** and **down** arrow keys.
- If a field can be modified, as you select the option, user instructions for modifying the option appear in the right column of the screen.
- If a field is a link to a sub-screen, instructions to press the **ENTER** key to access the sub screen appear in the right column.
- Modify the setup field and press the **Esc** key to save the changes and exit the screen.
- Some screens present a confirmation dialog box that enables unwanted changes to be retracted.
- On sub-screens that only provide configuration information and cannot be modified, press the **Esc** key to exit the screen.
- Follow the instructions on the Exit menu screen to save or discard your changes and exit the UEFI Setup utility.

NOTE: Change your settings carefully. When adjusting settings in your UEFI, be sure that you certain what the settings will affect. Changing settings incorrectly can lead to device or hardware failure.

NOTE: If you don't know what you want to change coming into the UEFI, you probably shouldn't change anything.

1.4 UEFI Setup Screens Overview

Table 1.1 contains summary descriptions of the top-level UEFI setup screens.

Table 1.1: UEFI Setup Screens Summary

SCREEN	DESCRIPTION	Menu Options
Main	General product information including UEFI Firmware, Board, Carrier, System information and Build date/time.	Main menu options
Advanced	Configuration information for Platform Settings, Trusted Computing, Serial Port Console Redirection, NVMe, Additional IO and other system information	Advanced menu options
Boot	Boot configuration and Boot option priorities	Boot Settings menu options
Save & Exit	Save/Discard options and Default options	Save & Exit menu options

See [UEFI Setup Utility Menu Screens](#) for examples of each of these screens.

2

Main Menu Options UEFI Setup Utility Menu Screens

NOTE: The screens shown are examples. The version numbers, screen items and selections shown are subject to change over the life of the product.

The main UEFI Setup Utility top-level screen provides four menu options across the top of the screen.

- [Main Menu Options](#)
- [Advanced Menu Options](#)
- [Boot Menu Options](#)
- [Save & Exit Menu Options](#)

2.1 Main Menu Options

The main menu screen provides very basic system information, system language and open-source software license information as well as functions for setting the system time and date.

UEFI Firmware Information

Option	Description
UEFI Firmware Core Vendor	: It allows the user to view the information about the UEFI vendor.
Core Version	: It allows the user to view the core version.
Compliance	: It allows the user to view UEFI specification version.
UEFI Firmware Revision	: It allows the user to view UEFI revision.
Build Date and Time	: It allows the user to view the date and time of the build.
Access Level	: It allows the user to view the access level.

Board Information

Option	Description
Board Vendor	: It allows the user to view the information about board vendor.
Board Name	: It allows the user to view the board name.
HW Version	: It allows the user to view the board hardware version.
Serial Number	: It allows the user to view the board serial number.
Order Code	: It allows the user to view the board order code.

Carrier Information

Option	Description
Carrier Vendor	: It allows the user to view the information about carrier vendor.
Carrier Name	: It allows the user to view the carrier's name.
HW Version	: It allows the user to view the carrier hardware version.
Serial Number	: It allows the user to view the carrier serial number.
Order Code	: It allows the user to view the carrier order code.

System Information

Option	Description
System ID	: It allows the user to view the system ID.
HW Version	: It allows the user to view the system hardware version.
Serial Number	: It allows the user to view the system serial number.
System UUID	: It allows the user to view the system UUID.

System Language

This option enables you to select a language to use in the G500 UEFI setup. English is the default language.

Open-Source Software License Information

The UEFI firmware of G500 contains open-source software. The user can find the license information in the sub-menu below.

Name	License Information
Base64 encoding / decoding	: Please find license information here: http://www.apache.org/licenses/LICENSE-2.0 : Please find the project homepage here: https://tls.mbed.org/base64-source-code
EDK/EDK II	: Please find license information here: https://opensource.org/licenses/bsd-license.php : Please find the project homepage here: http://www.tianocore.org/
OpenSSL	: Please find license information here: https://openssl.org/source/license.html : Please find the project homepage here: http://www.openssl.org/

System Date

This option allows the user to set the date on the system real-time clock RTC. Simply navigate to the month, day, or year and type in the correct numeric value.

- **Date (mm-dd-yyyy)** – Enter the date in a month – day – year (mm-dd-yyyy) format.

System Time

This option allows the user to set the time on the RTC. Simply navigate to the hour, minute, or second and type in the correct numeric value.

- **Time (hh:mm:ss)** – Enter the time in a 24-hour format (hh:mm:ss) format.

2.2 Advanced Menu Options

This UEFI Advanced screen provide detailed configuration for Platform Settings, Trusted Computing, Serial Port Console Redirection, NVMe, Additional IO and other system information.

- [Platform Settings](#)
- [Tls Auth Configuration](#)
- [Network Stack Configuration](#)
- [RAM Disk Configuration](#)
- [Trusted Computing](#)
- [Expert Settings](#)
- [SMART Settings](#)

- [Serial Port Console Redirection](#)
- [NVMe Configuration](#)
- [WHEA Configuration](#)
- [bC6L20 Board Configuration](#)
- [Module Embedded Controller Configuration](#)
- [Additional IO Configuration](#)

- [092 CPLD Configuration](#)
- [092 FPGA Configuration](#)
- [RTC Battery Configuration](#)
- [Security](#)
- [Secure Boot](#)

Platform Settings

	Default	Range	Description
Platform Settings			
UCSI Retry Workaround	Disabled	Disabled, Enabled	Enable as needed BIOS will retry to write parameters before EC goes out of burst mode, applicable only to DT platforms.
Firmware Configuration	Test	Ignore Policy Update, Production, Test	Firmware Configuration Options.
PS2 Keyboard and Mouse	Enabled	Disabled, Enabled	Enable/Disable PS2 Keyboard and Mouse.
Pmic Vcc IO Level	Disabled	Disabled, 1.05V, 1.071V, 1.023V, 0.997V, 0.850V, 0.900V, 0.950V	Select the Pmic Vcc IO Voltage Level.
Pmic Vddq Level	Disabled	Disabled, 0, 1, 2, 3, 4, 5, 6, 7	Select the Pmic Vddq Voltage Level.
SLP_S0# VM	Disabled	Disabled, Enabled	SLP_S0# Voltage Margining using Premium PMIC or discrete VR with GPIO control.

	Default	Range	Description
Platform Settings			
Power Sharing Manager	Disabled	Disabled, Enabled	Configure the PSM ACPI objects.
Wireless device	Disabled	Disabled, Enabled	Configure ACPI objects for wireless devices.
Enable Wireless Charge Support	Disabled	Disabled, Enabled	Enable/Disable wireless charge support.
Enable FFU Support	Disabled	Disabled, Enabled	Enable/Disable FFU support.
HID Event Filter Driver	Disabled	Disabled, Enabled	Enable/Disable HID Event Filter Driver interface to OS.
CoExistence Manager	Disabled	Disabled, Enabled	CoEx Manager mitigates radio coexistence issues between Intel WWAN and Intel WLAN.
Alternate Mode Synch Delay	0x0	0x0000 – 0x0032 (Step size: 0.1 sec)	Add delay to make sure display alternate mode negotiation completed.
System Time and Alarm Source	ACPI Time and Alarm Device	ACPI Time and Alarm Device, Legacy RTC	Select source of system time and alarm functions.

Tls Auth Configuration

	Function	Description
Server CA Configuration		
	Enroll Cert	Press <Enter> to enroll certificate.
	Delete Cert	Press <Enter> to delete certificate.
Client Cert Configuration (N/A)		

Network Stack Configuration

	Default	Range	Description
Network Stack	Disabled	Disabled, Enabled	Enable/Disable UEFI Network Stack.

RAM Disk Configuration

	Default	Range	Description
Disk Memory Type	Boot Service Data	Boot Service Data, Reserved	Specifies types of memory to use from available memory pool in system to create a disk.
Function			Description
Create raw			Create a raw RAM disk.
Create from file			Create a RAM disk from a given file.
Created RAM disk list:			
Remove selected RAM disk (s)			Remove selected RAM disk (s).

Trusted Computing

	Default	Range	Description
Configuration			
Security Device Support	Enabled	Disabled, Enabled	Enable/Disable BIOS support security device. OS will not show security device once disabled.

Expert Settings

Expert Settings – ACPI Settings

	Default	Range	Description
Expert Settings – ACPI Settings			
Enable ACPI Auto Configuration	Disabled	Disabled, Enabled	Enable/Disable BIOS ACPI Auto Configuration.
Enable Hibernation	Enabled	Disabled, Enabled	Enable/Disable system ability to Hibernate (OS/S4 Sleep State).
Lock Legacy Resources	Disabled	Disabled, Enabled	Enable/Disable Lock of Legacy Resources.

Expert Settings – Intel RC ACPI Settings

	Default	Range	Description
Expert Settings – Intel RC ACPI Settings			
PTID Support	Enabled	Disabled, Enabled	PTID Support will be loaded if enabled.
PECI Access Method	Direct I/O	Direct I/O, ACPI	PECI Access Method is Direct I/O or ACPI.
Native PCIE Enable	Enabled	Disabled, Enabled	Enable/Disable PCIe native control.
Native ASPM	Auto	Auto, Enabled, Disabled	Enabled – OS Controlled ASPM; Disabled – BIOS Controlled ASPM.
Wake System from S5 via RTC	Disabled	Disabled, Enabled	Enable/Disable system wake on alarm event. When enabled, system will wake on the <i>hr::min::sec</i> specified /programmed by the Tools from OS.
ACPI Debug	Disabled	Disabled, Enabled	Open a memory buffer for storing debug strings. Re-Enter SETUP after enabling to see the buffer address. Use method ADBG to write strings to buffer
Low Power S0 Idle Capability	Disabled	Disabled, Enabled	This variable determines if we enable ACPI Lower Power S0 Idle Capability (Mutually exclusive with Smart connect).

	Default	Range	Description
Expert Settings – Intel RC ACPI Settings			
Lpit Windows RS2 Workaround	Enabled	Disabled, Enabled	This will enable the workaround to publish 2 LPIT entries which is required for Windows RS2.
Lpit Recidency Counter	SLP S0	SLP S0, C10	Select Recidency Counter.
Intel Ready Mode Technology	Disabled	Disabled, Enabled	Enable/Disable Ready Mode support based on Windows Away-mode. Only on DT/AIO.
PCI Delay Optimization	Disabled	Disabled, Enabled	Experimental ACPI additions for FW latency optimizations.
ZpOdd Support	Disabled	Disabled, Enabled	ZpODD SSDT table will be loaded if enabled.
Type C Support	Enabled	Disabled, Enabled	Enable/Disable USB Type C support.

Expert Settings – CPU Configuration

	Default	Range	Description
Expert Settings – CPU Configuration			
Type	Intel ® Core ™ i3-7102E CPU @ 2.10GHz		
ID	0x906E9		
Speed	2100 MHz		

	Default	Range	Description
Expert Settings – CPU Configuration			
L1 Data Cache	32 KB x 2		
L1 Instruction Cache	32 KB x 2		
L2 Cache	256 KB x 2		
L3 Cache	3 MB		
L4 Cache	N/A		
VMX	Supported		
SMX/TXT	Not Supported		
SW Guard Extensions (SGX)	Software Controlled	Software Controlled, Enabled, Disabled	Enable/Disable Software Guard Extensions (SGX).
Select Owner EPOCH input type	No Change in Owner EPOCHs	No Change in Owner EPOCHs, Change to New Random Owner EPOCHs, Manual User Defined Owner EPOCHs	Select Owner EPOCH input type.
PRMRR Size	INVALID PRMRR		
CPU Flex Ratio Override	Disabled	Disabled, Enabled	Enable/Disable CPU Flex Ratio Programming.
CPU Flex Ratio Settings	21		
Hardware Prefetcher	Enabled	Disabled, Enabled	To turn on/off the MLC streamer prefetcher.
Adjacent Cache Line Prefetch	Enabled	Disabled, Enabled	To turn on/off prefetching of adjacent cache lines.
Intel (VMX) Virtualization Technology	Enabled	Disabled, Enabled	When enabled, a VMM can utilize the additional hardware capabilities provided by Vanderpool Technology.
PECI	Enabled	Disabled, Enabled	Enable/Disable Peci.
Active Processor Cores	All	All, 1	Number of cores to enable in each processor package.
Hyper-Threading	Enabled	Disabled, Enabled	Enabled for Windows XP and Linux (OS optimized for Hyper-Threading) and Disabled for other OS (OS not optimized for Hyper-Threading).
BIST	Disabled	Disabled, Enabled	Enable/Disable BIST (Build-In Self Test) on reset.

	Default	Range	Description
Expert Settings – CPU Configuration			
JTAG C10 Power	Disabled	Disabled, Enabled	Enable/Disable Power JTAG in C10 and deeper power states.
AP threads Idle Manner	MWAIT Loop	HALT loop, MWAIT Loop, RUN Loop	AP threads Idle Manner for waiting signal to run.
AP threads Handoff Manner	MWAIT Loop	HALT loop, MWAIT Loop	AP threads Handoff to OS Manner from end of POST.
AES	Enabled	Disabled, Enabled	Enable/Disable AES (Advanced Encryption Standard).
MachineCheck	Enabled	Disabled, Enabled	Enable/Disable Machine Check.
MonitorMWait	Enabled	Disabled, Enabled	Enable/Disable MonitorMWait.
BIOS Guard	Disabled		Not Configurable.
Flash Wear Out Protection	Disabled	Disabled, Enabled	Enable/Disable Flash Wear Out Protection feature
Current Debug Interface Lock	Disabled		Not Configurable.
Processor trace memory allocation	Disabled	Disabled, 4KB, 8KB, 16KB, 32KB, 128KB, 256KB, 512KB, 1MB, 2MB, 4MB, 8MB, 16MB, 32MB, 64MB	Disable or select Processor trace memory allocation size.
CPU SMM Enhancement - SMM Code Access Check	Enabled	Disabled, Enabled	Enable/Disable support for SMM Code Access feature.
CPU SMM Enhancement – SMM Use Delay Indication	Enabled	Disabled, Enabled	Enable/Disable usage of SMM_DELAYED MSR for MP sync in SMI
CPU SMM Enhancement – SMM Use Block Indication	Enabled	Disabled, Enabled	Enable/Disable usage of SMM_BLOCKED MSR for MP sync in SMI
FCLK Frequency for Early Power On	1GHz	Normal (800MHz), 1GHz, 400MHz	FCLK frequency can take values of 400MHz, 800MHz and 1GHz (1GHz not supported for ULT/ULX SKUs)
Three Strike Counter	Enabled	Disabled, Enabled	Enable/Disable Three Strike Counter.
Voltage Optimization	Auto	Disabled, Enabled, Auto	Enable/Disable Voltage Optimization. Auto: honor the Silicon default values. Enabled: for Mobile SKUs. Disabled: for all SKUs other than Mobile.

Expert Settings – Power & Performance

	Default	Range	Description
Expert Settings – Power & Performance – CPU Power Management Control			
Boot performance mode	Max Non-Turbo Performance	Max Non-Turbo Performance, Max Battery, Turbo Performance	Select the performance state that the BIOS will set starting from reset vector.
Intel® Speed Step™	Enabled	Disabled, Enabled	Allows more than two frequency ranges to be supported.
Race to Halt (RTH)	Enabled	Disabled, Enabled	Enable/Disable Rate To Halt feature. RTH will dynamically increase CPU frequency in order to enter pkg C-State faster to reduce overall power.
Intel® Speed Shift Tech.	Enabled	Disabled, Enabled	Enable/Disable Intel® Speed Shift Technology support. Enabling will expose the CPPCv2 interface to allow for hardware controlled P-States.
HDC Control	Enabled	Disabled, Enabled	Enable/Disable HDC configuration. If Enabled, it can be enabled by OS if OS native support is available.
View/Configure Turbo Options	View/Configure Turbo Options.		
CPU VR Settings	View/Configure CPU VR Settings.		

	Default	Range	Description
Expert Settings – Power & Performance – CPU Power Management Control			
Platform PL1 Enable	Disabled	Disabled, Enabled	Enable/Disable Platform Power Limit 1 programming.
Platform PL2 Enable	Disabled	Disabled, Enabled	Enable/Disable Platform Power Limit 2 programming.
Power Limit 4 Override	Disabled	Disabled, Enabled	Enable/Disable Power Limit 4 override. If this option is disabled, BIOS will leave the default values for Power Limit 4.
C States	Enabled	Disabled, Enabled	Enable/Disable CPU Power Management. Allow CPU to go to C states when it's not 100% utilized.
Enhanced C-States	Enabled	Disabled, Enabled	Enable/Disable C1E. When enabled, CPU will switch to minimum speed when all cores enter C-State.
C-State Auto Demotion	C1 and C3	Disabled, C1, C3, C1 and C3	Configure C-State Auto Demotion.
C-State Un-Demotion	C1 and C3	Disabled, C1, C3, C1 and C3	Configure C-State Un-Demotion.
Package C-State Demotion	Auto	Disabled, Enabled, Auto	Enable/Disable Package C-State Demotion.
Package C-State Un-Demotion	Auto	Disabled, Enabled, Auto	Enable/Disable Package C-State Un-Demotion.
C-State Pre-Wake	Enabled	Disabled, Enabled	Enable/Disable C-State Pre-Wake. Sets bit 30 of POWER_CTL MSR (0x1FC) to 1 to disable the C-State Pre-Wake.
IO MWAIT Redirection	Disabled	Disabled, Enabled	When enabled, will map IO_Read instructions sent to IO registers PMG_IO_BASE_ADDRBASE+offset to MWAIT(offset)
Package C-State Limit	Auto	Auto, CPU Default, C10, C9, C8, C7S, C7, C6, C3, C2, C0/C1	Maximum Package C-State Limit Setting.
C3 Latency Control (MSR 0x60A) – Time Unit	1024 ns	1 ns, 32 ns, 32768 ns, 1048576 ns, 33554432 ns	Unit of measurement for IRTL value – bits [12:10]
C3 Latency Control (MSR 0x60A) – Latency	78	0-1023	Interrupt Response Time Limit value – bits [9:0]
C6/C7 Short Latency Control (MSR 0x60B) – Time Unit	1024 ns	1 ns, 32 ns, 32768 ns, 1048576 ns, 33554432 ns	Unit of measurement for IRTL value – bits [12:10]

	Default	Range	Description
Expert Settings – Power & Performance – CPU Power Management Control			
C6/C7 Short Latency Control (MSR 0x60B) – Latency	118	0-1023	Interrupt Response Time Limit value – bits [9:0]
C6/C7 Long Latency Control (MSR 0x60C) – Time Unit	1024 ns	1 ns, 32 ns, 32768 ns, 1048576 ns, 33554432 ns	Unit of measurement for IRTL value – bits [12:10]
C6/C7 Long Latency Control (MSR 0x60C) – Latency	148	0-1023	Interrupt Response Time Limit value – bits [9:0]
Thermal Monitor	Enabled	Disabled, Enabled	Enable/Disable Thermal Monitor.
Interrupt Redirection Mode Selection	PAIR with Fixed Priority	Fixed Priority, Round Robin, Hash Vector, PAIR with Fixed Priority, PAIR with Round Robin, PAIR with Hash Vector, No Change	Interrupt Redirection Mode Select for Logical Interrupts.
Timed MWAIT	Disabled	Disabled, Enabled	Enable/Disable Timed MWAIT support.
Custom P-State Table – Number of P-State	0		Sets the number of custom P-States. At least 2 states must be present.
EC Turbo Control Mode	Disabled	Disabled, Enabled	Enable/Disable EC Turbo control mode
Energy Performance Gain	Disabled	Disabled, Enabled	Enable/Disable Energy Performance Gain.
EPG DIMM Idd3N	26		Not Configurable
EPG DIMM Idd3P	11		Not Configurable
Power Limit 3 Override	Disabled	Disabled, Enabled	Enable/Disable Power Limit 3 Override. If disabled, BIOS will leave the default values for Power Limit 3 and Power Limit 3 Time Window.
View/Configure CPU Lock Options – CFG Lock	Enabled	Disabled, Enabled	Enable/Disable CFG Lock.
View/Configure CPU Lock Options – Overclocking Lock	Enabled	Disabled, Enabled	Enable/Disable Overclocking Lock
Expert Settings – Power & Performance – GT Power Management Control			

	Default	Range	Description
Expert Settings – Power & Performance – CPU Power Management Control			
RC6 (Render Standby)	Enabled	Disabled, Enabled	Enable/Disable Render Standby support.
Maximum GT Frequency	Default Max Frequency	Default Max Frequency, 100MHz, 150MHz, 200MHz, 250MHz, 300MHz, 350MHz, 400MHz, 450MHz, 500MHz, 550MHz, 600MHz, 650MHz, 700MHz, 750MHz, 800MHz, 900MHz, 950MHz, 1000MHz, 1050MHz, 1100MHz, 1150MHz, 1200MHz	Configure Maximum GT Frequency limited by the user.

Enable SERR propagation	Yes	Yes, No	Specify if Enable SERR propagation
Enable PERR propagation	Yes	Yes, No	Specify if Enable PERR propagation

UEFI Variables Protection

	Default	Range	Description
UEFI Variables Protection			

Password protection of Runtime Variables	Enabled	Disabled, Enabled	Control the NVRAM Runtime Variable protection through System Admin Password.
--	---------	-------------------	--

Serial Port Console Redirection

Console Redirection Settings

	Default	Range	Description
COM0 (PCI Bus0, Dev30, Func0, Port1)			
Console Redirection	Enabled	Enabled, disabled	Enable or disable Console Redirection
Console Redirection Settings			These settings specify how the host computer and the remote computer (which the user is using) will exchange data. Both computers should have the same or compatible settings
Terminal Type	VT-UTF8	VT100, VT100+, VT-UTF8, ANSI	VT100: ASCII Char set. VT100+: Extends VT100 to support color, function keys, etc. VT-UTF8: Uses UTF8 encoding to map Unicode chars onto 1 or more bytes. ANSI: Extended char set.
Bits Per Second	115200	9600, 19200, 38400, 57600, 115200	Select serial port transmission speed. The speed must be matched on the other side. Long or noisy lines may require lower speed.
Data Bits	8	7, 8	Data Bits
Parity	None	None, Even, Odd, Mark, Space	A parity bit can be sent with the data bits to detect some transmission errors. None: No parity bit. Even: Parity bit is 0 if the num of 1's in the data bit is even. Odd: Parity bit is 0 if the num of 1's in the data bit is odd. Mark: Parity bit is always 1. Space: Parity bit is always 0. Mark and Space parity do not allow for error detection.
Stop Bits	1	1, 2	Stop bits indicate the end of a serial data packet. (A start bit indicates the beginning). The standard setting is stop bit. Communication with slow devices may require more than 1 stop bit.
Flow Control	None	None, Hardware RTS/CTS	Flow control can prevent data loss from buffer overflow. When sending data, if the receiving buffer are full, a 'stop' signal can be sent to stop the data flow. Once the buffers are empty, a 'start' signal can be sent to restart the flow. Hardware flow control uses two wires to send start/stop signals.

NVMe Configuration

WHEA Configuration

	Default	Range	Description
WHEA Support	Enabled	Disabled, Enabled	Enable or disable Windows Hardware Error Architecture.

bC6L20 Board Configuration

	Default	Range	Description
bC6L20 Board Configuration			
SDIO/GPIO Pins Usage	SDIO	SDIO, GPIO	Select which function should be available on the SDIO/GPIO COMExpress Pins.

Module Embedded Controller Configuration

	Default	Range	Description
Module Embedded Controller Configuration			
Firmware Version	1.3 Build 2		
Firmware Build Date and Time	2021/06/07 15:05		
State after AC Power Loss	Power On	Power Off, Power On, Last State, Not handled by EC	Select AC Power state when power is re-applied after a power failure.
Fan Control			
Fan Control Behavior	Fast	Fast, Mid, Slow, User	Select Fan control behavior mode.
Desired Temperature (setpoint)	Auto	40, 45, 50, 55, 60, 65, 70, 75, 80, 85, 87 (degree Celsius), Auto	Select the desired temperature setpoint.
Fan PWM frequency	25 KHz	33 Hz, 25 KHz	Select the Fan PWM frequency.
Minimal Fan Speed	88	0x0000-0x00FF	Specify the minimal Fan speed.
Fan Speed below optimal Temp.	Run at min. Speed	Run at minimum Speed, Turn Fan Off	Select the speed the Fan should run at if the temperature is equal to or below the optimal value.
Fan PWM Signal Inverted	Disabled	Disabled, Enabled	Enable or disable to invert Fan PWM signal.

Additional IO Configuration

	Default	Range	Description
Additional IO Configuration			
COMe Module FPGA Version	2.5.0 generic		
I2C1 Controller Device Config	IO=6A0h; IRQ=3,4,5,7,10	<Value is filled at runtime>	Select a setting for first I2C Controller Device.
I2C2 Controller Device Config	IO=6A8h; IRQ=3,4,5,7,10	<Value is filled at runtime>	Select a setting for second I2C Controller Device.
SV: LAN LED Mode Configuration	Open Drain	Open Drain, Push-Pull	Select a LAN LED mode.
WDT Device Config.	IO=690h; IRQ=None	<Value is filled at runtime>	Select a setting for WDT Device.
WDT Second Stage Exp. Mode	No Function at second expiration	No Function at second expiration, Generate Reset pulse and WDT pin high until unit resets, Generate WDT pin high until cleared, Generate NMI and WDT pin high until cleared	Select a WDT second stage expiration mode.

092 CPLD Configuration

	Default	Range	Description
092 CPLD Configuration			
092 CPLD Version	2.0.2		
GPI Device Config.	IO=6C0h; IRQ=3,4,5,7,10	<Value is filled at runtime>	Select a setting for GPI Device.
User Watchdog Timer Device Config.	IO=6D0h; IRQ=3,4,5,7,10	<Value is filled at runtime>	Select a setting for User Watchdog Timer Device
I2C Controller Device Config.	IO=6F0h; IRQ=3,4,5,7,10	<Value is filled at runtime>	Select a setting for I2C Controller Device.

092 FPGA Configuration

	Value
092 FPGA Configuration	
092 FPGA Version	01.03.00

RTC Battery Configuration

	Default	Range	Description
RTC Battery Configuration			
RTC Battery	Installed	Installed, Not Installed	Select if your system has a RTC battery or not.

Security

	Default	Range	Description
Security			
Password Description	If ONLY the Administrator's password is set, then this only limit access to Setup and is only asked for when entering Setup. If ONLY the User's password is set, then this is a power on password and must be entered to boot or enter Setup. In Setup the User will have Administrator rights.		
Minimum length	3	The password length must be in the range.	
Maximum length	20	The password length must be in the range.	
Administrator Password	Set Administrator Password		
User Password	Set User Password		
HDD Security Configuration			
P3: M.2 (S80) 3MG2-P	Self-Encrypting Drive (SED)		

HDD Security Configuration – P3: M.2 (S80) 3MG2-P (SED)

	Value	Description
HDD Password Description	Allows Access to Set, Modify and Clear Hard Disk User Password and Master Password. User Password is mandatory to Enable HDD Security. If Master password is installed (optional), it can also be used to unlock the HDD. If the 'Set User Password' option is hidden, do power cycle to enable the option again.	
HDD Password Configuration		
Security Supported	Yes	
Security Enabled	Yes	
Security Locked	No	
Security Frozen	No	
HDD User Pwd Status	Installed	
HDD Master Pwd Status	Not Installed	
Set User Password	Set HDD/SED User Password	
Set Master password	Set HDD/SED Master Password	

Set SED User Password

The SED user password is set by default, and it is strongly advised to change this password upon receiving the G500. If the SED password is set, the SED cannot be used with any other devices except the G500 and only if the SED password is known.

To change User Password for SED, choose Set User Password and enter the default password: **u123@MCPGE** when prompted. Then enter a new password and confirm the password. It is advised to power cycle the G500 device after setting SED password.

NOTE: The new password is implemented immediately. Discard or Save changes option in Save & Exit menu does not have any impact on SED when password is set or removed. If Set User Password option is hidden, do a power-cycle to enable the option again.

NOTE: The master password is not used for SED.

Secure Boot

	Default	Range	Description
System Mode	Setup		
Secure Boot	Not Active		Secure Boot feature is Active if Secure Boot is Enabled, Platform Key (PK) is enrolled, and the System is in User mode. The mode change requires platform reset.
Secure Boot Mode	Custom	Standard, Custom	Secure Boot mode selector. 'Custom' Mode enables users to change Image Execution policy and manage Secure Boot Keys.
Restore Factory Keys			Restore Factory Keys
Reset to Setup Mode			N/A
Key Management			Enables experienced users to modify Secure Boot variables.

Key Management

	Default	Range		Description
Vendor Keys	Valid			
Factory key Provision	Disabled	Disabled, Enabled		Install factory default Secure Boot keys when System us in Setup Mode
Restore Factory Keys				Restore Factory Keys
Reset to Setup Mode				N/A
Export Secure Boot Variables				N/A
Enroll Efi Image				Enroll Efi Image
Device Guard Ready				
Remove 'UEFI CA' from DB				N/A
Restore DB defaults				Restore DB defaults
Secure Boot variables	Size	Key#	Key Source	
Platform Key (PK)	0	0	No Keys	Enroll Factory Defaults or load the keys from a file with: 1. Public Key Certificate in: a) EFI_SIGNATURE_LIST b) EFI_CERT_X509 (DER encoded) c) EFI_CERT_RSA2048 (bin) d) EFI_CERT_SHA256 (bin) 2. Authenticated UEFI Variable
Key Exchange Keys	0	0	No Keys	
Authorized Signatures	0	0	No Keys	
Forbidden Signatures	0	0	No Keys	
Authorized TimeStamps	0	0	No Keys	
OsRecovery Signatures	0	0	No Keys	

2.3 Boot Menu Options

The UEFI Boot menu enables you to configure the boot device priority (storage drives). You can designate which device the system will attempt to boot from first. This is useful for booting from a flash drive to install or repair an operating system.

	Default	Range	Description
Boot Configuration			
Setup Prompt Timeout	5	0x0000-0xFFFF	Number of seconds to wait for setup activation key. 65535 (0xFFFF) means indefinite waiting.
Bootup NumLock State	On	On, Off	Select the keyboard NumLock state
Quiet Boot	Enabled	Disabled, Enabled	Enables or disables Quiet Boot option
Boot Option Priorities			
Boot Option #1			Sets the system boot order
Boot Option #2			Sets the system boot order
Fast Boot	Disabled	Disabled, Enabled	Enables or disables boot with initialization of a minimal set of devices required to launch active boot option. Has no effect for BBS boot options.
New Boot Option Policy	Default	Default, Place First, Place Last	Controls the placement of newly detected UEFI boot options

2.4 Save & Exit Menu Options

The UEFI Save & Exit options enable you to save changes / discard changes and exit, save changes / discard changes and reset, default options, restore defaults, boot override and other options.

To select and execute an option, follow these steps:

- Use the up and down arrow keys to scroll up and down the UEFI Exit options.
- Press Enter to select the option.
- A configuration dialog box appears that enables you to save or cancel the changes and exit the Setup utility.

NOTE: The configuration dialog box is only shown below for Save Changes and Exit option screen. The other configuration screens work in a similar way.

- When you are finished adjusting your settings, you will need to save and exit by using your UEFI “Save and Exit” key for your changes to take effect.
- When you save and reset, your device will reboot with new settings.

	Description
Save Options	
Save Changes and Exit	Exit system setup after saving the changes
Discard Changes and Exit	Exit system setup without saving any options
Save Changes and Reset	Reset the system after saving the changes
Discard Changes and Reset	Reset the system without saving the changes
Save Changes	Save changes done so far to any of the setup options

	Description
Discard Changes	Discard changes done so far to any of the setup options
Default Options	
Restore Defaults	Restore/Load Default values for all the setup options
Save as User Defaults	Save the changes done so far as User Defaults
Restore User Defaults	Restore the User Defaults to all the setup options
Boot Override	
PART1: OS Bootloader (P3: M.2 (S80) 3MG2-P)	Boot Override is a way to override the normal boot sequence. It does this only on this boot and doesn't change the default boot sequence. It's just an alternative to the boot menu that you can access with a function key on bootup. Please note that the order of Part 1 and Part 2 could be swapped depending on which one is detected first during boot time.
PART2: OS Bootloader (P3: M.2 (S80) 3MG2-P)	
Launch EFI Shell from filesystem device	Attempts to Launch EFI Shell application (Shell.efi) from one of the available filesystem devices.

Restore Defaults

Restoring default settings lets you reset all UEFI configuration settings to their default values and delete all UEFI non-volatile variables, such as boot configuration. Previous changes that you have made are lost. To restore default settings:

- From the Save & Exit menu, select Restore Defaults and press **Enter**.
- Select one of the following options:
 - o No, cancel the restore procedure.
 - o Yes, load optimized default settings.
- Press **F4** to save & exit to reboot the device for changes to take effect. Press **ESC** if you need to cancel the procedure.

Save as User Defaults

You can configure default settings as necessary and then save the configuration as the custom default configuration. When the system loads the default settings, the custom default settings are used instead of the manufacturing defaults. To save custom default settings:

- From the Save & Exit menu, select Save as User Defaults and press **Enter**.
- Select one of the following options:
 - o No, cancel the procedure.
 - o Yes, save values as user default settings.
- Press **F4** to save & exit to reboot the device for changes to take effect. Press **ESC** if you need to cancel the procedure.

Restore User Defaults

You can reset all UEFI configuration settings to their default options. Previous changes that you have made are lost. To restore default system settings:

- From the Save & Exit menu, select Restore User Defaults and press **Enter**.
- Select one of the following options:
 - o No, cancel the restore procedure.
 - o Yes, restore the default settings.
- Press **F4** to save & exit to reboot the device for changes to take effect. Press **ESC** if you need to cancel the procedure.

3

How to Enable/Disable USB Port(s)

3.1 How to Identify USB Ports

USB Port 1 and Port 2

UEFI Item	Chassis Identification – Front
USB Port 1 (SS)	1
USB Port 2 (SS)	2

USB Port 3, 4, 5 and 6

UEFI Item	Chassis Identification – Rear
USB Port 3	3
USB Port 4	4
USB Port 5	5
USB Port 6	6

Internal USB

UEFI Item	Chassis Identification – Internal
Internal USB Port	Internal

3.2 To Enable/Disable USB Port(s)

1. Enter UEFI.
2. Navigate to **Advanced** menu.

3. Scroll down to select **Expert Settings** and then press **Enter** to access the sub-menu.

4. Scroll down to select **PCH-IO Configuration** then press **Enter** to access the sub-menu.

5. Scroll down to select **USB Configuration** and then press **Enter** to access the sub-menu.

6. Under **HiSpeed Connections**, select **Enable** to enable the specific USB port or select **Disable** to disable the specific USB port.

NOTE: All USB Ports are enabled by default.

7. Press **F4** to save and exit.

4

How to Enable/Disable USB Mass Storage Driver Support

4.1 To Enable/Disable USB Mass Storage Driver Support

1. Enter **UEFI**.
2. Navigate to **Advanced** screen across the top.

3. Scroll down to **Expert Settings** and then press **Enter** to access the sub-menu.

4. Scroll down to **USB Configuration** and then press **Enter** to access the sub-menu.

5. **Enable / Disable** USB Mass Storage Driver Support.

NOTE: USB Mass Storage Driver Support is enabled by default.

6. Press **F4** to save and exit.

FAQs

Q: How to find the current UEFI version?

A: Open the UEFI Setup Utility Main menu, UEFI Firmware Information is displayed, showing the Core vendor, core version, compliancy, firmware revision, build date and time information.

Q: How to Reload default UEFI Setup settings?

A: Use the UEFI Setup Utility to restore the factory installed UEFI settings.

- In the UEFI Setup utility, select the Save & Exit menu.
- Select Restore Defaults and press **Enter**.
- Select one of the following options:
 - o No, cancel the restore procedure.
 - o Yes, load optimized default settings.
- Press **F4** to save & exit to reboot the device for changes to take effect. Press **ESC** if you need to cancel the procedure.
- The UEFI setup closes and the device boots to load optimized defaults.

Q: How to update the UEFI?

A: If you need to update the UEFI to resolve a specific issue, improve performance, or to support a new hardware component, contact:

<http://www.gevernova.com/grid-solutions/events/signup.asp?sid=208>

Q: When is a reboot required?

A: For certain configuration changes to take effect, a reboot might be required.

Q: How do I select a boot device?

A: In the UEFI Setup Utility Boot menu, Boot Option Priorities shows the priorities of the boot options. Users can change the priorities by selecting the particular boot option. The boot option selected in Boot option #1 will be the first priority, followed by second, third and so on. To select a boot device, you can select an option and press Enter to change it, either to disable it or specify another boot device.

Q: How do I configure the date and time?

A: From the UEFI Setup Utility Main menu, select:

- **System Date**
 - o This option allows the user to set the date on the system real-time clock RTC. Simply navigate to the month, day, or year and type in the correct numeric value.
Date (mm-dd-yyyy) – Enter the date in a month – day – year (mm-dd-yyyy) format.
- **System Time**
 - o This option allows the user to set the time on the RTC. Simply navigate to the hour, minute, or second and type in the correct numeric value.
Time (hh:mm:ss) – Enter the time in a 24-hour format (hh:mm:ss) format.

Q: How do I save my configuration changes and reboot the system?

A: To save configuration changes and to reboot the system:

- When you are done making changes, if you do not see the prompt *Changes are pending. Do you want to save changes and exit?* press **F4** to display it.
- Press **Y** to save your changes.
- Select Save changes and Exit option from the Save & Exit menu and press Enter- Exits the device and continues the normal boot process. The system continues through the boot order list and launches the first bootable option in the system.

Modification Record

VERSION	REVISION	DATE	CHANGE DESCRIPTION

Configuring the MCP devices for Centralized LDAP Authentication using Windows Active Directory

Product Support

If you need help with any aspect of your MCP product, you can:

- Access the GE Vernova Grid Solutions Web site
- Search the GE Vernova Technical Support library
- Contact Technical Support

Access GE Vernova Grid Solutions Web site

The GE Vernova Grid Solutions Web site provides fast access to technical information, such as manuals, release notes and knowledge base topics.

Visit us on the Web at: <https://www.gevernova.com/grid-solutions/>

Search GE Vernova Grid Solutions technical support library

This site serves as a document repository for post-sales requests. To get access to the Technical Support Web site, go to:

<https://www.gevernova.com/grid-solutions/events/signup.asp?sid=208>

Contact Technical Support

For help with any aspect of your GE Vernova Grid Solutions product, please contact our support team, 24/7, as follows:

Configuring the MCP devices for Centralized LDAP Authentication using Windows Active Directory

About this Document

Purpose

This manual describes how to install and configure the Windows® Server 2012 and Multilin™ MCP device for Centralized LDAP Authentication.

This document applies to the MCP family (G100/G500) unless otherwise indicated.

Screen captures may show G500 in some areas, however the workflow applies to products in the MCP family (G100/G500).

Intended audience

This manual is a helpful resource for utility personnel and system engineers who are implementing LDAP on Multilin™ MCP devices in an overall substation automation system.

Additional documentation

For the most current version of the Configuring Windows® Server 2012 and Multilin™ MCP for Centralized LDAP Authentication - Manual, please download a copy from GE Vernova Grid Solutions web site.

For information on fully installing, configuring, monitoring and testing a MCP device, refer to the:

- G500 Substation Gateway Instruction Manual, 994-0152
- G100 Substation Gateway Instruction Manual, 994-0155
- MCP Substation Gateway Software Configuration Guide, SWM0101

Configuring the MCP devices for Centralized LDAP Authentication using Windows Active Directory

Chapter 1: Windows 2012 Active Directory

The Lightweight Directory Access Protocol (LDAP) is an application protocol for accessing and maintaining distributed directory information services over an Internet Protocol (IP) network. This Directory services may provide any organized set of records, often with a hierarchical structure.

This chapter describes how to configure a Windows® Server 2012 and the MCP device for Centralized LDAP Authentication.

See section:

- [Basic setup](#)
- [Configuration tasks](#)
- [Installing AD DS](#)
- [Procedure to create MCP AD Groups on Active Directory](#)
- [Procedure for Adding MCP AD users to MCP AD Groups](#)
- [Installing AD CS](#)
- [Installing CA Certificates on the MCP device](#)
- [Configuring LDAP on the MCP device](#)

Basic setup

The following is required to configure the MCP device and the LDAP Servers:

- Windows Server 2012
- MCP device

The following is required only if Windows Server Active Directory Certificate Services (ADCS) are not installed:

- Open Source CA Package: X Certificate and Key Management (XCA):
Certificates are issued by a Certification Authority (CA). The MCP device is not delivered with a CA; consequently, you must make use of an existing CA or create your own. There are many third-party commercial and open source CAs available. This document describes one such open source CA package.

Configuration tasks

To configure Active Directory on Windows Server 2012, the following tasks are performed:

- Installation of AD DS on Windows Server 2012. See section: [Installing AD DS](#).
 - Create AD Groups on Active Directory. See section: [Procedure to create MCP AD Groups on Active Directory](#).
 - Add MCP AD Users to MCP AD Groups. See section: [Procedure for Adding MCP AD users to MCP AD Groups](#).
 - Setup of Active Directory Certificate Services and generation of Root CA Certificate. See section: [Installing AD CS](#).
 - Importing and Installing of Root CA, generated using AD CS to MCP device. See section: [Installing AD CS](#).
 - Installation of the Certificate on the MCP device. See section: [Installing CA Certificates on the MCP device](#).
 - Configure LDAP on the MCP device. See section: [Configuring LDAP on the MCP device](#).
-

Installing AD DS

Windows Server Active Directory Domain Services (AD DS) enables the creation of an LDAP-enabled central storage for users, groups, and other objects.

This section describes the equipment setup, prerequisites, and the procedure to install Active Directory - Domain Services.

Equipment setup to install AD DS

Figure 1 shows a simple hardware configuration for installing central authentication services. G500 is shown, however the functionality and workflow applies to products in the MCP family (G100/G500).

Figure 1: Central authentication - equipment setup

Prerequisites

Before configuring LDAP authentication:

- The server must:
 - Be running Windows Server 2012.
 - Have AD DS installed.
 - Have an Internet Protocol (IP) address.
 - Be logged in with administrator privileges.

Computer and domain names

While performing the procedures provided in this guide, it is optional to enter your own computer name and domain names. If you choose to use your own computer and domainnames, ensure that you substitute those names in the procedures provided in this guide.

To change the server name:

1. Click **Start**.
2. Right-click **computer**.
3. Select **Properties > Advanced system settings > Computer Name**.

Procedure to install AD DS

To install Active Directory Domain Services (AD DS) on the Windows server:

1. From the Windows 2012 desktop, open the Server Manager by selecting **Start** menu > **Server Manager**:

Result: The Server Manager window appears.

Or open the Server manager through shortcut icon on Windows 2012 desktop:

2. Add a new role:
 - 2.1. Select **Local Server**.

2.2. Click **Manage > Add Roles and Features**.

Result: The “Add Roles and features” wizard opens, showing the “Before you Begin” screen.

3. From the Before You Begin screen, click **Next**.
4. Select **Installation Type as Role-based or feature based installation**, and click **Next**.
5. Select a server from the server pool, click **Next**.

- 5.1. Under Server Roles menu, select the Roles option: **Active Directory Domain Services**, and click **Next**.

A notice displays that explains that you must also install additional roles, services, or features in order to install Domain Services. These additional capabilities include certificate services, federation services, lightweight directory services, and rights management.

- 5.2. When prompted to select the additional capabilities, click **Add RequiredFeatures**.
On the Select features screen, select the check boxes next to the features that you want to install during the AD DS installation process (if any or leave default selection) and click Next.
- 5.3. Review the information on the **AD DS** tab, then click **Next**.
- 5.4. Review the information on the **Confirm installation selections** screen, then click **Install**.
- 5.5. When the installation is complete, click **Close**.
6. Promote Server as Domain Controller.
- 6.1. After installing Active directory services, select Promote server to a domain controller from the server notification page.

- 6.2. Once you select this option, a separate **Active Directory Domain Services Configuration Wizard** appears.

7. Deployment Configuration.

Select Deployment option as per your requirement. If you are installing first Active Directory in the network, select Add a new forest.

- 7.1. Type in the **Root domain name**. The Root domain is the Full Qualified Domain Name; for example, GEServer.GE.local

Result: A prompt appears to install a domain name system (DNS) server.

- 7.2. Ensure that the **DNS server** option is selected, and click **Next**.

Result: If you have any unconfigured network interfaces, you are prompted to acknowledge the use of dynamically assigned IP addresses.

- 7.3. Since this is acceptable in this example, select **Yes, the computer will use dynamically assigned IP address**.

If you receive a popup warning regarding a delegation for a DNS server, this is normal; click **Yes** to continue.

Result: The computer will use a dynamically assigned IP address.

Result: You are prompted for a Password; you can use the same password as the current administrator account.

8. Click **Finish**.

Result: The system finalizes the installation and prompts you to restart the computer when the installation is complete.

9. Restart the Windows server.

10. Test the AD DS installation; see section: [Procedure to test the AD DS domain controller installation](#).

The local Windows Server 2012 account login will change from the local account to the domain account. For example, if the local computer name or account was Administrator or ADDS\Administrator, you must now log in to the device with CENTRAL\Administrator.

Procedure to test the AD DS domain controller installation

To test connectivity to an Active Directory Domain Controller (DC) from a Windows PC you can use several methods, one of which is **ldp.exe**.

LDP.EXE is a GUI tool that acts as a Lightweight Directory Access Protocol (LDAP) client, which lets you perform connect, bind, search, modify, add or delete operations against AD. To test the AD DS domain controller installation, the Administrator of the domain is to:

1. Open the **Server Manager** from the Windows Server 2012 Start Menu and select **AD DS**.
2. Select the server and right click and select **Active Directory Users and Computers**.

3. Right-click the Users folder and select **New User**.

In this step a Bind User is being created.

LDAP Bind Operation: Bind operations are used to authenticate clients (and the users or applications behind them) to the directory server, to establish an authorization identity that will be used for subsequent operations processed on that connection.

Once the bind user is created, binding is the step where LDAP server authenticates the MCP client and, if the client is successfully authenticated, allows the client access to the LDAP server based on that client's privileges. Rebinding is simply doing the process over to authenticate the client.

This bind user can have any username is usually different from the real users.

4. Create a new user name: **ldapbind**.

The user name is comprised of only lower-case letters, numbers, "-" (dash), and "_" (underscore) characters.

The screenshot shows the 'New Object - User' dialog box. The 'Create in' field is set to 'GE.local/Users'. The 'First name' field contains 'ldapbind', and the 'Full name' field also contains 'ldapbind'. The 'User logon name' field contains 'ldapbind' and the domain dropdown is set to '@GE.local'. The 'User logon name (pre-Windows 2000)' field contains 'GE\ldapbind'. The 'Next >' button is highlighted.

5. Click **Next**.

6. Create a password for the **ldapbind** user.

7. Select the option, **Password never expires**.

The MCP device does not support the **User must change password at next logon** option.

8. Click **Next** and **Finish**.

9. Go to **Start** menu > **Run**.
10. Type in **ldp.exe** and press the **Enter** key.

Result: The Ldp application window appears.

11. Click **Connection > Connect**. Enter the server name, e.g. "GEServer.GE.local" as per configured computer name with domain

name.

12. Click **OK**.
13. Ensure that the connection has been successfully established to AD DS. Result: Information about supported LDAP versions and policies may appear.
 - 13.1. Click **Connection > Bind**, and select **Bind with credentials**.
 - 13.2. Type in **ldapbind** (lower-case characters only) as the User name, with the appropriate Password.
 - 13.3. De-select the option: **Encrypt traffic after bind**.
 - 13.4. Click **OK**.

14. Ensure that you receive a successful authentication message; for example:

```
-----
0 = ldap_set_option(ld, LDAP_OPT_ENCRYPT, 0)
res = ldap_bind_s(ld, NULL, &NtAuthIdentity, NEGOTIATE (1158)); // v.3
      {NtAuthIdentity: User='ldapadmin'; Pwd=<unavailable>; domain = ''}
Authenticated as: 'GEGRID\ldapbind'
-----
```

Procedure to create MCP AD Groups on Active Directory

MCP allows 6-different user roles on MCP. These are Administrator, Observer, Operator, Supervisor, Passthrough and Remote Desktop Tunnel. To assign these roles we need to create 6-different groups in Active Directory. Follow the below steps to create MCP device AD group on an Active Directory:

1. Open the **Server Manager** from the Windows Server 2012 **Start** menu and select **AD DS**.
2. Right-click on the server and select **Active Directory Users and Computers**.

3. **Active Directory Users and Computers** window opens:

4. Right-click on Users and select **New -> Group**.

5. New index will open to create new object group. Type in the group name as below and click OK. This group name can be any name as per group representation (User defined name):

6. On completion of above step User group has been created successfully. Now this User Group is required to be mapped to MCP User Group. It can be done in two approaches:
- [Static Group Mapping](#)
 - [Dynamic Group Mapping](#)

Procedure for Static Group Mapping

In this approach, the Windows Server **AD group gid** shall be configured as per Table 1.

Table 1: Group IDs mapping on the AD User Groups

AD Group Name	GID Number	Description
G500Administrator	0	To map AD Group G500Administrator to G500 group Administrator
G500Observer	501	To map AD Group G500Observer to G500 group Observer
G500Operator	502	To map AD Group G500Operator to G500 group Operator
G500Supervisor	503	To map AD Group G500Supervisor to G500 group Supervisor
G500SSHPassThrough	504	To map AD Group G500Passthrough to G500 group Passthrough
G500RemoteTunnel	507	To map AD Group G500RemoteTunnel to G500 group RemoteTunnel

**NOTE**

The AD Group Name in the table is an example. AD Group Name can be any name as configured by the user, Eg.: Test Group etc. In this example is listed as “G500...”, could be “G100...”.

Because the functionality is the same across MCP family, this could be “MCP...”.

However, GID Number is fixed as specified in Table 1 for MCP (G500, G100) to recognize the same.

Example: In Active Directory, to map G500 device AD group with name “**G500Administrator**” to G500 group “**Administrator**” using static group mapping, the ADgroup **GID** must configured as in the Table 1.

1. To input this GID Number double click on the group created in the above step and go to Attribute Editor tab:

- Corresponding User Group properties index will be opened, click on **Attribute Editor** tab and enter the specific **gid number** as defined in Table 1 for different user role, like for administrator user group input the GID Number as 0.

- After setting the gid number for AD User group click **Apply** and **OK**.

RESULT: G500Administrator group has been mapped successfully for **Administrator** role in G500. Now the user added to this group will have administrator role in G500 (MCP in general). "[Procedure for Adding MCP AD users to MCP AD Groups](#)" will be described in further sections in this document.

Procedure for Dynamic Group Mapping

In this approach, the MCP device AD Group distinguished name “DN” must be configured in MCP group mapping. If user want to go for this approach, then GID Number entry in AD Group is not required. To continue with Dynamic group Mapping follow the below steps (G500 is listed as example, applies to G100 and MCP family):

1. Double click on the group created from the above step and go to Attribute Editor tab:

2. Note down the distinguished name which is also called “DN” (double click AD UserGroup → Attribute Editor → distinguishedName):

In the above example, the distinguished name (DN) of MCP device AD group G500Administrator is “**cn=G500Administrator,cn=users,dc=GE,dc=local**”

3. Continue at [Procedure to Configure Group Mapping on the MCP Device](#).

Procedure to create MCP device Users on Active Directory

Follow the below steps to create MCP device users on an Active Directory (AD):

1. Open the Server Manager from the Windows Server 2012 **Start** menu and select **AD DS**.
2. Right-click on the server and select **Active Directory Users and Computers**.

3. **Active Directory Users and Computers** window opens:

4. Right-click the Users folder and select **New User**.

5. Create a new User with Username: **ldapadmin**. The username must contain only the lower-case letters, numbers, "-" (dash), and "_" (underscore) characters. Click **Next**.
6. Type the password for the user, select **Password never expires** option and click **Next**.

NOTE

The MCP device does not support the option **User must change password at next logon**.

7. Click **Finish**.

Result: The user is created in AD DS.

Procedure for Adding MCP AD users to MCP AD Groups

In the above sections MCP AD Groups and MCP AD Users have been created. Now it is required to add these users to corresponding groups. For example, add all the administrator users to administrator group, operator users to operator groups, observer users to observer group, supervisor users to supervisor group, passthrough users to passthrough group and remote desktop tunnel users to remote tunnel group.

1. Open the Server Manager from the Windows Server 2012 **Start** menu and select **ADDS**.
2. Right-click on the server and select **Active Directory Users and Computers**.

3. **Active Directory Users and Computers** window opens:

4. Right click on the **User** to be added and select **Add to a group** option (For example in above step we had created a user named “**ldapadmin**”, so right click on it).

5. A new window will be opened to select User Group. Type the **MCP AD group name** (For example in above section we had created user group name **G500 Administrator**, type this name click on **Check Names** then click on **OK**).

RESULT: User is successfully added to MCP AD Group (G500Administrator in this example).

Installing AD CS

This section describes how to install Active Directory Certificate Service and import ROOTCA certificate onto the MCP device.

NOTE

If user would prefer to use a third-party certification authority instead of AD CS, the procedure to generate and import the certificate in Windows Server 2012 is described in the section [Creating and installing a third-party CA certificate](#).

Install Active Directory Certificate Services on Windows Server2012 procedure

To install Active Directory Certificate Services on Windows Server 2012:

1. Add a new role:
 - 1.1. Select **Local Server** from the server manager.
 - 1.2. Click **Manage > Add Roles and Features**.

Result: The Add Roles wizard opens, showing the "Before You Begin" screen.

2. Steps for installing the Active Directory Certificate Authority:
 - 2.1. From the Before You Begin screen, click **Next**.

- 2.2. Select **Installation Type: Role-based or feature based installation**, click **Next**.

- 2.3. Under **Server Selection** menu, check the option **Select a server from the server pool** and click **Next**.

- 2.4. When the wizard displays list of **Server Roles**, select **Active Directory Certificate Services** check box and click **Next**.

- 2.5. This opens up **Add Roles and Features** wizard. Click **Add Features**.

- 2.6. It opens the below screen. Click **Next**.

- 2.7. Select Certification Authority, Certification Authority Web Enrollment and click **Next**.

- 2.8. Click on **Add Features**.

- 2.9. The below screen appears, click **Next**.

- 2.10. This goes to the confirmation Page. Check the check-box to Restart the destination server automatically if required and **Install**.

- 2.11. Close the window once the installation is complete.

3. From the Server Manager Dashboard, click on the flag and click Active Directory Certificate Services.

- 3.1. It opens the AD CS Configuration window, in which enter the server credentials and click **Next**.
- 3.2. Select the below Role Services and click **Next**.

- 3.3. Select the Setup Type as Enterprise CA and click **Next**.

- 3.4. When prompted, select the **Root CA** option and click **Next**.

- 3.5. When prompted, select the **Create a new private key** option and click **Next**.
- 3.6. Select the hash algorithm, Common Name and Distinguished name of CA as per the Active Directory domain.
- 3.7. Set the CA certificate Validity period (default is 10 years but configurable) and complete the installation.

Result: Once installation is successfully completed, **AD CS** option is available in the **Server Manager**.

Exporting Root CA certificate to install on the MCP device

To export a Root CA certificate for installation on the MCP device:

1. From Server Manager select the **AD CS** option. Right click on the **Server** and select **Certification Authority**.

2. A new window opens, certsrv - Certification Authority.
3. In the Certification Authority window select the CA Certificate (i.e. root CA Certificate) and click **Properties**.
4. You can view the Root CA Certificate details like Issue to, Issue by, validity by clicking on **View Certificate**.

5. Export the root CA certificate to a file by clicking on the **Details** tab and then **Copy to File** button.

Result: The Certificate Export wizard opens.

6. Click **Next** to continue.
7. Select the export format by selecting the **Base-64 encoded x.509 (.CER)** option and click **Next**.

8. Give the certificate a name with **.cer** extension and then click **Next** to finish the certificate import from AD CS.

Result: A message appears: Export is successful. The certificate is saved in the destination path selected.

Installing CA Certificates on the MCP device

This section describes how to install the CA Certificate to the MCP device. There are two type of certificates you can create:

- Server certificate
- Client certificate

Files to be Created	• CA certificate to be installed in both the Client and Server. • Server Certificate to be installed in the Server for Server Authentication (This can be skipped if AD CS is used to create the CA Certificate).	
Files to be Transferred	MCP	MyCA.crt or MyCA.cer (LDAP Client)
	Windows Server2012	MyCA.crt or MyCA.cer servercert.p12 (LDAP Server) (This can be skipped if AD CS is used as Certification Authority).

CA Certificate transfer procedure from PC to MCP

You can import and install the CA certificate to MCP. This certificate can be transferred to MCP for installation, using either of the below two options:

1. CA Certificate Transfer to MCP by using DSAS Secure File Browser
2. CA Certificate transfer to MCP by using external Secured USB

CA Certificate Transfer to MCP by using DSAS Secure File Browser

- Copy the files containing the CA certificate to the following MCP location: **/mnt/usr/SecureScadaTransfer**
 - This can be done using the DSAS Secure File Browser (SFTP file transfer program).
 - To launch DSAS Secure File Browser, click on: **Start>All programs>DS AgileStudio vX.0> Secure File Browser vX.0.**

- Secure File Browser screen will be launched as below:

- Click **Connect**.
- The Connection Details window will appear.

- Enter Host name: MCP IP, Protocol: SFTP, User name details and then click **Connect**.

The 'Connection' dialog box has three tabs: 'Server', 'Proxy', and 'SSH'. The 'Server' tab is active. It contains a 'Connection' section with 'Host name' (172.12.231.31) and 'Port' (22). Below is a 'Protocol' dropdown menu set to 'SFTP'. The 'Credentials' section includes a 'User name' field (admin), a 'Domain' field, and 'Client certificate' and 'Private key' fields. There are 'Import...' and 'Clear' buttons for both certificates. A 'Use GSSAPI' checkbox is also present. At the bottom, there is a 'Logging level' dropdown set to 'Info' and a 'Connect' button.

- A Login window appears, enter the MCP User Name and click **Identify** tab.

The 'Login' dialog box has a title bar and a 'User Name' field containing 'admin'. At the bottom, there are 'Identify' and 'Cancel' buttons.

- Once the User Name is identified with the MCP, a Login window appears and prompt for the Password.

The 'Login' dialog box displays a message: 'UNAUTHORIZED ACCESS TO THIS DEVICE IS PROHIBITED. You must have explicit permission to access or configure this device. All activities may be logged. Violations of policy governing this device may result in disciplinary action and may be reported to law enforcement. There is no right to privacy in accessing this device.' Below the message, there are 'User Name' (admin) and 'Password' (masked with asterisks) fields. At the bottom, there are 'Login' and 'Cancel' buttons.

- Enter the Password and click **Login** to access the MCP folders.

- Once your Login is successful, you can see the below Secure File Browser screen:

- In the Secure File Browser window, PC folders are displayed on the left side and the MCP folders are displayed on the right.
- On MCP side, navigate to folder **/mnt/usr/SecureScadaTransfer**

- Select the required certificate from the PC folder and click **Upload**. This will upload the files from PC to MCP.

NOTE

After completion of these steps, LDAP client certificate is transferred successfully to MCP and is ready for installation.

CA Certificate transfer to MCP by using external Secured USB

Once the LDAP client certificate (CA certificate) is created and available on the PC and you can transfer this CA certificate to MCP using USB as follows:

1. Create a directory in USB drive **"SecureScadaTransfer"**.
2. Copy the CA certificate from PC to USB on a USB drive (LDAP Client certificate need to be available in USB at **SecureScadaTransfer**).
3. Insert the USB drive into any USB slot on the MCP device. E.g.: USB Port-1
4. Open Local HMI and login as administrator user.

5. Go to **Settings > Utilities** page in the local HMI and click on **Mount USB** option.

6. Now USB is mounted successfully to MCP and CA certificate is available at **/mnt/usb/usb1/SecureScadaTransfer**.

CA Certificate Installation procedure

Once the certificate is available in MCP by any of the transfer procedure mentioned in page 39 (Secure DSAS Browser or USB), it can be installed by using either of the below two interfaces:

- Import and Install CA certificate through Runtime DSAS
- Import and Install CA certificate through Local HMI

Import and Install CA certificate through Runtime DSAS

After certificate transfer to MCP at **/mnt/usb/SecureScadaTransfer/** or certificates can be installed to MCP using **DSAS > Utilities**. To proceed follow the below steps:

1. Open MCP Studio and click **Connect** to MCP.

2. Select Utilities tab, click on **Import**, to import the copied certificates.

3. Once the certificates are imported, a Certificate Import window appears which shows confirmation of import status. Click **OK**.

4. Once the certificates are imported successfully, click "**Manage**" to manage local certificates which display three tabs **Local**, **Issuer** and **CRL** as below:

5. Click on **Issuer** tab, select the Certificate and click **Install**.

6. Once the certificate is installed successfully, it is moved to the Installed Issuer Certificates section:

RESULT: This completes the Certification Installation process through DSAS Online HMI. You can use this certificate in LDAP Authentication.

Import and Install CA certificate through Local HMI

After the certificate is transferred to the MCP at **/mnt/usr/SecureScadaTransfer/** or **/mnt/usb/usb1/SecureScadaTransfer/** certificates can be installed to MCP using **Local HMI > Settings > Utilities**. To proceed follow the prescribed steps as below:

1. Open Local HMI and click **Settings** tab.

2. Click **Utilities** tab.

3. Click on **Import**, to import the copied certificates.

4. Once the certificates are imported, a Certificate Import window appears which shows confirmation of import status. Click **OK**.

5. Once the certificates are imported successfully, click **"Manage"** to manage local certificates which display three tabs Local, Issuer and CRL as below:

6. Click on **Issuer** tab, select the Certificate and click **Install**.

7. Once the certificate is installed successfully, it's moved to the Installed Issuer Certificates section:

RESULT: This completes the Certification Installation process through DSAS Online HMI. You can use this certificate in LDAP Authentication.

Configuring LDAP on the MCP device

This section describes the:

- Tasks performed prior to configuring the LDAP on the MCP device and
- The procedure to configure the LDAP on the MCP device.

Prerequisites to configuring LDAP on MCP device

Prior to configuring the LDAP on the MCP device it is mandatory to create emergency user in MCP. If user directly start LDAP configuration by using section [Procedure to configure LDAP on the MCP device](#) then user will get popup message that “Please add Emergency User before switching to LDAP/TACACS Authentication” and user will not be able to configure LDAP authentication without adding emergency users.

Create an Emergency Administrator User

This emergency user can be used when remote authentication server is not available and user is unable to access MCP using Remote Authentication. This emergency admin user is required to get access to the system in case of emergency, i.e. when LDAP server is not responsive / user forgets all credentials etc.

Emergency Users can be created by using any of the below two options:

- Using Web MCP Settings GUI
- Using the mcpcfg utility on MCP device through Secure Terminal Emulator

An emergency administrator user can login to MCP using any of the below three interfaces:

1. SSH session to MCP (Port-922)
2. Front serial port connection to MCP (Baud Rate- 115200)
3. MCP Emergency option in local console

Once user logs into MCP as Emergency Administrator user, executing “emergcfg” command shall provide options for user to perform the below two key functions:

- Change the mode authentication from remote to local mode.
- Generate emergency code to login to HMI without changing authentication from remote to local mode.

Below sections describes how to add emergency user in MCP by using any of these option step by step:

Using the mcpcfg utility on MCP device through Secure Terminal Emulator

1. To open Secure Terminal Emulator, select **Start > All Programs > DS Agile Studio vX.0 > Secure Terminal Emulator vX.0**

2. Click **Connect**. A pop-up window appears which shows Connections credentials.
3. Enter your MCP IP in Host name, Login name and Port 22 and click **Connect**.

4. A Login window appears, enter User Name and click **Identify**.

The image shows a 'Login' dialog box. It has a title bar 'Login'. Below it is a 'User Name' text box containing the text 'admin'. At the bottom of the dialog are two buttons: 'Identify' and 'Cancel'.

5. Once the User Name is identified with the MCP, a Login window appears to prompt for the Password. Enter the MCP password and click **Login**.

The image shows a 'Login' dialog box. It has a title bar 'Login'. Below it is a message: 'UNAUTHORIZED ACCESS TO THIS DEVICE IS PROHIBITED. You must have explicit permission to access or configure this device. All activities may be logged. Violations of policy governing this device may result in disciplinary action and may be reported to law enforcement. There is no right to privacy in accessing this device.' Below the message are two text boxes: 'User Name' containing 'admin' and 'Password' containing seven asterisks. At the bottom are two buttons: 'Login' and 'Cancel'.

6. Once you login successfully, MCP Shell window appears:

```
GE Multilin MCP Firmware Release 110 Production Build 391 2020-01-01:04:41:24
admin@G500:~$
```

7. Type **sudo mcpcfg** and enter your Administrator User Name and Password if prompts.
8. The Gateway Settings Menu appears:

```
=====
Gateway Settings Menu
=====

0. Back
1. Configure Authentication
2. Configure Network Settings
3. Configure Network Interfaces
4. Configure Secure Access
5. Configure Firewall
6. Configure Host Names

Using Web MCP Settings GUI

1. Login to MCP using local admin user authentication:
 - Entering their User Name.
 - Entering their Password.
 - Selecting Login to advance to the next screen and begin using the application.

The image shows a login screen for the MCP Settings GUI. It has a blue background with rounded corners. At the top center is the GE logo, which consists of a white circle containing the letters 'GE' in a stylized font. Below the logo, the text 'MCP Settings' is displayed in white. Underneath this, there are two input fields: the first is labeled 'Username' with a small person icon to its left, and the second is labeled 'Password' with a small padlock icon to its left. Both labels are in white. At the bottom center, there is a green rectangular button with the word 'Login' in white text.

2. Once you have logged in to the MCP Settings, you can see a menu on the center and Logout option on the top right of the screen. To explore the MCP settings use the menu options shown on the home page:

3. Select **Configure Authentication** from the main menu.

4. Click on **Emergency Group User** to add emergency User.

5. To add new emergency user click **Add User** tab.

6. Enter the desired Emergency Group Username, conforming to the emergency group username rules as listed below:
- Emergency Group Username must be between 2 and 31 characters.
 - Emergency Group Username must start with a lowercase alphabetical character.
 - Emergency Group Username must only contain [a-z][0-9][-,_] characters.

7. Enter the Full Name of the emergency group user.
8. Enter the Password, conforming to the password security rules as listed below:
 - Password must be between 8 and 199 characters in length
 - Password must contain:
 - 1 character from [a-z]
 - 1 character from [A-Z]
 - 1 digit from [0-9]
 - 1 special character from the set [\$%@!&]
 - Re-enter password and click Confirm.

RESULT: Pop-up window appears showing the Operation Status: **New user successfully added**, click **OK**.

Retrieve LDAP Authentication Server information

1. Retrieve the following LDAP authentication server information from the IT / Network team of your organization or company:

Name	Locate on LDAP Server
Primary Host Name	1. It is full name of your computer (LDAP Server). 2. Open properties of computer or server and view the Full Name of Computer
Primary Host IP Address	Open Server Manager in LDAP server and click on AD DS and note down the IP address of server.
Secondary Host Name	This is an optional field. It is full name of your secondary computer (LDAP Server). Open properties of computer or server and view the Full Name of Computer. If the Secondary LDAP Server is configured, MCP shall automatically switch to the secondary server when the primary server is not available.
Secondary Host IP Address	This is an optional field. Open Server Manager in secondary LDAP server and click on AD DS and note down the IP address of server.
LDAP Port	LDAP communication mechanism is TLS/SSL. Port-number = 389 for TLS communication Port-number = 636 for SSL communication

Name	Locate on LDAP Server
Base DN	1. It is Domain Name 2. Open properties of computer or server and view the Domain 3. If Domain is GE.local then Base DN will be "dc=GE,DC=LOCAL"
Bind User Name	Username of the bind user created in the LDAP server. Assume the user name to login LDAP machine or server is "ldapbind" and dc name is "GE" and dc type is "local" then the bind user name will be (in DN format) "cn=ldapbind,cn=Users,dc=GE,dc=local"
Bind Password	Password for the Bind User
Security Type	LDAP communication mechanism is TLS/SSL. Port-number = 389 for TLS communication Port-number = 636 for SSL communication
CA Certificate	Selected the imported CA certificate from the drop-down list.
Bind Time limit in Seconds	Use 30 as default value
User ID Attribute Map	User can use the default value "sAMAccountName"
Home Directory Attribute Map	User can use the default value "unixHomeDirectory"

Procedure to find the above-mentioned parameter in LDAP machine or server:

1. **Primary Host Name/Secondary Host Name**

- It is full name of computer (LDAP Server).
- Open properties of computer or server and view the Full Computer Name as below screen shot:

2. Primary Host IP Address/Secondary Host IP Address

- Open Server Manager from in LDAP server and click on **AD DS** and note down the IP address of server (Start → Server Manager → AD DS).

3. LDAP Port

- 3.1. LDAP authentication mechanism (that is, SSL or TLS) and the configured portnumber.
- 3.2. Example: For the Windows Active Directory the standard port numbers for TLS/SSL communication:
 - Portnumber = 389 for TLS communication
 - Portnumber = 636 for SSL communication
- 3.3. LDAP port number can be checked by below steps in Windows Server:
 - i. From Start menu -> run -> type **ldp** and press **Enter**.

ii. Select **Connection** menu > **Connect**.

iii. A new login index will be opened for login, the LDAP port will be automatically filled in the login prompt. Note down this port number: 389 as below:

4. Base DN

- 4.1. It is a Domain Name.
- 4.2. Open **Properties** of computer or server and note the Domain name.

4.3. If Domain is **GE.local** then Base DN will be “**dc=GE,dc=LOCAL**”.

5. Bind user name (in DN format)/Bind Password

- If the user name of LDAP machine or server is “**ldapbind**” and dc name is “**GE**” and dc type is “**local**” as shown in above screen shot then the bind user name will be (in DN format) “**cn=ldapbind,cn=Users,dc=GE,dc=local**”
Creation of Bind user is described in the section [Procedure to test the AD DS domain controller installation](#).
See [Checking DN Format](#) section for details on how to capture these details from the LDAP Server.
- The user name is comprised of only lower-case letters, numbers, “-” (dash), and “_” (underscore) characters.
- LDAP search is based on directory in DN format. For example: dc=GE,dc=local [Checking DN Format](#) for details.
- Bind password is the password created for the above bind user.
- For the LDAP Application to switch automatically to the Secondary LDAP server, when Primary LDAP server is not available, the exact same bind user should be created in both servers.

6. User ID Attribute Map

- Default/standard user ID attribute is sAMAccountName.

- To view the configured value open uid field for the Windows Active Directory. This can be viewed in the properties section of the user.

Idapbind Properties

Procedure to configure LDAP on the MCP device

You can configure or change the authentication to LDAP Authentication mode by using HMI. In above section (Retrieve LDAP Authentication Server Information), we already had collected all the parameters that will be used here for configuration: To configure the LDAP in the MCP device:

1. Login in to MCP HMI with an administrator user name and password.
2. Go to **Settings > Access > Authentication** and select **LDAP server** from the **Authentication Mode** drop-down menu.

3. On selecting the LDAP Server authentication, LDAP configuration page will be opened as below:

Name	Value
Primary Host Name(*)	
Primary Host IP Address(*)	
Secondary Host Name	
Secondary Host IP Address	
LDAP Port(*)	389
Base DN(*)	
Bind Username(*)	
Bind Password(*)	
Security Type	TLS
CA Certificate(*)	
Bind Timeout in seconds	30
USER ID Attribute Map	
Home Directory Attribute Map	

4. Input all the LDAP parameters we already had noted in the above section of this document. Follow the below table as an example to find all the parameter from LDAP server:

Name	Value	Locate on LDAP Server
Primary Host Name	GEServer.GE.local	1. It is full name of your computer (LDAP Server). 2. Open properties of computer or server and view the Full Name of Computer
Primary Host IP Address	172.12.235.77	Open Server Manager in LDAP server and click on AD DS and note down the IP address of server.
LDAP Port	389	LDAP communication mechanism is TLS/SSL. – Port-number = 389 for TLScommunication – Port-number = 636 for SSLcommunication

Name	Value	Locate on LDAP Server
Base DN	dc=GE,dc=local	1. It is Domain Name 2. Open properties of computer or server and view the Domain 3. If Domain is GE.local then Base DN will be "dc=GE,DC=LOCAL"
Bind User Name	cn=ldapbind,cn=Users,dc=GE,dc=local	Assume the user name to login LDAP machine or server is "ldapbind" and dc name is "GE" and dc type is "local" then the bind user name will be (in DN format) "cn=ldapbind,cn=Users,dc=GE,dc=local"
Bind Password	Password	Enter the bind user password. (This is the password created for the Bind user in the LDAP Server in the earlier steps).
Security Type	TLS	LDAP communication mechanism is TLS/SSL. – Port-number = 389 for TLS communication – Port-number = 636 for SSL communication
CA Certificate	Certificate installed earlier	Select the INSTALLED CERTIFICATE appear on dropdown list.
Bind Time limit in Seconds	30	Default Value
User ID Attribute Map	sAMAccountName	sAMAccountName is default value User can find it in user attribute tab in user properties of user in LDAP server
Home Directory Attribute Map	unixHomeDirectory	1. unixHomeDirectory is default value 2. User can find it in user attribute tab in user properties of user

3. Configure these LDAP parameters as shown below. Also, go to the drop-down menu of CA certificate and select the CA certificate for LDAP.

The screenshot shows the G500 configuration interface for LDAP authentication. The 'Authentication' tab is selected, and the 'Authentication Mode' is set to 'LDAP Server'. The 'Basic' sub-tab is active, displaying a table of configuration parameters.

Name	Value
Primary Host Name(*)	GEServer.GE.local
Primary Host IP Address(*)	172.12.235.77
Secondary Host Name	
Secondary Host IP Address	
LDAP Port(*)	389
Base DN(*)	dc=GE,dc=local
Bind Username(*)	cn=ldapbind,cn=Users,dc=GE,dc=local
Bind Password(*)	*****
Security Type	TLS
CA Certificate(*)	CN = GE-GESERVER-CA
Bind Timelimit in seconds	30
USER ID Attribute Map	sAMAccountName
Home Directory Attribute Map	unixHomeDirectory

- Click the **Test** button. It will validate the configuration and availability of LDAP server once the configuration verified, Testing Passed message will be popup.

Click OK.

Result : The server connectivity is verified.

5. If user had input wrong parameter for any of the field and click on test button then it will popup message as “Testing Failed” as below:

NOTE: Do not select the Enabled field.

6. Click on Save, it will save the configuration parameters, but still the authentication mode is local.
7. Till the above step LDAP configuration has been saved and tested successfully but still the authentication mode is Local. If user want to work with:
 - 7.1. If user want to work with Static mode of group mapping, then group mapping is not required in MCP. In this case user can directly enable and save the configuration as described in next steps. Static mode of group mapping is described in section [Procedure for Static Group Mapping](#).
 - 7.2. If user want to work with Dynamic mode of group mapping, then group mapping needs to be done in MCP. Note the distinguished names of the groups in MCP by following the [Procedure for Dynamic Group Mapping](#). After noting the distinguished names of all the groups in MCP, proceed with the next step.
8. Procedure to Configure Group Mapping on the MCP Device, if user want to work with dynamic user mapping approach then Group Mapping need to be done in MCP. Follow the below steps for Group Mapping in MCP. If you want to continue with static group mapping, skip the below steps from 8.1 to 8.8 and move to step 9:
 - 8.1. [Procedure for Dynamic Group Mapping](#). It has been noted in an earlier example that the Distinguished Name (DN) of group “G500Administrator” is as “cn=G500Administrator,cn=users,dc=GE,dc=local”.
 - 8.2. Login in to MCP HMI with an administrator user name and password.

- 8.3. Go to **Settings > Access > Authentication** and select **LDAP server** from the **Authentication Mode** drop-down menu.

- 8.4. On selecting the LDAP Server authentication, LDAP configuration page will be opened as below:

- 8.5. Click on “**Group Map**” tab. Select the **Device Role** of Group from drop down and input the **DN** in Group Map field as shown in below (DN has been noted in step 8.3):

- 8.6. Click on “**Add**” button, it will add the group in MCP and that group members or users will be privileged with the selected Device Role. For example if User role is selected as Administrator for “**G500Administrator**” user group then users under G500Administrator group will have administrator privilege.

- 8.7. Similarly add different User groups like G500Operator for Operator privilege, G500Observer for Observer privilege, G500Supervisor for Supervisor privilege, G500Passthrough for Passthrough privilege, and G500RemoteTunnel for Remote Desktop Tunnel privilege.
- 8.8. After adding the user group click on Save to save the configuration.
RESULT: Group Mapping has been done successfully.

9. **Select the Enabled field and Save**, This step should be done only after completion of Static/ Dynamic Group Mapping it will save this configuration parameters and forcefully logout the HMI for local user and LDAP authentication will be enabled for MCP. Now user can login to MCP by using only LDAP authentication.

NOTE: Select the Enabled field and Save, this will switch to Remote Authentication mode.

WARNING: Save with Enabled checked will switch to Remote Authentication immediately!

10. This warning is for the static user should be available to login MCP, click **OK** then again it will popup message to logout HMI for local user.
Click **Yes** to proceed:

Result: Now LDAP Authentication mode is successfully enabled, user is required to use LDAP credentials, for login to HMI, DSAS and SSH sessions to MCP.

11. If the MCP device is redundant and above steps were done in the Active MCP - perform a Sync Configuration to the Standby using Redundancy Manager, and after the Sync Configuration is finished - reboot the Standby MCP.

Configuring the MCP devices for Centralized LDAP Authentication using Windows Active Directory

Appendix A: Checking DN Format

This appendix describes how to check DN format of Users and Domains in the Windows Active Directory.

To check DN format of Users and Domains in the Windows Active Directory:

1. From **Start** menu, run, type **ldp** and press **Enter**.

2. Select **Connection** menu > **Connect**.

3. Click **OK** to continue.

4. Select **Connection** menu > **Bind**.

Result: The Bind window appears.

5. Select **Bind as Currently logged in user** and click **OK**.6. Select **View** menu > **Tree**.

Result: The Tree View window appears.

7. Select the **BaseDN** and click **OK**.

8. Expand the Base DN (where DC = central, DC = home) which appears on the left half- window. The hierarchy is the same as that when created from AD DS in the server Manager.
9. Select the appropriate DN format for groups as well as users.

Configuring the MCP devices for Centralized LDAP Authentication using Windows Active Directory

Appendix B: Third-party CA Certificate

This appendix describes how to create and install a third-party CA certificate on the MCP device.

Creating and installing a third-party CA certificate

This section describes how to create a third-party CA certificate from an XCA third party software for Windows Active Directory server.

Creating a third-party certificate involves:

- [Creating a third-party X.509 certificate](#)
- [Creating the Server X.509 Certificate](#)
- [Installing the third-party CA X.509 Certificate and Server Certificate into the AD DS/Windows Server](#)
- [Installing the third-party X.509 CA Certificates on to the MCP device](#)

Creating a third-party X.509 certificate

Creation of third-party Certificates for Active Directory involves creation of two certificates: namely:

- CA certificate to be installed in both the Client and Server
- Server Certificate to be installed in the Server for Server Authentication

Before you start, ensure that you have downloaded and installed the latest Windows version of the XCA software (available at <http://sourceforge.net/projects/xca/>).

To create third party X.509 Certificates for the Active Directory:

1. Create a new XCA database.
 - 1.1. Click **File > New DataBase**.
 - 1.2. Assign the database a name, and place it in a folder you can access later.
 - 1.3. When prompted, give the database a new password.

You need to select this database manually whenever you open XCA.

NOTE

Using a strong password when encrypting your XCA database helps prevent an adversary from gaining access to your critical X.509 certificate private keys.

2. Create a root CA certificate.

This root X.509 certificate will be used to sign the X.509 certificate used for AD DS on the Windows Server 2012 and will also be used on the MCP device.

3. From the **Templates** tab, click **New Template**.

4. Select **CA** as Preset Template Value and click **OK** to proceed with the creation of a new template.

5. On the **Subject** tab, enter your unique organizational information in the **Distinguished name** section.

The most important component is the **commonName**. This is the name that your Clients is configured to accept. Any difference between the commonName of the certificate and the name configured in the Client results in a failed connection. Choose other name components that are appropriate for your company. Table 2 provides example distinguished name components.

Table 2: Example Distinguished Name components

Distinguished Name Component	Example
Internal name	MyMCP
countryName	US
stateOrProvinceName	MyState
localityName	MyCity
organizationName	MyCompany
organizationalUnitName	MyDivision
commonName	MyMCP
emailAddress	mail@my.domain

NOTE You must enter all components of the distinguished name, including the emailAddress.

- Under the **Extensions** tab, if necessary change the **Time Range** that the CA certificate is valid for and click **Apply**. The default is 10 years. Certificates generated with this CA certificate after this period are no longer valid.
- Under the **Key usage** tab, do not change the defaults.

8. Under the **Netscape** tab, remove the value in the **Comment** field.

9. Under the **Advanced** tab, the following messages are expected, except the value of the X509v3 Subject Key Identifier, which differs from key to key:
If following messages do not appear, click **Validate** to view the message.

Result: The CA certificate Template is added.

10. From the **Certificates** tab, click **New Certificate**.

11. Click the **Source** tab. Ensure the CA template created in the previous step is selected under **Template for New Certificate Option**, and choose **SHA-256** for the Signature algorithm. Click **Apply all**.

12. On the **Subject** tab, enter your unique organizational information in the **Distinguishedname** section. See Table 3.

Table 3: Example Distinguished Name components

Distinguished Name Component	Example
Internal name	MyCA
countryName	US
stateOrProvinceName	MyState
localityName	MyCity
organizationName	MyCompany
organizationalUnitName	MyDivision
commonName	MyCA
emailAddress	mail@my.domain

You must enter all components of the distinguished name, including the emailAddress.

13. Under the **Subject** tab, click the **Generate a new key** button.
14. In the dialog that appears, enter the name of the CA (e.g., **MyCA**) in the **Name** field. Choose the **Keytype** as **RSA** or **DSA** to match the type of cipher suites you wish to use. Change the **Keysize** to **2048**.
15. Under the **Key usage** tab, do not change the defaults.
16. Under the **Netscape** tab, remove the value in the **Comment** field.
17. Under the **Advanced** tab, the following messages are expected except the value of the X509v3 Subject Key Identifier, which differs from key to key.
If the following messages do not appear, click **Validate** to view the messages.

18. Click **OK**.
Result: The CA certificate is created.
19. Under the **Certificates** tab of the main view of XCA, select the new **CertificationAuthority** and click **Export**.
20. Ensure the Export Format is set to **PEM**.
21. Browse to a protected directory (e.g., **My Documents > MyXCAFiles**) and click **Save**.
22. Click **OK**.
Result: The file is named based upon the internal name of your CA with a .crt file extension.

Creating the Server X.509 Certificate

A Server certificate allows the Server to authenticate itself to a MCP device Client. The Server certificate contains a **commonName** field. This field should uniquely identify the server in your network; that is, the Full Qualified Domain Name (Hostname) of the server should be the common name in the server certificate.

To generate Server X.509 Certificate:

1. Launch **XCA** from the Windows Programs menu.
2. In the tree view of the **Templates** tab, select the **New Template** option.
3. Select **HTTPS_server** as **Preset Template values** and click **OK**.

4. On the **Subject** tab, enter your unique organizational information in the **Distinguished name** section.
The most important component is the **commonName**. This should be the Full Qualified Domain Name of the server without which, it may result in a failed connection. Choose other name components that are appropriate for your company.
5. Under the **Extensions** tab, if necessary change the **Time Range** that the Server certificate is valid for and click **Apply**. The default is 1 year.
6. Under the **Key usage** tab, do not change the defaults.
7. Under the **Netscape** tab, remove the value in the **Comment** field.
8. Under the **Advanced** tab, click **Validate** to view the messages and verify that the **CA:false** message is observed
Result: The Server certificate Template is added.
9. In the tree view of the **Certificates** tab, select the branch containing your Certification Authority and click the **New Certificate** button.

10. Under the **Source** tab:
 - 10.1. Select the **Use this Certificate for signing** option. From the drop-down menu to the right of this check-box, select the CA you created in section: "Creating a third-party X.509 certificate" on page 75 (e.g., MyCA).
 - 10.2. Do not change the drop-down selection **Signature Algorithm set** from **SHA-256**.
 - 10.3. Change the drop-down **Template** for the new certificate to the Server Certificate Template Created in previous steps.
 - 10.4. Click **Apply all**.
11. Under the **Subject** tab, click the **Generate a new key** button.
 - 11.1. In the dialog that appears, enter a name that uniquely identifies the MCP device in your network.
 - 11.2. Choose the **Keytype**, as **RSA** or **DSA** to match the type of cipher that suites your needs. Change the **Keysize** to **2048**. Click **OK**.
 - 11.3. In the **Subject** tab, verify that the common name is the Full Qualified Domain Name (FQDN) of the server.
12. Under the **Extensions** tab, if necessary change the **Time Range** that the Server certificate is valid for and click **Apply**. The default is one year.
The shorter the Time Range the more secure the certificate. The shorter the Time Range, the more often you need to regenerate Server certificates and deploy them into your servers.
13. Under the **Key usage** tab, do not change the default values.
14. Under the **Netscape** tab, remove the comment.
15. Under the **Advanced** tab, click **Validate**.
Result: The following messages are expected except the value of the X509v3 Subject Key Identifier, which differs from key to key.

16. Click **OK**.
Result: You now have a Server certificate.
17. In the tree view under the **Certificates** tab, open the branch labeled after your Certificate Authority, and select the new Server certificate.
18. Click **Export**.
19. In the dialog that appears, ensure the Export Format field is set to **PKCS12 with Certificate Chain**. Browse to a protected location (e.g., **My Documents** > **MyXCAFiles**) and click **Save**.
20. Click **OK**.
Result: The certificate is in a file named with your Server Internal Name with the file extension **.p12** (e.g., servercert.p12).
The certificate file is always security-sensitive so keep it protected at all times.
21. Remove the file after it has been installed on the server.

Installing the third-party CA X.509 Certificate and Server Certificate into the AD DS Windows Server

To install the newly created CA X.509 into the AD DS:

1. Copy the certificate on to Windows server 2012.
 - 1.1. Open the Microsoft Management Console by selecting the **Start** menu > **Run** > **mmc**, and clicking **OK**.
 - 1.2. Select **File > Add/Remove Snap-in**.

Result: The Add or Remove Snap-ins window appears.

2. Select **Certificates** from the Available snap-ins window and click **Add**.

Result: The Certificates snap-in window appears.

3. Select **Service account** and click **Next**.

4. Select the **Local computer** option and click **Next**.

5. In the Service account menu, select the **Active Directory Domain Services** account and then click **Finish**.

6. Click **OK** to finalize the snap-in selection.

7. Browse to **Third Party Root Certification Authorities > Certificates**. Right-click **All Tasks** and select **Import**.

8. Click **Next** on the first page of the Wizard.
9. Click **Browse** and select the Root CA certificate generated in the previous steps.
10. Click **Next** and follow the certificate Import Instructions
11. Click **Finish**.
12. Repeat this step, clicking on **Trusted Root Certification Authorities**.
13. From the Console window, expand the **Certificates - Service...** option, and right-click **NTDS\Personal**. select **All Tasks > Import**.

14. In the Certificate Import Wizard, select the certificate you exported from XCA.

15. On the next screen, click **Next** to place the certificate in the NTDS\Personal certificate store.
16. Click **Next** and then **Finish**.
Result: A message appears notifying you that the import was successful.

Result: The certificate is now in the NTDS\Personal certificate store.

Result: The server certificate is automatically added after importing the CA certificate. If not, the manually follow the above procedure in step 13 to import the server certificate.
17. Click on **File** and follow steps 1 and step 2 in this procedure.
From the Certificates snap-in window, select **Computer account** and click **Next**.
18. Follow steps 4 to 16
19. Reboot the Windows server.

Installing the third-party X.509 CA Certificates on to the MCP device

To install the third-party X.509 CA Certificates on the MCP device:

1. Save the root CA Certificate generated in section: [Creating a third-party X.509 certificate](#), in a location on your PC.
2. Import the Root CA Certificate to the MCP device.
Follow the steps in section: [Installing CA Certificates on the MCP device](#).

Configuring the MCP devices for Centralized LDAP Authentication using Windows Active Directory

Appendix C: Troubleshooting

If you encounter issues while testing the operation of the LDAP server configuration, refer to the following listed errors and the recommended responses. When you click the Test Button, if a particular field is configured improperly, the corresponding message appears on the HMI.

The exact error messages may refer to MCP, G500 or G100 – the meaning is identical.

See sections:

- [LDAP error messages](#)
- [LDAP Certificate error messages](#)

LDAP error messages

Error Message	Response
Host not reachable	Ensure LDAP server was accessible in the network.
	Ensure LDAP server was not shutdown.
unable to access ldap port	Ensure LDAP server was using the specified port for LDAP protocol communication.
Invalid binddn	Ensure mentioned bind user dn (distinguished name) was available in the mentioned domain on the LDAP server.
Invalid bind usercredentials	Ensure bind user dn (distinguished name) mentioned in the MCP device LDAP server configuration was correct.
	Ensure bind user password entered was correct in the MCP device LDAP server configuration.
Hostname mismatch withserver certificate	Ensure LDAP server host name entered in the MCP device LDAP server configuration was matching with the LDAP server certificate subject name.
Server/Port not accessible	Ensure LDAP server was accessible in the network.
	Ensure LDAP server was not shutdown.
	Ensure LDAP server was using the specified port for LDAP protocol communication.
Invalid Host Name. Full Qualified Domain Name(FQDN) has invalid characters	Ensure Primary Host Name is configured in MCP device LDAP server configuration.

Error Message	Response
Invalid Host IP Address	Ensure Primary Host IP Address configured in MCP device LDAP server configuration is correct.
Failed to connect to Primary Host	Ensure LDAP Server is accessible in the network.
	Ensure Primary Host Name configured in MCP device LDAP server configuration is correct.
	Ensure Base DN configured in MCP device LDAP server configuration is correct.
	Ensure Bind User credentials (Bind Username and Bind Password) configured in MCP device LDAP server configuration are correct.
Primary Server : Server/Port not accessible	Ensure LDAP Server is not shutdown.
	Ensure Primary Host IP Address configured in MCP device LDAP server configuration is correct.
Configuration Timeout, please try again later	Ensure LDAP server was using the specified port for LDAP protocol communication.
Invalid User ID Attribute Map	Ensure User ID Attribute Map defined in LDAP Server is configured in MCP device LDAP server configuration.
Invalid HomeDirectory Attribute Map	Ensure HomeDirectory Attribute Map defined in LDAP server is configured in MCP device LDAP server configuration.
Connected to secondary Host, but failed to connect to primary Host	Ensure Primary Host Name and Primary Host IP Address configured in MCP device LDAP server configuration are correct.
Failed to connect to both primary and secondary Hosts	Ensure Primary Host Name and Secondary Host Name configured in MCP device LDAP server configuration are correct.
	Ensure Primary Host IP Address and Secondary Host IP Address configured in MCP device LDAP server configuration are correct.
	Ensure Base DN configured in MCP device LDAP server configuration is correct.
	Ensure Bind User credentials (Bind Username and Bind Password) configured in MCP device LDAP server configuration are correct.
Please add Emergency User before switching to LDAP/TACACS Authentication	Ensure at least one emergency admin group user is configured before switching to LDAP/TACACS Authentication.
The current Authentication Mode has been enabled. You cannot disable it unless switching to a different Authentication Mode	Current Authentication Mode is LDAP. Ensure to disable (Enabled checkbox unchecked) only when switching to a Authentication Mode other than LDAP.

LDAP Certificate error messages

Error Message	Response
List of trusted certificates is not complete	The issuer certificate of a looked up certificate could not be found. This normally means the list of trusted certificates installed on the MCP device or certificate list from LDAP server was not complete.
Unable to decrypt certificate's signature	The certificate signature could not be decrypted. This means that the actual signature value could not be determined rather than it not matching the expected value, this is only meaningful for RSA keys.
unable to decode issue public key	The public key in the certificate SubjectPublicKeyInfo of MCP device server could not be read.
certificate signature failure	The signature of the installed certificate on MCP device server certificate was invalid.

Error Message	Response
certificate is not yet valid	MCP device time might be backward w.r.to certificate valid time. The certificate is not yet valid: the not Before date is after the current time.
certificate has expired	CA certificate installed on MCP device got expired w.r.to LDAP server. MCP device time might be forward w.r.to certificate valid time. The certificate has expired: that is the notAfter date is before the current time.
format error in certificate's notBefore field	The certificate notBefore field contains an invalid time.
format error in certificate's notAfter field	The certificate notAfter field contains an invalid time.
Self-signed certificate cannot be found in the list of trusted certificates.	The passed certificate is self-signed and the same certificate cannot be found in the list of trusted certificates.
self-signed certificate in certificate chain	Ensure Installed a trusted CA signed primary SSL certificate and an intermediate certificate. Verify that the Root CA is not included in the certificate chain (as this is almost always self-signed).
unable to get local issuer certificate	This error code is thrown when a local certificate path is not found during the certificate check. LDAP server certificate's issuer certificate was not found, after looking in both the chain provided by the LDAP server and in the local trusted storage. This usually means the peer chain was missing or incomplete.
unable to verify the first certificate	The primary certificate (the one you purchase from a vendor) cannot establish the chain of trust between itself and the Root certificate stored locally. Usually installing the intermediate certificates fixes this.
certificate chain too long	The certificate chain length is greater than the supplied maximum depth. The LDAP server certificate's chain length exceeded the limit set locally by sslverifydepth or SSL Verify Depth. The chain length (depth) is the number of certificates beyond the leaf (client or server) certificate itself. a chain of length 1 is a leaf certificate plus its issuer certificate.
invalid CA certificate	A CA certificate is invalid. Either it is not a CA or its extensions are not consistent with the supplied purpose.
path length constraint exceeded	The basicConstraints path length parameter has been exceeded for certificate.
invalid or inconsistent certificate extension	invalid or inconsistent certificate extension
Hostname mismatch	Ensure LDAP server host name entered in the MCP device LDAP server configuration was matching with the LDAP server certificate subject name.
Certificate directory empty	No certificates installed over to the MCP device.

Configuring the MCP devices for Centralized LDAP Authentication using Windows Active Directory

Appendix D: List of Acronyms

Acronym Definitions

This Appendix lists and defines the acronyms used in this manual.

Table 4: Acronym list

Acronym	Definition
AD	Windows* Active Directory
AD CS	Active Directory Certificate Services
AD DS	Active Directory Domain Services
CA	Certificate Authority
MCP	MCP Substation Gateway
mcpcfg	Local configuration utility
DN	Domain Name
DNS	Domain Name System
FQDN	Full Qualified Domain Name
GE	General Electric
HMI	Human Machine Interface (also called Graphical User Interface – GUI)
IP	Internet Protocol
IT	Information Technology
LDAP	Lightweight Directory Access Protocol
NIS	Network Information Service
NTDS	TechNet Directory Services
PC	Personal Computer
PEM	Privacy Enhanced Mail
PKCS	Public-Key Cryptography Standards, published by RSA Laboratories
SCADA	Supervisory Control and Data Acquisition
SCP	Session Control Protocol
SFTP	Secure File Transfer Protocol
SHA	Secure Hash Algorithm

Acronym	Definition
SSL	Secure Sockets Layer
TLS	Transport Layer Security
USB	Universal Serial Bus
XCA	X Certificate and Key management

Configuring the MCP devices for Centralized LDAP Authentication using Windows Active Directory

Appendix E: Revision History

This appendix provides the document revision history.

Revision History

Version	Revision	Date	Change Description
1.00	0	23 rd April, 2020	Initial release.
2.00	0	26 th April, 2021	Updated for MCP family.
3.00	0	14 th March, 2023	Updated for G500 v3.0 release.
	1	15 th May, 2025	GE Vernova Logo is added on the first page. Updated Company name, Copyright Notice and Trademark Notice. Updated GE Vernova email addresses and phone numbers in Contact Technical Support section.
	2	14 th July, 2025	Updated to GE Vernova style.
	3	27 th January, 2026	Added a step to reboot the standby MCP device in Procedure to configure LDAP on the MCP device section.

Product Support

If you need help with any aspect of your MCP product, you can:

- Access the GE Vernova Grid Solutions Web site
- Search the GE Vernova Technical Support library
- Contact Technical Support

Access GE Vernova Grid Solutions web site

The GE Vernova Grid Solutions Web site provides fast access to technical information, such as manuals and knowledge base topics.

Visit us on the Web at: <https://www.gevernova.com/grid-solutions/>

Search GE Vernova Grid Solutions technical support library

This site serves as a document repository for post-sales requests. To get access to the Technical Support Web site, go to:

<https://www.gevernova.com/grid-solutions/events/signup.asp?sid=208>

Contact Technical Support

For help with any aspect of your GE Vernova Grid Solutions product, please contact our support team, 24/7, as follows:

Configuring the MCP devices for Centralized LDAP Authentication using Open LDAP Server

About this Document

Purpose

This manual describes how to install and configure the Open LDAP Server and Multilin™ MCP device for Centralized LDAP Authentication.

This document applies to the MCP family (G100/G500) unless otherwise indicated.

Screen captures may show G500 in some areas, however the workflow applies to products in the MCP family (G100/G500).

This document is not actively maintained for MCP versions after v280.

Intended audience

This manual is a helpful resource for utility personnel and system engineers who are implementing LDAP on Multilin™ MCP device in an overall substation automation system.

Additional documentation

For the most current version of the Configuring Open LDAP Server and Multilin™ MCP for Centralized LDAP Authentication - Manual, please download a copy from GE Vernova Grid Solutions web site.

For information on fully installing, configuring, monitoring and testing a MCP device, refer to the:

- G500 Substation Gateway Instruction Manual, 994-0152
- G100 Substation Gateway Instruction Manual, 994-0155
- MCP Substation Gateway Software Configuration Guide, SWM0101

Configuring the MCP devices for Centralized LDAP Authentication using Open LDAP Server

Chapter 1: Open LDAP Server

This chapter describes how to install and configure OpenLDAP server on the Ubuntu operating system.

See sections:

- [Creating OpenLDAP Server](#)
- [Changing default port numbers on OpenLDAP server](#)
- [Configuring OpenLDAP server](#)
- [Generating certificates](#)
- [Installing certificates on OpenLDAP server](#)

The software versions used are:

- Ubuntu: 14.04
- Open LDAP is v3

Creating OpenLDAP Server

This section will guide you to install and configure OpenLDAP server on Ubuntu system.

1. Enter the **sudo su** command into the terminal emulator to switch to the root user.

2. Run the following command to install OpenLDAP. During the installation:

apt-get install slapd ldap-utils

Result: You are prompted to set a password for the LDAP admin account.

3. Reconfigure the slapd with the updated values using the following command:

dpkg-reconfigure slapd

For example, see the following example selections for the re-configuration options:

- Omit OpenLDAP server configuration: **No**
- DNS domain name: **gegrid.com**
- Organization name: **gegrid**
- Administrator Password: **Admin@123**
- Database backend: **MDB**
- Remove the database when slapd is purged: **No**
- Move Old database: **Yes**
- Allow LDAPv2 protocol: **No**

4. Test the LDAP server using the **ldapsearch -x** command.

Result: The output towards the end should show **result: 0 Success.**

5. Install LDAP Web Interface administration package using the command:

apt-get install phpldapadmin

6. Configure phpLDAPadmin using command:

vi /etc/phpldapadmin/config.php

7. Scroll down further and replace the domain names with your own values:

- 7.1. Find the Define LDAP Servers section in the configuration file and edit the following lines as shown below. For example:

```
[...]
// Set your LDAP server name //
$servers->setValue('server','name','GE GRID Server');
[...]
// Set your LDAP server IP address //
$servers->setValue('server','host','127.0.0.1');
[...]
// Set Server domain name //
$servers-
>setValue('server','base',array('dc=gegrid,dc=com'));
[...]
// Set Server domain name again//
$servers-
>setValue('login','bind_id','cn=admin,dc=gegrid,dc=com');
[...]
```

8. Restart the apache service using command **systemctl restart apache2**. For Ubuntu 14.10 and older versions use command **service apache2 restart**.

9. Open <http://127.0.0.1/phpldapadmin/> in a web browser. Result: The php > LDAP > Admin screen appears.

Changing default port numbers on OpenLDAP server

By default the port numbers are:

- 389 for TLS and
- 636 for SSL.

The default configuration **slapd** file is located at:

/etc/default/

The folder contains the following:

```
LDAP_SERVICES="ldap:/// ldapi:/// ldaps://"
```

To change the default port numbers:

1. Enter the command:
sudo vi /etc/default/slapd:
2. Modify the **slapd** file content as below where the port 1389 is assigned for TLS and 1636 for SSL.

```
SLAPD_SERVICES="ldap://0.0.0.0:1389/ ldapi:/// ldaps://0.0.0.0:1636/"
```

3. Save any changes.
4. Restart the LDAP server service using command:
sudo /etc/init.d/slapd restart

Result: A message appears.

```
hudson@ldap:/etc/ldap/slapd.d$ sudo /etc/init.d/slapd restart
* Stopping OpenLDAP slapd [ OK ]
* Starting OpenLDAP slapd [ OK ]
hudson@ldap:/etc/ldap/slapd.d$
```

Configuring OpenLDAP server

This section describes how to create groups and users which are used for authentication purposes.

Creating role groups

To create user groups:

1. Open a browser window on Ubuntu at:

<http://127.0.0.1/phpldapadmin/>

2. Click on **login**.

3. Click the **Authenticate** button.

4. Expand the tree on the left-hand side and click **Create a new entry here**.

5. Select **Generic Organizational Unit**.

6. Type the name of the group; e.g., **groups** and click **Create Object**.

Result: The Organizational Unit ou=groups appears under the host tree.

7. Below the newly created groups entry, click **Create a new entry here**.

8. Select the **Generic Posix Group** option.

9. Provide the group name and GID number according to the role privilege required; see Table 1, and create the object.

Table 1: Roles and GID numbers

Role	GID number
admin	0
observer	501
operator	502
supervisor	503
passthrough	504

You must enter all components of the distinguished name, including the emailAddress.

If GID number is not editable during creation, create the object with any GID number and then immediately afterward update it with the desired GID number according to the role required.

10. You can create different groups as required. See the example groups shown below:

Creating users

To create users and link them to desired roles:

1. Expand the tree on the left-hand side and click **Create a new entry here**.

2. Select **Generic Organizational Unit**.

3. Type the name of the group; e.g., **groups** and click **Create Object**.

Result: The Organizational Unit ou=groups appears under the host tree.

4. Below the newly created groups entry, click **Create a new entry here**.

5. Select the **Generic Posix Group** option.

6. Complete the fields for the New User Account.
- 6.1. Type in the **Common Name**.
 - 6.2. Select the required **GID number**.
 - 6.3. Type in the **Last Name, Password** and **User ID**.

7. Click **Create Object** and **Commit**.

Do you want to create this entry?

Attribute	New Value	Skip
cn= observer1,ou=users,dc=gegrid,dc=com		
Common Name	observer1	☐
GID Number	501	☐
Home directory	/home/users/observer1	☐
Last name	observer1	☐
objectClass	inetOrgPerson posixAccount	☐
Password	*****	☐
UID Number	1005	☐
User ID	observer1	☐

Commit **Cancel**

8. You can create different users as required. Example users are shown below.

Result: The created users are available for authentication from the MCP device.

Group Mapping

Once the User group has been created successfully, these need to be mapped to MCP UserGroup. It can be done in two approaches:

Procedure for Static Group Mapping

In this approach, the MCP device **LDAP Server group gid** shall be configured as per Table 2.

Table 2: Group IDs mapping on the LDAP Server User Groups

LDAP Server GroupName	GID Number	Description
G500Administrator	0	To map LDAP Server Group G500Administrator to G500 groupAdministrator
G500Observer	501	To map LDAP Server Group G500Observer to G500 group Observer
G500Operator	502	To map LDAP Server Group G500Operator to G500 group Operator
G500Supervisor	503	To map LDAP Server Group G500Supervisor to G500 groupSupervisor
G500SSHPassThrough	504	To map LDAP Server Group G500Passthrough to G500 groupPassthrough

You must enter all components of the distinguished name, including the emailAddress.

The LDAP Server Group Name in the table is an example. LDAP Server Group Name can be any name as configured by the user, Eg.: Test Group etc. In this example is listed as “G500...”, could be “G100...”.

Because the functionality is the same across MCP family, this could be “MCP...”.

However, GID Number is fixed as specified in the table for MCP to recognize the same.

Example: In LDAP Server, to map MCP device LDAP Server group with name “**G500Administrator**” to G500 group “**Administrator**” using static group mapping, the LDAP Server group **GID** must be configured as in the Table 2.

- The procedure to set the GID number in the LDAP Server is described in the section [Creating role groups](#).

RESULT: Once the G500Administrator group has been mapped successfully for **Administrator** role in MCP, the user added to this group will have administrator role in MCP.

Procedure for Dynamic Group Mapping

In this approach, the MCP device LDAP Server Group distinguished name “DN” must be configured in MCP group mapping. If user wants to go for this approach, then GID Number entry in LDAP Server Group is not required.

- Login to MCP as administrator user and configure LDAP on the MCP device as mentioned in [Procedure to configure LDAP on the MCP device](#).

Generating certificates

Before you can configure a secure channel between a MCP device and an LDAP server you need certificates for authorization. Certificates can be generated by either:

- The server itself, or
- A Certification Authority (CA).

Generating certificates from the server

This section describes how to generate certificates from the LDAP server which is installed in the MCP device and used for authorization. You can use the below links to generate CA certificate on OpenLDAP Server in Ubuntu:

<https://www.openldap.org/faq/data/cache/185.html>

<https://help.ubuntu.com/its/serverguide/openldap-server.html>

Generating certificates using XCA

This section describes how to set up the XCA certification authority and generate third party signed certificates.

Once your CA is ready, export the CA certificate so that you can install it on the server and the MCP device.

NOTICE

A CA that is planned for field use should be protected with strong security measures. Such measures include dedicating a computer for the CA, physically securing the computer, ensuring the computer is accessible only by authorized users, and not connecting the computer to a network. Such measures are required because a security breach of a CA impacts all devices that used certificates generated by the CA.

XCA runs on Linux or Microsoft Windows. The following procedures describe how to set up and initialize an XCA certification authority.

Install XCA

1. Download the latest version of XCA at: <https://sourceforge.net/projects/xca/>.
2. Run the installation wizard to install XCA.

Generating root CA certificate

1. From XCA, select **File > New Database**.

2. Choose a protected location to save the database and then enter a strong password to encrypt the database.
3. Under the **Certificates** tab, click **New Certificate**.

4. Under the **Source** tab:
 - 4.1. Select the checkbox next to the label: **Create a self-signed certificate with the serial.**
 - 4.2. Do not change the **Signature Algorithm** selection from **SHA 1.**
 - 4.3. Do not change the **Template for the new certificate** selection from **[default] CA.**

5. Under the **Source** tab, click **Apply All.**
6. Under the **Subject** tab, click the **Generate a new key** button.
7. Complete the fields in the New Key dialog:
 - 7.1. Type the name of the CA (e.g., **rootCA**) in the **Name** field.
 - 7.2. Choose the **Keytype** as **RSA** or **DSA** to match your needs.
 - 7.3. Change the **Keysize** to **2048.**
 - 7.4. Click **Create.**

8. Under the **Subject** tab, enter the distinguished name of the CA certificate.

Result: The following image provides examples for the **Distinguished name** fields.

9. Under the **Extensions** tab, if necessary change the **Time Range** that the CA certificate is valid for and click **Apply**.

The default is 10 years. Certificates generated with this CA certificate after this period are no longer valid.

10. Under the **Key usage** tab, do not change the defaults.

11. Under the **Netscape** tab, remove the value in the **Comment** field.

12. Under the **Advanced** tab, the following messages appear, except for the value of the X509v3 Subject Key Identifier, which differs from key to key:

13. Click **OK**.

Result: You now have a CA certificate to sign your server and MCP device certificates.

14. Under the **Certificates** tab of the main view of XCA, select the new Certification Authority and click **Export**.

15. Ensure the Export Format is set to **PEM**.

16. Browse to a protected directory (e.g., My Documents → MyXCAFiles) and click **Save**.

17. Click **OK**.

Result: The file is named based upon the internal name of your CA with a .crt extension.

Generating certificates using root CA certificate

This subsection describes how to generate private keys and certificates for LDAP server. These certificates allow the LDAP server to authenticate itself to the MCP device.

There are two types of server certificates:

- Type 1: The server certificate is issued by the root CA certificate. For the procedure, see [Generating a LDAP server Certificate issued by root CA certificate](#).
- Type 2: A server certificate issued by an Intermediate CA certificate which is issued by a root CA certificate. Type 2 is the most secure since two CA certificates are used in authorization process. For the procedure, see [Generating an Intermediate CA certificate issued by root CA certificate](#).

NOTICE

It is important to keep the private key associated with the Server Certificate secure. For example, they should not be transmitted over the LAN unless you are using a strongly authenticated secure transport mechanism such as SSH with public/private key authentication or multi-factor authentication. Once the private keys reach their destination, they should be deleted from any devices used to transport them (e.g., a USB drive or laptop).

Generating a LDAPserver Certificate issued by root CA certificate

An LDAP Server certificate allows the LDAP server to authenticate itself to the MCP device. The LDAP Server certificate contains a commonName field. This field should match with the host name of LDAP server.

1. Launch XCA from the Windows Programs menu.
2. In the tree view of the **Certificates** tab, select the branch containing your CertificationAuthority.
3. Under the **Certificates** tab, click the **New Certificate** button.
4. Under the **Source** tab:
 - 4.1. Select the **Use this Certificate for signing** checkbox. From the drop-down menu to the right of this checkbox, select the CA you created in section: [Generating certificates using XCA](#). (e.g., **rootCA**).
 - 4.2. Do not change the drop-down **Signature Algorithm** from **SHA 1**.
 - 4.3. Change the drop-down selection from **Template for the new certificate** to **[default] HTTPS_server**.

4.4. Click **Apply all**.5. Under the **Subject** tab, click the **Generate a new key** button.

6. In the dialog that appears:
 - 6.1. Type in a name of the server key.
 - 6.2. Choose **Keytype** as **RSA** or **DSA** to match your needs.
 - 6.3. Change the Keysize to **2048**.
 - 6.4. Click **OK**.
7. Back in the **Subject** tab, type in the Distinguished name of the LDAP server certificate.

The most important component is the **commonName** which should match with LDAP server host name. Any difference between the commonName of the certificate and the host name configured in the server results in a failed connection.

Choose other name components that are appropriate for your company. The following image provides example distinguished name components.

8. Under the **Extensions** tab, if necessary, change the **Time Range** that the CA certificate is valid for and click **Apply**.

The default is one year. The shorter the Time Range the more secure the certificate. The longer the Time Range, the more often you need to regenerate LDAP Server certificates and deploy them to your LDAP server.

9. Under the **Key usage** tab, leave the defaults.
10. Under the **Netscape** tab, remove the comment.
11. Under the **Advanced** tab, click **Validate**.

The following messages are expected except the value of the X509v3 Subject Key Identifier, which differs from key to key:

12. Click **OK**.

Result: You now have a LDAP Server certificate.

13. In the tree view under the **Certificates** tab, open the branch labeled after your Certificate Authority, and then select the new Server certificate.

14. Click **Export**.

15. In the dialog that appears, ensure the **Export Format** field is set to **PEM**:

- 15.1. Browse to a protected location (e.g., My Documents → MyXCAFiles)

- 15.2. Click **Save**.

- 15.3. Click **OK**.

The file is named based upon the internal name of your LDAP server certificate with a .crt extension.

16. Click on the **Private Keys** tab and then select the LDAP server key which you created earlier. Click **Export**.

17. In the dialog that appears, ensure the **Export Format** field is set to **PEM Private**.

- 17.1. Browse to a protected location (e.g., My Documents → MyXCAFiles).

- 17.2. Click **Save**.

- 17.3. Click **OK**.

The file is named based upon the key name of your LDAP server certificate with a .pem extension.

These files are security-sensitive, so keep them protected at all times. Remove the files after they have been installed on the LDAP server.

18. Go to section: [Installing certificates on OpenLDAP server](#).

Generating an Intermediate CA certificate issued by root CA certificate

1. In the tree view of the **Certificates** tab, select the branch containing your CertificationAuthority.
2. Under the **Certificates** tab, select **New Certificate**.

3. Under the **Source** tab:
 - 3.1. Select the **Use this Certificate for signing** checkbox.
 - 3.2. From the drop-down menu to the right of this checkbox, select the self-signed CA you created in section: [Generating certificates using XCA](#). (e.g., **rootCA**).
 - 3.3. Do not change the drop-down selection **Signature Algorithm** from **SHA 1**.
 - 3.4. Change the drop-down **Template** for the new certificate to **[default] CA**.
 - 3.5. Click **Apply all**.
4. Under the **Source** tab, click **Apply All**.
5. Under the **Subject** tab, click the **Generate a new key** button.
6. In the dialog that appears:
 - 6.1. Type in the name of the CA (e.g., **MyCA**) in the **Name** field.
 - 6.2. Choose the **Keytype** as **RSA** or **DSA** to match your needs.
 - 6.3. Change the **Keysize** to **2048**.

7. Under the **Subject** tab, type in the distinguished name of the CA certificate.
Result: The following image provides example distinguished name components.

X Certificate and Key management

Create x509 Certificate

Source Subject Extensions Key usage Netscape Advanced

Distinguished name

Internal name	MyCA	organizationName	GE
countryName	IN	organizationalUnitName	GEGRID
stateOrProvinceName	TN	commonName	MyCA
localityName	CN	emailAddress	ldap.gegrid@ge.com

Type Content

8. Under the **Extensions** tab, change the **Time Range** to a time period before the expiry of CA (e.g. rootCA) which you created earlier and click Apply.
The default is 10 years. Certificates generated with this CA certificate after this period are no longer valid.
9. Under the **Key usage** tab, do not change the defaults.
10. Under the **Netscape** tab, remove the value in the **Comment** field.
11. Under the **Advanced** tab, the following messages are expected except the value of the X509v3 Subject Key Identifier, which differs from key to key:

X Certificate and Key management

Create x509 Certificate

Source Subject Extensions Key usage Netscape Advanced

13. Under the **Certificates** tab of the main view of XCA, select the new Certification Authority and click **Export**.
14. Ensure the **Export Format** is set to **PEM**.

Generating a LDAP server Certificate issued by an Intermediate CA certificate

15. Browse to a protected directory (e.g., My Documents → MyXCAFiles) and click **Save**. Click **OK**. The file is named based upon the internal name of your CA with a .crt extension.

An LDAP Server certificate allows the LDAP server to authenticate itself to the MCP device. The LDAP Server certificate contains a commonName field. This field should match with the host name of LDAP server.

1. In the tree view of the **Certificates** tab, select the branch containing your CertificationAuthority.

2. Under the **Certificates** tab, click the **New Certificate** button.
3. Under the **Source** tab:
 - 3.1. Select the **Use this Certificate for signing** checkbox. On the drop-down menu to the right of this checkbox, select the CA signed CA file you created in section: [Generating an Intermediate CA certificate issued by root CA certificate](#) (e.g., **MyCA**).
 - 3.2. Do not change the drop-down selection **Signature Algorithm** from **SHA 1**.
 - 3.3. Change the drop-down selection from **Template** for the new certificate to **[default] HTTPS_server**.

3.4. Click **Apply all**.

4. Under the **Subject** tab, click the **Generate a new key** button.
5. In the dialog that appears, enter a name of the server key. Choose **Keytype** as **RSA** or **DSA** to match your needs. Change the Keysize to **2048**. Click **OK**.

6. Back in the **Subject** tab:
 - 6.1. Type in the **Distinguished name** of the LDAP server certificate. The most important component is the commonName which should match with LDAP server host name. Any difference between the commonName of the certificate and the host name configured in the server results in a failed connection.
 - 6.2. Choose other name components that are appropriate for your company.
- The following image provides example distinguished name components.

Create x509 Certificate

7. Under the **Extensions** tab, if necessary change the **Time Range** that the CA certificate is valid for and click **Apply**.
The default is one year. The shorter the Time Range the more secure the certificate. The longer the Time Range, the more often you need to regenerate LDAP Server certificates and deploy them into your LDAP server.
8. Under the **Key usage** tab, do not change the defaults.
9. Under the **Netscape** tab, remove the comment.
10. Under the **Advanced** tab, click **Validate**.

Result: The following messages are expected except the value of the X509v3 SubjectKey Identifier, which differs from key to key:

Create x509 Certificate

Source Subject Extensions Key usage Netscape Advanced

Other Tabs

X509v3 Basic Constraints critical:
CA: FALSE

X509v3 Subject Key Identifier:
18:0F:AE:B8:29:B6:38:B2:B4:A0:59:EC:79:E4:F6:24:27:C0:F9:2D

X509v3 Key Usage:
Digital Signature, Non Repudiation, Key Encipherment

Netscape Cert Type:
SSL Server

11. Click **OK**.
Result: You now have a LDAP Server certificate.

12. In the tree view under the **Certificates** tab, open the branch labeled after your Certificate Authority, and then select the new Server certificate.

13. Click **Export**.

14. In the dialog that appears:

- 14.1. Ensure the **Export Format** field is set to **PEM**.
- 14.2. Browse to a protected location (e.g., My Documents → MyXCAFiles)
- 14.3. Click **Save**.
- 14.4. Click **OK**.

The file is named based upon the internal name of your LDAP server certificate with a .crt extension.

15. Under the **Private Keys** tab select the LDAP server key which you created earlier.

16. Click **Export**

17. In the dialog that appears,

- 17.1. Ensure the **Export Format** field is set to **PEM Private**. Browse to a protected location (e.g., My Documents → MyXCAFiles).
- 17.2. Click **Save**.
- 17.3. Click **OK**.

The file is named based upon the key name of your LDAP server certificate with a .pem extension.

These files are security-sensitive so keep it protected at all times. Remove the files after they have been installed on the LDAP server.

Installing certificates on OpenLDAP server

Server certificate private key and Server Certificate along with its issuer CA certificate need to be installed on OpenLDAP server.

1. Open the terminal of the Ubuntu system.
2. Copy the server certificate (.crt) and its issuer certificate (rootCA.crt in case of single CA file and MyCA.crt in case of 2 CA files) to /etc/ssl/certs folder.
3. Copy the server private key (.pem) to /etc/ssl/private folder.
4. Go to the **/etc/ldap/slapd.d** folder
5. Create a file with ldf extension. For example create certinfo.ldf and contents of the file should be similar to image and match the filenames to actual filenames. Make sure the files are copied to respective locations as mentioned. If you are adding filenames for the very first time, then remove the line "changetype: modify" in below example and replace keyword "replace" with "add". If you are modifying files names just follow the below example.

```
dn: cn=config
changetype: modify
replace: olcTLSCACertificateFile
olcTLSCACertificateFile: /etc/ssl/certs/MyCA.crt
-
replace: olcTLSCertificateFile
olcTLSCertificateFile: /etc/ssl/certs/ldapserver.crt
-
replace: olcTLSCertificateKeyFile
olcTLSCertificateKeyFile: /etc/ssl/private/ldapserver.pem
~
~
~
~
```

6. Execute the following command:
sudo ldapmodify -Y EXTERNAL -H ldapi:/// -f /etc/ldap/slapd.d/certinfo.ldf
Result: See the below image.

```
hudson@ldap:/etc/ldap/slapd.d$ sudo ldapmodify -Y EXTERNAL -H ldapi:/// -f /etc/
ldap/slapd.d/certinfo.ldf
SASL/EXTERNAL authentication started
SASL username: gidNumber=0+uidNumber=0,cn=peercred,cn=external,cn=auth
SASL SSF: 0
modifying entry "cn=config"
```

7. Open the cn=config.ldif file, Observer the updated file names in this file.

```
hudson@ldap: /etc/ldap/slapd.d
# AUTO-GENERATED FILE - DO NOT EDIT!! Use ldapmodify.
# CRC32 c7655995
dn: cn=config
objectClass: olcGlobal
cn: config
olcArgsFile: /var/run/slapd/slapd.args
olcLogLevel: none
olcPidFile: /var/run/slapd/slapd.pid
olcToolThreads: 1
structuralObjectClass: olcGlobal
entryUUID: 47e08ea2-4ef5-1035-86f8-89b334c52d3e
creatorsName: cn=config
createTimestamp: 20160114102822Z
olcTLSCACertificateFile: /etc/ssl/certs/MyCA.crt
olcTLSCertificateFile: /etc/ssl/certs/ldapserver.crt
olcTLSCertificateKeyFile: /etc/ssl/private/ldapserver.pem
entryCSN: 20160218100536.635095Z#000000#000#000000
modifiersName: gidNumber=0+uidNumber=0,cn=peercred,cn=external,cn=auth
modifyTimestamp: 20160218100536Z

"cn=config.ldif" 19 lines. 693 characters
```

8. Restart the LDAP server service using command **sudo /etc/init.d/slapd restart**.

Result: Messages appear as shown below:

```
hudson@ldap:/etc/ldap/slapd.d$ sudo /etc/init.d/slapd restart
* Stopping OpenLDAP slapd [ OK ]
* Starting OpenLDAP slapd [ OK ]
hudson@ldap:/etc/ldap/slapd.d$
```

Configuring the MCP devices for Centralized LDAP Authentication using Open LDAP Server

Chapter 2: Configure the LDAP on MCP

The Lightweight Directory Access Protocol (LDAP) is an application protocol for accessing and maintaining distributed directory information services over an Internet Protocol (IP) network. This Directory services may provide any organized set of records, often with a hierarchical structure.

This chapter describes how to install CA Certificates on the MCP device and configure LDAP on the MCP device.

See section:

- [Installing CA Certificates on the MCP device](#)
 - [CA Certificate transfer procedure from PC to MCP](#)
 - [CA Certificate Transfer to MCP by using DSAS Secure File Browser](#)
 - [CA Certificate transfer to MCP by using external Secured USB](#)
 - [CA Certificate Installation procedure](#)
 - [Import and Install CA certificate through Runtime DSAS](#)
 - [Import and Install CA certificate through Local HMI](#)
- [Configuring LDAP on the MCP device](#)
 - [Prerequisites to configuring LDAP on MCP device](#)
 - [Create an Emergency Administrator User](#)
 - [Retrieve LDAP Authentication Server information](#)
 - [Procedure to configure LDAP on the MCP device](#)

Installing CA Certificates on the MCP device

This section describes how to install the CA Certificate to the MCP device. There are two type of certificates you can create:

- Server certificate
- Client certificate

Files to be Created	- CA certificate to be installed in both the Client and Server. - Server Certificate to be installed in the Server for Server Authentication (This can be skipped if LDAP Server CS is used to create the CA Certificate).	
Files to be Transferred	MCP	MyCA.crt or MyCA.cer (LDAP Client)
	Open LDAP Server	MyCA.crt or MyCA.cer servercert.p12 (LDAP Server)

CA Certificate transfer procedure from PC to MCP

You can import and install the CA certificate to MCP. This certificate can be transferred to MCP for installation, using either of the below two options:

- CA Certificate Transfer to MCP by using DSAS Secure File Browser
- CA Certificate transfer to MCP by using external Secured USB

CA Certificate Transfer to MCP by using DSAS Secure File Browser

- Copy the files containing the CA certificate to the following MCP location:
/mnt/user/SecureScadaTransfer
 - This can be done using the DSAS Secure File Browser (SFTP file transfer program).
 - To launch DSAS Secure File Browser, click on: **Start>All programs>DS AgileStudio vX.0> Secure File Browser vX.0.**

- Secure File Browser screen will be launched as below:

- Click **Connect**.
- The Connection Details window will appear.
- Enter Host name: MCP IP, Protocol: SFTP, User name details and then click **Connect**.

- A Login window appears, enter the MCP User Name and click **Identify** tab.

- Once the User Name is identified with the MCP, a Login window appears and prompt for the Password.

- Enter the Password and click **Login** to access the MCP folders.
- Once your Login is successful, you can see the below Secure File Browser screen:

- In the Secure File Browser window, PC folders are displayed on the left side and the MCP folders are displayed on the right.
- On MCP side, navigate to folder **/mnt/usr/SecureScadaTransfer**

- Select the required certificate from the PC folder and click **Upload**. This will upload the files from PC to MCP.

NOTE

After completion of these steps, LDAP client certificate is transferred successfully to MCP and is ready for installation.

CA Certificate transfer to MCP by using external Secured USB

Once the LDAP client certificate (CA certificate) is created and available on the PC and you can transfer this CA certificate to MCP using USB as follows:

1. Create a directory in USB drive "**SecureScadaTransfer**".
2. Copy the CA certificate from PC to USB on a USB drive (LDAP Client certificate need to be available in USB at **\SecureScadaTransfer**).
3. Insert the USB drive into any USB slot on the MCP device. E.g.: USB Port-1
4. Open Local HMI and login as administrator user.
5. Go to **Settings > Utilities** page in the local HMI and click on **Mount USB** option.

6. Now USB is mounted successfully to MCP and CA certificate is available at **/mnt/usb/usb1/SecureScadaTransfer**.

CA Certificate Installation procedure

Once the certificate is available in MCP by any of the transfer procedure mentioned in page 38 (Secure DSAS Browser or USB), it can be installed by using either of the below two interfaces:

- Import and Install CA certificate through Runtime DSAS
- Import and Install CA certificate through Local HMI

Import and Install CA certificate through Runtime DSAS

After certificate transfer to MCP at **/mnt/usr/SecureScadaTransfer/** or certificates can be installed to MCP using **DSAS > Utilities**. To proceed follow the below steps:

1. Open MCP Studio and click **Connect** to MCP.

2. Select Utilities tab, click on **Import**, to import the copied certificates.

- 3. Once the certificates are imported, a Certificate Import window appears which shows confirmation of import status. Click **OK**.

- 4. Once the certificates are imported successfully, click “**Manage**” to manage local certificates which display three tabs **Local**, **Issuer** and **CRL** as below:

- 5. Click on **Issuer** tab, select the Certificate and click **Install**.

- 6. Once the certificate is installed successfully, it is moved to the Installed Issuer Certificates section:

RESULT: This completes the Certification Installation process through DSAS Online HMI. You can use this certificate in LDAP Authentication.

Import and Install CA certificate through Local HMI

After the certificate is transferred to the MCP at `/mnt/usr/SecureScadaTransfer/` or `/mnt/usb/usb1/SecureScadaTransfer/` certificates can be installed to MCP using **Local HMI > Settings > Utilities**. To proceed follow the prescribed steps as below:

- 1. Open Local HMI and click **Settings** tab.

- 2. Click **Utilities** tab.

3. Click on **Import**, to import the copied certificates.

4. Once the certificates are imported, a Certificate Import window appears which shows confirmation of import status. Click **OK**.

5. Once the certificates are imported successfully, click "**Manage**" to manage local certificates which display three tabs Local, Issuer and CRL as below:

6. Click on **Issuer** tab, select the Certificate and click **Install**.

7. Once the certificate is installed successfully, it's moved to the Installed IssuerCertificates section:

RESULT: This completes the Certification Installation process through DSAS Online HMI. You can use this certificate in LDAP Authentication.

Configuring LDAP on the MCP device

This section describes the:

- Tasks performed prior to configuring the LDAP on the MCP device and
- The procedure to configure the LDAP on the MCP device.

Prerequisites to configuring LDAP on MCP device

Prior to configuring the LDAP on the MCP device it is mandatory to create emergency user in MCP. If user directly start LDAP configuration by using section Procedure to configure LDAP on the MCP device then user will get popup message that “Please add Emergency User before switching to LDAP/TACACS Authentication” and user will not be able to configure LDAP authentication without adding emergency users.

Create an Emergency Administrator User

This emergency user can be used when remote authentication server is not available and user is unable to access MCP using Remote Authentication. This emergency admin user is required to get access to the system in case of emergency, i.e. when LDAP server is not responsive / user forgets all credentials etc.

Emergency Users can be created by using any of the below two options:

- Using Web MCP Settings GUI
- Using the mcpconfig utility on MCP device through Secure Terminal Emulator

An emergency administrator user can login to MCP using any of the below three interfaces:

1. SSH session to MCP (Port-922)
2. Front serial port connection to MCP (Baud Rate- 115200)
3. MCP Emergency option in local console

Once user logs into MCP as Emergency Administrator user, executing “emergcfg” command shall provide options for user to perform the below two key functions:

- Change the mode authentication from remote to local mode.
- Generate emergency code to login to HMI without changing authentication from remote to local mode.

Below sections describes how to add emergency user in MCP by using any of these option step by step:

Using the mcpcfg utility on MCP device through Secure Terminal Emulator

1. To open Secure Terminal Emulator, select **Start > All Programs > DS Agile Studio vX.0 > Secure Terminal Emulator vX.0**

2. Click **Connect**. A pop-up window appears which shows Connections credentials.
3. Enter your MCP IP in Host name, Login name and Port 22 and click **Connect**.

4. A Login window appears, enter User Name and click **Identify**.

The image shows a 'Login' dialog box. It has a title bar 'Login'. Below it is a 'User Name' label followed by a text input field containing the text 'admin'. At the bottom of the dialog are two buttons: 'Identify' and 'Cancel'.

5. Once the User Name is identified with the MCP, a Login window appears to prompt for the Password. Enter the MCP password and click **Login**.

The image shows a 'Login' dialog box. It has a title bar 'Login'. Below it is a message: 'UNAUTHORIZED ACCESS TO THIS DEVICE IS PROHIBITED'. Underneath is a paragraph of text: 'You must have explicit permission to access or configure this device. All activities may be logged. Violations of policy governing this device may result in disciplinary action and may be reported to law enforcement. There is no right to privacy in accessing this device.' Below this text are two input fields: 'User Name' with 'admin' and 'Password' with '*****'. At the bottom are 'Login' and 'Cancel' buttons.

6. Once you login successfully, MCP Shell window appears:

```
GE Multilin MCP Firmware Release 110 Production Build 391 2020-01-01:04:41:24
admin@G500:~$
```

7. Type **sudo mcpcfg** and enter your Administrator User Name and Password if prompts.
8. The Gateway Settings Menu appears:

```

```

Using Web MCP Settings GUI

1. Login to MCP using local admin user authentication:
 - Entering their User Name.
 - Entering their Password.
 - Selecting Login to advance to the next screen and begin using the application.

The image shows a login screen for the MCP Settings GUI. It has a blue background. At the top center is the GE logo. Below the logo, the text "MCP Settings" is displayed. Underneath, there are two input fields: the first is labeled "Username" with a person icon, and the second is labeled "Password" with a lock icon. At the bottom center is a green button labeled "Login".

MCP Settings

 Username

 Password

Login

2. Once you have logged in to the MCP Settings, you can see a menu on the center and Logout option on the top right of the screen. To explore the MCP settings use the menu options shown on the home page:

3. Select **Configure Authentication** from the main menu.

4. Click on **Emergency Group User** to add emergency User.

5. To add new emergency user click **Add User** tab.

6. Enter the desired Emergency Group Username, conforming to the emergency group username rules as listed below:
- Emergency Group Username must be between 2 and 31 characters.
 - Emergency Group Username must start with a lowercase alphabetical character.
 - Emergency Group Username must only contain [a-z][0-9][-,_] characters.

7. Enter the Full Name of the emergency group user.
8. Enter the Password, conforming to the password security rules as listed below:
 - Password must be between 8 and 199 characters in length
 - Password must contain:
 - 1 character from [a-z]
 - 1 character from [A-Z]
 - 1 digit from [0-9]
 - 1 special character from the set [\$%@!&]
 - Re-enter password and click Confirm.

RESULT: Pop-up window appears showing the Operation Status: **New user successfully added**, click **OK**.

Retrieve LDAP Authentication Server information

Retrieve the following LDAP authentication server information from the IT / Network team of your organization or company:

Name	Locate on LDAP Server
Primary Host Name	1. It is full name of your computer (LDAP Server). 2. Open properties of computer or server and view the Full Name of Computer
Primary Host IP Address	Open Server Manager in LDAP server and click on AD DS and note down the IP address of server.
Secondary Host Name	This is an optional field. It is full name of your secondary computer (LDAP Server). Open properties of computer or server and view the Full Name of Computer. If the Secondary LDAP Server is configured, MCP shall automatically switch to the secondary server when the primary server is not available.
Secondary Host IP Address	This is an optional field. Open Server Manager in secondary LDAP server and click on AD DS and note down the IP address of server.
LDAP Port	LDAP communication mechanism is TLS/SSL. Port-number = 389 for TLS communication Port-number = 636 for SSL communication

Name	Locate on LDAP Server
Base DN	1. It is Domain Name 2. Open properties of computer or server and view the Domain 3. If Domain is GE.local then Base DN will be "dc=GE,DC=LOCAL"
Bind User Name	Username of the bind user created in the LDAP server. Assume the user name to login LDAP machine or server is "ldapbind" and dc name is "GE" and dc type is "local" then the bind user name will be (in DN format) "cn=ldapbind,cn=Users,dc=GE,dc=local"
Bind Password	Password for the Bind User
Security Type	LDAP communication mechanism is TLS/SSL. Port-number = 389 for TLS communication Port-number = 636 for SSL communication
CA Certificate	Selected the imported CA certificate from the drop-down list.
Bind Time limit in Seconds	Use 30 as default value
User ID Attribute Map	User can use the default value " sAMAccountName "
Home Directory Attribute Map	User can use the default value " unixHomeDirectory "

Procedure to configure LDAP on the MCP device

You can configure or change the authentication to LDAP Authentication mode by using HMI. In above section [Retrieve LDAP Authentication Server information](#), we already had collected all the parameters that will be used here for configuration: To configure the LDAP in the MCP device:

1. Login in to MCP HMI with an administrator user name and password.
2. Go to **Settings > Access > Authentication** and select **LDAP server** from the **Authentication Mode** drop-down menu.

3. On selecting the LDAP Server authentication, LDAP configuration page will be opened as below:

Name	Value
Primary Host Name(*)	
Primary Host IP Address(*)	
Secondary Host Name	
Secondary Host IP Address	
LDAP Port(*)	389
Base DN(*)	
Bind Username(*)	
Bind Password(*)	
Security Type	TLS
CA Certificate(*)	
Bind Timelimit in seconds	30
USER ID Attribute Map	
Home Directory Attribute Map	

4. Input all the LDAP parameters we already had noted in the above section of this document. Follow the below table as an example to find all the parameter from LDAP server:

Name	Value	Locate on LDAP Server
Primary Host Name	GEServer.GE.local	1. It is full name of your computer (LDAP Server). 2. Open properties of computer or server and view the Full Name of Computer
Primary Host IP Address	172.12.235.77	Open Server Manager in LDAP server and click on AD DS and note down the IP address of server.
LDAP Port	389	LDAP communication mechanism is TLS/SSL. – Port-number = 389 for TLS communication – Port-number = 636 for SSL communication

Name	Value	Locate on LDAP Server
Base DN	dc=GE,dc=local	1. It is Domain Name 2. Open properties of computer or server and view the Domain 3. If Domain is GE.local then Base DN will be "dc=GE,DC=LOCAL"
Bind User Name	cn=ldapbind,cn=Users,dc=GE,dc=local	Assume the user name to login LDAP machine or server is "ldapbind" and dc name is "GE" and dc type is "local" then the bind user name will be (in DN format) "cn=ldapbind,cn=Users,dc=GE,dc=local"
Bind Password	Password	Enter the bind user password. (This is the password created for the Bind user in the LDAP Server in the earlier steps).
Security Type	TLS	LDAP communication mechanism is TLS/SSL. – Port-number = 389 for TLS communication – Port-number = 636 for SSL communication
CA Certificate	Certificate installed earlier	Select the INSTALLED CERTIFICATE appear on dropdown list.
Bind Time limit in Seconds	30	Default Value
User ID Attribute Map	sAMAccountName	sAMAccountName is default value User can find it in user attribute tab in user properties of user in LDAP server
Home Directory Attribute Map	unixHomeDirectory	1. unixHomeDirectory is default value 2. User can find it in user attribute tab in user properties of user

5. Configure these LDAP parameters as shown below. Also, go to the drop-down menu of CA certificate and select the CA certificate for LDAP.

Name	Value
Primary Host Name(*)	GEServer.GE.local
Primary Host IP Address(*)	172.12.235.77
Secondary Host Name	
Secondary Host IP Address	
LDAP Port(*)	389
Base DN(*)	dc=GE,dc=local
Bind Username(*)	cn=ldapbind,cn=Users,dc=GE,dc=local
Bind Password(*)	*****
Security Type	TLS
CA Certificate(*)	CN = GE-GESERVER-CA
Bind Time limit in seconds	30
USER ID Attribute Map	sAMAccountName
Home Directory Attribute Map	unixHomeDirectory

6. Click the **Test** button. It will validate the configuration and availability of LDAP server once the configuration verified, Testing Passed message will be popup. Click **OK**.

Result : The server connectivity is verified.

7. If user had input wrong parameter for any of the field and click on test button then it will popup message as “Testing Failed” as below:

NOTE: Do not select the Enabled field.

8. Click on Save, it will save the configuration parameters, but still the authentication mode is local.
9. Till the above step LDAP configuration has been saved and tested successfully but still the authentication mode is Local. If user want to work with:
 - 9.1. If user want to work with Static mode of group mapping, then group mapping is not required in MCP. In this case user can directly enable and save the configuration as described in next steps. Static mode of group mapping is described in section [Procedure for Static Group Mapping](#).
 - 9.2. If user want to work with Dynamic mode of group mapping, then group mapping needs to be done in MCP. Map the group in MCP by following the [Procedure for Dynamic Group Mapping](#). After mapping all the groups in MCP proceed with next step.
10. Procedure to Configure Group Mapping on the MCP Device, if user want to work with dynamic user mapping approach then Group Mapping need to be done in MCP. Follow the below steps for Group Mapping in MCP. If you want to continue with static group mapping, skip the below steps from 10.1 to 10.8 and move to step 11:
 - 10.1. [Procedure for Dynamic Group Mapping](#). It has been noted in an earlier example that the Distinguished Name (DN) of group “G500Administrator” is as “cn=G500Administrator,cn=users,dc=GE,dc=local”.
 - 10.2. Login in to MCP HMI with an administrator user name and password.

10.3. Go to **Settings > Access > Authentication** and select **LDAP server** from the **Authentication Mode** drop-down menu.

10.4. On selecting the LDAP Server authentication, LDAP configuration page will be opened as below:

- 10.5. Click on “**Group Map**” tab. Select the **Device Role** of Group from drop down and input the **DN** in Group Map field as shown in below (DN has been noted in step 10.1):

- 10.6. Click on “**Add**” button, it will add the group in MCP and that group members or users will be privileged with the selected Device Role. For example if User role is selected as Administrator for “**G500Administrator**” user group then users under G500Administrator group will have administrator privilege.

- 10.7. Similarly add different User groups like G500Operator for Operator privilege, G500Observer for Observer privilege, G500Supervisor for Supervisor privilege, G500Passthrough for Passthrough privilege.
- 10.8. After adding the user group click on Save to save the configuration.
RESULT: Group Mapping has been done successfully.

11. **Select the Enabled field and Save**, This step should be done only after completion of Static/ Dynamic Group Mapping it will save this configuration parameters and forcefully logout the HMI for local user and LDAP authentication will be enabled for MCP. Now user can login to MCP by using only LDAP authentication.

NOTE: Select the Enabled field and Save, this will switch to Remote Authentication mode.

The screenshot shows the G500 configuration interface for LDAP authentication. The 'Save' button is highlighted in red. The 'Enabled' checkbox is checked and highlighted in red. A warning dialog box is displayed over the configuration table.

Name	Value
Primary Host Name(*)	GEServer.GE.local
Primary Host IP Address(*)	172.12.235.77
Secondary Host Name	
Secondary Host IP Address	
LDAP Port(*)	
Base DN(*)	
Bind Username(*)	
Bind Password(*)	
Security Type	
CA Certificate(*)	CN = GE-GESERVER-CA
Bind Timelimit in seconds	30
USER ID Attribute Map	sAMAccountName
Home Directory Attribute Map	unixHomeDirectory

WARNING: Save with Enabled checked will switch to Remote Authentication immediately!

12. This warning is for the static user should be available to login MCP, click **OK** then again it will popup message to logout HMI for local user. Click **Yes** to proceed:

Result: Now LDAP Authentication mode is successfully enabled, user is required to use LDAP credentials, for login to HMI, DSAS and SSH sessions to MCP.

Configuring the MCP devices for Centralized LDAP Authentication using Open LDAP Server

Appendix A: Troubleshooting

If you encounter issues while testing the operation of the LDAP server configuration, refer to the following listed errors and the recommended responses. When you click the Test Button, if a particular field is configured improperly, the corresponding message appears on the HMI.

The exact error messages may refer to MCP, G500 or G100 – the meaning is identical.

See sections:

- [LDAP error messages](#)
- [LDAP Certificate error messages](#)

LDAP error messages

Error Message	Response
Host not reachable	Ensure LDAP server was accessible in the network.
	Ensure LDAP server was not shutdown.
unable to access ldap port	Ensure LDAP server was using the specified port for LDAP protocol communication.
Invalid bind dn	Ensure mentioned bind user dn (distinguished name) was available in the mentioned domain on the LDAP server.
Invalid bind user credentials	Ensure bind user dn (distinguished name) mentioned in the MCP device LDAP server configuration was correct.
	Ensure bind user password entered was correct in the MCP device LDAP server configuration.
Hostname mismatch with server certificate	Ensure LDAP server host name entered in the MCP device LDAP server configuration was matching with the LDAP server certificate subject name.
Server/Port not accessible	Ensure LDAP server was accessible in the network.
	Ensure LDAP server was not shutdown.
	Ensure LDAP server was using the specified port for LDAP protocol communication.
Invalid Host Name. Full Qualified Domain Name (FQDN) has invalid characters	Ensure Primary Host Name is configured in MCP device LDAP server configuration.

Error Message	Response
Invalid Host IP Address	Ensure Primary Host IP Address configured in MCP device LDAP server configuration is correct.
Failed to connect to Primary Host	Ensure LDAP Server is accessible in the network.
	Ensure Primary Host Name configured in MCP device LDAP server configuration is correct.
	Ensure Base DN configured in MCP device LDAP server configuration is correct.
	Ensure Bind User credentials (Bind Username and Bind Password) configured in MCP device LDAP server configuration are correct.
Primary Server :Server/Port not accessible	Ensure LDAP Server is not shutdown.
	Ensure Primary Host IP Address configured in MCP device LDAP server configuration is correct.
Configuration Timeout, please try again later	Ensure LDAP server was using the specified port for LDAP protocol communication.
Invalid User ID Attribute Map	Ensure User ID Attribute Map defined in LDAP Server is configured in MCP device LDAP server configuration.
Invalid HomeDirectory Attribute Map	Ensure HomeDirectory Attribute Map defined in LDAP server is configured in MCP device LDAP server configuration.
Connected to secondary Host, but failed to connect to primary Host	Ensure Primary Host Name and Primary Host IP Address configured in MCP device LDAP server configuration are correct.
Failed to connect to both primary and secondary Hosts	Ensure Primary Host Name and Secondary Host Name configured in MCP device LDAP server configuration are correct.
	Ensure Primary Host IP Address and Secondary Host IP Address configured in MCP device LDAP server configuration are correct.
	Ensure Base DN configured in MCP device LDAP server configuration is correct.
	Ensure Bind User credentials (Bind Username and Bind Password) configured in MCP device LDAP server configuration are correct.
Please add Emergency User before switching to LDAP/TACACS Authentication	Ensure at least one emergency admin group user is configured before switching to LDAP/TACACS Authentication.
The current Authentication Mode has been enabled. You cannot disable it unless switching to a different Authentication Mode	Current Authentication Mode is LDAP. Ensure to disable (Enabled checkbox unchecked) only when switching to a Authentication Mode other than LDAP.

LDAP Certificate error messages

Error Message	Response
List of trusted certificates is not complete	The issuer certificate of a looked up certificate could not be found. This normally means the list of trusted certificates installed on the MCP device or certificate list from LDAP server was not complete.
Unable to decrypt certificate's signature	The certificate signature could not be decrypted. This means that the actual signature value could not be determined rather than it not matching the expected value, this is only meaningful for RSA keys.
unable to decode issuer public key	The public key in the certificate SubjectPublicKeyInfo of MCP device server could not be read.
certificate signature failure	The signature of the installed certificate on MCP device server certificate was invalid.

Error Message	Response
certificate is not yet valid	MCP device time might be backward w.r.to certificate valid time. The certificate is not yet valid: the not Before date is after the currenttime.
certificate has expired	CA certificate installed on MCP device got expired w.r.to LDAP server. MCP device time might be forward w.r.to certificate valid time. The certificate has expired: that is the notAfter date is before the currenttime.
format error in certificate's notBeforefield	The certificate notBefore field contains an invalid time.
format error in certificate's notAfter field	The certificate notAfter field contains an invalid time.
Self-signed certificate cannot be found in the listof trusted certificates.	The passed certificate is self-signed and the same certificate cannot befound in the list of trusted certificates.
self-signed certificate incertificate chain	Ensure Installed a trusted CA signed primary SSL certificate and an intermediate certificate. Verify that the Root CA is not included in the certificate chain (as this isalmost always self-signed).
unable to get local issuercertificate	This error code is thrown when a local certificate path is not foundduring the certificate check. LDAP server certificate's issuer certificate was not found, after looking inboth the chain provided by the LDAP server and in the local trusted storage. This usually means the peer chain was missing or incomplete.
unable to verify the firstcertificate	The primary certificate (the one you purchase from a vendor) cannot establish the chain of trust between itself and the Root certificate storedlocally. Usually installing the intermediate certificates fixes this.
certificate chain too long	The certificate chain length is greater than the supplied maximum depth. The LDAP server certificate's chain length exceeded the limit set locally by sslverifydepth or SSL Verify Depth. The chain length (depth) is the number of certificates beyond the leaf (client or server) certificate itself. a chain of length 1 is a leaf certificate plus its issuer certificate.
invalid CA certificate	A CA certificate is invalid. Either it is not a CA or its extensions are notconsistent with the supplied purpose.
path length constraintexceeded	The basicConstraints path length parameter has been exceeded for certificate.
invalid or inconsistent certificate extension	invalid or inconsistent certificate extension
Hostname mismatch	Ensure LDAP server host name entered in the MCP device LDAP server configuration was matching with the LDAP server certificate subjectname.
Certificate directoryempty	No certificates installed over to the MCP device.

Appendix B: List of Acronyms

Acronym Definitions

This Appendix lists and defines the acronyms used in this manual.

Table 1: Acronym list

Acronym	Definition
CS	Certificate Services
DS	Domain Services
CA	Certificate Authority
MCP	MCP Substation Gateway
mcpcfg	Local configuration utility
DN	Domain Name
DNS	Domain Name System
FQDN	Full Qualified Domain Name
GE	General Electric
HMI	Human Machine Interface (also called Graphical User Interface – GUI)
IP	Internet Protocol
IT	Information Technology
LDAP	Lightweight Directory Access Protocol
NIS	Network Information Service
NTDS	TechNet Directory Services
PC	Personal Computer
PEM	Privacy Enhanced Mail
PKCS	Public-Key Cryptography Standards, published by RSA Laboratories
SCADA	Supervisory Control and Data Acquisition
SCP	Session Control Protocol
SFTP	Secure File Transfer Protocol
SHA	Secure Hash Algorithm

Acronym	Definition
SSL	Secure Sockets Layer
TLS	Transport Layer Security
USB	Universal Serial Bus
XCA	X Certificate and Key management

Configuring the MCP devices for Centralized LDAP Authentication using 389 Directory Server

About this Document

Purpose

This manual describes how to install and configure the 389 Directory Server and Multilin™ MCP device for Centralized LDAP Authentication.

This document applies to the MCP family (G100/G500) unless otherwise indicated.

Screen captures may show G500 in some areas, however the workflow applies to products in the MCP family (G100/G500).

This document is not actively maintained for MCP versions after v280.

Intended audience

This manual is a helpful resource for utility personnel and system engineers who are implementing LDAP on Multilin™ MCP device in an overall substation automation system.

Additional documentation

For the most current version of the Configuring 389 Directory Server and Multilin™ MCP for Centralized LDAP Authentication - Manual, please download a copy from GE Vernova Grid Solutions web site.

For information on fully installing, configuring, monitoring and testing a MCP device, refer to the:

- G500 Substation Gateway Instruction Manual, 994-0152
- G100 Substation Gateway Instruction Manual, 994-0155
- MCP Substation Gateway Software Configuration Guide, SWM0101

Configuring the MCP devices for Centralized LDAP Authentication using 389 Directory Server

Chapter 1: 389 Directory Server

The 389 directory server is an LDAP (Lightweight directory access protocol) server developed by Red Hat.

See sections:

- [Creating and installing the 389 directory server](#)
- [Generating certificates](#)
- [Retrieving certificates for 389 DS server](#)

Creating and installing the 389 directory server

This section describes how to install and configure the 389 Directory Server on a RHEL operating system.

389 directory server installation

To install and configure a 389 Directory Server on a RHEL system:

1. Install RHEL 6.5 VM.
2. Type in the **username** and **password**.

Result: The installation procedure

3. After successful installation, login with root and execute the below command

Install package:

```
[root@dshost ~]# yum install 389-ds-base
```

Result: The below messages appear.

Transaction Summary

[root@dshost ~]#
```

4. Download following pre-requisite packages:

- idm-console-framework-1.1.7-2.el6.noarch.rpm
- 389-adminutil-1.1.19-1.fc19.x86_64.rpm
- 389-admin-1.1.35-1.fc19.x86_64.rpm

- 389-admin-console-1.1.8-1.el6.noarch.rpm
- 389-console-1.1.7-1.el6.noarch.rpm
- 389-ds-console-1.2.6-1.el6.noarch.rpm

from:

https://dl.fedoraproject.org/pub/epel/6/x86_64/

and

<https://rpmfind.net/linux>

5. Install the packages in the following manner;

```
[root@dshost ldap]# yum install /tmp/ldap/idm-console-framework-1.1.7-2.el6.noarch.rpm
```

```
[root@dshost ldap]# yum install /tmp/389-adminutil-1.1.19-1.el6.x86_64.rpm
```

```
[root@dshost ldap]# yum install /tmp/389-admin-1.1.35-1.el6.x86_64.rpm
```

```
[root@dshost ldap]# yum install /tmp/ldap/389-console-1.1.7-1.el6.noarch.rpm
```

```
[root@dshost ldap]# yum install /tmp/ldap/389-ds-console-1.2.6-1.el6.noarch.rpm
```

```
[root@dshost ldap]# yum install /tmp/ldap/389-console-1.1.7-1.el6.noarch.rpm
```

Update IP address and host name

To update the IP address and host name:

1. Type in command: **# vi /etc/hosts**
2. Enter the IP address and host name

Configuring the 389 DS

To configure the 389 Directory Server:

1. Execute command: **[root@dshost ldap]# setup-ds-admin.pl**

Result: The below messages appear.

```
=====
This program will set up the 389 Directory and Administration Servers.
```

It is recommended that you have "root" privilege to set up the software.

Tips for using this program:

- Press "Enter" to choose the default and go to the next screen
- Type "Control-B" then "Enter" to go back to the previous screen
- Type "Control-C" to cancel the setup program

Would you like to continue with set up? [yes]:

2. Enter **Yes** to specify that you want to continue the set up.

Result: The below messages appear.

```
=====
Your system has been scanned for potential problems, missing patches, etc. The
following output is a report of the items found that need to be addressed before
running this software in a production environment.
```

389 Directory Server system tuning analysis version 23-FEBRUARY-2012.

```
NOTICE : System is x86_64-unknown-linux2.6.32-431.el6.x86_64 (1 processor).
NOTICE : The net.ipv4.tcp_keepalive_time is set to 7200000 milliseconds
(120 minutes). This may cause temporary server congestion from lost client
connections.
```

```
WARNING: There are only 1024 file descriptors (soft limit) available, which
limit the number of simultaneous connections.
```

```
WARNING : The warning messages above should be reviewed before proceeding.
```

Would you like to continue? [no]:

3. Enter **Yes** to specify that you want to continue the set up.

Result: The below messages appear.

```
=====
Choose a setup type:
  1. Express - Allows you to quickly set up the servers using the most
common options and pre-defined defaults. Useful for quick evaluation of the
products.
  2. Typical - Allows you to specify common defaults and options.
  3. Custom - Allows you to specify more advanced options. This is
recommended for experienced server administrators only.
To accept the default shown in brackets, press the Enter key.
```

Choose a setup type [2]: 2

4. Enter **2** to select the Typical setup.

Result: The below messages appear.

```
=====
Enter the fully qualified domain name of the computer on which you're
setting up server software. Using the form <hostname>.<domainname>
Example: eros.example.com.
```

To accept the default shown in brackets, press the Enter key.

Warning: This step may take a few minutes if your DNS servers can not be reached or if DNS is not configured correctly. If you would rather not wait, hit Ctrl-C and run this program again with the following command line option to specify the hostname:

```
General.FullMachineName=your.hostname.domain.name
Computer name [dshost.project.com]:
```

```
WARNING: There are problems with the hostname. Hostname 'dshost.project.com'
is valid, but none of the IP addresses resolve back to dshost.project.com
- address 3.185.121.199 resolves to host dshost
```

Please check the spelling of the hostname and/or your network configuration. If you proceed with this hostname, you may encounter problems.

Do you want to proceed with hostname 'dshost.project.com'? [no]:

5. Enter **Yes** to proceed with hostname 'dshost.project.com'.
6. Execute command:

```
[root@dshost ldap]# setup-ds-admin.pl
General.FullMachineName=dshost.project.com
```

Result: The below messages appear.

```
=====
This program will set up the 389 Directory and Administration Servers.

It is recommended that you have "root" privilege to set up the software.
Tips for using this program:
  - Press "Enter" to choose the default and go to the next screen
  - Type "Control-B" then "Enter" to go back to the previous screen
  - Type "Control-C" to cancel the setup program
Would you like to continue with set up? [yes]:
```

7. Enter **Yes** to continue.

Result: The below messages appear.

```
=====
Your system has been scanned for potential problems, missing patches, etc.

Computer name [dshost.project.com]:

WARNING: There are problems with the hostname. Hostname 'dshost.project.com' is valid, but none of the IP addresses resolve back to dshost.project.com
- address 3.185.121.199 resolves to host dshost

Please check the spelling of the hostname and/or your network configuration. If you proceed with this hostname, you may encounter problems.

Do you want to proceed with hostname 'dshost.project.com'? [no]:

10. Enter **Yes** to proceed with hostname 'dshost.project.com'.

Result: The below messages appear.

```
=====
The servers must run as a specific user in a specific group. It is strongly
recommended that this user should have no privileges on the computer (i.e. a
non-root user). The setup procedure will give this user/group somepermissions
in specific paths/files to perform server-specific operations.
```

If you have not yet created a user and group for the servers, create this user and group using your native operating system utilities.

```
System User [nobody]: ldapadmin
System Group [nobody]: ldapadmin
```

Ldapadmin is a user created in this OS.

```
=====
Server information is stored in the configuration directory server. This
information is used by the console and administration server to configure and
manage your servers. If you have already set up a configuration directory
server, you should register any servers you set up or create with the
configuration server. To do so, the following information about the
configuration server is required: the fully qualified host name of the form
<hostname>.<domainname>(e.g. hostname.example.com), the port number (default
389), the suffix, the DN and password of a user having permission to write
the configuration information, usually the configuration directory
administrator, and if you are using security (TLS/SSL). If you are using
TLS/SSL, specify the TLS/SSL (LDAPS) port number (default 636) instead of the
regular LDAP port number, and provide the CA certificate (in PEM/ASCII
format).
```

If you do not yet have a configuration directory server, enter 'No' to be prompted to set up one.

```
Do you want to register this software with an existing configuration directory
server? [no]:
```

11. Enter **No** to specify that this software is not to be registered with an existing configuration directory server.

Result: The below messages appear.

```
=====
Please enter the administrator ID for the configuration directory server.
This is the ID typically used to log in to the console. You will also be
prompted for the password.
```

```
Configuration directory server
administrator ID [admin]:
Password:
Password (confirm):
```

12. Enter the administrator ID and password created initially.

Result: The below messages appear.

```
=====
The information stored in the configuration directory server can be separated
into different Administration Domains. If you are managing multiple software
releases at the same time, or managing information about multiple domains,
you may use the Administration Domain to keep them separate.
```

If you are not using administrative domains, press Enter to select the default. Otherwise, enter some descriptive, unique name for the administration domain, such as the name of the organization responsible for managing the domain.

Administration Domain [project.com]:

13. Enter the domain name.

Result: The below messages appear.

```
=====
The standard directory server network port number is 389. However, if you are
not logged as the superuser, or port 389 is in use, the default value will
be a random unused port number greater than 1024. If you want to use port
389, make sure that you are logged in as the superuser, that port 389 is not in
use.
```

Directory server network port [389]:

14. Enter **389**.

Result: The below messages appear.

```
=====
Each instance of a directory server requires a unique identifier. This
identifier is used to name the various instance specific files and directories
in the file system, as well as for other uses as a server instance identifier.
```

Directory server identifier [dshost]:

15. Enter any name. For example: **dshost**.

Result: The below messages appear.

```
=====
The suffix is the root of your directory tree. The suffix must be a valid
DN.
It is recommended that you use the dc=domaincomponent suffix convention.
For example, if your domain is example.com, you should use dc=example,dc=com
for your suffix.
Setup will create this initial suffix for you, but you may have more than one
suffix.
Use the directory server utilities to create additional suffixes.
Suffix [dc=project, dc=com]:
```

16. Enter any name. For example: **dc=project, dc=com**.

Result: The below messages appear.

```
=====
Certain directory server operations require an administrative user. This user
is referred to as the Directory Manager and typically has a bind Distinguished
Name (DN) of cn=Directory Manager. You will also be prompted for the password
for this user. The password must be at least 8 characters long, and contain
no spaces.
Press Control-B or type the word "back", then Enter to back up and start
over.
```

```
Directory Manager DN [cn=Directory Manager]:
Password:*****
Password (confirm):*****
```

17. Enter the password.

Result: The below messages appear.

```
=====
The Administration Server is separate from any of your web or application
servers since it listens to a different port and access to it is restricted.
```

Pick a port number between 1024 and 65535 to run your Administration Server on. You should NOT use a port number which you plan to run a web or application server on, rather, select a number which you will remember and which will not be used for anything else.

Administration port [9830]:

18. Enter **9830**.

Result: The below messages appear.

```
=====
The interactive phase is complete. The script will now set up your servers.
Enter No or go Back if you want to change something.

Are you ready to set up your servers? [yes]:
Creating directory server . . .
Warning: Hostname dshost.project.com is valid, but none of the IP addresses

389 Directory Server groups and users Configuration

This section describes how to create groups and users which are used for authentication purposes.

Creation of role groups

To create role groups:

1. Open a browser window on the Ubuntu site.
2. Run the 389-console.

3. Enter the **user ID** and **Password**. Expand the created project.

4. Click on **Directory Server**.

5. Double-click on **Directory server**.

6. Select the **Directory** tab and expand the project tree on the left-hand side.
7. Right-click on Project and select **New > Organizational Unit**.

8. Enter the below parameters and click **OK**.

Create New Organizational Unit

Unit
Languages

* Name:
 Description:
 Phone:
 Fax:
 Alias:
 Address:

* Indicates a required field

Advanced... OK Cancel Help

9. Right-click on Project and select **New > Group**.
 10. Enter the below parameters and click **OK**.

Create New Group

General
Members
Languages
Posix Group

* Group Name:
 Description:

* Indicates a required field

OK Cancel Help

11. Provide the group name and GID number excluding the GID numbers in Table 1 if you require dynamic mapping.

Table 1: Group name and GID number

Role	GID number
admin	0
observer	501
operator	502
supervisor	503
Passthrough	504

You can create different groups as required.

You must enter all components of the distinguished name, including the emailAddress.

Creation of Users

To create users and link them to desired roles:

1. Right-click on Project and select **New > User**.
2. Update the below parameters.

The image shows two screenshots of the 'Create New User' dialog box. The top screenshot shows the 'User' tab selected in the left sidebar, with fields for First Name, Last Name, Common Name(s), User ID, Password, Confirm Password, E-Mail, Phone, and Fax. The bottom screenshot shows the 'Posix User' tab selected, with a red box around the 'Posix User' option in the sidebar and a red box around the 'Enable Posix User Attributes' checkbox. The fields in the bottom screenshot are UID Number, GID Number, Home Directory, Login Shell, and Gecos.

3. Click **OK**.

You can create different users as required.

Result: The users created in this procedure are used for authentication from the MCP device.

Group Mapping

Once the User group has been created successfully, these need to be mapped to MCP UserGroup. It can be done in two approaches:

Procedure for Static Group Mapping

In this approach, the MCP device **LDAP Server group gid** shall be configured as per Table 2.

Table 2: Group IDs mapping on the LDAP Server User Groups

LDAP Server Group Name	GID Number	Description
G500Administrator	0	To map LDAP Server Group G500Administrator to G500 group Administrator
G500Observer	501	To map LDAP Server Group G500Observer to G500 group Observer
G500Operator	502	To map LDAP Server Group G500Operator to G500 group Operator
G500Supervisor	503	To map LDAP Server Group G500Supervisor to G500 group Supervisor
G500SSHPassThrough	504	To map LDAP Server Group G500Passthrough to G500 group Passthrough

NOTE

You must enter all components of the distinguished name, including the emailAddress.

NOTE

The LDAP Server Group Name in the table is an example. LDAP Server Group Name can be any name as configured by the user, Eg.: Test Group etc. In this example is listed as “G500...”, could be “G100...”

Because the functionality is the same across MCP family, this could be “MCP...”.

However, GID Number is fixed as specified in the table for MCP to recognize the same.

Example: In LDAP Server, to map MCP device LDAP Server group with name “**G500Administrator**” to MCP group “**Administrator**” using static group mapping, the LDAP Server group **GID** must be configured as in the Table 2.

- The procedure to set the GID number in the LDAP Server is described in this section [Creation of role groups](#).

RESULT: Once the G500Administrator group has been mapped successfully for **Administrator** role in MCP, the user added to this group will have administrator role in MCP.

Procedure for Dynamic Group Mapping

In this approach, the MCP device LDAP Server Group distinguished name “DN” must be configured in MCP group mapping. If user wants to go for this approach, then GID Number entry in LDAP Server Group is not required.

- Login to MCP as administrator user and configure LDAP on the MCP device as mentioned in [Procedure to configure LDAP on the MCP device](#).

Generating certificates

Before you can configure a secure channel between a MCP device and the LDAP server you need certificates for authorization. Certificates can be generated by the server itself or it can be generated by a Certification Authority (CA).

Generating certificates from server

This subsection describes how to generate certificates from LDAP server itself which is to be installed in the MCP device and used for authorization.

To generate certificates from the server:

1. Run the 389-console.

2. Enter the **user ID** and **Password**. Expand the created project.
3. Click on **Directory Server**.

4. Select the **Tasks** tab.

- Click on **Manage Certificates**.

- Generate the below passwords:
 - Generate Security Password *****
 - private/ca-cert.key: Passphrase: *****
 - KDC database master key: *****
 - password for principal "root/admin@PROJECT.COM": *****

Generate the CA

To generate the CA:

- Navigate to the below path

```
# cd /etc/pki/CA/
# touch index.txt #
echo '01' > serial
# echo '01' > crlnumber
```
- Execute the command:

```
[root@dshost CA]# openssl req -new -x509 -extensions v3_ca -keyout private/ca-cert.key -out certs/ca-cert.crt -days 365
```
- Enter values for the following parameters:
 - Country name
 - State or Province name
 - Locality name
 - Organization (e.g., company) name
 - Organization Unit name (e.g., section)
 - Common name (e.g., your name or server name)
 - Email address

```
Generating a 2048 bit RSA private key
.....+++
.....+++
writing new private key to 'private/ca-cert.key'
Enter PEM pass phrase:ca@123
Verifying - Enter PEM pass phrase:
-----
You are about to be asked to enter information that will be incorporated
into your certificate request.
What you are about to enter is what is called a Distinguished Name or a DN.
There are quite a few fields but you can leave some blank
For some fields there will be a default value,
```

If you enter '.', the field will be left blank.

```
-----
Country Name (2 letter code) [XX]:IN
State or Province Name (full name) []:Location xyz
Locality Name (eg, city) [Default City]: Location xyz
Organization Name (eg, company) [Default Company Ltd]:company
Organizational Unit Name (eg, section) []:Team
Common Name (eg, your name or your server's hostname) []:dshost.project.com
Email Address []:root@localhost
[root@dshost CA]#
```

4. Execute the below command
chmod 400 private/ca-cert.key
5. Ensure that the ca file does not need to match the certificates that it is signing.
6. Edit the openssl.cnf file and replace match with **optional**.
vi /etc/pki/tls/openssl.cnf

```
[ policy_match ]
countryName          = optional
stateOrProvinceName  = optional
organizationName     = optional
```

Generate and sign the server certificate

To generate and sign the server certificate:

1. Launch 389-console
2. Navigate to the **Manage certificates**
3. Under the **Server Certs** tab, click the **Request** button.

4. Select **Request certificate manually** and click **Next**.

5. Enter the **Server Name**, and other details, and click **Next**.

6. Enter the **Server Name**, and other details, and click **Next**.
7. Enter **Yes** and **Enter a Password**.
8. Save to file: **/tmp/dshost.project.com.csr** (or to respective path), and click **Save**.
9. Execute command:

```
# mv /tmp/dshost.project.com.csr /etc/pki/CA/crl/
```

```
[root@dshost CA]# openssl ca -in /etc/pki/CA/crl/dshost.project.com.csr -out
/etc/pki/CA/newcerts/dshost.project.com.crt -keyfile /etc/pki/CA/private/
ca-cert.key -cert /etc/pki/CA/certs/ca-cert.crt
Using configuration from /etc/pki/tls/openssl.cnf
Enter pass phrase for /etc/pki/CA/private/ca-cert.key:*****
Check that the request matches the signature
Signature ok
Certificate Details:
    Serial Number: 1 (0x1)
    Validity
        Not Before: Dec 13 17:41:32 2015 GMT
        Not After : Dec 12 17:41:32 2016 GMT
    Subject:
        countryName             = IN
        organizationName        = xyz
        organizationalUnitName   = xyzabc
        commonName               = dshost.project.com
X509v3 extensions:
```

```

X509v3 Basic Constraints:
    CA:FALSE
Netscape Comment:
    OpenSSL Generated Certificate
X509v3 Subject Key Identifier:
    .....
X509v3 Authority Key Identifier:
    .....
Certificate is to be certified until Dec 12 17:41:32 2016 GMT (365 days)
Sign the certificate? [y/n]:

```

10. Enter **Y** to sign the certificate.

Result: The below messages appear.

```
1 out of 1 certificate requests certified, commit? [y/n]
```

11. Enter **Y** to commit.

Result: The below messages appear.

```

Write out database with 1 new entries
Data Base Updated
[root@dshost CA]#

```

Install the certificates and enable SSL

To install the certificates and enable SSL:

1. Run 389-console.
2. Navigate to **Manage Certificates**.
3. Click **Install** to install the CA Public Cert.

4. Select **in this local file** radio button and click **Browse**.

5. Select: file: `/etc/pki/CA/certs/ca-cert.crt`.
6. Click **Next > Next > Next > Done**.
7. In the Server Console, enable SSL:
 - 7.1. Select the **Configuration** tab.

- 7.2. Configure the below options, and click **Save** and **OK**.
- 7.3. Set up the pin file for directory server restarts.

8. Restart **dirsrv** service.

Result: You are prompted for the certificate password which the pin.txt will fix)

Result: The below messages appear.

```
admin[root@dshost ~]# /etc/init.d/dirsrv start
Starting dirsrv:
dshost...Enter PIN for Internal (Software) Token: password@123
[ OK ]
```

9. Execute command:

vi /etc/dirsrv/slapd-ldap01/pin.txt

```
Internal (Software) Token:<plain text password>
[root@dshost ~]# cat /etc/dirsrv/slapd-dshost/pin.txt
Internal (Software) Token:password@123
[root@dshost ~]#
```

```
# chmod 400 /etc/dirsrv/slapd-ldap01/pin.txt
```

```
# service dirsrv restart (it should not ask for the cert password now)
```

```
[root@dshost ~]# /etc/init.d/dirsrv restart
Shutting down dirsrv:
dshost... [ OK ]
Starting dirsrv:
dshost... [ OK ]
[root@dshost ~]#
```

```
Set up Kerberos
Set up DNS
```

Kerberos requires a proper entry in the /etc/hosts file.

```
# vi /etc/hosts

# Make sure the fqdn is set up before any aliases
# Make sure only one entry exists for the public ip your using.
3.185.121.199 dshost dshost.project.com
```

10. Set up **ntpd**.

Servers require synced time for kerberos to work properly.

```
[root@dshost ~]# chkconfig --list ntpd
ntpd 0:off 1:off 2:off 3:off 4:off 5:off 6:off
[root@dshost ~]# crontab -l
# Sync Time with NTP Server using hostname.
1,16,31,46 * * * * /usr/sbin/ntpdate -u 3.185.120.21 >/dev/null
```

11. Edit the **krb5.conf** file and modify a few parameters to match your domain.

```
# vi /etc/krb5.conf

[logging]
default = FILE:/var/log/krb5libs.log
kdc = FILE:/var/log/krb5kdc.log
admin_server = FILE:/var/log/kadmind.log

[libdefaults]
default_realm = PROJECT.COM
dns_lookup_realm = false
dns_lookup_kdc = false
ticket_lifetime = 24h
renew_lifetime = 7d
forwardable = true

[realms]
PROJECT.COM = {
    kdc = kerberos.example.com
```

```

kdc = dshost.project.com
admin_server = dshost.project.com
}

[domain_realm]
.project.com = PROJECT.COM
project.com = PROJECT.COM

```

12. Install the server and set up the database and configure the basics.

```

# yum install krb5-server
You should have this package on our local dvd repository/ISO image.
[root@dshost ~]# rpm -qa | grep krb5-server
krb5-server-1.10.3-10.el6_4.6.x86_64
[root@dshost ~]#

[root@dshost ~]# kdb5_util create -r PROJECT.COM -s
Loading random data
Initializing database '/var/kerberos/krb5kdc/principal' for realm
'PROJECT.COM',
master key name 'K/M@PROJECT.COM'
You will be prompted for the database Master Password.
It is important that you NOT FORGET this password.
Enter KDC database master key: krb@123
Re-enter KDC database master key to verify: krb@123
[root@dshost ~]#

# vi /var/kerberos/krb5kdc/kdc.conf

[kdcdefaults]
kdc_ports = 88
kdc_tcp_ports = 88

[realms]

des-cbc-md5 added to keytab WRFILE:/etc/krb5.keytab.
kadmin.local: q
[root@dshost ~]#
```

Enable/Start The Service

```
#
[root@dshost ~]# chkconfig krb5kdc on
[root@dshost ~]# chkconfig kadmin on
[root@dshost ~]# service kadmin start
Starting Kerberos 5 Admin Server: [ OK ]
[root@dshost ~]# service krb5kdc start
Starting Kerberos 5 KDC: [ OK ]
[root@dshost ~]#
```

13. Set up 389-ds to use Kerberos.

This will require setting up an ldap principle, exporting the keytab and setting an environment variable for the 389-ds instance.

```
[root@dshost ~]# grep ldap /etc/passwd
ldapadmin:x:501:501::/home/ldapadmin:/bin/bash
[root@dshost ~]#

# kadmin.local
[root@dshost ~]# kadmin.local
Authenticating as principal root/admin@PROJECT.COM with password.
kadmin.local: add_principal -randkey ldapadmin/
dshost.project.com@PROJECT.COM
WARNING: no policy specified for ldapadmin/dshost.project.com@PROJECT.COM;
defaulting to no policy
Principal "ldapadmin/dshost.project.com@PROJECT.COM" created.

type arcfour-hmac added to keytab WRFILE:/etc/dirsrv/ds.keytab.
Entry for principal ldapadmin/dshost.project.com with kvno 2, encryption
type des-hmac-sha1 added to keytab WRFILE:/etc/dirsrv/ds.keytab.
Entry for principal ldapadmin/dshost.project.com with kvno 2, encryption
type des-cbc-md5 added to keytab WRFILE:/etc/dirsrv/ds.keytab.
kadmin.local: quit
[root@dshost ~]#

[root@dshost ~]# ls -l /etc/dirsrv/ds.keytab
-rw-----. 1 root root 484 Dec 14 15:20 /etc/dirsrv/ds.keytab
[root@dshost ~]# chown ldapadmin: /etc/dirsrv/ds.keytab
[root@dshost ~]# ls -l /etc/dirsrv/ds.keytab
```

```
-rw----- . 1 ldapadmin ldapadmin 484 Dec 14 15:20 /etc/dirsrv/ds.keytab
[root@dshost ~]# chmod 600 /etc/dirsrv/ds.keytab
[root@dshost ~]# ls -l /etc/dirsrv/ds.keytab
-rw----- . 1 ldapadmin ldapadmin 484 Dec 14 15:20 /etc/dirsrv/ds.keytab
[root@dshost ~]#
```

```
# vi /etc/sysconfig/dirsrv
KRB5_KTNAME=/etc/dirsrv/ds.keytab ; export KRB5_KTNAME
```

```
[root@dshost ~]# service dirsrv restart
Shutting down dirsrv:
dshost... [ OK ]
Starting dirsrv:
dshost... [ OK ]
[root@dshost ~]#
```

14. The 389-ds server needs a gssapi mapping from the kerberos user and realm to the ldap dn under the ou=People,dc=linuxrackers,dc=com container.

```
# 389-console -a http://localhost:9830
```

```
Drill down to:
-> project.com
-> dshost.project.com
-> Directory Server
-> Open
```

In the Server Console do the following to install the CA Public Cert:

```
-> Configuration(tab) -> SASL Mappings(subtab)
-> Add
-> Name: gssapi-map
-> Regular Expression: uid=(.*),cn=PROJECT.COM,cn=gssapi,cn=auth
-> Search Base DN: uid=\1,ou=People,dc=project,dc=com
-> Search Filter: (objectClass=*)
-> Ok -> Save
```

```
[root@dshost ~]# service dirsrv restart
Shutting down dirsrv:
dshost... [ OK ]
Starting dirsrv:
dshost... [ OK ]
[root@dshost ~]# service dirsrv-admin restart
Shutting down dirsrv-admin:
[ OK ]
Starting dirsrv-admin:
httpd.worker: Could not reliably determine the server's fully qualified
domain name, using dshost.project.com for ServerName
[ OK ]
```

Retrieving certificates for 389 DS server

Server certificate installed on 389 DS can be retrieved through winscp or any other tool.

1. Launch winscp software.
2. Open the terminal of Red hat linux operating system.
3. Copy the server certificate (.crt) from **/etc/pki/CA/certs** to computer hard disk.
4. Follow procedure in next chapter to upload this certificate in the MCP device.

Configuring the MCP devices for Centralized LDAP Authentication using 389 Directory Server

Chapter 2: Configure the LDAP on MCP

The Lightweight Directory Access Protocol (LDAP) is an application protocol for accessing and maintaining distributed directory information services over an Internet Protocol (IP) network. This Directory services may provide any organized set of records, often with a hierarchical structure.

This chapter describes how to install CA Certificates on the MCP device and configure LDAP on the MCP device.

See section:

- [Installing CA Certificates on the MCP device](#)
 - [CA Certificate transfer procedure from PC to MCP](#)
 - [CA Certificate Transfer to MCP by using DSAS Secure File Browser](#)
 - [CA Certificate transfer to MCP by using external Secured USB](#)
 - [CA Certificate Installation procedure](#)
 - [Import and Install CA certificate through Runtime DSAS](#)
 - [Import and Install CA certificate through Local HMI](#)
- [Configuring LDAP on the MCP device](#)
 - [Prerequisites to configuring LDAP on MCP device](#)
 - [Create an Emergency Administrator User](#)
 - [Retrieve LDAP Authentication Server information](#)
 - [Procedure to configure LDAP on the MCP device](#)

Installing CA Certificates on the MCP device

This section describes how to install the CA Certificate to the MCP device. There are two type of certificates you can create:

- Server certificate
- Client certificate

Files to be Created	- CA certificate to be installed in both the Client and Server. - Server Certificate to be installed in the Server for Server Authentication (This can be skipped if LDAP Server CS is used to create the CA Certificate).	
Files to be Transferred	MCP	MyCA.crt or MyCA.cer (LDAP Client)
	389 Directory Server	MyCA.crt or MyCA.cer servercert.p12 (LDAP Server)

CA Certificate transfer procedure from PC to MCP

You can import and install the CA certificate to MCP. This certificate can be transferred to MCP for installation, using either of the below two options:

1. CA Certificate Transfer to MCP by using DSAS Secure File Browser
2. CA Certificate transfer to MCP by using external Secured USB

CA Certificate Transfer to MCP by using DSAS Secure File Browser

1. Copy the files containing the CA certificate to the following MCP location: **/mnt/usr/SecureScadaTransfer**
 - This can be done using the DSAS Secure File Browser (SFTP file transfer program).
 - To launch DSAS Secure File Browser, click on: **Start>All programs>DS AgileStudio vX.0> Secure File Browser vX.0.**

- Secure File Browser screen will be launched as below:

- Click **Connect**.
- The Connection Details window will appear.
- Enter Host name: MCP IP, Protocol: SFTP, User name details and then click **Connect**.

- A Login window appears, enter the MCP User Name and click **Identify** tab.

- Once the User Name is identified with the MCP, a Login window appears and prompts for the Password.

Login

UNAUTHORIZED ACCESS TO THIS DEVICE IS PROHIBITED

You must have explicit permission to access or configure this device. All activities may be logged. Violations of policy governing this device may result in disciplinary action and may be reported to law enforcement. There is no right to privacy in accessing this device.

User Name:

Password:

- Enter the Password and click **Login** to access the MCP folders.
- Once your Login is successful, you can see the below Secure File Browser screen:

- In the Secure File Browser window, PC folders are displayed on the left side and the MCP folders are displayed on the right.
- On MCP side, navigate to folder **/mnt/usr/SecureScadaTransfer**

- Select the required certificate from the PC folder and click **Upload**. This will upload the files from PC to MCP.

NOTE

After completion of these steps, LDAP client certificate is transferred successfully to MCP and is ready for installation.

CA Certificate transfer to MCP by using external Secured USB

Once the LDAP client certificate (CA certificate) is created and available on the PC and you can transfer this CA certificate to MCP using USB as follows:

1. Create a directory in USB drive "**SecureScadaTransfer**".
2. Copy the CA certificate from PC to USB on a USB drive (LDAP Client certificate need to be available in USB at **/mnt/usb/SecureScadaTransfer**).
3. Insert the USB drive into any USB slot on the MCP device. E.g.: USB Port-1
4. Open Local HMI and login as administrator user.
5. Go to **Settings > Utilities** page in the local HMI and click on **Mount USB** option.

6. Now USB is mounted successfully to MCP and CA certificate is available at **/mnt/usb/usb1/SecureScadaTransfer**.

CA Certificate Installation procedure

Once the certificate is available in MCP by any of the transfer procedure mentioned in page 32 (Secure DSAS Browser or USB), it can be installed by using either of the below two interfaces:

- Import and Install CA certificate through Runtime DSAS
- Import and Install CA certificate through Local HMI

Import and Install CA certificate through Runtime DSAS

After certificate transfer to MCP at **/mnt/usb/SecureScadaTransfer/** or certificates can be installed to MCP using **DSAS > Utilities**. To proceed follow the below steps:

1. Open MCP Studio and click **Connect to MCP**.

2. Select Utilities tab, click on **Import**, to import the copied certificates.

3. Once the certificates are imported, a Certificate Import window appears which shows confirmation of import status. Click **OK**.

4. Once the certificates are imported successfully, click “**Manage**” to manage local certificates which display three tabs **Local**, **Issuer** and **CRL** as below:

5. Click on **Issuer** tab, select the Certificate and click **Install**.

6. Once the certificate is installed successfully, it is moved to the Installed Issuer Certificates section:

RESULT: This completes the Certification Installation process through DSAS Online HMI. You can use this certificate in LDAP Authentication.

Import and Install CA certificate through Local HMI

After the certificate is transferred to the MCP at `/mnt/usr/SecureScadaTransfer/` or `/mnt/usb/usb1/SecureScadaTransfer/` certificates can be installed to MCP using **Local HMI > Settings > Utilities**. To proceed follow the prescribed steps as below:

1. Open Local HMI and click **Settings** tab.

2. Click **Utilities** tab.

3. Click on **Import**, to import the copied certificates.

4. Once the certificates are imported, a Certificate Import window appears which shows confirmation of import status. Click **OK**.

5. Once the certificates are imported successfully, click **Manage** to manage local certificates which display three tabs Local, Issuer and CRL as below:

6. Click on **Issuer** tab, select the Certificate and click **Install**.

7. Once the certificate is installed successfully, it's moved to the Installed IssuerCertificates section:

RESULT: This completes the Certification Installation process through DSAS Online HMI. You can use this certificate in LDAP Authentication.

Configuring LDAP on the MCP device

This section describes the:

- Tasks performed prior to configuring the LDAP on the MCP device and
- The procedure to configure the LDAP on the MCP device.

Prerequisites to configuring LDAP on MCP device

Prior to configuring the LDAP on the MCP device it is mandatory to create emergency user in MCP. If user directly start LDAP configuration by using section Procedure to configure LDAP on the MCP device then user will get popup message that “Please add Emergency User before switching to LDAP/TACACS Authentication” and user will not be able to configure LDAP authentication without adding emergency users.

Create an Emergency Administrator User

This emergency user can be used when remote authentication server is not available and user is unable to access MCP using Remote Authentication. This emergency admin user is required to get access to the system in case of emergency, i.e. when LDAP server is not responsive / user forgets all credentials etc.

Emergency Users can be created by using any of the below two options:

- Using Web MCP Settings GUI
- Using the mcpconfig utility on MCP device through Secure Terminal Emulator

An emergency administrator user can login to MCP using any of the below three interfaces:

1. SSH session to MCP (Port-922)
2. Front serial port connection to MCP (Baud Rate- 115200)
3. MCP Emergency option in local console

Once user logs into MCP as Emergency Administrator user, executing “emergcfg” command shall provide options for user to perform the below two key functions:

- Change the mode authentication from remote to local mode.
- Generate emergency code to login to HMI without changing authentication from remote to local mode.

Below sections describes how to add emergency user in MCP by using any of these option step by step:

Using the mcpcfg utility on MCP device through Secure Terminal Emulator

1. To open Secure Terminal Emulator, select **Start > All Programs > DS Agile Studio vX.0 > Secure Terminal Emulator vX.0**

2. Click **Connect**. A pop-up window appears which shows Connections credentials.
3. Enter your MCP IP in Host name, Login name and Port 22 and click **Connect**.

4. A Login window appears, enter User Name and click **Identify**.

The image shows a 'Login' dialog box. It has a title bar 'Login'. Below it is a 'User Name' label followed by a text input field containing the text 'admin'. At the bottom of the dialog are two buttons: 'Identify' and 'Cancel'.

5. Once the User Name is identified with the MCP, a Login window appears to prompt for the Password. Enter the MCP password and click **Login**.

The image shows a 'Login' dialog box. It has a title bar 'Login'. Below it is a message: 'UNAUTHORIZED ACCESS TO THIS DEVICE IS PROHIBITED'. Below the message is a paragraph of text: 'You must have explicit permission to access or configure this device. All activities may be logged. Violations of policy governing this device may result in disciplinary action and may be reported to law enforcement. There is no right to privacy in accessing this device.' Below the text are two input fields: 'User Name' with 'admin' and 'Password' with '*****'. At the bottom are two buttons: 'Login' and 'Cancel'.

6. Once you login successfully, MCP Shell window appears:

```
GE Multilin MCP Firmware Release 110 Production Build 391 2020-01-01:04:41:24
admin@G500:~$
```

7. Type **sudo mcpcfg** and enter your Administrator User Name and Password if prompts.
8. The Gateway Settings Menu appears:

```
=====
Gateway Settings Menu
=====

0. Back
1. Configure Authentication
2. Configure Network Settings
3. Configure Network Interfaces
4. Configure Secure Access
5. Configure Firewall
6. Configure Host Names
7. Configure Time & Time Sync
8. Reset System Logs
9. Reset Database Tables
10. Reset File Persistence Data
11. Local HMI
12. Configure Sync Manager
13. Redundancy
14. ARRM
15. Suppress Forced Qualities To Masters
16. Emulate D20 RTU IEC101 DPA Unbalanced Mode Functionality
17. Configure IEC101+104 DPA Startup Quality Event Suppress Interva
18. Configure Serial Ports
19. Configure D.20 Port Settings
20. EdgeOS Host
21. Clear Chassis Intrusion State
```

9. Enter **1** to select **Configure Authentication** option and the below menu appears:

```

Gateway Settings Menu  Authentication
=====

Current AuthMode Status : Local

0.  Back
1.  Root Administrator Settings
2.  Pass-Through Password Authentication
3.  Administrator Group Users
4.  Emergency Group Users

Enter Your Choice : ( Between 0 and 4 ): █

```

10. Enter **4** to select **Emergency Group Users** to Add an Emergency Admin User.

```

Gateway Settings Menu
Authentication - Emergency Admin Group Users
=====

0.  Back
1.  List Users
2.  Add User
3.  Change Password
4.  Remove User

Enter Your Choice : ( Between 0 and 4 ): █

```

11. Enter **2** to Add User.

12. Enter the new emergency user name, full name, password and re-enter password.

```

Gateway Settings Menu
Emergency Group Users - Add user in Emergency group
=====

Enter user name : emadmin

Enter user's full name : Emergency Administrator

Enter the password for emadmin:
Re-enter the password : █

```

13. Type "Y" to confirm to the user.

```

Gateway Settings Menu
Emergency Group Users - Add user in Emergency group
=====

Enter user name : emadmin

Enter user's full name : Emergency Administrator

Enter the password for emadmin:
Re-enter the password :

You entered:
User Name      : emadmin
User Full Name : Emergency Administrator

Confirm that you want to add this user ? <Y/N> : █

```

14. Once user is added successfully, press **Enter**.

```
=====
Gateway Settings Menu
Emergency Group Users - Add user in Emergency group
=====

Enter user name : emadmin

Enter user's full name : Emergency Administrator

Enter the password for emadmin:
Re-enter the password :

You entered:
User Name      : emadmin
User Full Name : Emergency Administrator

Confirm that you want to add this user ? <Y/N> :      y

Successfully added user : emadmin

Press ENTER Key to continue....█
```

15. Navigate back to Emergency Group Users and enter **1** to view the List of EmergencyAdmin Group Users.

```
=====
Gateway Settings Menu
Authentication - Emergency Admin Group Users
=====

0.  Back
1.  List Users
2.  Add User
3.  Change Password
4.  Remove User

Enter Your Choice : ( Between 0 and 4 ) : █
```

16. The menu displays the list of Added Emergency Admin Users.

```
=====
Gateway Settings Menu
Emergency Group Users - List of users in Emergency group
=====

User Name      UID      Full Name
=====
1. emadmin      1005    Emergency Administrator

Press ENTER Key to continue....█
```

Using Web MCP Settings GUI

1. Login to MCP using local admin user authentication:
 - Entering their User Name.
 - Entering their Password.
 - Selecting Login to advance to the next screen and begin using the application.

- Once you have logged in to the MCP Settings, you can see a menu on the center and Logout option on the top right of the screen. To explore the MCP settings use the menu options shown on the home page:

Gateway Settings

Configure Authentication
Configure Network Settings
Configure Network Interfaces
Configure Secure Access
Configure Firewall
Configure Host Names
Configure Time & Time Sync
Reset System Logs
Reset Database Tables
Reset File Persistence Data
Local HMI
Configure Sync Manager
Redundancy
ARRM
Suppress Forced Qualities To Masters
Emulate D20 RTU IEC101 DPA Unbalanced Mode Functionality
Configure IEC101+104 DPA Startup Quality Event Suppress Interval
Configure Serial Ports
Configure D.20 Port Settings
EdgeOS Host
Clear Chassis Intrusion State
Restore Clone Snapshot
Restore Factory Default
Reboot Device

3. Select **Configure Authentication** from the main menu.

4. Click on **Emergency Group User** to add emergency User.

5. To add new emergency user click **Add User** tab.

6. Enter the desired Emergency Group Username, conforming to the emergency group username rules as listed below:
- Emergency Group Username must be between 2 and 31 characters.
 - Emergency Group Username must start with a lowercase alphabetical character.
 - Emergency Group Username must only contain [a-z][0-9][-,_] characters.

7. Enter the Full Name of the emergency group user.
8. Enter the Password, conforming to the password security rules as listed below:
 - Password must be between 8 and 199 characters in length
 - Password must contain:
 - 1 character from [a-z]
 - 1 character from [A-Z]
 - 1 digit from [0-9]
 - 1 special character from the set [\$%@!&]
 - Re-enter password and click Confirm.

RESULT: Pop-up window appears showing the Operation Status: **New user successfully added**, click **OK**.

Retrieve LDAP Authentication Server information

Retrieve the following LDAP authentication server information from the IT / Network team of your organization or company:

Name	Locate on LDAP Server
Primary Host Name	1. It is full name of your computer (LDAP Server). 2. Open properties of computer or server and view the Full Name of Computer
Primary Host IP Address	Open Server Manager in LDAP server and click on AD DS and note down the IP address of server.
Secondary Host Name	This is an optional field. It is full name of your secondary computer (LDAP Server). Open properties of computer or server and view the Full Name of Computer. If the Secondary LDAP Server is configured, MCP shall automatically switch to the secondary server when the primary server is not available.
Secondary Host IP Address	This is an optional field. Open Server Manager in secondary LDAP server and click on AD DS and note down the IP address of server.
LDAP Port	LDAP communication mechanism is TLS/SSL. Port-number = 389 for TLS communication Port-number = 636 for SSL communication

Name	Locate on LDAP Server
Base DN	1. It is Domain Name 2. Open properties of computer or server and view the Domain 3. If Domain is GE.local then Base DN will be "dc=GE,DC=LOCAL"
Bind User Name	Username of the bind user created in the LDAP server. Assume the user name to login LDAP machine or server is "ldapbind" and dc name is "GE" and dc type is "local" then the bind user name will be (in DN format) "cn=ldapbind,cn=Users,dc=GE,dc=local"
Bind Password	Password for the Bind User
Security Type	LDAP communication mechanism is TLS/SSL. Port-number = 389 for TLS communication Port-number = 636 for SSL communication
CA Certificate	Selected the imported CA certificate from the drop-down list.
Bind Time limit in Seconds	Use 30 as default value
User ID Attribute Map	User can use the default value "sAMAccountName"
Home Directory AttributeMap	User can use the default value "unixHomeDirectory"

Procedure to configure LDAP on the MCP device

You can configure or change the authentication to LDAP Authentication mode by using HMI. In above section [Retrieve LDAP Authentication Server information](#), we already had collected all the parameters that will be used here for configuration: To configure the LDAP in the MCP device:

1. Login in to MCP HMI with an administrator user name and password.
2. Go to **Settings > Access > Authentication** and select **LDAP server** from the **Authentication Mode** drop-down menu.

3. On selecting the LDAP Server authentication, LDAP configuration page will be opened as below:

Name	Value
Primary Host Name(*)	
Primary Host IP Address(*)	
Secondary Host Name	
Secondary Host IP Address	
LDAP Port(*)	389
Base DN(*)	
Bind Username(*)	
Bind Password(*)	
Security Type	TLS
CA Certificate(*)	
Bind Timelimit in seconds	30
USER ID Attribute Map	
Home Directory Attribute Map	

4. Input all the LDAP parameters we already had noted in the above section of this document. Follow the below table as an example to find all the parameter from LDAP server:

Name	Value	Locate on LDAP Server
Primary Host Name	GEServer.GE.local	1. It is full name of your computer (LDAP Server). 2. Open properties of computer or server and view the Full Name of Computer
Primary Host IP Address	172.12.235.77	Open Server Manager in LDAP server and click on AD DS and note down the IP address of server.
LDAP Port	389	LDAP communication mechanism is TLS/SSL. – Port-number = 389 for TLScommunication – Port-number = 636 for SSL communication

Name	Value	Locate on LDAP Server
Base DN	dc=GE,dc=local	1. It is Domain Name 2. Open properties of computer or server and view the Domain 3. If Domain is GE.local then Base DN will be "dc=GE,DC=LOCAL"
Bind User Name	cn=ldapbind,cn=Users,dc=GE,dc=local	Assume the user name to login LDAP machine or server is "ldapbind" and dc name is "GE" and dc type is "local" then the bind user name will be (in DN format) "cn=ldapbind,cn=Users,dc=GE,dc=local"
Bind Password	Password	Enter the bind user password. (This is the password created for the Bind user in the LDAP Server in the earlier steps).
Security Type	TLS	LDAP communication mechanism is TLS/SSL. – Port-number = 389 for TLS communication – Port-number = 636 for SSL communication
CA Certificate	Certificate installed earlier	Select the INSTALLED CERTIFICATE appear on dropdown list.
Bind Time limit in Seconds	30	Default Value
User ID Attribute Map	sAMAccountName	sAMAccountName is default value User can find it in user attribute tab in user properties of user in LDAP server
Home Directory Attribute Map	unixHomeDirectory	1. unixHomeDirectory is default value 2. User can find it in user attribute tab in user properties of user

5. Configure these LDAP parameters as shown below. Also, go to the drop-down menu of CA certificate and select the CA certificate for LDAP.

The screenshot shows the G500 configuration interface for LDAP authentication. The 'Authentication' tab is selected, and the 'Authentication Mode' is set to 'LDAP Server'. The 'Basic' sub-tab is active, displaying a table of LDAP parameters. The table has two columns: 'Name' and 'Value'.

Name	Value
Primary Host Name(*)	GEServer.GE.local
Primary Host IP Address(*)	172.12.235.77
Secondary Host Name	
Secondary Host IP Address	
LDAP Port(*)	389
Base DN(*)	dc=GE,dc=local
Bind Username(*)	cn=ldapbind,cn=Users,dc=GE,dc=local
Bind Password(*)	*****
Security Type	TLS
CA Certificate(*)	CN = GE-GESERVER-CA
Bind Timelimit in seconds	30
USER ID Attribute Map	sAMAccountName
Home Directory Attribute Map	unixHomeDirectory

6. Click the **Test** button. It will validate the configuration and availability of LDAP server once the configuration verified, Testing Passed message will be popup. Click **OK**.

Result : The server connectivity is verified.

7. If user had input wrong parameter for any of the field and click on test button then it will popup message as “Testing Failed” as below:

NOTE: Do not select the Enabled field.

8. Click on Save, it will save the configuration parameters, but still the authentication mode is local.
9. Till the above step LDAP configuration has been saved and tested successfully but still the authentication mode is Local. If user want to work with:
 - 9.1. If user want to work with Static mode of group mapping, then group mapping is not required in MCP. In this case user can directly enable and save the configuration as described in next steps. Static mode of group mapping is described in section [Procedure for Static Group Mapping](#).
 - 9.2. If user want to work with Dynamic mode of group mapping, then group mapping needs to be done in MCP. Map the group in MCP by following the [Procedure for Dynamic Group Mapping](#). After mapping all the groups in MCP proceed with next step.
10. Procedure to Configure Group Mapping on the MCP Device, if user want to work with dynamic user mapping approach then Group Mapping need to be done in MCP. Follow the below steps for Group Mapping in MCP. If you want to continue with static group mapping, skip the below steps from 8.1 to 8.8 and move to step 9:
 - 10.1. [Procedure for Dynamic Group Mapping](#). It has been noted in an earlier example that the Distinguished Name (DN) of group “G500Administrator” is as “cn=G500Administrator,cn=users,dc=GE,dc=local”.
 - 10.2. Login in to MCP HMI with an administrator user name and password.

10.3. Go to **Settings > Access > Authentication** and select **LDAP server** from the **Authentication Mode** drop-down menu.

10.4. On selecting the LDAP Server authentication, LDAP configuration page will be opened as below:

- 10.5. Click on “**Group Map**” tab. Select the **Device Role** of Group from drop down and input the **DN** in Group Map field as shown in below (DN has been noted in step 8.3):

- 10.6. Click on “**Add**” button, it will add the group in MCP and that group members or users will be privileged with the selected Device Role. For example if User role is selected as Administrator for “**G500Administrator**” user group then users under G500Administrator group will have administrator privilege.

- 10.7. Similarly add different User groups like G500Operator for Operator privilege, G500Observer for Observer privilege, G500Supervisor for Supervisor privilege, G500Passthrough for Passthrough privilege.
- 10.8. After adding the user group click on Save to save the configuration.
RESULT: Group Mapping has been done successfully.
11. **Select the Enabled field and Save**, This step should be done only after completion of Static/ Dynamic Group Mapping it will save this configuration parameters and forcefully logout the HMI for local user and LDAP authentication will be enabled for MCP. Now user can login to MCP by using only LDAP authentication.
NOTE: Select the Enabled field and Save, this will switch to Remote Authentication mode.

WARNING: Save with Enabled checked will switch to Remote Authentication immediately!

12. This warning is for the static user should be available to login MCP, click **OK** then again it will popup message to logout HMI for local user. Click **Yes** to proceed:

Result: Now LDAP Authentication mode is successfully enabled, user is required to use LDAP credentials, for login to HMI, DSAS and SSH sessions to MCP.

Configuring the MCP devices for Centralized LDAP Authentication using 389 Directory Server

Appendix A: Troubleshooting

If you encounter issues while testing the operation of the LDAP server configuration, refer to the following listed errors and the recommended responses. When you click the Test Button, if a particular field is configured improperly, the corresponding message appears on the HMI.

The exact error messages may refer to MCP, G500 or G100 – the meaning is identical.

See sections:

- [LDAP error messages](#)
- [LDAP Certificate error messages](#)

LDAP error messages

Error Message	Response
Host not reachable	Ensure LDAP server was accessible in the network. Ensure LDAP server was not shutdown.
unable to access ldap port	Ensure LDAP server was using the specified port for LDAP protocol communication.
Invalid bind dn	Ensure mentioned bind user dn (distinguished name) was available in the mentioned domain on the LDAP server.
Invalid bind user credentials	Ensure bind user dn (distinguished name) mentioned in the MCP device LDAP server configuration was correct. Ensure bind user password entered was correct in the MCP device LDAP server configuration.
Hostname mismatch with server certificate	Ensure LDAP server host name entered in the MCP device LDAP server configuration was matching with the LDAP server certificate subject name.
Server/Port not accessible	Ensure LDAP server was accessible in the network. Ensure LDAP server was not shutdown. Ensure LDAP server was using the specified port for LDAP protocol communication.
Invalid Host Name. Full Qualified Domain Name (FQDN) has invalid characters	Ensure Primary Host Name is configured in MCP device LDAP server configuration.

Error Message	Response
Invalid Host IP Address	Ensure Primary Host IP Address configured in MCP device LDAP serverconfiguration is correct.
Failed to connect toPrimary Host	Ensure LDAP Server is accessible in the network.
	Ensure Primary Host Name configured in MCP device LDAP serverconfiguration is correct.
	Ensure Base DN configured in MCP device LDAP server configuration iscorrect.
	Ensure Bind User credentials (Bind Username and Bind Password)configured in MCP device LDAP server configuration are correct.
Primary Server :Server/Port not accessible	Ensure LDAP Server is not shutdown.
	Ensure Primary Host IP Address configured in MCP device LDAP serverconfiguration is correct.
Configuration Timeout,please try again later	Ensure LDAP server was using the specified port for LDAP protocol communication.
Invalid User ID AttributeMap	Ensure User ID Attribute Map defined in LDAP Server is configured inMCP device LDAP server configuration.
Invalid HomeDirectory Attribute Map	Ensure HomeDirectory Attribute Map defined in LDAP server is configured in MCP device LDAP server configuration.
Connected to secondary Host, but failed to connectto primary Host	Ensure Primary Host Name and Primary Host IP Address configured inMCP device LDAP server configuration are correct.
Failed to connect to bothprimary and secondary Hosts	Ensure Primary Host Name and Secondary Host Name configured inMCP device LDAP server configuration are correct.
	Ensure Primary Host IP Address and Secondary Host IP Addressconfigured in MCP device LDAP server configuration are correct.
	Ensure Base DN configured in MCP device LDAP server configuration iscorrect.
	Ensure Bind User credentials (Bind Username and Bind Password)configured in MCP device LDAP server configuration are correct.
Please add Emergency User before switching to LDAP/TACACS Authentication	Ensure at least one emergency admin group user is configured beforeswitching to LDAP/TACACS Authentication.
The current AuthenticationMode has been enabled. You cannot disable it unless switching to a different Authentication Mode	Current Authentication Mode is LDAP. Ensure to disable (Enabled checkbox unchecked) only when switching to a Authentication Mode other than LDAP.

LDAP Certificate error messages

Error Message	Response
List of trusted certificates is not complete	The issuer certificate of a looked up certificate could not be found. This normally means the list of trusted certificates installed on the MCP device or certificate list from LDAP server was not complete.
Unable to decrypt certificate's signature	The certificate signature could not be decrypted. This means that the actual signature value could not be determined rather than it not matching the expected value, this is only meaningful for RSA keys.
unable to decode issuer public key	The public key in the certificate SubjectPublicKeyInfo of MCP deviceserver could not be read.
certificate signature failure	The signature of the installed certificate on MCP device server certificatewas invalid.

Error Message	Response
certificate is not yet valid	MCP device time might be backward w.r.to certificate valid time.
	The certificate is not yet valid: the not Before date is after the currenttime.
certificate has expired	CA certificate installed on MCP device got expired w.r.to LDAP server.
	MCP device time might be forward w.r.to certificate valid time.
	The certificate has expired: that is the notAfter date is before the currenttime.
format error in certificate's notBefore field	The certificate notBefore field contains an invalid time.
format error in certificate's notAfter field	The certificate notAfter field contains an invalid time.
Self-signed certificate cannot be found in the list of trusted certificates.	The passed certificate is self-signed and the same certificate cannot be found in the list of trusted certificates.
self-signed certificate in certificate chain	Ensure Installed a trusted CA signed primary SSL certificate and an intermediate certificate.
	Verify that the Root CA is not included in the certificate chain (as this is almost always self-signed).
unable to get local issuer certificate	This error code is thrown when a local certificate path is not found during the certificate check.
	LDAP server certificate's issuer certificate was not found, after looking in both the chain provided by the LDAP server and in the local trusted storage. This usually means the peer chain was missing or incomplete.
unable to verify the first certificate	The primary certificate (the one you purchase from a vendor) cannot establish the chain of trust between itself and the Root certificate stored locally. Usually installing the intermediate certificates fixes this.
certificate chain too long	The certificate chain length is greater than the supplied maximum depth.
	The LDAP server certificate's chain length exceeded the limit set locally by sslverifydepth or SSL Verify Depth. The chain length (depth) is the number of certificates beyond the leaf (client or server) certificate itself.
	a chain of length 1 is a leaf certificate plus its issuer certificate.
invalid CA certificate	A CA certificate is invalid. Either it is not a CA or its extensions are not consistent with the supplied purpose.
path length constraint exceeded	The basicConstraints path length parameter has been exceeded for certificate.
invalid or inconsistent certificate extension	invalid or inconsistent certificate extension
Hostname mismatch	Ensure LDAP server host name entered in the MCP device LDAP server configuration was matching with the LDAP server certificate subject name.
Certificate directory empty	No certificates installed over to the MCP device.

Configuring the MCP devices for Centralized LDAP Authentication using 389 Directory Server

Appendix B: List of Acronyms

Acronym Definitions

This Appendix lists and defines the acronyms used in this manual.

Table 1: Acronym list

Acronym	Definition
CS	Certificate Services
DS	Domain Services
CA	Certificate Authority
MCP	MCP Substation Gateway
mcpcfg	Local configuration utility
DN	Domain Name
DNS	Domain Name System
FQDN	Full Qualified Domain Name
GE	General Electric
HMI	Human Machine Interface (also called Graphical User Interface – GUI)
IP	Internet Protocol
IT	Information Technology
LDAP	Lightweight Directory Access Protocol
NIS	Network Information Service
NTDS	TechNet Directory Services
PC	Personal Computer
PEM	Privacy Enhanced Mail
PKCS	Public-Key Cryptography Standards, published by RSA Laboratories
SCADA	Supervisory Control and Data Acquisition
SCP	Session Control Protocol
SFTP	Secure File Transfer Protocol
SHA	Secure Hash Algorithm

Acronym	Definition
SSL	Secure Sockets Layer
TLS	Transport Layer Security
USB	Universal Serial Bus
XCA	X Certificate and Key management

Configuring the MCP devices for Centralized LDAP Authentication using 389 Directory Server

Appendix C: Revision History

This appendix provides the document revision history.

Revision History

Version	Revision	Date	Change Description
1.00	0	27 th April, 2020	Initial release.
2.00	0	26 th April, 2021	Updated for MCP family.
	1	30 th August, 2022	Added a note under About this Document > Purpose .
	2	15 th May, 2025	GE Vernova Logo is added on the first page. Updated Company name, Copyright Notice and Trademark Notice. Updated GE Vernova email addresses and phone numbers in Contact Technical Support section.
	3	23 rd July, 2025	Updated to GE Vernova style.

About this Document

Purpose

This document describes the MCP IEC 61850 Server Functionality and provides guidelines on how to enable and configure the IEC 61850 Server.

This document applies to:

MCP v3.00, v3.10 or v4.00 when used in conjunction with IEC 61850 Server.

This document is a supplement to the Additional Documentation listed below, and assumes the reader has collateral knowledge from the Additional Documentation.

Throughout this document the term “legacy” refers to “non-IEC 61850”.

Screen captures may show G100 or G500 in some areas, or indicate only v3.00, however the workflow applies to products in the MCP family (G100/G500), unless otherwise indicated.

Screen captures may show different specific version numbers, however the workflow and instructions remain valid and same.

Intended Audience

This document is targeted for End Users, Projects and System Integrators personnel responsible to configure IEC 61850 Server in **MCP v3.00, v3.10 or v4.00**.

A strong understanding of IEC 61850 data modelling is required.

Prerequisites

1. Computer having Windows 10x64 operating system
2. DS Agile Studio v3.00 or newer
3. IEC 61850 Server CID Tool
4. DSAS MCP package v3.00, v3.10 or v4.00
5. MCP Firmware Version v3.00, v3.10 or v4.00
6. IEC 61850 Server Product License for MCP firmware v3.00, v3.10 or v4.00 (SGA0088)

Additional Documentation

For further information about the MCP family (G100/G500) refer to the latest versions of the following documents:

- G100 Substation Gateway Instruction Manual (994-0155)
- G500 Substation Gateway Instruction Manual (994-0152)
- MCP Software Configuration Guide (SWM0101)
- MCP HMI Online Help
- DS Agile MCP Studio Online Help
- G100 Quick Start Guide (SWM0116)
- G500 Quick Start Guide (SWM0106)
- Configuring UEFI Settings on G100 User Guide (SWM0122)
- Configuring UEFI Settings on G500 User Guide (SWM0110)
- Configuring UEFI Settings on G500 with Intel Hardware User Guide (SWM0125)

Product Support

Full Support

If you need help with any other module or aspect of your GE Vernova Grid Solutions product, you can:

- Access the GE Vernova Grid Solutions Web site
- Search the GE Vernova Grid Solutions Technical Support library
- Contact Technical Support

Access GE Vernova Grid Solutions Web Site

The GE Vernova Grid Solutions Web site provides fast access to technical information, such as manuals, release notes and knowledge base topics.

Visit us on the Web at: <https://www.gevernova.com/grid-solutions/>

Search GE Vernova Grid Solutions Technical Support Library

This site serves as a document repository for post-sales requests. To get access to the Technical Support Web site visit us on the Web at: <https://www.gevernova.com/grid-solutions/events/signup.asp?sid=208>

Contact Technical Support

For help with any aspect of your GE Vernova Grid Solutions product, please contact our support team, 24/7, as follows:

1. Overview

1.1 Product Perspective

The IEC 61850 MMS Server provides an interface to one or more clients using the IEC 61850 MMS communications protocol suite.

It can function as several distinct IEC 61850 Server Instances. Each instance is called a Logical Remote Unit (LRU) and appears as a single IEC 61850 Server Access Point and Physical Device Name to any IEC 61850 client host communicating with it.

Note: The IEC 61850 Server can be configured using only the Offline Editor on DS Agile (MCP) Studio.

1.2 Product Functions

The MCP IEC 61850 MMS Server supports the following functions:

- Multiple server instantiation (multiple LRU), with only one server instance per Ethernet LAN interface
- Communication using IEC 61850 MMS protocol with multiple clients (up to 8 for each LRU)
- Support for IEC 61850 data models as specified in IEC 61850-7-4:2007 & IEC 61850-7-3:2007
- Support for Buffered and Un-buffered Report Control Blocks (BRCB, URCB)
- Accumulator freeze processing
- Control Model: Direct with Normal Security or SBO with Normal Security
- MCP deployment as Single or Warm-Standby or Hot-Hot redundancy
- IEC 61850 Server is NOT supported in v3.00 for Hot-Standby redundancy, use instead Hot-Hot mode.

When configuring MCP IEC 61850 server – DS Agile MCP Studio and the CID Tool support the following functions:

- Custom assignment of object references to define the IEC 61850 Model for legacy data, directly in the legacy communication protocols client maps
- Automatic assignment of IEC 61850 object references to database pseudo-points
- Automatic use of IEC 61850 Model from IEDs configured with IEC 61850 MMS communications (configured using Loader)
- Automatic addition of mandatory data objects specified in IEC 61850-7-4:2007
- Automatic generation of datasets, buffered and unbuffered report control blocks based on pre-defined rules

1.2.1 IEC 61850 Server in Warm-Standby Redundant Mode

In warm-standby mode the IEC 61850 Server is active and accepts connections only in the MCP Active unit.

The IEC 61850 Client communicating with the MCP will only talk to one MCP unit at a time, that being the Active one.

There are no special requirements for the IEC 61850 Client.

The failover / switchover time will be similar to a power-on sequence and will be associated with the time it takes the IEC 61850 Server to finish initialization in the standby unit when it becomes active.

There will be re-initialization data events generated when MCP fails / switch over (i.e. is not bumpless).

In this mode the IP address of the IEC 61850 Server must be configured as one of the Active IP address(es).

In the IEC 61850 Server:

LD0/LPHD1.RedSt = True indicates the Device is "Active"

In Standby unit IEC 61850 Server doesn't run so False state will not occur.

1.2.2 IEC 61850 Server in Hot-Hot Redundant Mode

In hot-hot redundant mode the IEC 61850 Server can be configured in two different operational modes:

1.2.2.1 Hot-Hot Communication (hot-hot checkbox is selected)

In this mode the IEC 61850 Server is active and accepts connections in both MCP A and B devices.

It is up to the IEC 61850 Client to determine which IEC 61850 Server will be selected and used. This is referred to as "IEC 61850 Client Control Redundancy", where Client shall decide the 'Active' and 'Standby' MCP based on 'RedSt' data from both MCP devices.

There will be bumpless data transfer when MCP fails / switch over.

In this mode non-active IP address of each MCP (IP Address A and IP Address B) are used to configure the IP Address of the IEC 61850 Server.

In the IEC 61850 Server:

LD0/LPHD1.RedSt = True indicates the Device is "Active"

LD0/LPHD1.RedSt = False indicates the Device is "Standby"

Control operations shall be done only on 'Active' MCP.

1.2.2.2 Warm- Standby Communication (hot-hot checkbox is not selected)

In this mode the IEC 61850 Server is active and operates same as in Warm-Standby Redundant Mode.

1.3 High Level Workflow

The high-level workflow steps to configure and run the IEC 61850 MMS Server are:

1. Request a license and enable IEC 61850 Server in MCP Firmware v3.00, v3.10 or v4.00
2. Use a MCP v3.00, v3.10 or v4.00 device in the DS Agile Studio project
3. If this is a device upgraded from a previous version of D400/MCP – click on the button “*Upgrade to Edition 2*” to set the IEC 61850 schema to Ed.2 (in the Project page, with the device selected). This is required for IEC 61850 Server configuration. The MCP will continue to communicate with the previously configured IEC 61850 IEDs, even if they were Ed.1

4. Enable IEC 61850 Server in Device Properties
5. Open Offline Editor for this device

6. Instantiate required IEC 61850 IED Connections and map associated data using Loader
7. Instantiate required Legacy Connections and map associated legacy data using Offline Editor
8. Associate IEC 61850 Object References to legacy data as required, in the Client Maps
9. Finalize all Automation applications configurations
10. Finalize all Legacy Server connections and configurations
11. Instantiate required IEC 61850 Server connections and create the corresponding CID file for each instance
12. Save offline editor session
13. Synch to device
14. Use the IID file to configure the other IEC 61850 Clients as needed

Note: MCP v3.00, v3.10 or v4.00 and DS Agile Studio v3.00 or later do not support the IEC 61850 system tool workflow where the SCD file created by the system tool is used to update the MCP IEC 61850 Server configuration with communication configuration (e.g., IED name and communication addresses) and data flow configuration (e.g., control blocks and data sets).

1.4 CID Tool

Please note:

- The CID Tool requires the Anaconda framework to run.
- GE Vernova cannot re-distribute the Anaconda Distribution Package; this must be obtained and installed directly by end user.
- Even if the Anaconda Distribution Package is downloaded separately – step 11 requires online Internet availability for a one time setup, after which online Internet access is not required anymore.
- It is strongly recommended that only users authorized as administrator or supervisor on the MCP should be permitted to use the CID_Tool in a production environment. This means there should be controls in place to enforce user authentication and authorization on the computer / engineering workstation on which the CID_Tool is installed.
- The "cid_tool" environment created in the installation instructions has a specific version of python only for the purposes of running the CID_Tool. It is not recommended to use the "cid_tool" environment for general purposes. The base environment should be used for general purposes as it has the latest version of python.

1.4.1 CID Tool Installation

The CID Tool is provided by GE Vernova and can be obtained using DSAS MCP Studio “Updates” utility:

Steps required to be performed by an *Administrator*:

1. Download the IEC 61850 Server CID Tool installer provided by GE, and save it to any location in your computer. The installer file name is in the form of:

`SetupCIDTool_vx.y.z.n.exe`

where x.y.z are the version of the tool, **x** being the major version and **n** is the signed build for the exe file.

After installation, in the CID_Tool folder, the file “Tool_Version.txt” shows the installed version in form of **x.y.z** digits (**n** is not shown).

In this document we will refer to the versions of the CID Tool only by **x.y.z** numbers (**n** is only associated with the exe file build).

The associations of CID Tool Versions with MCP Versions are below:

- MCP v2.70 requires CID Tool v5.*
- MCP v2.80 requires CID Tool v6.*
- MCP v3.00, v3.10, v4.00 or v4.10 requires CID Tool v8.*
- MCP v5.00, v5.10 requires CID Tool v9.*

Ensure you use the correct major version of the CID Tool, according to the MCP Version you have. More than one CID Tool major version can be installed in same computer.

2. Run the installer and follow the prompts.
 - The CID Tool v5.* is deployed as a full Python ZIP file, to be extracted by user in any folder, and doesn't require Anaconda framework to run, this is an internal GE Vernova restricted distribution version.
 - The CID Tool v6.* is deployed in the folder: C:\CID_Tool
 - The CID Tool v8.* is deployed in the folder: C:\CID_Tool_v8
 - The CID Tool v9.* is deployed in the folder: C:\CID_Tool_v9

The target folder cannot be changed during installation.

If you need to have both CID Tool versions 5.* and 6.* in same computer – install v5 first, rename the folder to be: C:\CID_Tool_v5

and then install v6 and rename the folder to be: C:\CID_Tool_v6

1.4.2 Anaconda Installation

Steps required to be performed by an *Administrator*:

1. Proceed to install the Anaconda Distribution Package, download it from here:

<https://www.anaconda.com/products/distribution>

(No need to sign up for Jupyter Notebook when prompted. If your organization has a commercial agreement with (Data Science) Anaconda for Anaconda version 3.9 or higher, then use the package version approved by that agreement instead of the latest package version available on the Internet. For example, if your organization has a package called Data Science Anaconda 3.9.7, then use that package rather than the latest package available on the Internet.)

Result: package file is downloaded, exact versions may be different, e.g.:

"Anaconda3-2022.05-Windows-x86_64.exe"

2. Install the downloaded package following these screen shots:

3. Read, Review and Accept the EULA between yourself and Anaconda:

Note: It may take a long time to complete the installation (10-15 minutes, depending on the computer environment).

Click "Next" when completed.

4. Uncheck boxes:

1.4.3 CID Tool Environment setup

Steps required to be performed by an *Administrator*, once for each CID Tool major version:

1. From Windows Start Menu:

Start the Anaconda Powershell Prompt (Anaconda3)

2. Change directory to the CID_Tool folder, for e.g.:

```
cd C:\CID_Tool
```

 A screenshot of the Anaconda Powershell Prompt window. The title bar reads 'Select Anaconda Powershell Prompt (Anaconda3)'. The command prompt shows the following sequence of commands and output:

```
(base) PS C:\Users\admin> cd C:\CID_Tool\
(base) PS C:\CID_Tool> ls
```

 The output of the 'ls' command is a directory listing for 'C:\CID_Tool':

Mode	LastWriteTime	Length	Name
d----	5/30/2022 2:06 PM		Generated_Config
d----	5/30/2022 2:06 PM		Input_File
-a----	5/31/2022 7:25 AM	293669	CID_Tool.py
-a----	5/30/2022 4:22 AM	11340	cid_tool_environment.yml
-a----	5/26/2022 1:57 AM	523	Tool_Version.txt

 The prompt ends with '(base) PS C:\CID_Tool> _' and a cursor.

3. Next is the environment setup, an Internet connection is required for next step.
4. If your network uses a proxy server to access the Internet, set the proxy environment variables as follows, where <PITC-Zscaler-Global-ZEN.proxy.corporate.ge.com:80> is an example that should be replaced with your company's proxy.

```
conda config --set proxy_servers.http http://PITC-Zscaler-Global-ZEN.proxy.corporate.ge.com:80
```

```
conda config --set proxy_servers.https http://PITC-Zscaler-Global-ZEN.proxy.corporate.ge.com:80
```

5. Type the following in the Anaconda powershell:

```
conda env create -f cid_tool_environment.yml
```

6. Accept all the elevated rights requests:

Note: It may take a long time to complete the environment setup (10-15 minutes, depending on the Internet speed and computer environment).

7. At the conclusion of the environment setup, you should see this message if successful:

 A screenshot of an "Anaconda PowerShell Prompt (Anaconda3)" window. The terminal shows the following output:

```

rtree-0.9.7 | 49 KB | ##### | 100%
intervaltree-3.1.0 | 26 KB | ##### | 100%
Preparing transaction: done
Verifying transaction: done
Executing transaction: done
#
# To activate this environment, use
#
#   $ conda activate cid_tool
#
# To deactivate an active environment, use
#
#   $ conda deactivate
(base) PS C:\CID_Tool>
  
```

```

#
# To activate this environment, use
#
#   $ conda activate cid_tool
#
# To deactivate an active environment, use
#
#   $ conda deactivate
  
```

8. Type the following command:

```
conda activate cid_tool
```

 A screenshot of the Anaconda PowerShell Prompt showing the command being entered. The prompt is "(base) PS C:\CID_Tool>". The command "conda activate cid_tool" is typed in yellow. The prompt changes to "(cid_tool) PS C:\CID_Tool>".

9. Associate shortcut with CID Tool folder

Open Windows Start Menu and find the shortcut for “Anaconda Powershell Prompt (cid_tool)”. Right click on it and Open File Location:

Right click and select Properties:

Set the Start In value to the full path of the CID Tool folder:

Click Apply and accept the elevated rights prompt with Continue:

Click OK to close the shortcut properties.

Close all open windows.

If more than one major version of the CID Tool is installed – repeat all steps 1-9 for each CID Tool folder, replacing for e.g. C:\CID_Tool with C:\CID_Tool_v8

Note:

- If you are upgrading CID Tool v8.* from a version prior to 8.2.6, you will need to run the following command one time only in the Anaconda Powershell Prompt immediately after installing the new version:

```
conda env update --file cid_tool_environment.yml
```

- If you have any version prior to v9 installed, you will need to run the following commands one time only in the Anaconda PowerShell Prompt immediately after installing any version in the v9.* series:

```
conda env update --file cid_tool_environment.yml
```

```
conda activate cid_tool_v9
```

Your computer is now set to run the CID Tool.

There is no requirement for an Internet connection from now on.

1.4.4 CID Tool run

To run the CID Tool, launch first the Anaconda environment from Windows Start Menu > Anaconda Powershell Prompt (cid_tool version you need) :

CID Tool v6.* should have:

CID Tool v8.* should have:

A screenshot of a PowerShell window titled "Anaconda CID_Tool_v8". The prompt is "(cid_tool_v8) PS C:\CID_Tool_v8>".

```
Anaconda CID_Tool_v8
(cid_tool_v8) PS C:\CID_Tool_v8>
```

Use the following command in the open window:

`python .\CID_Tool.py`

A screenshot of a PowerShell window titled "Anaconda Powershell Prompt (cid_tool)". The prompt is "(cid_tool) PS C:\CID_Tool>". The command "python .\CID_Tool.py" is entered and highlighted in yellow.

```
Anaconda Powershell Prompt (cid_tool)
(cid_tool) PS C:\CID_Tool> python .\CID_Tool.py
```

2. MCP IEC 61850 MMS Server Model

The MCP IEC 61850 MMS Server presents an IEC 61850 model to clients for monitoring and control of a substation. It is organized in a hierarchy composed of Logical Device (LD), Logical Node (LN), Data Object (DO) and Data Attribute (DA). The model also includes Datasets and Report Control Blocks (RCB). Datasets contain a collection of Data Objects. The reporting of Datasets to clients is controlled by RCBs.

2.1 Background Summary

This section provides a background summary of the IEC 61850 modelling. IEC 61850 experienced users can skip over this.

The Abstract Communications Service Interface (ACSI) is defined in 61850-7/IEC 61850-7-2, 61850-7-3, and 61850-7-4. A fundamental component of ACSI is its information model, which defines the ACSI names of signals, and attaches a "semantic" to name parts. A semantic is a usually brief description of what the named item represents.

For instance, the name part "stVal" has the defined semantic "Status value of the data". The figure shows the information model that organizes the native device signals.

Figure 1: ACSI Block

The native IED signals (Legacy IED's, Pseudo points etc.) are assigned to entities known as Data Attributes (DAs). Data Attributes typically contain the value of a single signal, most often with a Boolean, Float or Enumerated value. Alternatively, a data attribute can have meta-data related to another data attribute, such as the quality, timestamp, and range of the other attributes. Data attributes have defined names and semantic as defined in IEC 61850-7-3:2010 clause 8. There are 15 pages of these in the standard, so they are not listed here.

A few representative data attributes are as follows:

- stVal — Status value of the data

- t — Timestamp of the last change in one of the attribute(s) representing the value of the data or in the q attribute
- q — Quality of the attribute(s) representing the value of the data

A collection of related data attributes is combined into an entity at the next level up in the hierarchy known as a Data Object (DO). Data objects are required to be formed in accordance with one of the Common Data Class (CDC) definitions in IEC 61850-7-3:2010 clause 7. A CDC defines what data attributes an implementing data object is required to contain and which data objects an implementing data object can optionally contain. CDCs also define the functional constraint (FC) of each data attribute. An FC is a two-letter code with additional information, such as ST (status information). For instance, the Single point status CDC, which is named SPS, requires data attributes stVal, q, and t, and it allows certain data attributes concerned with the substitution model, value update blocking, and description. The data attribute stVal is required by the CDC to be a Boolean value, q is required to be a code for the quality of stVal, and t is required to be the time at which stVal last changed state. Thus, an SPS data object contains an amalgamation of information about a Boolean condition, for instance the thermal alarm status of a thermal overload protection.

In some cases, data objects are constructed from data objects and data attributes. These are known as constructed data objects. An example is the Phase to ground/neutral related measured values of a three-phase system (WYE) CDC that is constructed of data objects implementing the Complex measured value (CMV) CDC. The complex measured values here are the individual phase and neutral phasor value measurements.

A collection of related data objects is combined into an entity at the next level up in the hierarchy known as a Logical Node. Logical nodes are required to be formed in accordance with one of the individual logical node class specifications in IEC 61850-7-4:2010 clause 5, as well as conforming to the common logical node class specifications in clause 5.3.3. A logical node class defines what kind of function an implementing logical node models (its "semantic"), what data objects an implementing logical node is required to contain, and which data objects an implementing logical node can optionally contain. A logical node class also defines the name and CDC of each of its data objects. IEC 61850-7-4:2010 clause 6 defines the semantic of standard data object names. For instance, the Instantaneous overcurrent logical node class, which has class name PIOC, requires an Op data object with the following CDC Protection activation information (ACT) and semantic:

"Operate (common data classes ACT) indicates the trip decision of a protection function (LN). The trip itself is issued by PTRC."

Logical node class PIOC also requires the mandatory data object Beh (Behaviour, meaning on, off, test, and so on) and permits the optional data objects Str (Start), OpCntRs (Resettable operation counter), StrVal (Start value setting) and several others from the common logical node class. It is possible for a device manufacturer to add data objects in addition to those specified by a logical node class, but the expansion rules in IEC 61850-7-1:2011 clause 14 must be followed. MCP devices do extend the standard logical nodes in some cases; the data objects implemented are as tabulated in the MICS.

Logical node names are required to be formed from the four-character logical node class name that it implements, a prefix text, and a suffix instance number. An example is PhslocPIOC1, in which "PIOC" is the implemented logical node class name, "Phsloc" is the prefix, and "1" is the instance number.

A collection of related logical nodes is combined into an entity at the next level up in the hierarchy known as a Logical Device. Logical devices are required to have one logical node implementing logical node LLNO, which addresses common issues for the containing logical device. Logical devices can also contain as many logical nodes as desired.

Note: The symbol "LDName" is used in standard documents to represent either the function related or product-related name as appropriate to the context, while "IdName" is used to define the function-related name. Upper/lower case is critically significant in many 61850 names.

The complete set of logical devices in an IED are combined into an entity at the next level up in the hierarchy known as a Server.

When a particular data attribute or data object needs to be referenced by an SCL configuration file, in many cases the name of each level in the information hierarchy are independently specified. For instance, to specify the reception of the power of AC source 1 from an external IED, SCL can contain the following:

```
<ExtRef iedName="Fdr1" ldInst="Meter" prefix="ACsrc" lnClass="MMXU"
lnInst="1" doName="TotW" daName="mag.f" fc="MX" />
```

In other cases, an ObjectReference is used to identify the data attribute. An ObjectReference concatenates the names of each hierarchical level with defined delimiting characters. For instance, the ObjectReference for the previous example looks like the following:

```
Fdr1Meter/ACsrcMMXU1.TotW.mag.f
```

This format is known as the ACSI ObjectReference format, which is used exclusively in SCL, and in communication messages where the value of a data attribute containing an ObjectReference is being transmitted.

However, in communications messages where an ObjectReference is a reference to the entity whose value is being communicated, it is reformatted according to the MMS addressing scheme specified in IEC 61850 8-1. Thus, on the wire, one can see a message requesting the present value of source 1 power identifying the requested data attribute as

```
Fdr1Meter/ACsrcMMXU1$MX$TotW$mag$f
```

MCP has functionality which results in signal types that have no equivalence to the IEC 61850 standard name space. In such cases a GE Vernova name space was used, and these custom definitions are marked in the System Object Reference tables, Column "MCP Custom LN/DO" as either LN (for custom LN class) and/or DO (custom DO).

2.2 Logical Devices and Hierarchy

The MCP 61850 Server Model uses product-related naming according to IEC 61850-90-2 subsection 7.1.3.3.2. Product-related naming means that Logical Device names are constructed by concatenating the "Physical Device Name" of the IEC 61850 Server Logical Remote Unit (LRU) defined in the "Connection" page of DSAS Offline Editor with the resulting construct of Logical Device names defined in the System Points mapped to the LRU.

```
<PhysDevName><Construct of LD Names>
```

The <Construct of LD Names> in the MCP Data Model in the 61850 MMS Server is as below:

2.2.1 System logical devices

These model MCP system and automation related data and controls, originated in the MCP database (i.e. not from IEDs). These are database points originated from MCP Pseudo-points, Data Translation Applications (DTA), or Automations.

- Data associated with DTA points uses Logical Device "LD0_" for all the Gateway originated points, the LD Instance name associated with all DTA pseudo points are named as: <LD0_+Application_ID> (e.g. LD0_CALC, LD0_HAMA, etc.).

These are enforced to be unique and start with LD0_

These **cannot** be changed when modeled in the IEC 61850 Server.

- Data associated with IED (Client, DCA) connection status has the LD represented in the MCP database as <IED_Physical_Device_Name>/GWComms

These are enforced to be unique and do not start with LD0_

These **cannot** be changed when modeled in the IEC 61850 Server

- Data associated with Master (Server, DPA) connection status has the LD represented in the MCP database as <Master_Assigned_LD_Name>/GWComms
These are enforced to be unique and do not start with LD0_
These **cannot** be changed when modeled in the IEC 61850 Server.

2.2.2 Proxy logical devices

These model MCP data received from IEDs via “Client” applications (DCA).

- Data from IEC 61850 IEDs (via Loader) inherits the model of the IED. The LD is represented in the MCP database as a construct of: <IED_Physical_Device_Name><IED_LD>
These are enforced to be unique.
These **cannot** be changed when modeled in the IEC61850 Server.
- Data from non-IEC 61850 IEDs (“legacy”) can have the LD represented according to two different naming models:
 - Product-related** naming
 - Function-related** naming

Only for non-IEC 61850 IEDs (“legacy”) is possible to use either product-related or function-related naming according to IEC 61850-90-2 subsection 7.1.3.3.3.

- The naming model for legacy IEDs is set for the entire MCP device in offline editor under: Systemwide > RTDB > **"Use Legacy IED Physical Device Name in IEC 61850 model"** (Yes/No).

The screenshot shows the 'Systemwide Settings' dialog box with the 'RTDB' tab selected. The 'Use Legacy IED Physical Device Name in IEC 61850 model' setting is highlighted with a red box and set to 'Yes'.

Name	
AI Persistence	RAM
AO Persistence	RAM
DI Persistence	RAM
DO Persistence	RAM
ACC Persistence	RAM
Text Persistence	RAM
Output Command Time to Live	5
Max Startup Sync	300
Event Queue Full Action	DoNotLoseEvents
Event Distribution Priority	High
Global Control Disable Home Directory	SS00001
Global Control Disable Point ID	-2021
Default Value of Global Control Disable Point	Enabled
Reject Control Request on Offline Points	Yes
Report Offline Points if CommLost	Yes
Use Legacy IED Physical Device Name in IEC 61850 model	Yes

- If set to **Yes**, is product-related naming and the Physical Device Name will be used to compose the overall LD Name.
- If set to **No**, is function-related naming and the Physical Device Name will be ignored.

2.2.2.1 Product-related naming for Legacy IEDs

The LD is represented in the MCP database as a construct of:

<IED_Physical_Device_Name>{IED_LD} where {IED_LD} is optional.

This ensures automatic uniqueness of Object References from legacy IEDs, but will prevent mixing data from different legacy IEDs under the same LD.

Example of Product-related naming:

I have a station with 2 bus sections and 3 feeders in each bus section. Each feeder is served by one legacy device (e.g. here D.20C IO) – making 6 legacy devices in total.

I need to report Active Power (W) in each feeder based on product related naming, under the LD = MEAS.

In the legacy client map I have one ObjRef: MMXU1.TotW.mag.f[MX] and no overrides:

IEC 61850 Reference	LN Instance	DO Instance	IEC 61850 LD Override	IEC 61850 Prefix Override
MMXU1.TotW.mag.f[MX]	1			

In connections I have the 6 legacy devices.

I would configure in Connections as below, all with same map file:

Map File	IEC 61850 Physical Device Name	IEC 61850 LD	IEC 61850 LN Prefix
D20C1_01_ACC.xml	D20_C1_1	MEAS	
D20C1_01_ACC.xml	D20_C1_2	MEAS	
D20C1_01_ACC.xml	D20_C1_3	MEAS	
D20C1_01_ACC.xml	D20_C1_4	MEAS	
D20C1_01_ACC.xml	D20_C1_5	MEAS	
D20C1_01_ACC.xml	D20_C1_6	MEAS	

In this example the resulting ObjRefs for the IEC61850 Server Model will be:

D20_C1_1MEAS/MMXU1.TotW.mag.f[MX]

D20_C1_2MEAS/MMXU1.TotW.mag.f[MX]

D20_C1_3MEAS/MMXU1.TotW.mag.f[MX]

D20_C1_4MEAS/MMXU1.TotW.mag.f[MX]

D20_C1_5MEAS/MMXU1.TotW.mag.f[MX]

D20_C1_6MEAS/MMXU1.TotW.mag.f[MX]

2.2.2.2 Function-related naming for Legacy IEDs

By not using <IED_Physical_Device_Name> in the LD Construct – this allows mixing data from different legacy IEDs under the same LD.

The LD is represented in the MCP database as

<IED_LD> which is mandatory in this model.

These **can** be changed at the Connections level for IEC61850 Server modelling.

In this mode:

- user must enter LD Names for all IED LD fields in Connection tab.

- the MCP configuration tool cannot automatically enforce the uniqueness of Object References from legacy IEDs and the user is responsible to check uniqueness in Mapper.
- using LD Name and Prefix overrides in the legacy IED client map and then use this same client map for IEDs with same LD Name in Connections tab – will result in multiple identical Object References (duplicates); this must be resolved by users by changing at least one element of the Object Reference build.
- if the application requires some legacy IEDs to be modelled using their <IED_Physical_Device_Name> then user must manually enter the <IED_Physical_Device_Name> in the <IED_LD> field in Connections, only for those IEDs.

Example of Function-related naming with separate prefixes:

I have a station (AA1) with 2 bus sections (E1, E2) and 3 feeders (Q1, Q2, Q3) in each bus section. Each feeder is served by one legacy device (e.g. here D.20C IO) – making 6 legacy devices in total.

I need to report Active Power (W) in each feeder grouped into two LD, e.g. E1 and E2 as LD Name, and Q1, Q2, Q3 as prefixes.

In the legacy client map I have one ObjRef: MMXU1.TotW.mag.f[MX] and no overrides:

IEC 61850 Reference	LN Instance	DO Instance	IEC 61850 LD Override	IEC 61850 Prefix Override
MMXU1.TotW.mag.f[MX]	1			

In connections I have the 6 legacy devices that I need to group into 2x LD Names in the model (3 devices in each).

I would configure in Connections as below, all with same map file:

Map File	IEC 61850 Physical Device Name	IEC 61850 LD	IEC 61850 LN Prefix
D20C1_01_ACC.xml	D20_C1_1	AA1E1	Q1
D20C1_01_ACC.xml	D20_C1_2	AA1E1	Q2
D20C1_01_ACC.xml	D20_C1_3	AA1E1	Q3
D20C1_01_ACC.xml	D20_C1_4	AA1E2	Q1
D20C1_01_ACC.xml	D20_C1_5	AA1E2	Q2
D20C1_01_ACC.xml	D20_C1_6	AA1E2	Q3

In this example the resulting ObjRefs for the IEC61850 Server Model will be:

AA1E1/Q1MMXU1.TotW.mag.f[MX]

AA1E1/Q2MMXU1.TotW.mag.f[MX]

AA1E1/Q3MMXU1.TotW.mag.f[MX]

AA1E2/Q1MMXU1.TotW.mag.f[MX]

AA1E2/Q2MMXU1.TotW.mag.f[MX]

AA1E2/Q3MMXU1.TotW.mag.f[MX]

More details on creating these models are described in the subsequent sections.

Except for Legacy IEDs in function-related naming mode - DS Agile MCP Studio generates internally in the MCP database a unique LD_Instance_name for each instance of DCAs, DPAs and DTAs, based on the LD Uniqueness Rules presented above.

The MCP 61850 MMS server can support any number of Logical Devices (LD), limited only by process memory.

The MCP IEC 61850 MMS Server Performance Data is documented in the MCP Release Notes (*MIS-0109 MCP Firmware Release Notes*).

The logical devices are organized in a two-level hierarchy: one logical device (Root LD/LD0 in this case) is referenced by all other LDs as a higher-level logical device.

The root LD contains the following value (refer to LLN0/ LPHD Initialization for more details):

LLN0.NamPlt, LLN0.Beh, LLN0.Health, LLN0.Mod, LPHD1.PhyNam, LPHD1.Proxy, LPHD1.RedSt

The root logical device have the data LPHD.Proxy.stVal of the LPHD logical node set to "False". If instantiated in other logical devices, LPHD.Proxy.stVal shall be set to "True" and system point mapping is not allowed for that attribute.

2.3 Logical Nodes

The MCP IEC61850 MMS Server supports:

2.3.1 System logical nodes

These represent the MCP system and automation related data and controls, originated in the MCP database (i.e. not from IEDs).

- Database points originated from MCP owned Data Translation Applications (DTA), or Automations.
- Pseudo points associated with DCAs and DPAs (e.g. communication status, device status, etc.). These do not include actual points originated in IEDs.
- These **cannot** be changed when modeled in the IEC61850 Server.

2.3.2 Proxy logical nodes

These represent data in MCP received from IEDs via "Client" applications (DCA).

- Data from IEC 61850 IEDs (via Loader) inherits the LN and Object Reference of the IED. If data acquired from IEC 61850 IEDs contains custom data models, e.g. custom LN or DAO names:
 - o For CID tool version prior to **v8.2.5**, these will NOT be processed into the MCP IEC61850 Server CID file. Please ensure you do not use custom data in the IEC 61850 IEDs. These **cannot** be changed when modeled in the IEC 61850 Server.
 - o For CID tool version **v8.2.5** and above, these will be processed into the MCP IEC61850 Server CID file. Please refer to the [Configure IEC 61850 MMS Server](#) chapter for the detailed procedure to keep these custom data models.
 - o Custom data objects with the common data class ENC from IEC 61850 IEDs, processed through the Loader, are not supported and will be excluded from the MCP IEC 61850 Server CID file.
- Data from non-IEC 61850 IEDs ("legacy") can be associated by the user, in the legacy client map, with custom LN as per IEC 61850 standard rules.

These **can** be changed at the Client Map level for IEC61850 Server modelling.

3. Database Associations for IEC 61850

MCP applications *without* IEC 61850 MMS Server

MCP can be configured and used without IEC 61850 MMS Server associated data models.

This applies to legacy applications where the reporting of data is performed exclusively to non-IEC 61850 collection points (e.g. to Master Stations using DNP3, IEC 60870-5-101/104, MODBUS).

In this case there is no need to visualize or to associate IEC 61850 models to the database.

For data collected from IEC 61850 IEDs – the MCP database will indeed inherit the IEC 61850 model from those IEDs, but for legacy collection points this is not required further.

Same, for the MCP automation related data, and communication pseudo points originated in the MCP itself – there is no need to associate it with IEC 61850 models when reporting of data is performed exclusively to non-IEC 61850 collection points.

Therefore – to aid and simplify the MCP database organization for all applications **without** IEC 61850 MMS Server – the IEC 61850 Model is disabled at database level by default.

MCP applications *with* IEC 61850 MMS Server required

In applications with IEC 61850 MMS Server, the IEC 61850 Model at database level must be present and visible. This allows the MCP to create an IEC 61850 MMS Server model for:

- All data originated from IEC 61850 IEDs (if any),
- All or subsets of data originated from legacy IEDs,
 - o Conceptually – the association of legacy data points with IEC 61850 ACSI Object References is done directly in the IED templates (client maps), which simplifies and automates greatly the IEC 61850 modelling
 - o Not all legacy data has to be associated with IEC 61850 models, only the data desired to be present in the IEC 61850 MM Server models
- All data originated in the MCP itself (e.g. Automation data, communications pseudo points, other internal MCP data)

Therefore – to configure and operate the MCP with an IEC 61850 MM Server – this must be enabled by the user in *MCP Device Properties > Licensing* tab. Below are the requirements to be met.

3.1 Enabling the IEC 61850 Server license in Device Properties

For IEC 61850 Server Configurations – the associated IEC 61850 Server license must be enabled in the MCP Device Properties > Licensing tab:

Note: User has the option to later disable IEC 61850 Server by clearing the “IEC 61850 Server” license checkbox in Device Properties. When disabled, any configuration and IEC 61850 models previously associated with legacy client maps will be retained and will be reverted if the option is Enabled again. However, configuration may be out of sync depending on the configuration workflow, for e.g. a legacy signal may have changed from being a “voltage” to being a “current”, but the previously associated IEC 61850 Object Reference will still indicate a “voltage” type. It is expected the user will re-check the cross-associations in legacy client maps in this case.

3.2 Uniqueness Rules for Device Names

In the IEC 61850 MMS Server data model – the Automation (DTA, System) LD Names are automatically assigned by the configuration tool as: LD0_+Application_ID making these inherently unique.

For all devices connected to the MCP (DCA, DPA), *Uniqueness Rules* are implemented which ensure a unique LD name is associated with each Connection and each IED, except when using function-related naming. These rules are applicable to the Connections page of the MCP Offline Configuration tool.

3.2.1 IEC 61850 Physical Device Name

Each instantiated IED must have a unique assigned IEC 61850 Physical Device Name which is then used by the IEC 61850 MMS Server model.

This is automatically generated from the Device ID based on the rules below to comply with the naming convention in the standards IEC 61850-7-2 and IEC 61850-6. All characters are retained except below:

1. 'whitespace' - ~ \ / [] { } () become all _ (“underscore”)
2. ! becomes 1
3. ? becomes 2
4. # becomes 3
5. + becomes 4
6. ^ becomes 6

7. * becomes 8
8. < > become 0 and 9 respectively

Notes:

If the first letter of the **Device ID** is a number, it is converted to [a-j] based on the [0-9] equivalence.

The IEC 61850 MMS Server model requires that each **Physical Device Name** is unique within a given MCP configuration space. If the **Device ID** is not unique, then the **Physical Device Name** appends the Home Dir at the end to make it unique.

If a specific **Physical Device Name** is desired in the IEC 61850 MMS Server model – then ensure that **Device ID** is configured to be that specific value, and is unique.

The character replacement rules above should apply when working with legacy MCP configurations, before enabling the IEC 61850 MMS Server.

When working with new MCP configurations in presence of IEC 61850 MMS Server – the **Device ID** should be assigned upfront as IEC 61850 compliant and unique.

4. Assigning IEC 61850 Object References to Legacy Devices

This section describes how IEC 61850 Object References (ObjRef) are assigned to Legacy IED Devices (Modbus, DNP etc.) in the MCP database.

The IEC 61850 columns are visible in the Client Map files only when IEC 61850 Server is enabled in Device Properties > Licensing tab.

- IEC 61850 Reference
- LN Instance
- DO Instance
- IEC 61850 LD Override
- IEC 61850 Prefix Override

4.1 Legacy Client Map Files

Below is the snapshot of a Legacy DNP Client Map file configured in MCP with IEC61850 server enables as mentioned in the above section

Address	Point Reference	Point Description	Multiplier	Offset	Point Group	IEC 61850 Reference	LN Instance	DO Instance	IEC 61850 LD Override	IEC 61850 Prefix Override
0	CCT1 Va Mag	CCT1 Va Mag	1	0	PVal	MMXU.PhV.phsA.cVal.mag.f[MX]	1			
1	CCT1 Vb Mag	CCT1 Vb Mag	1	0	PVal	MMXU.PhV.phsB.cVal.mag.f[MX]	1			
2	CCT1 Vc Mag	CCT1 Vc Mag	1	0	PVal	MMXU.PhV.phsC.cVal.mag.f[MX]	1			
3	CCT1 Va Angle	CCT1 Va Angle	1	0	PVal	MMXU.PhV.phsA.cVal.ang.f[MX]	1			
4	CCT1 Vb Angle	CCT1 Vb Angle	1	0	PVal	MMXU.PhV.phsB.cVal.ang.f[MX]	1

As shown in the above snapshot, user can choose to add IEC 61850 References only to data points that need to be populated in the IEC 61850 model. Points (rows) left blank in the IEC 61850 columns will continue to operate normal but without an IEC 61850 association.

1. To select the IEC 61850 Reference for a data point, a user-friendly UI has been built with following features:
 - a. User can start typing the LN name, or DO names, or words like: Voltage, Current, Frequency, Alarm, Recorder, etc. – and a list filtered for supported Object References is displayed when expanding the drop down button, as shown below:

User can scroll the drop down to select the relevant Object Reference with the mouse – at which point the drop down filtered list is closed.

The filter is based on the point type (AI, DI, etc.) and on background searching of everything associated with a given IEC 61850 object reference class and type, including the description associated with it, as listed in the standard in English language.

- b. User can select partial strings (mouse click + drag) in an Object Reference from a previously instantiated data point, copy it (CTRL+C) and paste it (CTRL+V) to a new blank field, then immediately click the arrow down which will expand a filtered list based on the pasted string. Do not simply navigate away or press <Enter> right after the paste operation, because the string will be incomplete and invalid at that time and an error message will be displayed.

• **Example 1:**

In this example I want to repeat the same LN Class but for a slightly different DO.

Select and copy the first string part of the existing Object Reference, here the MMXU Phase Voltage part:

Paste it in a new empty row and immediately click on drop down – only Object References starting with the pasted string will be shown, move your mouse above the entries, the tooltip will explain each one (do not yet click mouse):

0 PVal	MMXU.PhV		
0 PVal	MMXU.PhV.phsA.cVal.mag.f[MX]		
0 PVal	MMXU.PhV.phsA.cVal.ang.f[MX]		
0 PVal	MMXU.PhV.phsB.cVal.mag.f[MX]		
0 PVal	MMXU.PhV.phsB.cVal.ang.f[MX]		
0 PVal	MMXU.PhV.phsC.cVal.mag.f[MX]		2
0 PVal	MMXU.PhV.phsC.cVal.ang.f[MX]		2
0 PVal	MMXU.PhV.neut.cVal.mag.f[MX]		2
0 PVal	MMXU.PhV.neut.cVal.ang.f[MX]		2
0 PVal	MMXU.PhV.net.cVal.mag.f[MX]		2
0 PVal	MMXU.PhV.net.cVal.ang.f[MX]		2
0 PVal	MMXU.PhV.res.cVal.mag.f[MX]		2

Phase to ground (line) voltages.
Measurement
Phase to ground (line) voltages.
Phase to ground/neutral related measured values of a three-phase system (WYE)
Net current, as the algebraic sum of the instantaneous values of currents flowing through all
Complex measured value (CMV)
Complex value based on a deadband calculation from the instantaneous value 'instCVal.m'

Select with mouse what entry is desired, the list closes and selection is finalized:

MMXU.PhV.net.cVal.mag.f[MX]	
-----------------------------	--

- Example 2:**

In this example I want to find other LN classes that contain V Phase C magnitude, so the selected string is in the middle of the Object Reference:

Select and copy the data referencing V Phase C, magnitude:

MMXU.PhV.phsC.cVal.mag.f[MX]	
MMXU.PhV.phsA.cVal.ang.f[MX]	

Paste it in a new empty row and immediately click on drop down – only Object References containing the pasted string will be shown. As seen in the example, this will list all possible LN classes that have Voltage Phase C magnitude. Move your mouse above the entries, the tooltip will explain each one (do not yet click mouse):

0 PVal	PhV.phsC.cVal.mag	▼
0 PVal	PPAM.FltPhV.phsC.cVal.mag.f[MX]	▲
0 PVal	PRTR.FltPhV.phsC.cVal.mag.f[MX]	
0 PVal	PSCH.FltPhV.phsC.cVal.mag.f[MX]	
0 PVal	PSDE.FltPhV.phsC.cVal.mag.f[MX]	
0 PVal	PSOF.FltPhV.phsC.cVal.mag.f[MX]	
0 PVal	PTDV.FltPhV.phsC.cVal.mag.f[MX]	
0 PVal	PTEF.FltPhV.phsC.cVal.mag.f[MX]	
0 PVal	PTHF.FltPhV.phsC.cVal.mag.f[MX]	
0 PVal	PTOC.FltPhV.phsC.cVal.mag.f[MX]	
0 PVal	PTOF.FltPhV.phsC.cVal.mag.f[MX]	
Fault voltage. It is configured by setting if this value represents the voltage Time overcurrent Fault voltage. It is configured by setting if this value represents the voltage Phase to ground/neutral related measured values of a three-phase system Value of phase C. Complex measured value (CMV) Complex value based on a deadband calculation from the instantaneous v		
0 PVal	PTOF.FltPhV.phsC.cVal.mag.f[MX]	
0 PVal	PVOC.FltPhV.phsC.cVal.mag.f[MX]	
0 PVal	PVPH.FltPhV.phsC.cVal.mag.f[MX]	
0 PVal	PZSU.FltPhV.phsC.cVal.mag.f[MX]	▼
0 PVal	LLN0.Beh.stVal[ST]	

Perhaps I am now interested in a different LN class, e.g. PTOC; select with mouse what entry is desired, the list closes and selection is finalized:

PTOC.FltPhV.phsC.cVal.mag.f[MX]

- Example 3:**

This is an example when paste was not followed by drop down list action, but instead was <Return> - resulting in an incorrect action.

Select and copy the first string part of the existing Object Reference, here the MMXU Phase Voltage part:

MMXU.PhV.phsB.cVal.ang.f[MX]
MMXU.PhV.phsC.cVal.ang.f[MX]
GGIO.AnIn.mag.f[MX]
GGIO.AnIn.mag.f[MX]
GGIO.AnIn.mag.f[MX]
GGIO.AnIn.mag.f[MX]
GGIO.AnIn.mag.f[MX]

Paste it in a new empty row and then Enter (on keyboard):

or navigate away:

- c. User can copy all the columns in the client map file to an Excel sheet by using the copy button and pasting the same in excel

User can then use excel features to update the columns, for e.g. LN and adding DO instances, etc. It is not recommended to use Excel to manipulate the Object Reference strings because there is no data validation performed in Excel, for this reason – leave this as was pasted into Excel.

After updating the data in Excel user can copy the Excel content (all range must be selected) and paste it back to DSAS Offline configurator using the below Paste option

Invalid pasted data will be removed or replaced with defaults:

1	0 PVal	GGIO.AnIn.mag.f[MX]	1	3
1	0 PVal	GGIO.AnIn.mag.f[MX]	1	4
1	0 PVal	GGIO.AnIn.mag.f[MX]	1	5
1	0 PVal			
1	0 PVal			
1	0 PVal			
1	0 PVal			
1	0 PVal			
1	0 PVal			
1	0 PVal			
1	0 PVal			
1	0 PVal			
1	0 PVal	MMXU.PhV.phsB.cVal.ang.f[MX]	2	
1	0 PVal	MMXU.PhV.phsC.cVal.ang.f[MX]	2	
1	0 PVal	GGIO.AnIn.mag.f[MX]	2	1

2. LN instance is a mandatory field for all LNs except LLN0 (LLN0 must be left blank). By default, LN Instance is set to 1 and user can modify it based on the configuration needs. Same or different instances can be configured as needed by the application. Maximum value is 99.
3. DO instances are mandatory for DOs that support multiple instances. For e.g. by Logical Nodes for Generic References (LN Group: G). By default, the value is set to 1. Same or different instances can be configured as needed by the application.

For all other LNs, DO instance is set to blank and read only.

4. Multiplier and Offset must be configured in the Client Map file to reflect the correct engineering value in the database.

There is no option for scaling at the Server Level.

5. If the LD Override field is left empty, then LD entered in “Connections” page is used (refer to Legacy Connections section next). However, users can override the LD coming from “Connections” page if the client map is for a sub-level data concentrator IED.
6. If the Prefix Override field is left empty, then LN Prefix entered in “Connections” page is used. However, users can override the LN prefix coming from “Connections” page if the client map is for a sub-level data concentrator IED.
7. If the LN class is LLN0 – the Prefix Override must be left blank.

Best Practice - User must ensure there are no duplicates inside the same client map. If user needs same Object Reference, LN Instance and DO instance for multiple points, they need to use the override options and make sure that the combination is unique. There is no automated check for duplicates inside a client map.

Assignment of Object References to Double Bit Digital Input Points

Client maps for DNP3 and IEC 101/104 protocols support Double Bit Digital Input Point definitions.

When in the Double Bit Digital Input tab - each row has a pair of binary input points: one for OFF and one for ON.

The IEC 61850 Object References for Data Objects with double bit assignments contain (1) or (2) at the end, for e.g.:

XCBR.Pos.stVal[ST](1)

XCBR.Pos.stVal[ST](2)

The bit which is selected in the IEC 61850 Reference cell is associated with the OFF Point, and the paired bit with the ON Point.

Only one selection is required – either (1) or (2).

Address	Off Point Ref	Off Point ON St...	Off Point OFF State	On Point Ref	On Point ON State	On Point OFF State	Point Group	IEC 61850 Reference
0 DBDI 0A	ON	OFF		DBDI 0B	ON	OFF	PVal	XCBR.Pos.stVal[ST](1)

Normally the object reference would be picked as (1), in which case:

- Bit (1) is associated with the OFF legacy bit (LSB).
- Bit (2) is associated with the ON legacy bit (MSB).

Assigning the Object Reference in reverse will swap the LSB and MSB bits in the IEC 61850 model and:

- Bit (2) is associated with the OFF legacy bit (LSB).
- Bit (1) is associated with the ON legacy bit (MSB).

Address	Off Point Ref	Off Point ON St...	Off Point OFF State	On Point Ref	On Point ON State	On Point OFF State	Point Group	IEC 61850 Reference
0 DBDI 0A	ON	OFF		DBDI 0B	ON	OFF	PVal	XCBR.Pos.stVal[ST](2)

4.2 Legacy Connections

Map files created in the earlier section are instantiated in the “Connections” page. Below are the details:

1. The IEC 61850 LD and the IEC 61850 LN Prefix are not mandatory to satisfy the model rules, but should be set to reflect the system application, the type of data acquired and substation element name being interfaced with.
 - Normally, each legacy IED should be of a given type (e.g. meter, etc.) and tied to a given substation element (a feeder, bus, incomer line, etc.)
 - In cases where data inside the same IED must reflect either different LD (data categories) or substation elements (e.g. when reading from some data concentrator type of device, or IEDs which cover more than one Bay), the user has the choice to enter the override LD and override LN Prefix into the client map file, on a per point basis (as described in the previous section).
2. Once these devices are instantiated, at the database level, an IEC 61850 Object Reference is generated which becomes the Model in Server ICD file.
3. For data coming from IEC 61850 Client IEDs – all IEC 61850 LD, LN Prefix and Object References are assigned according to the 61850 model subscribed in the Loader (as MMS Client).

4. The remaining IEC 61850 publisher (MMS Server) elements (like LDName, RCB Name, triggers, datasets) are created automatically by the *CID Points Mapping Tool*.

The advantage of this architecture is that signals coming from any device (including from DTAs) are automatically assigned to IEC 61850 structures, essentially adding 61850 “assignments” to any RTDB point right at the acquisition level, which are then inherited and templated across the system. This eliminates the need for the user to open the entire database and to start assigning IEC 61850 structures one by one, for every point, repeating the process for all points even if they are of similar type.

4.2.1 IEC 61850 Object References assigned to Legacy Connection status

The MCP database has points that indicate the connection status of each instantiated connection (DCA, DPA).

To satisfy IEC 61850 rules – each instantiated connection must have a unique assigned LD Name, which is then used by the IEC 61850 MMS Server model.

When a new legacy connection is created, a default unique LD Name is assigned to it.

Users can later change it as desired, as long as remains unique across all Connections.

When performing a Save operation in the Connections tab: if the connection assigned LD Name is found duplicated, it will have the last characters as the home directory of the duplicated connection, to ensure uniqueness.

The rules for constructing the **initial default** Connection LD names are:

- For Serial DCA connections (applies to Generic ASCII, IEC 101 multidrop, IEC 103 multidrop):
<protocol>_<serialport>
- For Network DCA connection blocks (applies to IEC 104 multidrop, D.20 connection):
<protocol>BLK<block>
- For Master (DPA) connections:
<protocol>{S|N}M<nn>

Where:

<protocol> is the Protocol abbreviation:

MB = Modbus

DNP = DNP3

I101 = IEC101

I104 = IEC104

I61850 = IEC61850

GASC = Generic ASCII

D20 = D.20

TEJASV = Tejas V

<serialport> is the serial port number of the connection.

<block> is the block number of the connection.

{S|N} is optional, only when the protocol abbreviation allows either serial or network. Applies to MODBUS and DNP.

S = Serial

N = Network

BLK are letters denoting a Block connection.

M is letter M denoting a Master connection for all protocols except Tejas V.

Tejas V uses letters **A,B,C,...,Z** where each letter is assigned in ascending order to instantiated connections.

<nn> is the instance, a consecutive number within the same **<protocol>{S|N}M** construct. This allows for at least two digits (may be longer for shorter names, but will be 2 for IEC61850).

Examples of Connection Assigned LD:

I104BLK1 = IEC104 (DCA) Block 1

D20BLKA = D.20 Block A

GASC_005 = Generic ASCII DCA on serial port 5

I103_006 = IEC103 DCA on serial port 6

MBSM1 = Modbus RTU Serial Master 1

MBNM1 = Modbus TCP Master 1

I104M2 = IEC104 Master 2

I16850M1 = IEC61850 Master 1

DNPSM3 = DNP3 Serial Master 3

DNPNM2 = DNP3 Network Master 2

TEJASVA01 = Tejas V Master connection 1, LRU 1

TEJASVD12 = Tejas V Master connection 4, LRU 12

4.3 Assigning IEC 61850 Object References to DCAs

This section describes the assignments of IEC 61850 Object References to Data Collection Applications

4.3.1 D.20 Network Client

5. Assigning IEC 61850 Object References to Automation Applications

This section describes the assignments of IEC 61850 Object References to Automation Applications

5.1 LLN0/ LPHD Initialization

Name	Value
LLN0.NamPlt.vendor	GE Multilin
LLN0.NamPlt.swRev	3.0
LPHD1.PhyNam.vendor	GE Multilin
LPHD1.PhyNam.name	MyMCP (name attribute of the MasterStation element in DeviceConnection.xml)
LPHD1.PhyNam.swRev	3.0
LPHD1.PhyNam.model	G500-AHU8-TUUUUU-AUUU-UUU-UUU-S-CAC0000-UUUUUUU (model number of the MCP device)

5.2 Hardware Asset Management Application (HAMA)

HAMA gathers live dynamic data (e.g.: network modes, serial port settings, temperature, real time utilization of various resources etc.) and represents this information in the Real time Database as Analog/ Digital/ Accumulator/ Text Points.

5.5 System Point Manager

The System Point Manager enables user to configure a variety of advanced automation functions as described below

5.5.1 Accumulator Freeze

This feature enables user to create groups of accumulator points whose values are frozen periodically or on demand.

Point Type	Point ID	Point Reference	Object Reference	LN Instance	CDC	DO	Do Instance	MCP Custom LN/DO	FC	DA
ACC	-10002	FrzTime_AccFreezeGrpx	LD0_ACCFRZ/ GAPC (Group ID/100) .FrzTm.actVal	(Group ID/100)	BCR	FrzTm	Group ID%100	DO	ST	actVal
ACC		ACCFRZ Owned Point	LD0_ACCFRZ/ GGIO5.CntVal<Point ID 6 digit>.actVal	5	BCR	CntVal	<Point ID 6 digit>		ST	actVal

Group ID is a unique non-editable reference identifier for an Accumulator Group. It starts with 1 and increments by 1 for each configured Accumulator group.

FrzTime_AccFreezeGrpx is a dynamic pseudo point created for every Accumulator group configured. The LN instance is incremented by 1 for every 100 Accumulator groups starting with 0. The DO instance increments from 1 and resets to 0 for every 100 groups.

5.5.2 Analog Value Selection

This feature allows user to define a group of prioritized analog input points. Valid points with highest priority are reported to a single analog input point.

Point Type	Point ID	Point Reference	Object Reference	LN Instance	CDC	DO	Do Instance	MCP Custom LN/DO	FC	DA
AI	-10002	Group Point_Grp x	LD0_AISEL/ GAPC ((Group ID/100)).GrPt.stVal	((Group ID/100)	INS	GrPt	Group ID%100	DO	ST	stVal

Group ID is a unique non-editable reference identifier for an AI Selection Group. It starts with 1 and increments by 1 for each configured AI Selection group.

Group Point_Grp x is a dynamic pseudo point created for every AI Selection group configured. The LN instance is incremented by 1 for every 100 AI Selection groups starting with 0. The DO instance increments from 1 and resets to 0 for every 100 groups.

5.5.3 Control Lockout

This feature helps configure controls in a way that, only a single master station can access a group of controls at one time and lock out groups of local controls for maintenance purpose

Point Type	Point ID	Point Reference	Object Reference	LN Instance	CDC	DO	Do Instance	MCP Custom LN/DO	FC	DA
AI	-10008	GroupOwner_LclGrp x	LD0_CGLO/ LCLGRPGAPC ((Group ID/100)).GrOwn Group ID%100 .stVal	((Group ID/100)	INS	GrOwn	Group ID%100	DO	ST	stVal
AI	-10004	GroupOwner_RmtGrpx	LD0_CGLO/ GAPC ((Group ID/100)).GrOwn.stVal	((Group ID/100)	INS	GrOwn	Group ID%100	DO	ST	stVal
DI	-10007	Locked_LclGrpx	LD0_CGLO/GAPC ((Group ID/100)).GrLkd.stVal	((Group ID/100)	SPS	GrLkd	Group ID%100	DO	ST	stVal

Point Type	Point ID	Point Reference	Object Reference	LN Instance	CDC	DO	Do Instance	MCP Custom LN/DO	FC	DA
DI	- 1000 6	Active_LclCrpx	LD0_CGLO/GAPC (Group ID/100) .GrActive.stVal	((Group ID/100)	SPS	GrActive	Group ID%100	DO	ST	stVal
DI	- 1000 3	Locked_RmtGrpx	LD0_CGLO/GAPC (Group ID/100) .GrLkd.stVal	((Group ID/100)	SPS	GrLkd	Group ID%100	DO	ST	stVal
DI	- 1000 2	Active_RmtGrpx (x is group number)	LD0_CGLO/GAPC (Group ID/100) .GrActive.stVal	((Group ID/100)	SPS	GrActive	Group ID%100	DO	ST	stVal
DO	- 1000 9	GroupLockout_LclGrpx	LD0_CGLO/LCLGRPGAPC (Group ID/100) .GrLO Group ID%100 .Oper.ctlVal	((Group ID/100)	SPC	GrLO	Group ID%100	DO	CO	Oper.ctlVal
DO	- 1000 5	GroupLockout_RmtGrpx	LD0_CGLO/GAPC (Group ID/100) .GrLO.Oper.ctlVal	((Group ID/100)	SPC	GrLO	Group ID%100	DO	CO	Oper.ctlVal

Group ID is a unique non-editable reference identifier for a Local/ Remote Group. It starts with 1 and increments by 1 for each of the configured Local/ Remote group separately.

Dynamic pseudo point created for every Local/ Remote group configured, as defined in the table. The LN instance is incremented by 1 for every 100 Local / Remote groups starting with 0. The DO instance increments from 1 and resets to 0 for every 100 groups.

5.5.4 Double Points

This feature associates two digital input points to form a double point indication. They will be part of the source point files.

5.5.5 Input Point Suppression

This feature suppresses reporting of input points while they are unavailable during maintenance.

Point Type	Point ID	Point Reference	Object Reference	LN Instance	CDC	DO	Do Instance	MCP Custom LN/DO	FC	DA
DI	-10002	Quality_Grpx	LD0_IPSPR/ GAPC[(GroupID/100)].QualGr Group ID%100 .stVal	[(Group ID/100)	SPS	QualGr	Group ID%100	DO	ST	stVal
DO	-10003	Grpx_<candidate>_Apply Suppression	LD0_IPSPR/GAPC<xx>.Supr<yyy>.Op er.ctlVal	<xx>	SPC	Supr<yyy> >		DO	CO	Oper.c tlVal

Group ID is a unique non-editable reference identifier for an Input Suppression Group. It starts with 1 and increments by 1 for each of the configured groups

Dynamic pseudo point is created for every group configured, as defined in the table. The LN instance is incremented by 1 for every 100 groups starting with 0. The DO instance increments from 1 and resets to 0 for every 100 groups.

For the point Dynamic point, Grpx_<candidate>_Apply Suppression, xxyyy is the Group ID (from 1 to 99999)

xx represents the “thousands” in the above number (as the LN instance between 0 and 99)

yyy is always 3 characters representing the last 3 digits of the group number, with leading zeroes.

A few examples for IPS:

LD0_IPSPR/HMIGAPC0.Supr001 - this is IPS group 1 for HMI candidate

LD0_IPSPR/LDC_MSTR1GAPC1.Supr005 - this is IPS group 1005 for the master with the IEC 61850 name LDC_MSTR1

5.5.6 Redundant I/O

This feature allows user to specify a secondary data point for any MCP point. This secondary point is used to report the value and quality when the associated primary points is invalid/ questionable.

Point Type	Point ID	Point Reference	Object Reference	LN Instance	CD C	DO	Do Instance	MCP Custom LN/DO	FC	DA
DI	-10001	Secondary SourceDI_I/O Group x	LD0_RDNIO/ GAPC[(Group ID/100)].ScndSrcGr[Group ID%100].stVal	[(Group ID/100)	SPC	ScndSrcGr	Group ID%100	DO	ST	stVal
DO	-10002	Secondary SourceDO_I/O Group x	LD0_RDNIO/ GAPC[(Group ID/100)].ScndSrcGr[Group ID%100].Oper.ctlVal	[(Group ID/100)	SPC	ScndSrcGr	Group ID%100	DO	CO	Oper.ctlVal

Group ID is a unique non-editable reference identifier for an I/O Group. It starts with 1 and increments by 1 for each of the configured groups.

Dynamic pseudo point is created for every group configured, as defined in the table. The LN instance is incremented by 1 for every 100 groups starting with 0. The DO instance increments from 1 and resets to 0 for every 100 groups.

5.5.7 Control In Progress

This feature allows user to trace if a control command on a digital output point is in progress or not. This feature also provides the information about the application that has issued the command and the control command type

Point Type	Point ID	Point Reference	Object Reference	LN Instance	CDC	DO	Do Instance	MCP Custom LN/DO	FC	DA
AI	-10009	Last Comand Issuer on <Member Reference>	LD0_CTRLPRG/ GAPCGroup ID.CmdIs<Point ID 5 digit>.stVal	Group ID	INS	CmdIs	<Point ID 5 digit>	DO	ST	stVal

Point Type	Point ID	Point Reference	Object Reference	LN Instance	CDC	DO	Do Instance	MCP Custom LN/DO	FC	DA
AI	-10008	Last Issue Command Type on <Member Reference>	LD0_CTRLPRG/ GAPCGroup ID.CmdTyp<Point ID 5 digit>.stVal	Group ID	INS	CmdTyp	<Point ID 5 digit>	DO	ST	stVal
DI	-1007	InProgress <Member Reference>	LD0_CTRLPRG(Inherited from IED 61850 LD)/ Inherited from IEDInherited from IEDInherited from IED.Inherited from IED.Inherited the feedback from IED	Inherited from IED	Inherited from IED	Inherited from IED		DO	Inherit the feedback from IED	Inherit the feedback from IED

Group ID is a unique non-editable reference identifier for an InProgress Group. It starts with 1 and increments by 1 for each of the configured groups.

The Pseudo Point InProgress<member reference>, the Object Reference is Inherited from the feedback from source IED from which it is mapped by appending it with LD0_CTRLPRG to show that it is a Control In Progress point. If the input signal does not have an Object Reference, then this pseudo will not have one either, it means the user is not interested to model either of them in 61850.

5.6 Alarms- Digital Event Manager (DEM)

This feature allows user to configure and modify how alarms are processed and reported by MCP. Digital input points must be configured in a Map File before they can be selected as alarmable points

Point Type	Point ID	Point Reference	Object Reference	LN Instance	CDC	DO	Do Instance	MCP Custom LN/DO	FC	DA

DO	-2040	Acknowledge Orphan Alarms	LD0_DEM/ GLOBALCALH1.AckOrphAlm.Oper.ctlVal	1	SPC	AckOrph Alm		DO	CO	Oper.ctlVal

Group ID is a unique non-editable reference identifier for an Alarm Group. It starts with 1 and increments by 1 for each of the configured groups.

Individual Alarm Indication when enabled, digital input pseudo point is created for each alarm in the group (Note that redundant pseudo points are created if alarms are assigned to multiple groups)

This is indicated in the above table by the pseudo point GroupName-PointName. For this point, the Object reference is inherited from the source IED. e.g. the DI point which is part of the alarm group has IED1PROT/BRKAA1PDIF1.Op and this creates in turn an individual alarm point in DEM (if the option is enabled in DEM).

This shall be represented as LD0_DEM_IED1PROT/BRKAA1PDIF1.Op which is a direct relation to the original signal, but shows as a DEM point (the remote 61850 client looking at this dataset shall see the actual signal's Object Reference and when it became alarmed based on the DEM configuration).

If the input signal does not have an Object Reference, then this pseudo will not have one either, it means the user is not interested to model either of them in 61850.

For edge cases where the source IED+LD is already at the maximum length, adding LD0_DEM in front will exceed the max limit. In this case, the RTDB shall truncate such that the last 5 characters are replaced by _dddd with dddd being a number assigned in sequence, as it is identified in order.

For e.g.

IEDLONGLONGNAME1PROTDLONGLONGLONG/BRKAA1PDIF1.Op was mapped to DEM and creates an individual alarm point in DEM.

This should become:

LD0_DEM_ IEDLONGLONGNAME1PROTDLONGLON_0001/BRKAA1PDIF1.Op

5.7 Calculator

This application is used to carry out the following functions:

- Perform mathematical, Logical, or Timer based operations on selected system data points
- Automatically operate one or more digital or analog outputs when certain conditions are met

Report ID is a unique non-editable reference identifier for a Datalogger Group. It starts with 1 and increments by 1 for each of the configured Local/Remote group separately.

Dynamic pseudo point created for every Report configured, as defined in the table. The LN instance is incremented by 1 for every 100 Reports starting with 0. The DO instance increments from 1 and resets to 0 for every 100 reports.

5.9 Load Shed

This application allows user to configure sets of feeders and load shed zones. Inputs to the MCP can be used to trigger the opening of feeders in order to shed load on the system. Load shedding can also be referred to as Demand Side Management or Load Management.

Point Type	Point ID	Point Reference	Object Reference	LN Instance	CDC	DO	Do Instance	MCP Custom LN/DO	FC	DA

DO	-10003	Clear Recorder Memory for File Set - St<x>/Device <y>/ File Set <z>	LD0_ARRM/IARC1.MemClr.Oper.ctlVal	1	SPC	MemClr	{ same instance for the same unique combination of xyz, then +1 }		CO	Oper.ctlVal

Point Type	Point ID	Point Reference	Object Reference	LN Instance	CDC	DO	Do Instance	MCP Custom LN/DO	FC	DA
DO	-10003	Disable Automatic Retrieval for File Set - St<x>/Device <y>/ File Set <z>	LD0_ARRM/IARC1.RetDsa.O per.ctlVal	1	SPC	RetDsa	{ same instance for the same unique combination of xyz, then +1 }		C O	Oper. ctlVal
DO	-10003	Enable Connection Polling for File Set - St<x>/Device <y>/ File Set <z>	LD0_ARRM/IARC1.PollEna.O per.ctlVal	1	SPC	PollEna	{ same instance for the same unique combination of xyz, then +1 }		C O	Oper. ctlVal

The DO instance can be explained as below:

For each unique combination of x,z,z an instance number is generated, starting with 1, regardless of what x,y,z may be.

So, combination x1,y1,z1 has everything DO instance 1;

x1,y2,z3 has 2;

x3,y1,z777 has 3 and so on.

There is no intended calculation or automated association between x,y,z and the DO instance. IEC 61850 Server only identifies the unique sets of x,y,z and give them DO numbers in the order identified. DO instance numbers are assigned in order as, 1,2,3,4,5,6,7,..... etc.

Users can filter them in the mapper like in Excel (mapper is like Excel). And then can leave them as they are, or assign a prefix etc.

5.11 Analog Report

This application allows users to configure different sets of reports in the system.

6. Configure IEC 61850 MMS Server

After all required IEC 61850 Object References assignments are completed, user can proceed to the configuration of the IEC 61850 MMS Server.

The workflow presented in this chapter applies only to MCP v3.00, v3.10 or v4.00.

6.1 IEC 61850 Server Instances

6.1.1 Adding an IEC 61850 Server instance

Add an IEC 61850 Server Instance (LRU) using the Connections Page “green +” button, new Network Connection and Select IEC 61850 Server:

A new IEC 61850 Server connection is added:

The configuration is split into two workflow modes:

Changes which require full workflow with CID tool

This section refers to workflows involving parameters that require CID tool workflow, in addition to Save/Commit:

- LRU Name
- IEC 61850 Assigned LD
 - o This field must respect IEC 61850 Naming rules and should be as short as possible because it will be prepended to database LD Names.
- Checkbox “Auto Start”; this should be always enabled, and disabled only for testing to prevent the IEC 61850 LRU start at runtime.
- Changes in the IEC 61850 Data Model

Note: The “Auto Start” checkbox is automatically disabled if an existing configuration has been upgraded between major MCP versions, due to changes in the data model. In this case – a CID Tool workflow (export / generate / import) is required to enable the “Auto Start” and save the Offline Editor session.

Changes which can be Saved/Committed without CID tool

This section refers to workflows involving parameters that are updated only with MCP Save/Commit operations (no CID tool workflow is required).

- IP address associated with the LRU
- The “Network Port” (102) and “OSI Transport Selector” (0001) should be left to their default values.
- “Transport Layer”, “SubNetwork”, “Access Point Name” and “Application Parameters (MMS)” are read only.
- “IEC 61850 Physical Device Name” field must respect IEC 61850 Naming rules and should be as short as possible because it will be prepended to database LD Names.

Repeat the process for additional IEC 61850 Server instances (LRUs).

“LRU Name”, “IEC 61850 Physical Device Name” should be unique across all instances for easy identification.

“Assigned LD” must be unique across all instances; if is repeated it will be replaced with an appended Home Directory number at the end when “Save”, to make it unique.

6.1.2 IEC 61850 Server Instances with Hot-Hot Redundancy

If MCP device is configured as Hot-Hot redundancy and “Hot-Hot Communication” is enabled – the IEC 61850 server has following different parameters for MCP A and MCP B:

The screenshot shows the 'Network Host Settings' dialog box. The 'Changes here require full workflow with CID Tool' section has 'LRU Name' set to 'IEC 61850 Assigned LD', 'G500' in the first text box, 'I61850M1' in the second, and both 'Auto Start' and 'Hot-Hot Communication' checked. The 'Changes here can be Saved / Committed without CID Tool' section has 'IP Address A' as '10.11.12.50', 'IP Address B' as '10.11.22.50', 'Transport Layer' as 'TCP', 'Network Port' as '102', 'OSI Transport Selector' as '0001', 'SubNetwork' as 'SBUS network', 'Access Point Name' as 'AP1', and 'IEC 61850 Physical Device Name' as 'MCP'. The 'Application Parameters (MMS)' section has 'Use Default' selected.

- IP address associated with MCP A (not the Active Address)
- IP address associated with MCP B (not the Active Address)

If MCP device is configured as Hot-Hot redundancy and “Hot-Hot Communication” is **not** enabled – the IEC 61850 server has the same parameters as not being redundant.

The screenshot shows the 'Network Host Settings' dialog box. The 'Changes here require full workflow with CID Tool' section has 'LRU Name' set to 'IEC 61850 Assigned LD', 'G500' in the first text box, 'I61850M1' in the second, and 'Auto Start' checked while 'Hot-Hot Communication' is unchecked. The 'Changes here can be Saved / Committed without CID Tool' section has 'IP Address' as '10.11.12.50', 'Transport Layer' as 'TCP', 'Network Port' as '102', 'OSI Transport Selector' as '0001', 'SubNetwork' as 'SBUS network', 'Access Point Name' as 'AP1', and 'IEC 61850 Physical Device Name' as 'MCP'. The 'Application Parameters (MMS)' section has 'Use Default' selected.

6.1.3 Parameters assignment to CID file

The IEC 61850 Server instance parameters in Connections will be used by the CID tool to create the CID file as following:

In the Communication section of CID file:

- “IEC 61850 Physical Device Name” is used for “iedName” and “IED name”
- “Access Point” is used for “apName” and “AccessPoint Name”
- “IP address” is used for “IP”

"IP-Subnet" is defaulted to /24 and "IP-Gateway" address is defaulted to x.x.x.1 and if necessary need to be changed manually in the CID file according to Network Interface settings and application.

Network Host Settings

Changes here require full workflow with CID Tool

LRU Name: G500 IEC 61850 Assigned LD: I61850M1 ☒ Auto Start  Mapper  Export to CID tool  Import from CID tool  Export IID

Changes here can be Saved / Committed without CID Tool

IP Address: 10.11.12.50 Transport Layer: TCP Network Port: 102 OSI Transport Selector: 0001 SubNetwork: SBUS network Access Point Name: AP1 IEC 61850 Physical Device Name: MCP

Application Parameters (MMS)
☒ Use Default  Show

Example of CID file communication section for non-hot-hot MCP:

```

6.2 Operations

The IEC 61850 Server instance provides the following interactive buttons, which are operational if the device contains a Loader configuration upgraded to Edition 2.

- Mapper
- Export to CID tool
- Import from CID tool
- Export IID

6.2.1 Cases when interactive buttons do not work

Clicking on the buttons may result in the following messages, depending on the environment setup:

Loader configuration is not Edition 2

If the following message is shown – the Loader configuration must be upgraded to Edition 2 (see [High Level Workflow](#)):

MCP Device Properties doesn't have the IEC 61850 Server enabled

If the IEC 61850 Server license is not enabled in the Device Properties > Licensing tab – the following message will be displayed:

6.3 Mapper View

The “Mapper” button opens a grid table that contains all IEC 61850 Object References for all points in the MCP database.

Network Host Settings

Changes here require full workflow with CID Tool

LRU Name	IEC 61850 Assigned LD	☒ Auto Start	Mapper	Export to CID tool	Import from CID tool	Export IID
G500	I61850M1					

Changes here can be Saved / Committed without CID Tool

IP Address	Transport Layer	Network Port	OSI Transport Selector	SubNetwork	Access Point Name	IEC 61850 Physical Device Name
10.11.12.50	TCP	102	0001	SBUS network	AP1	MCP

Application Parameters (MMS)

☒ Use Default

In MCP v3.00, v3.10 or v4.00 the only operations available in the Mapper are data viewing, filtering and export data to an Excel file.

Duplicate Object References are shown in red and user must resolve these in legacy IED Client Map files or in Connections to ensure uniqueness.

There is no persistency for changes.

While the Mapper window is open, access to DSAS resources is blocked.

The Mapper window can be closed with the upper right X button.

On clicking “File > Export To”, this IEC 61850 configuration can be saved as an Excel workbook to the local machine, for use outside of MCP Studio. This may be useful for point by point testing, configuration checking, signal tracing, etc.

6.4 Export to CID tool

The button “Export to CID tool” is used to transfer the IEC 61850 database data to the external CID creation tool.

Network Host Settings

Changes here require full workflow with CID Tool

LRU Name: IEC 61850 Assigned LD

G500 | I61850M1 | ☒ Auto Start | Mapper | **Export to CID tool** | Import from CID tool | Export IID

Changes here can be Saved / Committed without CID Tool

IP Address: 10.11.12.50 | Transport Layer: TCP | Network Port: 102 | OSI Transport Selector: 0001 | SubNetwork: SBUS network | Access Point Name: AP1 | IEC 61850 Physical Device Name: MCP

Application Parameters (MMS)

☒ Use Default | Show

To the resulting dialog select the CID Tool “Input_File” folder, e.g.: C:\CID_Tool\Input_File:

For MCP v3.00, v3.10 or v4.00 the path will be:

C:\CID_Tool_v8\Input_File:

Ensure you export the data to the compatible CID Tool version, otherwise an error message will be shown.

If prompted – select Yes to overwrite and continue:

Acknowledge the result:

For more than one IEC 61850 LRU instance – you only need to Export to CID tool once, there will be prompts to select the LRU name when running the CID Tool.

Note: the export path is retained after a first successful operation and the data will always be exported to the last selected folder.

6.5 Run the CID tool

Launch first the Anaconda environment from Windows Start Menu > Anaconda, which matches the CID Tool version required:

6.5.1 Single IEC 61850 LRU instance

Use the following command in the open window:

```
python .\CID_Tool.py
```

When prompted provide input for maximum Number of Dataset members to be configured in one dataset, default is 100.

For example, if the input provided is “100”, the tool generates CID file with up to 100 dataset members in each dataset. A good value would be 400.

If the device has IEC 61850 IEDs configured in Loader – the tool will prompt to include the real data points from these IEDs in the IEC 61850 Server configuration.

The communication pseudo points associated with IEC 61850 IEDs are included regardless of the above answer.

Starting with CID Tool **v8.2.5**, if the input is 2 – No to the question, the tool will proceed the same as before; however, if the input is 1 – Yes, that is, you want to map IEC61850 real data points to Server, then it is required to export the SCD file from the Loader to the CID Tool “Input_File” folder before you can proceed further. The SCD file is used to accommodate the needs to support custom data models inherited from the IEC61850 IEDs. This SCD file is different every time after Loader saved operations.

```

Do you want to map IEC61850 real data points to Server : Enter 1 for yes and 2 for no : 1
Traceback (most recent call last):
  File "C:\CID_Tool_v8\CID_Tool.py", line 300, in <module>
    raise Exception("Could not find IEC61850Loader.scd file in Input_File folder,please copy scd file and run again")
Exception: Could not find IEC61850Loader.scd file in Input_File folder,please copy scd file and run again
(base) PS C:\CID_Tool_v8>

```

To export the SCD file,

1. Exit the Offline Editor.
2. Select the device you are working on if it is not selected.
3. Click "Export Group" on the ribbon under IEC61850 category.

4. To the resulting dialog, select the CID Tool "Input_File" folder, e.g.: C:\CID_Tool_v8\Input_File. Keep the file name as default - "IEC61850Loader".

- Click Save button and then you will be prompted with the following dialog:

- Choose No to the question “Do you want to indent the output file? (This will cause a significant increase in the size of this file)”. You may also want to check “Do not show this message again” checkbox so that it will not prompt this question again next time.
- The SCD file is then saved to the folder.
- Run the CID Tool again by using command: `python .\CID_Tool.py`

Starting with MCP V5.0 (CID_Tool v9.4.6) the tool will prompt for whether to map Accumulator pseudo points:

```
(CID_Tool_v9) PS C:\CID_Tool_v9> python CID_Tool.py
Tool_Version : 9.4.6
Enter the no. of dataset members needs to be configured in one dataset: 128
Do you want to map IEC61850 real data points to Server [Enter 2 if no IEC61850 DCA is configured]: Enter 1 for YES and 2 for NO : YES
Do you want to map Accumulator pseudo points to Server? Enter 1 for YES and 2 for NO, default is [2]: 1
Which type of normal security control model do you want to use? Enter 1 for SBO and 2 for Direct : 
```

- Map Accumulator pseudo points (from IEC 61850 DCA and other producers), regardless of whether IEC 61850 real points are mapped.
- Do not map Accumulator pseudo points.

Starting with MCP V3.00 (CID Tool v8.*) the tool will prompt for the security control model to be used:

```
Which type of normal security control model do you want to use? Enter 1 for SBO and 2 for Direct : 1
Enter the SBO Timeout value in seconds [30]: 50_
```

- SBO with Normal Security, followed by the timeout value in seconds (default is 30)
- Direct

Wait for the tool to finish processing, it will return to the prompt.

```
CID and Servermap Files are generated
(cid_tool) PS C:\CID_Tool> _
```

The CID tool generates the configuration for 61850 Server and associated CID file in the “Generated_Config” Folder. The CID file name and IEC 61850 DPA Point map file name are the “IEC 61850 Assigned LD” provided in the Connections page.

If needed – a log of the actions performed by the CID tool is in:

`\CID_Tool(_vx)\CID_Tool.log`

The log is reset every time the tool is ran.

6.5.2 Multiple IEC 61850 LRU instances:

For more than one IEC 61850 LRU instance – you need to run the CID tool once for each LRU instance, by using the “IEC 61850 Assigned LD” as parameter:

```
(cid_tool) PS C:\CID_Tool> python .\CID_Tool.py I61850M1
```

```
(cid_tool) PS C:\CID_Tool> python .\CID_Tool.py I61850M2
```

When finished each time, the CID tool generates the configuration for 61850 Server and associated CID file in the “Generated_Config” Folder with the CID file name and IEC 61850 DPA Point map file name being each “IEC 61850 Assigned LD”.

6.6 Verify “IP-Subnet” and “IP-Gateway” values

Using a text editor (e.g. Notepad), open each generated .CID file and update if needed the “IP-Subnet” and “IP-Gateway” addresses to match the MCP Net adapter you configured for this connection.

Do NOT change anything else in the CID file.

Save the file.

Note: Do not use Word to edit this file.

6.7 Import from CID tool

6.7.1 Single IEC 61850 LRU instance

The button “Import from CID tool” is used to import each CID file generated by the CID tool (one file for each IEC 61850 LRU).

Network Host Settings

Changes here require full workflow with CID Tool

LRU Name	IEC 61850 Assigned LD	☒ Auto Start				
G500	I61850M1					

Changes here can be Saved / Committed without CID Tool

IP Address	Transport Layer	Network Port	OSI Transport Selector	SubNetwork	Access Point Name	IEC 61850 Physical Device Name
10.11.12.50	TCP	102	0001	SBUS network	AP1	MCP

Application Parameters (MMS)

☒ Use Default

In the resulting dialog, navigate to the CID Tool “Generated_Config” folder and select it.

For MCP v3.00, v3.10 or v4.00 the path will be:

C:\CID_Tool_v8\Generated_Config

Ensure you select the compatible CID Tool version, otherwise an error message will be shown.

The .cid file with the same name as the “IEC 61850 Assigned LD” in the Server Instance you are working will be pre-filtered, if found.

If not found this indicates the CID Tool did not complete successfully (see previous steps).

If a previous import action was performed for same IEC 61850 LRU – select yes to override the configuration:

The resulting IEC 61850 Server Log shows the result of the import operation:

The log can be exported for further debugging, if needed please provide the log to your GE Vernova support contact.

Note: Messages related to absence of GOOSE are normal since GOOSE is not configured in this CID file.

If the log contains errors – choosing “Yes” in the following dialog will overwrite the current IEC 61850 Server instance configuration, but the IEC 61850 Server will not be operational at runtime.

The final dialog indicates success of importing the CID file from the CID tool:

Note: The import path is retained after a first successful operation and the CID file will always be imported from this path, if found.

6.7.2 Multiple IEC 61850 LRU instances:

For more than one IEC 61850 LRU instance – repeat the Import From CID tool operation once for each instance.

6.8 Synch to Device

Save and Commit changes.

Save the offline Editor session, and proceed to synch to device.

After completion – open the firewall settings and verify that IEC 61850 Server TCP port 102 is enabled for the required network interface(s).

6.9 Export the IID file(s) for Clients

Each IID file associated with an IEC 61850 Server instance can be exported using the button “Export IID”.

Network Host Settings

Changes here require full workflow with CID Tool

LRU Name: IEC 61850 Assigned LD: ☒ Auto Start

Changes here can be Saved / Committed without CID Tool

IP Address: Transport Layer: Network Port: OSI Transport Selector: SubNetwork: Access Point Name: IEC 61850 Physical Device Name:

Application Parameters (MMS)
☒ Use Default

After clicking on the Export IID button, select a folder where to export the IID file.

The default file name will be:

`<IEC61850PhysicalDeviceName>_<IEC61850AssignedLD>.iid`

If there is no present IID file for the LRU (meaning one was never imported from CID tool) - there will be a prompt that there is no IID file.

The exported IID file (one for each IEC 61850 LRU) can be provided to IEC 61850 Clients as configuration, to allow such Clients to be configured and communicate with the MCP.

If MCP device is configured as Hot-Hot redundancy and “Hot-Hot Communication” is enabled – the export to IID operation results in two IID files, one for each MCP_A and MCP_B:

`<IEC61850PhysicalDeviceName>_<IEC61850AssignedLD>_A.iid`

`<IEC61850PhysicalDeviceName>_<IEC61850AssignedLD>_B.iid`

“IP-Subnet” and “IP-Gateway” addresses need to be changed manually in the IID files according to the required network configuration of the IEC 61850 Client(s) that will use the IID file(s).

7. Runtime HMI

7.1 IEC 61850 Server Logs

At runtime, in the MCP Logs – the IEC 61850 Server is identified as “A047”.

7.2 IEC 61850 Object Visibility

When the MCP configuration has IEC 61850 Server Enabled – at runtime a new column is visible in all Point Details screens in the Runtime HMI: “*IEC 61850 Reference*”.

This new column shows the associated IEC 61850 Object Reference for each point in the database as following:

- All IEC 61850 IED originated points
- All pseudo points (DCA, DTA, DPA)
- All legacy points that have an associated IEC 61850 Object Reference in the client map.
- Legacy points that do not have an associated IEC 61850 Object Reference in the client map will not show anything in the IEC 61850 Reference column.

8. IEC 61850 Server Controls Processing

8.1 Control Processing Workflow

MCP IEC 61850 Server processes the client control select and operate requests in the sequence illustrated below.

Each block in the diagram represents a level of check in the control process workflow.

In the MCP IEC 61850 Server - the control evaluation is split into two levels:

- Application Server Checks
- RTDB Checks

8.1.1 IEC 61850 Server Application Checks

When a control request is received, the IEC 61850 Server Performs the first level of checks to determine whether the control can be processed or not. If a check fails an appropriate add cause is returned as specified below.

- **<rootLD>** - this refers to LD0 – available in the default Object Reference Mapping
- **<parentLD>** - this refers to the Logical Device of the <anyLN> (user mapped)
- **<anyLN>** - this refers to the Logical Node that is being controlled (user mapped)
- **LockKey** – this data object represents the status of a mapped DI, e.g. a physical key switch tied to a local I/O and allows to take over the control authority within the substation. If LockKey=false, control commands are allowed.
- **Loc** – this data object represents the status of the control behavior allowed at the respective level; comes from IED. If Loc=false, control commands are allowed.

- **LocSta** – this data object shows the switching authority at station level. If LocSta=false, control commands are allowed from a remote control center.

At every level, if the point to be checked is not present, that check is performed considering the point value being FALSE.

S. No.	Control Check	Add Cause
Step 1 Check <rootLD>	OR condition of { <rootLD>.LLN0.Loc <rootLD>.LLN0.LocKey } (local/ remote for complete Substation) Note: If Loc is not present at a level, it is considered as False	If Local(1(true)), The Client control request to the 61850 server is inhibited (Refer to "AllControlsDisabled " in section System Status Manager) ADD CAUSE: BLOCKED-BY-SWITCHING-HIERARCHY (2) If Remote(0(false)), Step 2
Step 2 Check <parentLD>	OR condition of { <parentLD>.LLN0.Loc <parentLD>.LLN0.LocKey <parentLD>.<anyLN>.Loc <parentLD>.<anyLN>.LocKey } (local/ remote for complete bay/zone) Note: If Loc, LocKey is not present at a level, it is considered as False	If Local(1(true)), The client control request to the LD shall be inhibited ADD CAUSE: BLOCKED-BY-SWITCHING-HIERARCHY (2) If Remote(0(false)), Step 3
Step 3 Check <anyLN>	If <Any LN> in the previous step is CSWI OR condition of { <parentLD>.<matching XCBR>.Loc <parentLD>.<matching XCBR>.LocKey } (local/ remote for this point) Note: <Matching XCBR> refers to Loc or LocKey on XCBR with same Prefix and Instance as CSWI Ex: Control point MyCSWI1.Pos will have MyXCBR1.Loc, MyXCBR1.LocKey checked	If Local(1(true)), The client control request to this point shall be rejected ADD CAUSE: BLOCKED-BY-SWITCHING-HIERARCHY (2) If Remote(0(false)), Step 4
Step 4	OR condition of { <root LD>.LLN0.LocSta, <root LD>.ITCI.LocSta,	If True, The orCat service parameter only allows: • Station-control

S. No.	Control Check	Add Cause
Check <orCat>	<rootLD>.<anyLN>.LocSta <parentLD>.LLN0.LocSta <parentLD>.ITCI.LocSta <parentLD>.<anyLN>.LocSta } Note: If LocSta is not present at a level, it is considered as False MltLev is not supported in the model and is assumed to be True	- Automatic-station-Control If False, The orCat service parameter only allows: - Station-control - Automatic-station-Control - Remote-Control - Automatic-Remote-Control - Maintenance-Control If orCat check fails, Client control request to the LD shall be rejected ADD CAUSE: BLOCKED-BY-SWITCHING-HIERARCHY (2) Else, Step 5
Step 5 Check <Beh>, <Mod> state	Any of the points mapped to <anyLN>.Beh and <anyLN>.Mod are invalid/questionable/non- existing (orphaned points)	If True, ADD CAUSE: BLOCKED-BY-HEALTH (13) If False, Step 6
Step 6 Check <Beh>, <Mod> System Level	<anyLN>.Beh (Based on Mode and Beh at parent level, the <anyLN>.Beh is recalculated as per the truth table) Truth table for the behavior values as a function of mode is available below in section 8.1.1.1	If <resulting Beh of the truth table is off(5)> OR <if the Test Service parameter (test flag in the control request) is set and the resulting behavior is neither test/ test blocked > OR <if the test service parameter is clear and the resulting behavior is either test/ test blocked>, ADD CAUSE: BLOCKED-BY-MODE (8) Else, Step 7
Step 7 Check <Health>	<anyLN>.Health	If not equal to OK(1)/ Warning(2), ADD CAUSE: BLOCKED-BY-HEALTH (13) If equal to OK(1)/ Warning(2) Step 8
Step 8	CILO EnaCls OR	If check fails, ADD CAUSE:

S. No.	Control Check	Add Cause
Check <CILO> Note: Optional CmdBlk is not supported	CILO EnaOpn (refer to Section 8.1.1.2 Interlocking checks based on CILO with same Prefix/Inst)	BLOCKED-BY-INTERLOCKING (10) Else if the check passes, Step 9
Step 9 Check feedback	Feedback Point state and Quality	If, a) Feedback point Quality – Invalid/ Questionable ADD CAUSE: BLOCKED BY HEALTH (13) b) AI/DI in same state as control ADD CAUSE: POSITION REACHED (5) c) For DPC, if feedback state is Intermediate/ Bad and Invalid Position check configuration parameter is Enabled (see Note **) ADD CAUSE: INVALID POSITION (4) Else, Move to Step 10 in 8.1.2 RTDB Checks

Note ** : In MCP v3.00, v3.10 or v4.00: Invalid Position check configuration parameter is always Disabled.

8.1.1.1 Resulting Behaviour Based on Mode

For correct operation, Mod and Beh should be present in the MCP database.

For IEC61850 Devices, Mod and Beh are proxied from the IEC 61850 IED (if mapped in Loader).

For Legacy Devices:

- Beh is always ON by default unless associated as Object Reference to AI points in Legacy Client Maps – in which case will follow the legacy point value and state.
- Mod is not available unless associated as Object Reference to AO points in Legacy Client Maps – in which case is assumed the Legacy IED has the capability of switching controls capabilities according to IEC 61850.

Beh is mandatory in the data model, Mod is not.

Mode is an Analog Output that is passed from the Master to the IED via the MCP. It can also be operated locally on the IED. The IED/ MCP will then recalculate the Resulting Beh according to the table below. The Resulting Beh is used for control checking.

Notes:

- For cases where <parentLD>/<anyLN>.Mod is not mapped, the resulting Beh of <parentLD>/<anyLN>.Beh will be equal to the <parentLD>/LLN0.Beh as defined in the table below
- For cases where <parentLD>/<LLN0>.Beh is not mapped, the resulting Beh of <parentLD>/<anyLN>.Beh will be equal to the <parentLD>/<anyLN>.Mod as defined in the table below

Set Mod at IED Level (Assumed as “on” if not mapped)	LD Beh at higher level (Read Only) (Initialized as “on” if not mapped)	Calculated Resulting Beh provided by the server at a level (read only) (The calculated Beh takes precedence over the mapped Beh, from the IED, for control processing)	
<anyLN>.Mod	LLN0.Beh	<anyLN>.Beh	Value
On	on	on	1
on	blocked	blocked	2
on	test	test	3
on	test/ blocked	test/ blocked	4
on	off	off	5
blocked	on	blocked	2
blocked	blocked	blocked	2
blocked	test	test/ blocked	4
blocked	test/ blocked	test/ blocked	4
blocked	off	off	5
test	on	test	3
test	blocked	test/ blocked	4
test	test	test	3
test	test/ blocked	test/ blocked	4
test	off	off	5
test/ blocked	on	test/ blocked	4
test/ blocked	blocked	test/ blocked	4
test/ blocked	test	test/ blocked	4
test/ blocked	test/ blocked	test/ blocked	4
test/ blocked	off	off	5
off	on	off	5
off	blocked	off	5
off	test	off	5
off	test/ blocked	off	5
off	off	off	5

Note: For the root LD, the values in LLN0.Mod and LLN0.Beh are the same.

The Enumerations for the column Value in the above table are as below:

Enumeration	Value
on	1
blocked	2
test	3
test/ blocked	4
off	5

8.1.1.2 Interlocking checks based on CILO with same Prefix/Inst

The check bits send by client in control service indicate if interlock check (Operative test) and synchrocheck (dynamic test) needs to be performed before accepting the command.

For each client control request, the IEC 61850 server performs interlock check conditions based on the status of interlock check bit and ignores the synchrocheck bit.

MCP IEC 61850 server performs interlock checks based on the associated permissive states as defined below:

If the controllable CDC maps digital outputs, IEC 61850 server supports:

- **CILO EnaCls** - indicates if ON/HIGHER command is permitted (if the mapped DI status is ON)
- **CILO EnaOpn** – indicates if OFF/LOWER command is permitted (if the mapped DI status is ON)

For the association of the EnaOpn and EnaCls permissive conditions to work correctly – the CILO LN must have:

- Same LD parent,
- Same LN Prefix and
- Same LN Inst

as the LN to which the permissive conditions are applicable.

For e.g.:

BCU01CONTROL1/QA1CILA5.Pos.stVal

BCU01CONTROL1/QA1CSWI5.Pos.stVal

BCU01CONTROL1/QA1XCBR5.Pos.stVal

For data obtained from IEC 61850 IEDs – the MCP inherits the model.

For data obtained from Legacy IEDs – the user can assign the Object References as per the above data model when CILO control interlocking is required.

Data from MCP automation applications cannot be assigned to CILO in v3.00, v3.10 or v4.00.

Interlocking for Analog Outputs is not supported through this method.

The EnaOpn and EnaCls data objects are used as in the standard.

Data Object Name	Common Data Class	Explanation
EnaOpn	SPS	Enable Open
EnaCls	SPS	Enable Close

Note: The 'Interlock Check Bit' is set while issuing a control command from IEC 61850 client

The implication of this approach is that the whole LN is interlocked rather than points in the LN.

Below is the list of DO's that shall be supported for CILO based interlocking:

LN Class Name	Data Object Name	CDC	Transient	M/O/C	Explanation
1 CPOW	Pos	DPC		O	Switch, general
2 CPOW	PosA	DPC		O	Switch L1
3 CPOW	PosB	DPC		O	Switch L2
4 CPOW	PosC	DPC		O	Switch L3
5 CSWI	Pos	DPC		M	Switch, general
6 CSWI	PosA	DPC		O	Switch L1
7 CSWI	PosB	DPC		O	Switch L2
8 CSWI	PosC	DPC		O	Switch L3
7 KVLV	Pos	DPC		O	Valve to full open or closed position
2 XCBR	Pos	DPC		M	Switch position
8 XSWI	Pos	DPC		M	Switch position
6 YPSH	Pos	DPC		M	Switch position

If the associated CILO attributes are missing in above described data model, or is configured without binding to a DI – the IEC 61850 server uses the corresponding permissive DI status as ON and the command passes validation.

If associated CILO data model is valid as described above, and if EnaCls/EnaOpn are: offline, questionable, invalid or non-existing – the IEC 61850 server rejects the control with **AddCause: Blocked-by-Health (13)**.

For each of the above interlocking conditions being active, except as indicated above – the MCP 61850 server sends the negative response with **AddCause: Blocked-by-interlocking (10)**.

Example:

Configure CSWI and CILO with the same LD parent, LN Prefix and LN Inst

LD1/Q1CSWI1.Pos.StVal

The control commands for switch and breaker related logical nodes i.e. LN CSWI are processed or rejected based on the status of

LD1/Q1CILO1.EnaCls.stVal

LD1/Q1CILO1.EnaOpn.stVal

If:

LD1/Q1CILO1.EnaCls.stVal = "True" then all the ON control commands are processed successfully and are rejected if the status is "False"

LD1/Q1CILO1.EnaOpn.stVal = "True" then all the OFF control commands are processed successfully and are rejected if the status is "False"

8.1.2 RTDB Checks

Once the control evaluation passed the **IEC 61850 Server Application Checks**, the evaluation proceeds to the next level: **RTDB Checks**.

S. No.	Control Check	Add Cause
Step 10	RTDB Point Quality Check/ Non-Existing (i.e. Orphaned) Check	If Unhealthy, AO/DO point Quality – Invalid/ Questionable/ Control Inhibited ADD CAUSE: BLOCKED-BY-HEALTH (13) If Healthy, Step 11
Step 11	Is the Point Mapped to control Lockout Application	If True, Step 12 If False, Step 15
Step 12	If the client sends an Operate request, and if the output point control status is already active	If True, ADD CAUSE: COMMAND-ALREADY-IN-EXECUTION (12) If False, Step 13
Step 13	Local/ Remote group status	If Active, ADD CAUSE: 1-of-n-control (14) If not active, Step 14
Step 14	Local group locked	If True, ADD CAUSE: LOCKED-BY-OTHER-CLIENT (27) Else, Step 15
Step 15	Control Request processed	If control fails, ADD CAUSE: unknown Else, Control Success

In Step 15, if all the checks passed but RTDB returned the control as failure – then

AddCause: Unknown

is returned by the IEC 61850 Server.

If all the above checks are satisfied, then the control Request is processed, and the Control Response is checked by evaluation of Add Cause from IED in case of IEC 61850 Client and protocol status from other IED types.

Note: When the IEC 61850 Server receives an operate request, it shall issue an RTDB control initialized as follows:

ctlVal	CDC	cmdQual	Expected RTDB Control Type	Status
ON	SPC/DPC	persistent	Latch ON	
OFF	SPC/DPC	persistent	Latch OFF	
ON	SPC/DPC	pulse	Close	
OFF	SPC/DPC	pulse	Trip	
Higher	BSC	n/a	Close	
Lower	BSC	n/a	Trip	

This table is based on IEEE 1815.1 Table 27. CROB Mapping, Use Case (b).

8.2 CF Parameters

Below are the CF Parameters available in the Server Map File (Read-only, it is recommended not to change the default values of these parameters). This Server Map file is a “.xml” file that is auto generated by the CID tool and available in the “Generated_Config” folder as described in the [Run the CID tool](#).

Point Type	Settings of 61850 Server and GOOSE	Description	Default Value
DO	<i>rangeCheckEnabled</i>	Determines whether minVal / maxVal check is performed by MCP device.	Disabled
DO	<i>initialNumPls</i>	Determines the number of state changes to cause the Control to execute when operated	1
DO	<i>initialOnDur</i>	Determines the time to hold a two-state Control in its on state, when pulsed.	1000 Units: ms
DO	<i>initialOffDur</i>	Determines the time to hold a two-state Control in its off state, when pulsed.	1000 Units: ms
DO	<i>cmdQual</i>	Determines whether the control will be executed as Latch On/Off (persistent) or Close/Trip (pulse)	Pulse
DO	<i>minVal</i>	This value represents the minVal of a Binary Controlled Step Position (BSC) object or Binary Analog Controlled (BAC) object.	1
DO	<i>maxVal</i>	This value represents the maxVal of a Binary Controlled Step Position (BSC) object or Binary Analog Controlled (BAC) object.	10
DO	<i>stepSize</i>		1

Point Type	Settings of 61850 Server and GOOSE	Description	Default Value
DO	<i>ctlModel</i>	Determines whether the digital output may be operated on Direct-With-Normal-Security or SBO-With-Normal-Security or Status-Only model. If control model is set to Status-Only, then the digital output cannot be operated. Refer to IEC 61850-7-2 for a description of the control models.	Direct-With-Normal-Security
AO	<i>multiplier</i>	Multiplier and offset are used to convert IEC 61850 requested value to an RTDB system value using the equation $RTDB\ system\ value = [(IEC\ 61850\ Requested\ Value) / 10^{unitsMultiplier} - offset] / multiplier$.	1
AO	<i>offset</i>	See multiplier description.	0
AO	<i>rangeCheckEnabled</i>	Determines whether minVal / maxVal check is performed by MCP device.	Disabled
AO	<i>minVal</i>	This value represents the minVal of an Integer Controlled Step Position (ISC) object, Integer Controlled (INC) object, or Analog Process Controlled (APC) object.	1
AO	<i>maxVal</i>	This value represents the maxVal of an Integer Controlled Step Position (ISC) object, Integer Controlled (INC) object, or Analog Process Controlled (APC) object.	10
AO	<i>stepSize</i>	This value represents the stepSize of an Analog Process Controlled (APC) object.	1
AO	<i>ctlModel</i>	Determines whether the analog output may be operated on Direct-With-Normal-Security or SBO-With-Normal-Security or Status-Only model. If control model is set to Status-Only, then the analog output cannot be operated. Refer to IEC 61850-7-2 for a description of the control models.	Direct-With-Normal-Security
AO	<i>units</i>	Determines the IEC 61850 specified SI Units the numerical value represents. This is informational data and has no effect on the operation of the application, other than to report the configured units to the Client.	None
AO	<i>unitsMultiplier</i>	See multiplier description. The IEC 61850 server "f" value is equal to the pval / $10^{unitsMultiplier}$.	0

9. List of Acronyms

Table 9.1: List of Acronyms

Abbreviation	Description
CID	Configured IED Description file
DA	IEC 61850 Data attributes
DCA	Data Collection Application
DO Instance	IEC 61850 Data Objects
DPA	Data Presentation Application
DTA	Data Translation Application
DSAS	DS Agile Studio
IEC	International Electrotechnical Commission
IEDs	Intelligent Electronic Devices
IP	Internet Protocol
LD	Logical Device
LN Class	IEC 61850 Logical Node Class
LN Instance	IEC 61850 Logical Node Instance
RTDB	Real Time Data Base

10. Modification Record

VERSION	REVISION	DATE	CHANGE DESCRIPTION
1.00	0	25 th February, 2022	Initial release for G500 v2.70.
2.80	0	24 th June, 2022	Updated for CID Tool general distribution and G500 v2.80
	1	12 th July, 2022	Updated firewall rule status screenshot for IEC61850 server.
	2	05 th August 2022	Updated Object References for IEC 60870-5-103/101/104. Updated LD Name behavior for Service Update: G500_280_01_20220729_LDNAME.DS7zip
3.00	0	12 th March, 2023	Updated for MCP v3.00.
3.10	0	02 nd August, 2023	Updated the section 4.3.2 DNP DCA . i.e., DI point IDs (-169, -170) and DO point IDs (-2047, -2048).
3.11	0	02 nd July, 2024	Updated for CID Tool v8.2.5
	1	01 st August, 2024	Updated GE Vernova Logo, Company name, Copyright Notice and Trademark Notice.
	2	20 th August, 2024	Cyber Security fix is added for CID Tool v8.2.6
5.00	0	08 th November, 2024	Updated for MCP v5.00. Updated Additional Documentation section.
	1	19 th December, 2024	Updated for CID Tool v9.4.6
	2	15 th May, 2025	Updated to GE Vernova style. Updated GE Vernova email addresses and phone numbers in Contact GE Vernova Grid Solutions Technical Support section.
	3	07 th August, 2025	Updated the section 6.5.1 Single IEC 61850 LRU instance .
5.40	0	29 th January, 2026	Updated the section 4.3.4 to add two new pseudo points for SEL DCA.

MCP Firmware Upgrade and Restore to Defaults Workflows

Technical Note

Date: May 15, 2025

Classification: GE Vernova Information

Publication Number: TN0116 V300 R8

Overview

The firmware of the MCP device can be upgraded to provide the latest functionality and improvements. The same process can be used to recover a MCP unit for which all administrator credentials have been lost and it cannot be accessed anymore, resulting into a factory defaulted device.

NOTICE

This document applies to the MCP family (G100/G500) unless otherwise indicated.

Screen captures may show G500 in some areas, however the workflow applies to products in the MCP family (G100/G500).

Prerequisites

For this workflow you require:

1. A G100 or G500 device with:
 - o Keyboard, Video monitor and Mouse and (KVM), or
 - o For G100 only: Serial null modem cable and a serial port on laptop/PC.
 - o For G500 only: Type A to B USB cable connecting G500 front Type B USB port to laptop/PC.
 - This requires the G500 front USB serial driver to be installed in the PC (*CDM21228_Setup.exe* which can be found on the MCP Documentation CD under link "G500 Front Serial USB Driver" or directly in folder \Software of same CD image).
 - o For workflows using the serial maintenance port – the console port redirection must be enabled in UEFI (COM4 for G100, front USB for G500). This is the default UEFI setting. Refer to "SWM0122 Configuring UEFI Settings on G100 User Guide" or "SWM0110 Configuring UEFI Settings on G500 User Guide" or "SWM0125 Configuring UEFI Settings on G500 with Intel Hardware User Guide for details on how to access UEFI, view or edit the console port redirection.
2. A portable USB Flash Drive with storage size **between 8GB and 32GB** inclusively, formatted as FAT32.
 - o When MCP backups are taken on the USB Drive, and to ensure strong protection of the backup data at rest, a hardware encrypted USB Drive is recommended to be used.
NOTE: GE VERNOVA tested the following hardware protected USB model: Apricorn Aegis 3NX.

- o Please note that hardware encrypted USB Drives will have to be placed into a temporary "open" mode while they are connected to the MCP USB port, in order to preserve access across MCP reboot operations. The exact method to do this depends on each hardware encrypted USB, please refer to their associated manuals (e.g. Lock-Override Mode of Apricorn Aegis 3NX USB Drive).
 - o When a hardware encrypted USB Drive is connected in "open" state to the MCP, to initiate process, do not use a cold re-start of the MCP, because this will remove power from the USB which will likely result in a closed USB Drive. Instead, use soft reboot commands for the MCP, from the console, after activating the human presence feature if applicable.
 - o The MCP does not support software encrypted USB Drives.
3. A Windows 7 or 10 PC loaded with the following:
- o **DS Agile Studio** v2.1 or higher for G500
 - o **DS Agile Studio** v2.3 or higher for G100

The high level workflow consists of:

1. Create a USB Drive with correct data.
2. Boot the MCP device from the created USB Drive.
3. Reboot MCP device without the USB Drive.

The following Sections describe in detail each process.

Section 1: Using DSAS “MCP Firmware Upgrade” tool to create the USB disk image

Use the DSAS “MCP Firmware Upgrade” tool to create the USB disk image

In the context of this section: "importing into DSAS" means "adding to the DSAS PC environment a package which is not already available in this environment".

If required packages are already available to be selected and used in the DSAS PC there is no need to re-import them, such action will override the existing ones again.

DSAS may restart after importing packages, this is normal and does not imply the package has to be imported again as long as after restart it shows being available.

"Packages" can be: MCP Firmware Packages, MCP Service Updates, MCP Utilities Packages, MCP Editor Packages.

1. Insert the USB Drive into your PC and Start DS Agile Studio.
2. Launch MCP Firmware Upgrade tool.

From the **File** menu, select **Miscellaneous** → **MCP Firmware Upgrade**.

MCP Firmware Upgrade tool window appears.

3. The ribbon shows from left to right the steps in the order they should be performed in this workflow.
 - A. Import Packages
 - B. USB Actions
 - C. Apply Packages
 - D. Apply Snapshots
 - E. Finish
4. **Under ribbon “Import Packages”** use the options to Import the desired MCP firmware, MCP utilities and MCP Service Update Packages.

At least one MCP Firmware package and one MCP Utilities package is required to be imported. MCP Service Update packages can be optionally imported.

If the packages are already available in the computer, or on a shared drive, for example they have been downloaded and saved previously, you can choose to import them **From File System** otherwise you will need to download them **From Internet**.

If this PC has the packages already imported into this tool - skip this process.

To Import the packages from file system:

Click **From File System** to open Import Package Details dialog.

Click ... to browse the file system to select the package file.

Click **OK** to import the selected package.

Repeat the same process to import more Packages as needed.

Technical Note

To Import the packages from Internet: (Internet Access is required)

Click the drop-down list of **From Internet**.

Select **MCP Firmware**.

The list of available MCP Firmware package files will appear.

Select the desired Firmware Packages that you want to upgrade to and then click **OK**.

Select a folder to store the packages that is about to download.

Once a folder is selected, the downloading will begin.

The package file(s) will be imported after downloaded.

Repeat the same procedure to download and import an MCP Utilities package.

Repeat the same procedure to download and import one or more MCP Service Update packages.

Multiple MCP Firmware, MCP Utilities and MCP Service Update packages can be imported.

5. Under ribbon “USB Actions” - Select the target USB Drive.

Select the USB Drive that you want to use to perform the firmware upgrade and click **OK**.

If the volume label of the USB Drive needs to be updated, click **Yes** to proceed further or click **No** to cancel the process.

Once completed, the volume label will be changed to **MCPFWU** (or **G500FWU** for DS Agile Studio v2.1 and v2.2) and the status is **Scanned**.

Note: If you are prompted with the following warning message, it basically means that you have enhanced security policy in place on your Windows system.

The suggested solutions are:

Option 1:

- 1) Close **MCP Firmware Upgrade** tool and DS Agile Studio.
- 2) Re-launch **DS Agile Studio** in elevated mode, that is, Right click the icon and choose **Run as Administrator**.
- 3) Re-do the above USB actions.

Option 2:

- 1) Close **MCP Firmware Upgrade** tool.
- 2) Open **File Explorer** from Windows.
- 3) Right click the USB Drive to rename it to **MCPFWU** or **G500FWU** for DS Agile Studio v2.1 and v2.2 only. Click **Continue** when you are being prompted with security warning.

Click **Erase** to erase the USB Drive as needed.

Click **Format** to format the USB Drive as needed.

Note: If you are prompted with the following warning message, it basically means that you have enhanced security policy in place on your Windows system.

The suggested solutions are similar as those described above when updating the volume label.

Option 1:

- 1) Close **MCP Firmware Upgrade** tool and **DS Agile Studio**.
- 2) Re-launch **DS Agile Studio** in elevated mode, that is, Right click the icon and choose **Run as Administrator**.
- 3) Select the **USB Drive** and then click **Format**.

Option 2:

- 1) Close **MCP Firmware Upgrade** tool.
- 2) Open **File Explorer** from Windows.
- 3) Right click the USB Drive to choose **Format**. Click **Continue** when you are being prompted with security warning.
- 4) Ensure **FAT32** is selected for the File system.

Add Utilities Package

Only one MCP Utilities package can be added to the USB Drive at a time. The latest version of the MCP Utilities package is compatible with all MCP firmware versions.

Click **Add/Update Utilities Package** to select the desired MCP Utilities package from the list and click **OK**.

It starts verifying and extracting the package and then apply to the USB Drive with below message once completed.

Update Platform Package

From the File menu, select **Miscellaneous** → **Import Package**.

The Import Package Details window appears:

Click the ellipsis after the Package File Name box and browse to the folder named **dsas_packages** on the USB Drive. Then, select the **MCPPlatform.7zip** file:

The Import Package Details dialog shows the MCPPlatform Package selected:

Click **OK**.

If the package was successfully installed, you will get the following message:

If the package is already installed, you will get the following message. However, this means you already have the correct package and so you may continue.

In either case, Click **OK**.

Add Firmware Packages

Multiple MCP Firmware package can be added to the USB Drive.

Click **Add Firmware Package** to select the desired firmware package from the list and click **OK**.

It starts verifying and extracting the package and then apply to the USB Drive with below message once completed. This may take a long time.

Add Service Update Packages

Multiple MCP Firmware package can be added to the USB Drive.

Click **Add Mandatory Service Updates** to add mandatory service updates associated with the firmware packages on the USB Drive and click **OK**.

It starts verifying and extracting the package and then apply to the USB Drive with below message once completed.

7. Under ribbon “Apply Snapshots” - Add MCP Clone Snapshots as needed.

Multiple MCP Clone Snapshots can be added to the USB Drive.

If the MCP Clone Snapshots are already available in the computer, for example, they have been saved from the device previously, you can add them **From File System** otherwise you will need to add it **From Device** directly.

To Add the snapshot from file system:

Click **Add** → **From File System** to open Select snapshot file dialog:

Browse the file system to select the MCP Clone Snapshot file and click **Open**. Multiple file selection under the same folder is also supported.

The snapshot is then being added to the USB Drive with below message once completed.

- Repeat the same procedure to add more snapshots to the USB Drive as needed.

To Add the snapshot from Device:

This is very useful if you are already connected to the device to be upgraded and you wish to take the clone snapshot at exact same moment.

Click **Add → From Device** to open Save Snapshot dialog.

Enter the IP Address of the MCP and click **OK**.

A dialog box titled "Save Snapshot" with a close button (X) in the top right corner. It contains a label "IP Address" above a text input field. The input field has a small icon on the left and contains the text "0 . 0 . 0". At the bottom, there are three buttons: "OK", "Cancel", and "Help".

The Device Snapshot Details window appears.

A window titled "Device Snapshot Details". It has several sections: "Archive File Name:" with a dropdown menu showing "C:\Temp\Upgrade Packages\FWU_Demo.MCPCloneSnapshot.DS7zip" and a browse button "..."; "Device Name:" with a text input field; "Description:" with a text area; "Snapshot contents" with a list of checkboxes: "Configuration data and network settings" (checked), "Hardware, license and diagnostic information" (unchecked), "Log files (password required)" (unchecked), and "Information required to clone this device (password required)" (checked); "Mandatory password (for integrity-checking, cloning devices and including/extracting log files)" with a password input field showing "*****"; and a section "If used, must meet the following requirements:" with four checkboxes: "At least 8 characters" (checked), "At least one uppercase and one lower case letter" (checked), "At least one number" (checked), and "At least one non-alphanumeric character (e.g., @, %, &, *)" (checked). At the bottom are "OK", "Cancel", and "Help" buttons.

Specify the user-defined Archive File Name and leave the default checkbox selections.

Enter **Mandatory password** and ensure this password is available while performing the snapshot restoration after the firmware upgrade.

Click **OK** and then the Confirm Password window appears.

- Enter password again and click **OK** and then a Login popup appears.
- Enter User Name and Password for the physical MCP device and click Login as an administrator.
- The MCP Clone Snapshot file from the MCP device is then saved to the selected location and added the USB Drive as well.

8. Upgrade the snapshots as needed.

This step is intended to convert the configuration settings to the format required by the new MCP firmware version.

Select the archived MCP Clone snapshot in the main tool screen area and click **Upgrade**.

Enter the password when prompted for and click **OK**.

Technical Note

After processing archive is done, click **OK** to go further. Then click **OK** again when prompted to continue.

Specify the file name if you want, otherwise leave the name as what it suggests (it appends _Vxx). Then click **Save**.

A success message will display once the upgrade is done.

9. To conclude, **under ribbon “Finish”** click **Validate** to validate the prepared USB Drive to make sure it is ready to be used for firmware upgrade. Once this process is complete, the status of the integrity of the utility package as well as any firmware packages will be displayed.

10. The USB can now be removed from the PC, to be used in one or more MCP devices.

Section 2: Use the created USB Drive to upgrade the existing firmware and configuration

Depending on the product (G100 or G500) and on the interface used (KVM or Serial Maintenance port) – the steps to boot from the prepared USB Drive and launch the utility to initiate the firmware upgrade are different.

G100 using KVM

- Insert the prepared USB Drive into the blue USB port of the G100 to be updated.
- Connect the KVM (Keyboard / Video monitor / Mouse) to the G100 ports.
- Turn on the power on the G100 or reboot it.
- Press F7 repeatedly until the Boot Menu appears (the setup prompt timeout in G100 UEFI/Boot is set by default to 5 seconds).
- Select the UEFI option for Partition 1 of your USB Drive (e.g. *UEFI: ApricornSecure Key 3.0 0441, Partition 1*).

- A selection screen will be displayed. Select the first option "**MCP Image Upgrade (64bit)**". If need to navigate UP or DOWN – you must use the keys indicated in the message (e.g. ^ and v).

Note: If the GRUB screen shows, press Enter, type exit and press Enter, will take it back to first step.

- This will launch the Firmware Upgrade utility, continue to section “[Firmware Upgrade utility \(all use cases\)](#)”.

G100 using Serial Maintenance port

- Insert the prepared USB Drive into the blue USB port of the G100 to be updated.
- Do not connect a video monitor to the G100 DP as this will prevent redirection of messages to the serial maintenance port (for G100 is either DP or serial maintenance port, not both at the same time).
- Connect a computer with a VT100 Terminal Emulator set to 115200, 8, N, 1 to the serial maintenance port of the G100 (COM4).

Note: If using the *Secure Terminal Emulator* application provided with DS Agile Studio – configure it as below:

Technical Note

- Turn on the power on the G100 or reboot it. Wait (typically 10 seconds) for the message below:
Press <Tab> or to enter setup.
- Press <TAB> or within 4 seconds when the message shows on the terminal console (the setup prompt timeout in G100 UEFI/Boot is set by default to 5 seconds).
- In UEFI, navigate using arrows to last tab "Save & Exit".
- Using arrow down, select the UEFI option for Partition 1 of your USB Drive (e.g. *UEFI OS: ApricornSecure Key*) and click Enter (depending on the USB Drive, it may not show partition number).

- A selection screen will be displayed. Navigate DOWN using the key indicated in the message (e.g. letter **v**) and select the second option "**MCP Image Upgrade (64bit, serial console)**".

Note: If the GRUB screen shows, press Enter, type exit and press Enter, will take it back to UEFI screen.

- This will launch the Firmware Upgrade utility (the messages about no suitable video found are normal in this step):

```
error: no suitable video mode found.  
error: no suitable video mode found.  
Booting in blind modeBooting in blind mode  
  
Starting version 251.4-1-arch  
  
Initializing autorun...
```

- Continue to section “*Firmware Upgrade utility (all use cases)*”.

G500 using KVM

- Insert the prepared USB Drive into any of the front blue USB ports of the G500 to be updated.
- Connect the KVM (Keyboard / Video monitor / Mouse) to the G500 ports.

The G500 must be placed first in a mode where it accepts interrupting POST/BOOT process. For this, perform the following steps:

If the G500 is powered on already:

- Press gently the physical presence button with a paper clip. The physical presence button is shown in the following picture:

- Keep pressing gently and wait approximately 30 seconds until the CPU and Temp LEDs start flashing fast alternatively, in amber color. Remove the paper clip from the physical presence button, the unit is now in “interrupt POST/BOOT mode”.

Note: The unit will remain in “interrupt POST/BOOT mode” until power is cycled, or the physical presence button is pressed again briefly, or up to 6 hours.

- Reboot the unit without cycling the power, e.g. from a Shell or Settings GUI session.
- On the KVM connected keyboard, press F7 repeatedly and fast until the Boot Menu appears (the setup prompt timeout in G500 UEFI/Boot is set by default to 1 second).

If the G500 is **not** powered on:

- Press gently the physical presence button with a paper clip.
- Power on the unit while pressing gently the physical presence button and wait approximately 30 seconds until the CPU and Temp LEDs start flashing fast alternatively, in amber color. Remove the paper clip from the physical presence button, the unit is now in "interrupt POST/BOOT mode".

Note: the unit will remain in "interrupt POST/BOOT mode" until power is cycled, or the physical presence button is pressed again briefly, or up to 6 hours.

- On the KVM connected keyboard press F7 repeatedly and fast until the Boot Menu appears (the setup prompt timeout in G500 UEFI/Boot is set by default to 1 second).

Boot menu appears:

- Select the UEFI option for Partition 1 of your USB Drive (e.g. *UEFI: ApricornSecure Key 3.0 0441, Partition 1*).

- A selection screen will be displayed. Select the first option "**MCP Image Upgrade (64bit)**". If need to navigate UP or DOWN – you must use the keys indicated in the message (e.g. ^ and v).

Note: If the GRUB screen shows, press Enter, type exit and press Enter, will take it back to first step.

- This will launch the Firmware Upgrade utility, continue to section “[Firmware Upgrade utility \(all use cases\)](#)”.

G500 using Serial Maintenance port

- Insert the prepared USB Drive into any of the front blue USB ports of the G500 to be updated.
- One or more video monitors may be connected to the G500 DP++ while interacting using the serial maintenance port (G500 supports mirroring of serial maintenance port actions on the DP++ ports).
- Connect a computer with a VT100 Terminal Emulator set to 115200, 8, N, 1 to the serial maintenance port of the G500 (front USB type B).

Note: If using the *Secure Terminal Emulator* application provided with DS Agile Studio – configure it as below:

The G500 must be placed in a mode where it accepts interrupting POST/BOOT process. For this perform the following steps:

If the G500 is powered on already:

- Press gently the physical presence button with a paper clip. The physical presence button is shown in the following picture:

- Keep pressing gently and wait approximately 30 seconds until the CPU and Temp LEDs start flashing fast alternatively, in amber color. Remove the paper clip from the physical presence button, the unit is now in “interrupt POST/BOOT mode”.

Note: The unit will remain in “interrupt POST/BOOT mode” until power is cycled, or the physical presence button is pressed again briefly, or up to 6 hours.

- Reboot the unit without cycling the power, e.g. from a Shell or Settings GUI session.
- In the Terminal Emulator, press F7 repeatedly and fast until the Boot Menu appears (the setup prompt timeout in G500 UEFI/Boot is set by default to 1 second).

If the G500 is **not** powered on:

- Press gently the physical presence button with a paper clip.
- Power on the unit while pressing gently the physical presence button and wait approximately 30 seconds until the CPU and Temp LEDs start flashing fast alternatively, in amber color. Remove the paper clip from the physical presence button, the unit is now in “interrupt POST/BOOT mode”.

Note: The unit will remain in “interrupt POST/BOOT mode” until power is cycled, or the physical presence button is pressed again briefly, or up to 6 hours.

- In the Terminal Emulator, press F7 repeatedly and fast until the Boot Menu appears (the setup prompt timeout in G500 UEFI/Boot is set by default to 1 second).

Boot menu appears:

- Select the UEFI option for Partition 1 of your USB Drive (e.g. *UEFI: ApricornSecure Key 3.0 0441, Partition 1*).

- A selection screen will be displayed. Navigate DOWN using the key indicated in the message (e.g. letter **v**) and select the second option "**MCP Image Upgrade (64bit, serial console)**".

Note: If the GRUB screen shows, press Enter, type exit and press Enter, will take it back to first step.

- This will launch the Firmware Upgrade utility, continue to section "[Firmware Upgrade utility \(all use cases\)](#)".

Firmware Upgrade utility (all use cases)

Once the utility screen shows – the workflow is common for G100 and G500.

UP or DOWN arrows on the keyboard navigate up or down, the first letter color indicates the selection.

LEFT or RIGHT arrows navigate between horizontally placed buttons.

1. Select the desired firmware image that you want the MCP to upgrade to.

Note: Only images compatible with the device are shown, even if the USB Drive contains both G100 and G500 images.

E.g. For G100:

E.g. For G500:

Technical Note

If no firmware image compatible with the current device type can be found – the message is:

2. A process will start and verify the image file. Once the image file is verified, it won't be verified again on same USB Drive. This verification process takes about 2 minutes.

```
Testing the zip file (G500_2.6.90_20211217_wic.zip) integrity...
Archive:  /tmp/image/images/G500_2.6.90_20211217_wic.zip
testing: predix_edge_OS.wic
```

3. The utility will next prompt whether to install the image on the first disk of your MCP. Press **Yes** or **No**:
 - If you press **Yes**, the firmware upgrade will proceed.

- If you press **No**, the firmware upgrade will be aborted: you will be prompted to remove the USB Drive. Afterwards, the device will reboot and come up with the original firmware and configuration.

NOTE: All MCP units have only one drive, so it is of no concern that the image is always deployed on the first drive.

4. Choose whether you want the device (system) to come up in a factory default state. If you press **Yes**, you will *not* be prompted to restore the clone snapshot in step 9; in other words, the device will be loaded with factory default configuration when the process is done.

If you press **No**, you will be able to restore a clone snapshot in step 9.

NOTE: If you select **No** to the above dialog, runtime information such as logs and database records from the current device will be archived in the folder /prev_version_backup on the upgraded device. Select **Yes** if you do not wish to retain such information (e.g. when wanting to release the device for reuse).

5. Backup and/or Restore current device configuration and data as needed.

This step is intended to address the need of reverting the firmware upgrade so that the original configuration and data will be restored.

6. If you have previously made a device backup during firmware upgrade attempts in the past, you may be prompted whether to restore a device (system) backup. Press **Yes** if you are reverting the firmware upgrade and restore back the saved backup of device configuration and data otherwise simply press **Cancel (No)** to skip it.

7. You will be prompted whether to make a backup of the device (system) configuration and data on this MCP that is to be updated. Such a backup will be used should you decide to revert the firmware upgrade.

If you press **Yes**, it will proceed to back up current device configuration and data.

```
Checking the disk space...
*****
Use partclone with pzstd to save the image.
Image file will be split with size limit 2048 MB.
*****
If this action fails or hangs, check:
* Is the disk full ?
*****
Run partclone: partclone.ext3 -z 10485760 -L /var/log/partclone.log -c -s /dev/sda5 --output - | pzstd -c -
  2> /tmp/split_error.d0KSOI
Partclone v0.3.12 http://partclone.org

File system:  EXTFS
Device size:  117.7 GB = 28733435 Blocks
Space in use:   8.5 GB = 2080789 Blocks
Free Space:   109.2 GB = 26652646 Blocks
Block size:   4096 Byte
Elapsed: 00:00:30, Remaining: 00:01:54, Completed: 20.75%, 3.54GB/min,
current block: 1871728, total block: 28733435, Complete: 6.51%
```

If there is insufficient space on the USB Drive – an error message will be shown:

If you press **No**, the backup process will be bypassed.

8. The utility will continue with restoring the new firmware image to the MCP device and verify the integrity.
The image will be verified on the drive.

This process will take about 6 minutes to complete.

9. If in step 4, you selected **No**, the utility looks on the USB Drive for saved clone snapshots compatible with the same firmware version and device type that was restored.

If no compatible clone snapshot is found, a message will be shown after which the utility will continue with restoring the Factory Default configuration:

The option to restore a clone snapshot will not be available if a backup restore action was selected previously.

The option to restore a clone snapshot will not be available if you chose that you wanted the device to come up in a factory default state previously (**Yes** in step 4).

10. Select the MCP clone snapshot to restore from the USB and press **OK** to proceed further or press **Cancel** to bypass the restoring of snapshot.

Enter the password for the MCP Clone snapshot.

If the MCP Clone snapshot password is not known, then it is not possible to restore it.

11. When done, you will be prompted to remove the USB Drive and close the dialog to reboot the unit. Remove your USB Drive and press **OK**.

NOTE: Cyber security related Certificates are not included in the MCP clone snapshots, and therefore cannot be restored. All certificates must be imported again after the clone snapshot restore. All secure connections using certificates must be re-associated with the new imported certificates (e.g. Secure Connection Relay, VPN Server, etc.).

Alternatively – if the option to Restore Factory Default was selected (**Yes** in step 4) – the success message will be slightly different:

12. Remove the USB Drive, click **OK** and the MCP will reboot to finalize the installation.

Section 3: MCP boot first time after firmware upgrade and final steps

Edge OS POST (boot up) messages are shown only on the Video Output (DP) port. This is why is recommended to perform this process via KVM, or – if the serial maintenance port was used for the firmware upgrade – to connect a monitor to the DP port after the user interactive workflow to upgrade the firmware is finished.

First time after a firmware upgrade – full completion of the POST may take up to 15 minutes, and in absence of a video monitor connected to the DP port showing progress messages – it may be perceived the system is hung or un-responsive. **Do not power off during this time.**

After a first boot - full completion of the POST may take up to 5 minutes.

If a clone snapshot restore action was selected, the device may boot one more time automatically.

Wait for the device to come up again. On the G500, also wait for the G500 product name to appear on the front OLED.

The upgraded MCP device will now be loaded with MCP clone snapshot or backup if one was selected above. If not – it will run the default configuration.

Login to verify the firmware and the restored configuration.

Login with a previous administrator user that was defined in the restored MCP Clone Snapshot or Backup, if one was selected above. If running the factory default configuration, use “defadmin”.

Verify the firmware version number by typing the command “ver”.

```
admin@G500:~$ ver
GE Multilin MCP Firmware Release 200 Production Build 155 2020-05-17:02:40:15
Kernel Version:4.14.71-yocto-standard #1 SMP PREEMPT Sun May 17 01:41:59 UTC 2020
admin@G500:~$
```

Section 4: Use the created USB to re-image the MCP

Use this procedure to erase data and restore to defaults in case where all administrators' credentials have been lost.

1. Follow the same procedure in Section 1:
Use the DSAS "MCP Firmware Upgrade" tool to create the USB disk image.
2. Follow the procedure in Section 2 and Boot from the created USB Drive.
3. Select the firmware image of which the version is identical with the MCP to be defaulted.
4. Make sure to press **Yes** when this dialog pops up.

5. Bypass the step to backup and/or restore the device configuration and data.

You may be prompted whether to restore device backup. If you have previously made a device backup during firmware upgrade attempts in the past. Make sure to press **Cancel** to bypass it.

6. Continue steps in Section 2 to restore the firmware image to the MCP.
7. Verify the integrity by following Section 3.
8. Wait for the device to restart. On the G500, wait for the G500 product name to appear on the front OLED.
9. The upgraded MCP device will be loaded with factory default configuration.
10. Login to verify the firmware and the restored configuration.

Login with the default administrator user credentials, that is, "defadmin" for the username and " defadmin" for the password.

Verify the firmware version number by typing the command "ver".

```
GE Multilin MCP Firmware Release 200 Production Build 159 2020-05-27:08:57:24 + Updates
Kernel Version:4.14.71-yocto-standard #1 SMP PREEMPT Wed May 27 08:28:24 UTC 2020
```

Section 5: Troubleshooting

Power failure during the firmware upgrade

In the event of power failure during the firmware upgrade, the USB Drive may be corrupted in some ways. It should be reformatted before using it to resume the upgrade.

1. If still accessible, copy the files under files-to-restore and backups on the USB to a folder on your PC.

2. Format the USB by using MCP Firmware Upgrade tool.

3. Copy the files under files-to-restore and backups back from the folder on the PC.
4. Repeat the steps in Section [1](#) to prepare the USB Drive and then perform the firmware upgrade once again.

USB flash drive disk runs out of space during a firmware upgrade

The USB flash drive is used to store artifacts from the currently running system, including license keys, logs, database records, and complete partition backups. In the event, the USB Drive runs out of space while such artifacts are being copied to the USB Drive, a message will be displayed indicating that the upgrade failed due to a lack of space on the USB Drive. If this happens, clean the USB Drive as explained in the following steps.

1. View the contents of the USB Drive from Windows File Explorer, for example:

The folders highlighted in yellow above show the folders that will be cleaned in subsequent steps.

2. Navigate to the **backups** folder and remove any unneeded backups. Each backup is stored as a subfolder. Remove the whole subfolder to remove the backup. An example of what you will see is shown as follows:

To determine if a backup is unneeded, review the folder name, which includes the date the backup was made, the firmware version, and the serial number of the MCP device.

3. Navigate to the **images** folder and remove any unneeded image files. An example of what you will see is shown as follows:

To determine if an image is unneeded, review the file name, which includes the type of MCP device (i.e., G500 or G100), and the firmware version.

An optional file ending with “.verified” may be present along with each image file. Delete this file as well when deleting an image. By deleting it, you will ensure that if the same image is copied again to the drive, a test for corruption caused by unsafe USB Drive removal will be performed during the upgrade.

4. Navigate to the **snapshots** folder and remove any unneeded MCP clone snapshot files. An example of what you will see is shown as follows:

5. Move the USB Drive back to the MCP device and perform the firmware upgrade again. If the upgrade still fails due to lack of space on the USB Drive, try reformatting the USB Drive as explained in the previous section or use a larger USB Drive.

Product Support

If you need help with any aspect of your GE Vernova Grid Solutions product, you can:

- Access the GE Vernova Grid Solutions Web site
- Search the GE Vernova Grid Solutions Technical Support library
- Contact GE Vernova Grid Solutions Technical Support

GE Vernova Grid Solutions Web Site

The GE Vernova Grid Solutions Web site provides fast access to technical information, such as manuals, release notes and knowledge base topics. Visit us on the Web at: <https://www.gevernova.com/grid-solutions/>

Substation Automation Technical Support Library

The Technical Support website provides fast access to technical information, such as manuals, release notes, firmware, software, technical notes, and more. To *get* access to the Technical Support Web site, go to:

Document Revision History

Version	Revision	Date	Change Description
1.0	0	14 th Feb, 2020	First Release.
	1	23 rd Feb, 2020	Added config update steps.
2.0	0	26 th May, 2020	Updated for G500 v2.0 release.
	1	15 th June, 2020	Updated factory default workflow.
	2	29 th June, 2020	Updated certificates related information.
	3	13 th July, 2020	Added MCP Platform Package prerequisite.
	4	23 rd July, 2020	Updated to take MCP Platform Package prerequisite from USB.
	5	6 th Nov, 2020	Updated to take MCP Platform Package prerequisite from USB for DSAS 2.2 and below.
3.0	0	6 th May, 2021	Updated for MCP family and Service Update workflows.
	1	26 th May, 2021	Updated "SWM0122 Configuring UEFI Settings on G100 User Guide" reference.
	2	27 th July, 2021	Updated for backwards compatibility with DSAS 2.1 and 2.2, and to always attempt to install the MCP Platform package.
	3	28 th Sep, 2021	Updated GE logo. Added section "USB flash drive disk runs out of space during a firmware upgrade".
	4	09 th Dec, 2021	Updated content in Section 2 and Section 3 showing "only on a locally connected display (KVM)".
	5	17 th Nov, 2022	Updated for MCP v3.0 release.
	6	30 th Jan, 2023	Added DSAS import clarifications in Section 1.
	7	25 th July, 2023	Re-worded and split per device type workflows.
	8	15 th May, 2025	Added "SWM0125 Configuring UEFI Settings on G500 with Intel Hardware User Guide" document reference in Prerequisites section. Updated to GE Vernova style. Updated GE Vernova email addresses and phone numbers in Contact Technical Support section.

Installing Service Updates on MCP

Technical Note

Date: June 30, 2025 **Classification:** GE Vernova Information **Publication Number:** TN0123 V1.00 R4

Overview

The MCP Substation Gateway can be updated to correct software defects or to provide new features between firmware releases. A service update should only be applied if you are experiencing a particular issue addressed by the update. Software modifications that are contained in service updates are all implemented on subsequent firmware releases. All MCP Service Updates are signed by GE Vernova to ensure end to end integrity.

NOTICE

This document applies to the MCP family (G100/G500) unless otherwise indicated.
Screen captures may show G500 in some areas, however the workflow applies to products in the MCP family (G100/G500).

Installing Service Updates

Please refer to the release notes provided with each service update file for information on any restrictions or warning. This workflow applies to the DSAS MCP Studio v2.3 or later version working with full range of the firmware versions of MCP.

For G500 versions prior to DSAS MCP Studio 2.3 – please follow instead “[TN0117] Installing MCP Service Updates pre-DSASv2.3”.

1. Create a device that matches your MCP device if you don't have such an existing device (firmware version, IP address to connect).
2. Perform “Sync From Device” operation if you haven't done so previously.
3. Select the device and click the Properties button to open the device Properties page.

To Import Service Updates from Internet. (Internet Access is Required)

- Click the drop-down list of Import Service Update to PC
- Select From Internet.

- The list of available MCP Service Update files will appear.

- Select the desired MCP Service Update(s) that you want to import to your PC and then click OK.

- Select a folder to store the service updates that are about to download. This folder is for your future re-distribution of the saved files. The import operation will also place the files automatically in their reserved DSAS environment in the PC.

- Once a folder is selected, the downloading will begin.

- The service update file will be imported after it is downloaded (i.e. placed in a reserved DSAS location). If you do not need the files in the folder above (e.g. Temp), you can later remove them, this action will not remove the imported files from the PC.

- You only need to import a given service update once into a given PC, and the list will be shown under **Imported Service Updates in PC**.

To Import Service Updates from file system

- Click the drop-down list of **Import Service Update to PC**
- Select **From File System** to open Import Package Details dialog.

- Click ... to browse the file system to select the service update file.

- Click **OK** to import the selected service update.

- The service update file will be imported after it is selected (i.e. placed in a reserved DSAS location). If you do not need the files in the folder above (e.g. Temp), you can later remove them, this action will not remove the imported files from the PC.
- You only need to import a given service update once into a given PC, and the list will be shown under **Imported Service Updates in PC**.

Available Service Updates

- Under the area **Available Service Updates**, you will see a list of only service updates compatible with this device firmware version. This may be a subset of the **Imported Service Updates in PC** list.
- You may Verify service update **Details**.

- The Details dialog can be re-sized as needed, including the vertical separation bar.
 - If you need, with the Details dialog open, press **CTRL+C** to copy the *Description* content into the Windows Clipboard.
- You can Read Service Update History (Access as Administrator role to MCP device is required).
 - Click **Read Service Update Log** button to bring forth Login process (this will use the IP address configured under the main Properties tab).
 - If you have connected to the device and it is still connected, the login process will be bypassed (as long as the Device Properties dialog is kept open).

- Type in an administrator role User Name and Login window will pop up after clicking **Identify**.

- Type in password and click **Login**.
- Service Update History will then be displayed.
- The following message will pop up in case there are no service updates that have been applied before.

7. Install Service Update.

- Select the desired service update that you want to apply to the MCP and click **Install Service Update**.

Notes:

If there are multiple service updates to be applied, apply one service update at a time.

Unless otherwise instructed in service updates release notes, you should deploy them as needed and in the ascending order of their date.

- You will be prompted with a confirmation dialog to confirm this operation, and that the **MCP will be restarted if you choose to proceed**.
- Click **No** to cancel the operation and **Yes** to continue.

- The process to login to the device is not required if you have already connected to the device in last step and never exited the Device Properties window.

- The message “Applying service update...” will be displayed during the progress.
- The signature of the Service Update is verified, and the service update is placed into to the MCP target device.
- The MCP device will reboot when the update is finished, and a successful message will be displayed as follows.

- When clicking OK, the detailed update log during the process will be displayed as following:

- You may want to review the detailed service update log by scrolling up/down and right/left while waiting for the MCP device to complete the reboot.
- Once the device is ready, click **Read Service Update Log** button again to retrieve and review the summary of service update history and confirm the successful update(s).

- You may copy the log content to the Windows clipboard by click inside the Service Update Log window, then **CTRL+A** and **CTRL+C**.

- Repeat the above steps to apply another service update if needed.

	4	30 th June, 2025	Updated to GE Vernova style.

MCP Firmware Upgrade via PETC

Technical Note

Date: May 15, 2025 **Classification:** GE Vernova Information **Publication Number:** TN0125 V300 R2

Overview

The firmware of the MCP device can be upgraded online, without USB storage required – using PETC (**Predix Edge Technician Console**) to provide the latest functionality and improvements.

Notes:

- G100 versions 2.20, 2.30, 3.00 don't support PETC upgrade.
- G500 versions 2.80, 3.00 support PETC upgrade.
- The MCP's power supply must be kept available and stable during the upgrade. In the event of power failure during the firmware upgrade, the USB upgrade workflow will be required. For more details, refer to “TN0116 MCP Firmware Upgrade and Restore to Defaults Workflows” Technical Note document.
- This PETC based workflow and resulting state of the MCP are different compared to the USB based upgrade workflow described under TN0116.
- With this PETC workflow only the MCP license and configured IP addresses are retained after upgrade.

Prerequisites

For this workflow are required:

1. DSAS (**DS Agile Studio**) v3.0 or higher.
2. Default **Edge Host** IP address or configured **Edge Manager** IP address on MCP.

PETC can be accessed according to below table: Edge Host (**H**, default and always enabled) or via the Edge Manager (**EM**, only one active instance, configurable).

PETC access	Net0	Net1	Net2	Net3	Net4	Net5	Net6
G100		H	EM	EM	EM		
G500	H	EM	EM			EM	EM

- **H - Net0 (G500), Net1(G100):**
 - Recommended to use if the user intends to upgrade the firmware via PETC local access.
 - Edge Host default IP address: 192.168.168.82/24 is already available and can be changed in PETC.
 - The Edge Host Net0 (G500), Net1 (G100) interface intended for PETC access must be configured in PETC. The current IP configuration of Net0 (G500), Net1 (G100) can be viewed, but not changed in mcpcfg or the MCP settings GUI. For more details, refer to Chapter 9 - EdgeManager and PETC in *"SWM0101 MCP Software Configuration Guide"*.
- **EM - Net1 (G500), Net2 (G100, G500), Net3 (G100), Net4 (G100), Net5 (G500), Net6 (G500):**
 - Only one of these interfaces can be configured to access PETC at a time
 - Used if the user intends to upgrade the firmware via PETC remote access
 - Edge Manager (EM) IP address can be configured in mcpcfg or the MCP settings GUI. For example, to configure Net2 in Settings GUI, navigate to **Home → Configure Network Interface → Net1-Net2 → Current/Edit Configuration → Net2 → EdgeManager Connectivity Configuration**. For more details, refer to Chapter 4 - MCP Local Configuration Utilities (mcpcfg) and Chapter 5 - MCP Settings GUI in *"SWM0101 MCP Software Configuration Guide"*.

3. Saved MCP Clone snapshot from MCP device using DSAS (**DS Agile Studio**).
For more details, refer to Chapter 1 - MCP Basics → MCP Configuration → Snapshot Management section in *"SWM0101 MCP Software Configuration Guide"*.
4. Upgraded firmware version of the saved MCP Clone snapshot to the target version.
For more details, refer to Chapter 1 - MCP Basics → MCP Configuration → Snapshot Management section in *"SWM0101 MCP Software Configuration Guide"*.

5. Firmware image in SWU format. Note that G100 and G500 images have different filenames. Obtain the SWU firmware image from DSAS:

- From the **File** menu, select **Miscellaneous** → **Updates**.

- Select **MCP Firmware (PETC)**

- The list of available MCP Firmware (PETC) package files will appear.

- Select the desired Firmware Packages that you want to upgrade to and then click **OK**.
- Select a folder to store the packages that are about to download.

- Once a folder is selected, the downloading will begin.

Upgrade MCP Firmware via PETC

Make sure you maintain the browser open and connected to the target MCP device during entire process, which may take 20 minutes on a G500 4-cores CPU, longer on less capable CPUs.

1. Open a web browser (Chrome recommended) and navigate to <https://<Edge Manager IP Address>>.

Since, the web browser used a self-signed certificate, the browser warns that the connection is not private. You can proceed. For example, on Chrome, click **Advanced**, then **Proceed to _____(unsafe)**.

2. Enter your username and password to login. If this is your first time logging into the PETC, use the default credentials – “admin / admin” and you will be prompted to change your password. For more details, refer to Chapter 9 - EdgeManager and PETC in “*SWM0101 MCP Software Configuration Guide*”.

PREDIX

Edge Technician Console

USERNAME

PASSWORD

Sign In

Copyright © 2019 General Electric Company. All rights reserved.

- When you sign into PETC, the **Device Status** page is displayed. Click **Update OS** to navigate to **Device Setup**.

Note: The version displayed here is the version information for the Predix Edge OS not the MCP firmware.

- On **Host OS** tab, click **Upload OS Update**, you will be prompted with a file selection dialog. You can either **Drag and Drop** the SWU image file here or click **Choose File** to browse the file system and select the SWU image file.

Make sure you select the correct target file for the device: G100 or G500. Selecting the incorrect target file will result in a failed operation which cannot be recovered via PETC process, and will require the USB workflow.

- When the image file is selected, click **Upload** to upload the signed SWU firmware image to target device and wait for the upload to complete.

Note: The version displayed here is the version information for the Predix Edge OS not the MCP firmware.

- When the upload is completed, wait for the following message
“Success! Upgrade file <filename> was uploaded.” to appear before you proceed further. You may need to wait a few minutes to see this message.

Notes:

- Proceeding without this confirmation message will likely cause an upgrade failure.
- In the event of such upgrade failure, the device is still accessible, but the user is advised to delete the firmware image file and upload again.

7. Click **Apply Update** and then **Apply & Restart** and wait for the update process to complete.

- The stage "Applying Update" may take 10 minutes on a G500 4-cores CPU, longer on less capable CPUs.

8. When the update is completed successfully, the MCP device begins restart and PETC console page will be reloaded. This step may take 5 minutes on a G500 4-cores CPU, longer on less capable CPUs.

9. Login to PETC again, messages “**Success! Update applied**” and “**Success! Upgrade file was deleted**” will be displayed on the right top corner of **Device Status** page.

Note: For a dual-core G500 and G100, since it takes longer time to restart, the user may receive a timeout message and a series of errors about inaccessible services. This is normal till the MCP boots up completely with the new firmware installed. From restart to complete initialization it may take up to 9 minutes on a G500 4-cores CPU, longer on less capable CPUs.

10. Now the MCP's firmware is upgraded to the target version
 - The upgraded MCP will now run the default configuration except IP address settings.
 - IP address settings prior to the upgrade will be preserved.
11. Login to the MCP to verify the firmware
 - Use any SSH client to connect to the MCP's Adapter's IP address.
 - Login the MCP by using default credentials – “defadmin / defadmin”.
 - Verify the firmware version number by typing the command “ver”.
12. Restore the upgraded Clone MCP snapshot from DSAS.

For more details, refer to Getting Started → Setup MCP – With a Snapshot section in “*SWM0106 G500 Substation Gateway Quick Start Guide*”.
13. Using mcpcfg or MCP Settings GUI, select Reset Database Tables → Delete Digital Event Data : SOE and Alarm records.

Answer the prompt "Stopping all applications on Gateway (G500)... Are you sure you want to restart applications now?" as Yes.
14. Install Service Updates for target firmware version as needed.

For more details, refer to DS Agile Studio Devices → Device Properties → Gateway Device – Service Updates Tab in “*DS Agile Studio Help*”.

MCP Snapshot and Configuration Workflows

Application Note AN0015

How to Save and Restore Snapshot....

NOTICE

This Application Note supplements the information in the user documentation provided with your product. Read and thoroughly understand all provided user documentation before undertaking any actions shown in this document. Only qualified personnel should perform this procedure.

NOTICE

This document applies to the MCP family (G100/G500).

Screen captures may show G500 in some areas, however the described workflows apply to products in the MCP family (G100/G500).

Snapshots are valid within same MCP product type, are not directly portable between G100-G500.

MCP (G100/G500)

PC with DSAS MCP Studio installed

Save Standard Snapshot Workflow

This creates a file that contains selected settings and configuration of the live MCP.

Start workflow:

From Ribbon, Archive:

From Right click in a project space:

From File > Archive menu:

From Ribbon, Synch From:

Enter IP address of live device

The option to create an offline device is not present because the workflow started outside of a Project context.

All else is identical to workflow started within a Project.

Creating a **Standard** Snapshot comes with various options to include/exclude information from the live device – see the tooltip explanations.

Internal “secrets” are for e.g. internally configured IED passwords, ARRM passwords, email server credentials, etc.

Provide a snapshot name and folder location

The live device's own user data and credentials are saved only if the clone checkbox is selected.

User has an option to encrypt the entire snapshot if this checkbox is selected. If left clear – only existing “secrets” shall be encrypted, and if such “secrets” are present in the live device.

If the standard snapshot is **encrypted** and the snapshot password is lost, **NOTHING** from this snapshot can be restored!

This is the password associated with the created snapshot. The password becomes mandatory if the snapshot contains confidential data (device's own users, internal “secrets”)

If the live device contains internal “secrets” – the user has an option to exclude these from the snapshot.

This is useful when the resulting snapshot is being handled by 3rd party entities / vendors who cannot be in possession of the IED passwords.

Save Snapshot

IP Address: 192 . 168 . 168 . 81

☒ Create device in the current project and page

☒ Standard snapshot
☐ MCP clone snapshot

OK Cancel Help

If this checkbox was selected, after the snapshot has been saved, user will be prompted to enter a Device Name for the device offline creation.

Create new device

Device name: G500_01

OK Cancel

Password required

Mandatory password (for encryption)

☐ Exclude IED and email passwords from archive

OK Cancel Help

In this case, the live device contains internal “secrets” – and the user chose to **exclude** these from the snapshot.

The resulting snapshot (and offline device if selected to be created) are void of any “secrets” that were configured in the live device.

If an optional password was applied, and this password is lost - the non-clone Settings and Configuration data can still be restored, but the anti-tampering data at rest confidence cannot be verified.

DS Agile Studio™

Are you sure you want to exclude passwords from the archive? You will not be able to connect to any IEDs referenced in the device configuration(s) that require passwords. Do you wish to continue?

Yes No

Enter the live device's administrator credentials

Save MCP Clone Snapshot Workflow (used also for Firmware Upgrade)

This creates a file that contains all settings, users, and configuration of the live MCP.

Start workflow:

From Ribbon, Archive:

From Right click in a project space:

From File > Archive menu:

From Ribbon, Synch From:

Enter IP address of live device

A screenshot of the 'Save Snapshot' dialog box. It features an 'IP Address' field with the value '192.168.168.81'. Below this is a checked checkbox labeled 'Create device in the current project and page'. There are two radio button options: 'Standard snapshot' and 'MCP clone snapshot', with 'MCP clone snapshot' being selected. At the bottom are 'OK', 'Cancel', and 'Help' buttons.

The option to create an offline device is not present because the workflow started outside of a Project context.

All else is identical to workflow started within a Project.

A screenshot of the 'Save Snapshot' dialog box, identical to the one on the left. It shows the 'IP Address' field with '192.168.168.81', the 'Create device in the current project and page' checkbox checked, and the 'MCP clone snapshot' radio button selected.

Save Snapshot

IP Address: 192 . 168 . 168 . 81

☒ Create device in the current project and page

☐ Standard snapshot
☒ MCP clone snapshot

OK Cancel Help

Creating a MCP Clone Snapshot comes with various options to include/exclude information from the live device (HW, License, Logs).

Internal “secrets” are for e.g. internally configured IED passwords, ARRM passwords, email server credentials, etc.

Device Snapshot Details

Archive File Name: C:\Temp\Snap_Workflows\G500_01.MCPCloneSnapshot.DS7zip

Device Name:

Description:

Snapshot contents

- ☒ Configuration data and network settings
- ☒ Hardware, license and diagnostic information
- ☒ Log files (password required)
- ☒ Information required to clone this device (password required)

Mandatory password (for encryption)

.....

If used, must meet the following requirements:

- ☒ At least 8 characters
- ☒ At least one uppercase and one lower case letter
- ☒ At least one number
- ☒ At least one non-alphanumeric character (e.g., @, %, &, *)

OK Cancel Help

Provide a snapshot name and folder location

The live device's own user data and credentials, and all internal “secrets” are always part of an MCP Clone snapshot.

The MCP Clone snapshot is always encrypted using this password.
If the snapshot password is lost, NOTHING from this snapshot can be restored!

A snapshot may contain different data, depending on the user's choices.

All snapshots contain configuration data and network settings.

Optionally, the user may choose to include:

- Log files created by the device
- Hardware, license and diagnostic information for the benefit of the Technical Support team
- Additional information allowing the user to clone an existing configuration

For all choices except 'cloning' and log files, the snapshot file may be optionally secured by specifying a password.

Cloning data can only be restored when the correct password is provided.

Please note there is no alternative method through GE Digital Energy to obtain the password entered when the snapshot was saved.

Please click on the Help button for more information on cloning, and the use of passwords.

There is no option to exclude “secrets” from the MCP Clone snapshot.

The 'Save Snapshot' dialog box contains the following elements:

- IP Address:** A text field with the value '192.168.168.81'.
- Create device in the current project and page:** A checkbox that is checked.
- Snapshot Type:** Two radio buttons: 'Standard snapshot' (unselected) and 'MCP clone snapshot' (selected).
- Buttons:** 'OK', 'Cancel', and 'Help' buttons at the bottom.

If this checkbox was selected, after the snapshot has been saved, user will be prompted to enter a Device Name for the device offline creation.

The 'Create new device' dialog box contains the following elements:

- Device name:** A text field with the value 'G500_01' highlighted in yellow.
- Buttons:** 'OK' and 'Cancel' buttons at the bottom.

The MCP Clone snapshot (and offline device if selected to be created) contains all live device's user confidential data and secrets, and is protected with the user provided strong password.

If the MCP Clone snapshot password is lost, NOTHING from this snapshot can be restored!

Enter the live device's administrator credentials (must use administrator role)

The 'Device Snapshot Details' dialog box contains the following fields and options:

- Archive File Name:** A dropdown menu showing 'C:\Temp\Snap_Workflows\G500_01.MCPCloneSnapshot.DS7zip' with a browse button.
- Device Name:** An empty text field.
- Description:** An empty text area.
- Snapshot contents:** A list of checkboxes, all of which are checked:
 - Configuration data and network settings
 - Hardware, license and diagnostic information
 - Log files (password required)
 - Information required to clone this device (password required)
- Mandatory password (for encryption):** A password field with a masked password '*****'. Below it, a note states: 'If used, must meet the following requirements:' followed by a list of requirements, all checked:
 - At least 8 characters
 - At least one uppercase and one lower case letter
 - At least one number
 - At least one non-alphanumeric character (e.g., @, %, &, *)
- Buttons: OK, Cancel, and Help.

The 'Login' dialog box has a 'User Name' field containing 'admin' and two buttons: 'Identify' and 'Cancel'.

This dialog box displays an error message: 'UNAUTHORIZED ACCESS TO THIS DEVICE IS PROHIBITED'. Below the message, it states: 'You must have explicit permission to access or configure this device. All activities may be logged. Violations of policy governing this device may result in disciplinary action and may be reported to law enforcement. There is no right to privacy in accessing this device.' At the bottom, there are 'User Name' and 'Password' fields (the password is masked with '*****') and 'Login' and 'Cancel' buttons.

The 'Retrieving snapshot from device' dialog box shows a progress bar that is 100% complete.

The 'DS Agile Studio' notification dialog box contains an information icon and the following text: 'Device has been archived to C:\Temp\Snap_Workflows\G500_01.MCPCloneSnapshot.DS7zip'. Below this, a red-bordered box contains the warning: 'Please note that if you forget this password, you will not be able to access or restore any part of the contents of this snapshot.' An 'OK' button is at the bottom.

Offline devices do NOT contain credentials for the users in the live device (only snapshots do, and only if the “clone” option has been selected).

The resulting offline device (if selected to be created) retains all “secrets” from the live device, but these can only be used to connect to the specific IEDs.

User cannot read back any secrets (and these are securely stored inside DSAS repository).

Please specify which SEL Binary IED you would like to connect

Restore Snapshot to a Live Device Workflow

This restores to a MCP all or selected settings, users, and configuration data from a snapshot file.

Start workflow:

From Ribbon, Archive:

From Right click in a project space:

From File > Archive menu:

From Ribbon, Synch To:

Enter IP address of live device

The option to create an offline device is not present because the workflow started outside of a Project context.

All else is identical to workflow started within a Project.

The 'Restore Snapshot' dialog box features a title bar with a close button (X). Below the title bar is a section labeled 'IP Address' containing a text input field with the value '192.168.168.81'. At the bottom of the dialog are three buttons: 'OK', 'Cancel', and 'Help'.

The data options to be restored depend on the type and content of the selected snapshot file.

If various data types were not included in the snapshot file, the associated options will not be visible here.

User has a choice to select what data types to restore.

If the snapshot file contains confidential data (users, “secrets”), the snapshot password must be provided for this type of data to be restored.

Otherwise, this data will be excluded from the restore operations.

If the selected snapshot file is of type “MCP Clone”, or “Standard and Encrypted”, the password associated with the snapshot file must be provided, otherwise **NOTHING** can be restored!

Select the snapshot file to be restored

The 'Restore Snapshot Details' dialog box has a title bar. It contains several fields: 'Archive File Name' with a text box showing 'C:\Temp\Snap_Workflows\STD_FULL.MCPSnapshot.DS7zip' and a browse button (...); 'Archived Device Name' with a text box showing 'MCP'; and a 'Description' text area. Below these are three checked checkboxes: 'Restore configuration data', 'Restore network settings', and 'Restore information required to done a device'. At the bottom is a section titled 'Mandatory password (for encryption)' with a password input field (masked with dots) and a checkbox labeled 'Reset IED and email passwords in restored device(s)'. At the very bottom are 'OK', 'Cancel', and 'Help' buttons.

If the snapshot file contains internal “secrets” – the user has an option to exclude these from the restore operation.

If this checkbox was selected, after the snapshot has been restored, user will be prompted to enter a Device Name for the device offline creation.

Firmware upgrade:

If the live device contains a firmware version higher than the one in the snapshot – the snapshot is first upgraded to the firmware version of the live device, after which is restored to the live device.

In addition in this case, if “create device in current project” checkbox was also selected – the offline device created will also the new firmware version, same as the live device. This is to allow user to have both a restored online device and an offline one that match each other.

Configuration compare:

Optionally, the user may wish to perform workflow “Restore Snapshot to an Offline Device”, selecting the same initial snapshot (with the older firmware version) – resulting into a second offline device (with a different name), with the initial firmware version from the snapshot.

A configuration compare action can then be performed across the two offline devices if desired.

Restore Snapshot to an Offline Device Workflow

This creates an offline device from a snapshot file
(only Configuration data)

Start workflow:

From Ribbon, Archive:

From Right click in a project space:

Enter the Name for the offline device

Only Configuration data can be restored to an offline device

If the snapshot file contains confidential data ("secrets"), the snapshot password must be provided for this type of data to be restored. Otherwise, this data will be excluded from the restore operations.

Restore Snapshot Details

Archive File Name: C:\Temp\Snap_Workflows\STD_FULL.MCPSnapshot.DS7zip

Archived Device Name: MCP

Description:

Restore Device Name: MCP

☒ Restore configuration data

If the snapshot file contains internal "secrets" – the user has an option to exclude these from the restore operation.

Mandatory password (for encryption)

Reset IED and email passwords in restored device(s)

OK Cancel Help

Select the snapshot file to be restored

Restore Snapshot to a Folder Workflow

This creates an offline Folder with Configuration data from a snapshot file.

Start workflow:

From Ribbon, Archive:

From Right click in a project space:

From File > Archive menu:

See next page

From previous page:

The screenshot shows the 'Restore Snapshot To Folder Details' dialog box. It contains the following fields and controls:

- Archive File Name:** A text box with the value 'C:\Temp\Snap_Workflows\STD_FULL.MCPSnapshot.DS7zip' and a browse button (...).
- Archived Device Name:** A text box with the value 'MCP'.
- Description:** A large text area.
- Restore Device Name:** A text box with the value 'MCP'.
- Restore configuration data:** A checked checkbox.
- Mandatory password (for encryption):** A text box with masked characters (dots).
- Reset IED and email passwords in restored device(s):** An unchecked checkbox.
- Buttons:** OK, Cancel, and Help.

Annotations with arrows point to the following elements:

- An arrow from 'From previous page:' points to the 'Archive File Name' field.
- An arrow from 'Select the snapshot file to be restored' points to the browse button (...).
- An arrow from 'Only Configuration data can be restored to a Folder' points to the 'Restore configuration data' checkbox.
- An arrow from 'If the snapshot file contains confidential data ("secrets"), the snapshot password must be provided for this type of data to be restored, but will remain encrypted.' points to the 'Mandatory password (for encryption)' text box.
- An arrow from 'Otherwise, this data will be excluded from the restore operations.' points to the 'Reset IED and email passwords in restored device(s)' checkbox.
- An arrow from 'See next page' points to the 'OK' button.

Tables

Table 1 Objects/Variations/Qualifiers/Function Codes supported by the MCP DNP3 Server9

1. DNP3 Server Application on MCP - Device Profile Document

This document summarizes the MCP DNP3 Server implementation of the DNP3 protocol. Several items in the Device Profile Document require additional explanation. All timeouts used by the DNP3 Server are configurable.

Each digital input point configured in the DNP3 Server is monitored for digital input change events. The user configures whether to report these as time-tagged or non-time-tagged digital events.

Counters rollover at whatever variation they are configured for. For example, if the counter is configured for a 32-bit variation, then it rolls over at 32 bits.

Unsolicited responses in the DNP3 Server are enabled and disabled for all classes (class 1, class 2 and class 3). However, if unsolicited responses are disabled in the configuration, unsolicited responses cannot be enabled or disabled during run-time via requests from the master station.

If unsolicited responses are enabled for one or more classes, the following IIN exceptions generate unsolicited responses: device restart, need time synchronization, and digital event buffer overflow.

The default variation of the static objects and change objects are configurable. When the Master requests data with all variations, the DNP3 Server responds with the configured variation. When the Master requests with a specific variation, the DNP3 Server responds with requested variation.

DNP3 DEVICE PROFILE DOCUMENT		
This document is accompanied by a table having the following headings:		
Object Group	Request Function Codes	Response Function Codes
Object Variation	Request Qualifiers	Response Qualifiers
Object Name (optional)		
Vendor Name: GE Vernova Grid Solutions		
Device Name: MCP DNP3 Server (both Serial and LAN)		
Highest DNP3 Level Supported:		Device Function:
For Requests	Level 3	☐ Master ☒ Outstation
For Responses	Level 3

Sends Multi-Fragment Responses: ☒ Yes ☐ No				

Table 1 explains which objects/variations are used with which Function Codes and Qualifier Codes by the MCP DNP3 Server implementation.

To understand the table, consider the third row of Table 1. This row specifies how object 1, variation 2 (Binary Input with Status) is accessed. To access this type of object, the DNP3 Server shall process a request using Function Code 1 (READ) with a Qualifier Code in the range of 00, 01, or 06. The DNP3 Server shall respond with Function Code 129 (RESPONSE), Qualifier Code 01. The DNP3 Server shall also support a request using Function 2 (WRITE).

Table 1 Objects/Variations/Qualifiers/Function Codes supported by the MCP DNP3 Server

Obj.	Var.	Description	Request Function Code	Request Qualifier Codes (Hexadecimal)	Response Function Code	Response Qualifier Codes (Hexadecimal)
1	0	BINARY INPUT-ALL VARIATIONS	1, 22	00, 01, 06	Not Used	Not Used

MODIFICATION RECORD

VERSION	REVISION	DATE	CHANGE DESCRIPTION
1.00	0	02 nd May, 2019	Created.
2.00	0	18 th October, 2021	Added support for Double-Bit Binary Inputs.
	1	09 th September, 2025	GE Vernova Logo is added on the first page. Updated Company name, Copyright Notice and Trademark Notice. Updated to GE Vernova style.

DNP3 Client (DCA) for the MCP

Conformance Statement

Associated with NTEK-A023M-0CS

Version 2.00 Revision 2

Associated Software Release: Version 2.60

1. DNP3 Client Application on MCP – Device Profile Document

This document contains the Device Profile for the DNP3 Client Application on the MCP. Note that this Profile applies to the Client Application, not to the entire MCP.

DNP3 Device Profile Document	
Vendor Name: GE Vernova Grid Solutions	
Device Name: MCP DNP3 Client (both Serial and LAN).	
Highest DNP Level Supported: For Requests 2 For Responses 3	Device Function: ☒ Master ☐ Slave
Notable objects, functions, and/or qualifiers supported in addition to the Highest DNP Levels Supported (the complete list is described in the attached table): = Accepts many more qualifiers than specified in Level 3. = Can issue Enable Unsolicited Response for Class 1, 2 and 3 upon receipt of Null Unsolicited Response.	
Maximum Data Link Frame Size (octets): Transmitted ____ 292 ____ Received ____ 292 ____	Maximum Application Fragment Size (octets): Transmitted ____ 100 to 65535 ____ Received ____ 100 to 65535 ____
Maximum Data Link Re-tries: ☐ None ☐ Fixed at ____ ☒ Configurable, range 0 to 255 (config file)	Maximum Application Layer Re-tries: ☐ None ☐ Fixed at ____ ☒ Configurable, range 0 to 255 (config file)
Requires Data Link Layer Confirmation: ☐ Never ☐ Always ☐ Sometimes If 'sometimes', when? ____ ☒ Configurable If 'configurable', how? Using a config file	
Requires Application Layer Confirmation: ☒ Never ☐ Always (not recommended) ☐ When reporting Event Data (Slave devices only) ☐ When sending multi-fragment responses (Slave devices only) ☐ Sometimes If 'sometimes', when? ____ ☐ Configurable If 'configurable', how? ____	

DNP3 Device Profile Document		
Timeouts while waiting for:		
Data Link Confirm	☐ None	☐ Fixed at _____
☐ Variable	☒ Configurable	
Complete Appl. Fragment	☐ None	☐ Fixed at _____
☐ Variable	☒ Configurable	
Application Confirm	☒ None	☐ Fixed at _____
☐ Variable	☐ Configurable	
Complete Appl. Response	☒ None	☐ Fixed at _____
☐ Variable	☐ Configurable	
Others _____		
Sends/Executes Control Operations:		
WRITE Binary Outputs	☒ Never	☐ Always
	☐ Sometimes	☐ Configurable
SELECT/OPERATE	☐ Never	☐ Always
	☒ Sometimes	☐ Configurable
DIRECT OPERATE	☐ Never	☐ Always
	☒ Sometimes	☐ Configurable
DIRECT OPERATE - NO ACK	☐ Never	☐ Always
	☒ Sometimes	☐ Configurable
Count > 1	☐ Never	☐ Always
	☒ Sometimes	☐ Configurable
Pulse On	☐ Never	☐ Always
	☒ Sometimes	☐ Configurable
Pulse Off	☐ Never	☐ Always
	☒ Sometimes	☐ Configurable
Latch On	☐ Never	☐ Always
	☒ Sometimes	☐ Configurable
Latch Off	☐ Never	☐ Always
	☒ Sometimes	☐ Configurable
Queue	☒ Never	☐ Always
	☐ Sometimes	☐ Configurable
Clear Queue	☒ Never	☐ Always
	☐ Sometimes	☐ Configurable
The type of control operation issued depends on the local software executing and the configuration of the DNP3 Client. The Client can be configured to send all controls as Direct Operate, SBO, or Direct Operate No Ack. The Client can only send one control per DNP message.		

DNP3 Device Profile Document	
Reports Binary Input Change Events when no specific variation requested (Slave Only): ☒ Never ☐ Only time-tagged ☐ Only non time-tagged ☐ Configurable to send both, one or the other (attach explanation)	Reports time-tagged Binary Input Change Events when no specific variation requested: ☒ Never ☐ Binary Input change with time ☐ Binary Input change with Relative time ☐ Configurable (attach explanation)
Master Expects Binary Input Change Events: ☒ Either time-tagged or non-time-tagged for a single event ☐ Both time-tagged and non-time-tagged for a single event ☐ Configurable (attach explanation)	
Sends Unsolicited Responses (Slave Only): ☒ Never ☐ Configurable (attach explanation) ☐ Only certain objects ☐ Sometimes (attach explanation) ☐ ENABLE/DISABLE UNSOLICITED Function codes Supported	Sends Static Data in Unsolicited Responses (Slave Only): ☒ Never ☐ When Device Restarts ☐ When Status Flags Change No other options are permitted.
Sends Multi-Fragment Responses (Slave Only): ☐ Yes ☒ No	

The Client sends to remote devices the subset of DNP3 objects, variations, qualifiers and function codes listed in Table 1.

Table 1: DNP3 Subset Sent by the Client under normal operation

Object			Request		
Obj	Var	Description	Function Codes	Qual Codes (Hex)	Sent...
1	0	Binary Input [All variations]	READ (1)	06	On a periodic basis as configured by the user
2	0	Binary Input Change [All variations]	READ (1)	06	On a periodic basis as configured by the user
3	0	Double-Bit Binary Input [All variations]	READ (1)	06	On a periodic basis as configured by the user
4	0	Double-Bit Binary Input Change [All variations]	READ (1)	06	On a periodic basis as configured by the user
10	1	Binary Output Status	READ (1)	06	On a periodic basis as configured by the user Sent immediately following the issue of a CROB command. Also sent (according to user config) if LOCAL IIN detected.
12	1	Control Relay Output Block	SELECT (3) OPERATE (4) DIRECT OPERATE (5) DIRECT OPERATE - NO ACK (6)	28	Only on demand.
20	0	Binary Accumulators [All Variations]	READ(1)	06	On a periodic basis as configured by the user
21	0	Frozen Accumulators [All Variations]	READ(1)	06	On a periodic basis as configured by the user
22	0	Accumulator Change Events [All Variations]	READ(1)	06	On a periodic basis as configured by the user
23	0	Frozen Accumulator Change Events [All Variations]	READ(1)	06	On a periodic basis as configured by the user

Object			Request		
Obj	Var	Description	Function Codes	Qual Codes (Hex)	Sent...
30	0,1,2,5,6	Analog Inputs [All Variations, 16 Bit, 32 Bit, Float, Long Float]	READ(1)	06	On a periodic basis as configured by the user
32	0	Analog Input Change Events [All Variations]	READ(1)	06	On a periodic basis as configured by the user
40	0,1,2	Analog Outputs [All Variations, 16 Bit, 32 Bit]	READ(1)	06	On a periodic basis as configured by the user
50	1	Time and Date	WRITE (2)	07 quant = 1	Regularly scheduled and/or in response to TIME SYNC REQUIRED IIN.
60	1	Class 0 Data	READ (1) ENABLE UNSOLICITED (20) DISABLE UNSOLICITED (21)	06	READ sent periodically, in response to various IINs. ENABLE/DISABLE UNSOLICITED sent as configured upon startup, and on receipt of a NULL Unsolicited Response
60	2	Class 1 Data	READ (1)	06	On periodic basis, to retrieve a configured number of class 1 events.
				06	On periodic basis, in response to various IINs.
			ENABLE UNSOLICITED (20) DISABLE UNSOLICITED (21)	06	ENABLE/DISABLE UNSOLICITED sent as configured upon startup, and on receipt of a NULL Unsolicited Response
60	3	Class 2 Data	READ (1)	08	On periodic basis, to retrieve a configured number of class 2 events.
				06	On periodic basis, in response to various IINs.
			ENABLE UNSOLICITED (20) DISABLE UNSOLICITED (21)	06	ENABLE/DISABLE UNSOLICITED sent as configured upon startup, and on receipt of a NULL Unsolicited Response

Object			Request		
Obj	Var	Description	Function Codes	Qual Codes (Hex)	Sent...
60	4	Class 3 Data	READ (1)	08	On periodic basis, to retrieve a configured number of class 3 events.
				06	On periodic basis, in response to various IINs.
			ENABLE UNSOLICITED (20) DISABLE UNSOLICITED (21)	06	ENABLE/DISABLE UNSOLICITED sent as configured upon startup, and on receipt of a NULL Unsolicited Response
80	1	Internal Indication	WRITE (2)	00	On receipt of a response containing the DEVICE RESTART bit set.
No object			DELAY MEASUREMENT (23)	None	On demand. If Auto Time Synchronization Enable is True it will also be sent in response to the TIME SYNC NEEDED IIN.

1.1 Profile of Normal Operation

The following table describes all the DNP3 objects, function codes, and qualifiers sent or received by the DNP3 Client software during normal operation. Each line of the table lists an object variation.

If the *Request* columns are blank, the Client does not send that object variation to remote devices. If the *Request* columns are non-blank, they indicate that the Client sends that object variation, with the specified function codes, under certain conditions.

The *Sent When* column describes these conditions, as follows:

- D** : The Client sends the request when a local software application **Demands** it do so.
- O** : The Client sends the request following a previous **Output** request.
- I** : The Client sends the request as a result of an **Internal Indication** from the remote device.
- A** : The Client sends the request **Automatically** as a part of its own operation, e.g. at start-up time, or if the local time changes.
- P** : The Client sends the request **Periodically**.
- (C)** : Following any of the above indicates the Client can be **Configured** to perform or not perform the request in this manner.

If the *Response* columns are blank, the Client does not accept the object variation and will discard any message containing that object variation. If the *Response* columns are non-blank, the Client accepts the object variation in responses, provided the remote device uses a valid function code and qualifier.

A “✓” in the *Uses* column means that the Client stores or forwards the data; otherwise, it ignores the object when parsing.

Table 2: DNP3 Subset Implemented by the Client

MODIFICATION RECORD

VERSION	REVISION	DATE	CHANGE DESCRIPTION
1.00	0	02 nd May, 2019	Created.
2.00	0	20 th October, 2021	Added support for Double-Bit Binary Inputs.
	1	10 th December, 2021	Removed support for Object Groups 31 and 33.
	2	10 th September, 2025	GE Vernova Logo is added on the first page. Updated Company name, Copyright Notice and Trademark Notice. Updated to GE Vernova style.

IEC 60870-5-101-104 Server (DPA) for the MCP

Conformance Statement

NTEK-A024M-0CS

Version 1.00 Revision 3

Associated Software Release: Version 1.00

Tables

No table of figures entries found.

1. IEC 60870-5-101 DPA Interoperability Profile

This interoperability profile presents the sets of parameters and alternatives, and identifies by selection, those items required for implementation in the GE Vernova Grid Solutions MCP. The following legend reflects the options used in this selection of requirements:

- ☒ Function or ASDU is used as standardized (default)
- ☐ A black check box indicate that the option cannot be selected (and is thus not required)
- ☒ Function or ASDU is used in reverse mode
- ☒ Function or ASDU is used in standard and reverse mode
- ☐ Function or ASDU is not used

In cases where several options are available, for example, multiple lengths of address fields, the GE Vernova Grid Solutions MCP shall be configurable to use the required value.

In this document, the bracketed number trailing each subheading title refers to the corresponding section number within the IEC® 60870-5-101 standard.

1.1 System or Device (8.1)

- ☐ System definition
- ☐ Controlling station definition (Master)
- ☒ Controlled station definition (Slave)

1.2 Network Configuration (8.2)

(network-specific parameter)

- | | |
|---|---|
| ☒ Point-to-point | ☒ Multipoint-party line |
| ☒ Multiple point-to-point | ☒ Multipoint-star |

1.3 Physical Layer (8.3)

(network-specific parameter)

1.3.1 Transmission Speed (Control Direction)

Unbalanced interchange circuit V.24/V.28 Standard	Unbalanced interchange circuit V.24/V.28 Recommended if > 1,200 bit/s	Balanced Interchange Circuit X.24/X.27	
☐ 100 bit/s	☒ 2,400 bit/s	☐ 2,400 bit/s	☐ 56,000 bit/s
☐ 200 bit/s	☒ 4,800 bit/s	☐ 4,800 bit/s	☐ 64,000 bit/s
☐ 300 bit/s	☒ 9,600 bit/s	☐ 9,600 bit/s	
☒ 600 bit/s	☒ 19,200 bit/s	☐ 19,200 bit/s	
☒ 1,200 bit/s		☐ 38,400 bit/s	

1.3.2 Transmission Speed (Monitor Direction)

Unbalanced Interchange Circuit V.24/V.28 Standard	Unbalanced Interchange Circuit V.24/V.28 Recommended if > 1,200 bit/s	Balanced Interchange Circuit X.24/X.27	
☐ 100 bit/s	☒ 2,400 bit/s	☐ 2,400 bit/s	☐ 56,000 bit/s
☐ 200 bit/s	☒ 4,800 bit/s	☐ 4,800 bit/s	☐ 64,000 bit/s
☐ 300 bit/s	☒ 9,600 bit/s	☐ 9,600 bit/s	
☒ 600 bit/s	☒ 19,200 bit/s	☐ 19,200 bit/s	
☒ 1,200 bit/s		☐ 38,400 bit/s	

NOTE: The DPA shall only support the Unbalanced Interchange (Circuit V2.4/V2.8). The combination of V.24 and V.28 is ITU-T's equivalent to the EIA's RS-232.

1.4 Link Layer (8.4)

(network-specific parameter)

Frame format FT 1.2 (IEC 60870-5-1 Section 6.2.4.2) fixed and variable length is used (length is configurable).

Single character 1 (IEC 60870-5-1 Section 6.2.4.3) is used as an acknowledge.

Fixed time out interval is used (value is configurable).

Link Transmission Procedure

- ☒ Balanced transmission
- ☒ Unbalanced transmission

Frame Length

Maximum length L (number of bytes)

Number of repetitions.

Address Field of the Link

- ☐ Not present (balanced transmission only)
- ☒ One byte
- ☒ Two bytes
- ☒ Structured
- ☒ Unstructured

NOTE: For unbalanced mode, Maximum Frame Length (L) = Maximum ASDU frame length. For balanced mode, Max Frame Length (L) = Maximum ASDU frame length + 1 + Link Address Length.

When using an unbalanced link layer, the following ASDU types are returned in Class 2 messages (low priority) with the indicated clauses of transmission:

- ☒ The standard assignment of ASDUs to Class 2 messages is used as follows

Type identification	Cause of transmission
9,11,13,21	<1>

- ☒ A special assignment of ASDUs to Class 2 messages is used as follows

Type identification	Cause of transmission
1,3,5,7,9,11,13,21	<2>
1,2,3,4,5,6,7,8,9,10,11,12,13,14,21,30,31,32,33,34,35,36	<5>
1,3,5,7,9,11,13,21	<20-36>

NOTE: In response to a Class 2 poll, a controlled station can respond with Class 1 data when there is no Class 2 data available.

1.5 Application Layer (8.5)

1.5.1 Transmission Mode for Application Data

Mode 1 (Least significant byte first), as defined in clause 4.10 of IEC 60870-5-4, is used exclusively for all application data.

1.5.2 Common Address of ASDU

(system-specific parameter)

- ☒ One byte ☒ Two bytes

1.5.3 Information Object Address

(system-specific parameter)

- ☒ One byte ☒ Structured
☒ Two bytes ☒ Unstructured
☒ Three bytes

1.5.4 Cause of Transmission

(system-specific parameter)

- ☒ One byte ☒ Two bytes (with originator address).
Set to zero in case of no originator address

1.5.5 Selection of Standard ASDUs

1.5.5.1 Process Information in Monitor Direction

(station-specific parameter)

☒	<1>	:= Single-point information	M_SP_NA_1
☒	<2>	:= Single-point information with time tag	M_SP_TA_1
☒	<3>	:= Double-point information	M_DP_NA_1
☒	<4>	:= Double-point information with time tag	M_DP_TA_1
☒	<5>	:= Step position information	M_ST_NA_1
☒	<6>	:= Step position information with time tag	M_ST_TA_1
☒	<7>	:= Bitstring of 32 bits	M_BO_NA_1
☒	<8>	:= Bitstring of 32 bits with time tag	M_BO_TA_1
☒	<9>	:= Measured value, normalized value	M_ME_NA_1
☒	<10>	:= Measured value, normalized value with time tag	M_ME_TA_1
☒	<11>	:= Measured value, scaled value	M_ME_NB_1
☒	<12>	:= Measured value, scaled value with time tag	M_ME_TB_1
☒	<13>	:= Measured value, short floating-point value	M_ME_NC_1
☒	<14>	:= Measured value, short floating-point value with time tag	M_ME_TC_1
☒	<15>	:= Integrated totals	M_IT_NA_1
☒	<16>	:= Integrated totals with time tag	M_IT_TA_1
☐	<17>	:= Event of protection equipment with time tag	M_EP_TA_1
☐	<18>	:= Packed start events of protection equipment with time tag	M_EP_TB_1
☐	<19>	:= Packed output circuit information of protection equipment with time tag	M_EP_TC_1
☐	<20>	:= Packed single-point information with status change detection	M_PS_NA_1
☒	<21>	:= Measured value, normalized value without quality descriptor	M_ME_ND_1
☒	<30>	:= Single-point information with time tag CP56Time2a	M_SP_TB_1
☒	<31>	:= Double-point information with time tag CP56Time2a	M_DP_TB_1
☒	<32>	:= Step position information with time tag CP56Time2a	M_ST_TB_1
☒	<33>	:= Bit string of 32 bits with time tag CP56Time2a	M_BO_TB_1
☒	<34>	:= Measured value, normalized value with time tag CP56Time2a	M_ME_TD_1
☒	<35>	:= Measured value, scaled value with time tag CP56Time2a	M_ME_TE_1
☒	<36>	:= Measured value, short floating point with time tag CP56Time2a	M_ME_TF_1
☒	<37>	:= Integrated totals with time tag CP56Time2a	M_IT_TB_1
☐	<38>	:= Event of protection equipment with time tag CP56Time2a	M_EP_TD_1
☐	<39>	:= Packed start events of protection equipment with time tag CP56Time2a	M_EP_TE_1
☐	<40>	:= Packed output circuit information of protection equipment with time tag CP56Time2a	M_EP_TF_1

1.5.5.2 Process Information in Control Direction

(station-specific parameter)

☒	<45>	:= Single command	C_SC_NA_1
☒	<46>	:= Double command	C_DC_NA_1
☒	<47>	:= Regulating step command	C_RC_NA_1
☒	<48>	:= Set point command, normalized values	C_SE_NA_1
☒	<49>	:= Set point command, scaled value	C_SE_NB_1
☒	<50>	:= Set point command, short floating-point value	C_SE_NC_1
☐	<51>	:= Bitstring of 32 bits	C_BO_NA_1

1.5.5.3 System Information in Monitor Direction

(station-specific parameter)

☒	<70>	:= End of initialization	M_EI_NA_1
-------------------------------------	------	--------------------------	-----------

1.5.5.4 System Information in Control Direction

(station specific parameter)

☒	<100>	:= Interrogation command	C_IC_NA_1
☒	<101>	:= Counter interrogation command	C_CI_NA_1
☒	<102>	:= Read command	C_RD_NA_1
☒	<103>	:= Clock synchronization command	C_CS_NA_1
☒	<104>	:= Test command	C_TS_NA_1
☒	<105>	:= Reset process command	C_RP_NC_1
☒	<106>	:= Delay acquisition command	C_CD_NA_1

1.5.5.5 Parameter in Control Direction

(station-specific parameter)

☒	<110>	:= Parameter of measured value, normalized value	P_ME_NA_1
☒	<111>	:= Parameter of measured value, scaled value	P_ME_NB_1
☒	<112>	:= Parameter of measured value, short floating-point value	P_ME_NC_1
☒	<113>	:= Parameter activation	P_AC_NA_1

1.5.5.6 File Transfer

(station-specific parameter)

File Download and Upload

☐	<120>	:= File ready	F_FR_NA_1
☐	<121>	:= Section ready	F_SR_NA_1
☐	<122>	:= Call directory, select file, call file, call section	F_SC_NA_1
☐	<123>	:= Last section, last segment	F_LS_NA_1

- ☐ <124> := Ack file, ack section F_AF_NA_1
☐ <125> := Segment F_SG_NA_1
☐ <126> := Directory {blank or x, only available in monitor (standard) direction} F_DR_TA_1

1.5.5.7 Type identifier and Cause of Transmission Assignments

(station-specific parameter)

Shaded box[es] are not required.

Blank = Function or ASDU is not used

Type identification		Cause of transmission																		
		1	2	3	4	5	6	7	8	9	10	11	12	13	20 to 36	37 to 41	44	45	46	47

Basic Application Functions (8.6)

1.5.6 Station Initialization

(station-specific parameter)

- ☒ Remote initialization

1.5.7 Cyclic Data Transmission

(station-specific parameter)

- ☒ Cyclic data transmission

1.5.8 Read Procedure

(station-specific parameter)

- ☒ Read Procedure

1.5.9 Spontaneous Transmission

(station-specific parameter)

- ☒ Spontaneous transmission

1.5.10 Double Transmission of Information Objects with Cause of Transmission Spontaneous

(Station-specific parameter)

The following type identification can be transmitted in succession caused by a single status change of an information object. The information object addresses for which double transmission is enabled are defined in a project-specific list.

- ☐ Single-point information M_SP_NA_1, M_SP_TA_1, M_SP_TB_1 and M_PS_NA_1
- ☐ Double-point information M_DP_NA_1, M_DP_TA_1 and M_DP_TB_1
- ☐ Step position information M_ST_NA_1, M_ST_TA_1 and M_ST_TB_1
- ☐ Bitstring of 32 bits M_BO_NA_1, M_BO_TA_1 and M_BO_TB_1
- ☐ Measured value, normalized value M_ME_NA_1, M_ME_TA_1, M_ME_ND_1 and M_ME_TD_1
- ☐ Measured value, scaled value M_ME_NB_1, M_ME_TB_1 and M_ME_TE_1
- ☐ Measured value, short floating-point number M_ME_NC_1, M_ME_TC_1 and M_ME_TF_1

1.5.11 Station Interrogation

(station-specific parameter)

- ☒ global

- ☒ group 1

- ☒ group 2

- ☒ group 3

- ☒ group 4

- ☒ group 5

- ☒ group 6

- ☒ group 7

- ☒ group 8

- ☒ group 9

- ☒ group 10

- ☒ group 11

- ☒ group 12

- ☒ group 13

- ☒ group 14

- ☒ group 15

- ☒ group 16

Information Object Address assigned to each group shall be shown in a separate table

1.5.12 Clock Synchronization

(station-specific parameter)

- ☒ Clock synchronization
- ☐ Day of week used
- ☐ RES1, GEN (time tag substituted/not substituted used)
- ☐ SU-bit (summertime) used

1.5.13 Command Transmission

(object-specific parameter)

- ☒ Direct command transmission
- ☒ Direct set point command transmission
- ☒ Selected and Execute Command
- ☒ Select and execute set point command
- ☒ C-SE ACTTERM Used

- ☒ No additional definition
- ☒ Short pulse duration (duration determined by a system parameter in the controlled station)
- ☒ Long pulse duration (duration determined by a system parameter in the controlled station)
- ☒ Persistent output

1.5.14 Transmission of Integrated Totals

(station or object-specific parameter)

- ☒ Mode A: Local freeze with spontaneous transmission
- ☐ Mode B: Local freeze with counter interrogation
- ☒ Mode C: Freeze and transmit by counter-interrogation command
- ☒ Mode D: Freeze by counter-interrogation command, frozen values reported spontaneously

- ☒ Counter read
- ☒ Counter freeze without reset
- ☒ Counter freeze with reset
- ☒ Counter reset

- ☒ General request counter
- ☒ Request counter group 1
- ☒ Request counter group 2
- ☒ Request counter group 3
- ☒ Request counter group 4

Addresses per group must be defined

1.5.15 Parameter Loading

(object-specific parameter)

- ☒ Threshold value
- ☐ Smoothing factor
- ☒ Low limit for transmission of measured value
- ☒ High limit for transmission of measured value

1.5.16 Parameter Activation

(object-specific parameter)

- ☒ Activ/deactiv. of persistent cyclic or periodic transmission of the addressed object

1.5.17 Test Procedure

(station-specific parameter)

- ☒ Test procedure

1.5.18 File Transfer

(station-specific parameter)

1.5.18.1 File Transfer in Monitor Direction

- ☐ Transparent file
- ☐ Transmission of disturbance data of protection equipment
- ☐ Transmission of sequences of events
- ☐ Transmission of sequences of recorded analogue values

1.5.18.2 File Transfer in Control Direction

- ☐ Transparent file

1.5.18.3 Background Scan

(station-specific parameter)

- ☒ Background scan

1.5.18.4 Acquisition of Transmission Delay

(station-specific parameter)

- ☒ Acquisition of transmission delay

2. IEC 60870-5-104 DPA Interoperability Profile

This interoperability profile presents the sets of parameters and alternatives, and identifies by selection, those items required for implementation in the GE Vernova Grid Solutions MCP. The following legend reflects the options used in this selection of requirements:

- ☒ Function or ASDU is used as standardized (default)
- ☐ A black check box indicate that the option cannot be selected (and is thus not required)
- ☒ R Function or ASDU is used in reverse mode
- ☒ B Function or ASDU is used in standard and reverse mode
- ☐ Function or ASDU is not used

The text descriptions of parameters, which are not applicable to this standard, are strike-through (corresponding check box is marked black).

In this document, the bracketed number trailing each subheading title refers to the corresponding section number within the IEC 60870-5-104 standard.

NOTE: In addition, the full specification of a system shall possibly require individual selection of certain parameters for certain parts of the system, such as the individual selection of scaling factors for individually addressable measured values.

2.1 System or Device (9.1)

- ☐ System definition
- ☐ Controlling station definition (Master)
- ☒ Controlled station definition (Slave)

2.2 Network Configuration (9.2)

(network-specific parameter)

- | | |
|--|--|
| ☐ Point-to-point | ☐ Multipoint-party line |
| ☐ Multiple-point-to-point | ☐ Multipoint-star |

2.3 Physical layer (9.3)

(network-specific parameter)

2.3.1 Transmission Speed (Control Direction)

Unbalanced interchange circuit V.24/V.28 Standard	Unbalanced interchange circuit V.24/V.28 Recommended if > 1200 bit/s	Balanced Interchange Circuit X.24/X.27	
■ 100 bit/s	■ 2,400 bit/s	■ 2,400 bit/s	■ 56,000 bit/s
■ 200 bit/s	■ 4,800 bit/s	■ 4,800 bit/s	■ 64,000 bit/s
■ 300 bit/s	■ 9,600 bit/s	■ 9,600 bit/s	
■ 600 bit/s	■ 19,200 bit/s	■ 19,200 bit/s	
■ 1,200 bit/s		■ 38,400 bit/s	

2.3.2 Transmission Speed (Monitor Direction)

Unbalanced Interchange Circuit V.24/V.28 Standard	Unbalanced Interchange Circuit V.24/V.28 Recommended if > 1200 bit/s	Balanced Interchange Circuit X.24/X.27	
■ 100 bit/s	■ 2,400 bit/s	■ 2,400 bit/s	■ 56,000 bit/s
■ 200 bit/s	■ 4,800 bit/s	■ 4,800 bit/s	■ 64,000 bit/s
■ 300 bit/s	■ 9,600 bit/s	■ 9,600 bit/s	
■ 600 bit/s	■ 19,200 bit/s	■ 19,200 bit/s	
■ 1,200 bit/s		■ 38,400 bit/s	

2.4 Link Layer (9.4)

(network-specific parameter)

Frame format FT1.2, single character 1 and the fixed time out interval is used exclusively in this companion standard.

Link Transmission Procedure

- Balanced transmission
- Unbalanced transmission

Frame Length

- Maximum length L (number of bytes)

Address Field of the Link

- Not present (balanced transmission only)
- One byte
- Two bytes
- Structured
- Unstructured

2.5 Application Layer (9.5)

2.5.1 Transmission Mode for Application Data

Mode 1 (Least significant byte first), as defined in clause 4.10 of IEC 870-5-4, is used exclusively in this companion standard.

2.5.2 Common address of ASDU

(system-specific parameter)

- ☐ One byte ☒ Two bytes

2.5.3 Information Object Address

(system-specific parameter)

- ☐ One byte ☒ Structured
☐ Two bytes ☒ Unstructured
☒ Three bytes

2.5.4 Cause of Transmission

(system-specific parameter)

- ☐ One byte ☒ Two bytes (with originator address).
 Originator address is set to zero if not used

2.5.5 Length of APDU

(system specific parameter)

The maximum length of APDU is 253 (default). The maximum length can be reduced by the system.

253 Maximum length of APDU

2.5.6 Selection of Standard ASDUs

2.5.6.1 Process Information in Monitor Direction

(station-specific parameter)

☒	<1>	:= Single-point information	M_SP_NA_1
☐	<2>	:= Single-point information with time tag	M_SP_TA_1

Basic Application Functions (9.6)

2.5.7 Station Initialization

(station-specific parameter)

- ☒ Remote initialization

2.5.8 Cyclic Data Transmission

(station-specific parameter)

- ☒ Cyclic data transmission

2.5.9 Read Procedure

(station-specific parameter)

- ☒ Read Procedure

2.5.10 Spontaneous Transmission

(station-specific parameter)

- ☒ Spontaneous transmission

2.5.11 Double Transmission of Information Objects with Cause of Transmission Spontaneous

(station-specific parameter)

The following type identification can be transmitted in succession caused by a single status change of an information object. The information object addresses for which double transmission is enabled are defined in a project-specific list.

- ☐ Single-point information M_SP_NA_1, M_SP_TA_1, M_SP_TB_1 and M_PS_NA_1
- ☐ Double-point information M_DP_NA_1, M_DP_TA_1 and M_DP_TB_1
- ☐ Step position information M_ST_NA_1, M_ST_TA_1 and M_ST_TB_1
- ☐ Bitstring of 32 bits M_BO_NA_1, M_BO_TA_1 and M_BO_TB_1
- ☐ Measured value, normalized value M_ME_NA_1, M_ME_TA_1, M_ME_ND_1 and M_ME_TD_1
- ☐ Measured value, scaled value M_ME_NB_1, M_ME_TB_1 and M_ME_TE_1
- ☐ Measured value, short floating-point number M_ME_NC_1, M_ME_TC_1 and M_ME_TF_1

2.5.12 Station Interrogation

(station-specific parameter)

- ☒ Global
- ☒ Group 1 ☒ Group 7 ☒ Group 13

- | | | |
|---|--|--|
| ☒ Group 2 | ☒ Group 8 | ☒ Group 14 |
| ☒ Group 3 | ☒ Group 9 | ☒ Group 15 |
| ☒ Group 4 | ☒ Group 10 | ☒ Group 16 |
| ☒ Group 5 | ☒ Group 11 | |
| ☒ Group 6 | ☒ Group 12 | |

Information Object Address assigned to each group shall be shown in a separate table

2.5.13 Clock Synchronization

(station-specific parameter)

- ☒ Clock synchronization
- ☐ Day of week used
- ☐ RES1, GEN (Time tag substituted/not substituted) used
- ☐ SU-bit (summertime) used

2.5.14 Command Transmission

(object-specific parameter)

- | | |
|--|---|
| ☒ Direct Command Transmission (Step Position) | ☒ Selected and Execute Command (Single & Double CMDS) |
| ☒ Direct set point command transmission | ☒ Select and execute set point command |
| | ☒ C-SE ACTTERM Used |
| ☒ No additional definition | |
| ☒ Short pulse duration (duration determined by a system parameter in the outstation) | |
| ☒ Long pulse duration (duration determined by a system parameter in the outstation) | |
| ☒ Persistent output | |
| ☒ Supervision of maximum delay in command direction of Commands and Set Point Commands | |

60s

Maximum allowable delay for Commands and Set Point Commands

2.5.15 Transmission of Integrated Totals

(station or object-specific parameter)

- | | |
|---|---|
| ☒ Mode A: Local freeze with spontaneous transmission | |
| ☐ Mode B: Local freeze with counter interrogation | |
| ☒ Mode C: Freeze and transmit by counter-interrogation command | |
| ☒ Mode D: Freeze by counter-interrogation command, frozen values reported spontaneously | |
| ☒ Counter read | ☒ General request counter |
| ☒ Counter freeze without reset | ☒ Request counter group 1 |

- | | |
|---|---|
| ☒ Counter freeze with reset | ☒ Request counter group 2 |
| ☒ Counter reset | ☒ Request counter group 3 |
| | ☒ Request counter group 4 |

Addresses per group must be defined

2.5.16 Parameter Loading

(object-specific parameter)

- ☒ Threshold value
- ☐ Smoothing factor
- ☒ Low limit for transmission of measured value
- ☒ High limit for transmission of measured value

2.5.17 Parameter Activation

(object-specific parameter)

- ☒ Act/de-act of persistent cyclic or periodic transmission of the addressed object

2.5.18 Test Procedure

(station-specific parameter)

- ☒ Test procedure

2.5.19 File Transfer

(station-specific parameter)

2.5.19.1 File Transfer in Monitor Direction

- ☐ Transparent file
- ☐ Transmission of disturbance data of protection equipment
- ☐ Transmission of sequences of events
- ☐ Transmission of sequences of recorded analogue values

2.5.19.2 File Transfer in Control Direction

- ☐ Transparent file

2.5.20 Background Scan

(station-specific parameter)

- ☒ Background scan

2.5.21 Acquisition of Transmission Delay

(station-specific parameter)

■ Acquisition of transmission delay

2.5.22 Definition of Time Outs

Parameter	Default value	Remarks	Selected value
t_0	30 s	Time-out of connection establishment	30 s
t_1	15 s	Time-out of send or test APDUs	15 s
t_2	10 s	Time-out for acknowledges in case of no data messages $t_2 < t_1$	10 s
t_3	20 s	Time-out of sending test frames in case of a long idle state	20 s

Maximum range of values for all time-outs: 1 to 255 s, accuracy 1 s.

2.5.23 Maximum Number of Outstanding I Format APDUs k and Latest Acknowledge APDUs (w)

Parameter	Default value	Remarks	Selected value
K	12 APDUs	Maximum difference receives sequence number to send state variable	12 APDUs
W	8 APDUs	Latest acknowledge after receiving w I format APDUs	8 APDUs

Maximum range of values k : 1 to 32767 ($2^{15}-1$) APDUs, accuracy 1 APDU

Maximum range of values w : 1 to 32767 APDUs, accuracy 1 APDU (Recommendation: w should not exceed two-thirds of k).

2.5.24 Port Number

Parameter	Value	Remarks
Port number	2404	In all cases

2.5.25 Redundant Connections

Number N of redundancy group connections used

2.5.26 RFC 2200 suite

RFC 2200 suite is an official Internet Standard that describes the state of standardization of protocols used in the Internet as determined by Internet Architecture Board (IAB). It offers a broad spectrum of actual standards used in the Internet. The suitable selection of documents from RFC 2200 defined in this standard for given projects must be chosen by the user of this standard.

- ☒ Ethernet 802.3
- ☐ Serial X.21 interface
- ☐ Other selection from RFC 2200:

MODIFICATION RECORD

VERSION	REVISION	DATE	CHANGE DESCRIPTION
1.00	0	02 nd May, 2019	Created.
	1	09 th July, 2020	Updated "Type identifier and Cause of Transmission Assignments" sections and added "Redundant Connections" section.
	2	08 th October, 2020	Updated "Link Layer (8.4)", "Type identifier and Cause of Transmission Assignments", "Transmission of Integrated Totals", "System Information in Control Direction", "Redundant Connections" and "Application Layer (9.5)" sections.
	3	11 th September, 2025	GE Vernova Logo is added on the first page. Updated Company name, Copyright Notice and Trademark Notice. Updated to GE Vernova style.

IEC 60870-5-103 Client (DCA) for the MCP

Conformance Statement

1.3 Link Layer (IEC 870-5-101 Section 8.3)

- Frame format FT1.2 (IEC[®] 870-5-1 Section 6.2.4.2) of fixed and variable length.
- Single character I, 0xE5, (IEC 870-5-1 Section 6.2.4.2.3) - used as a positive acknowledge.
- Single character II, 0xA2, (IEC 870-5-1 Section 6.2.4.2.3) - used as a negative acknowledge.

- Fixed CONFIRM time out interval (value is configurable).
- Fixed RESPOND time out interval (value is configurable).

1.4 Link Transmission Procedures

Balanced transmission : Not Supported
Unbalanced transmission : Supported

1.5 Address Field of The Link

Not present (balanced transmission only) : Not Supported
One octet : Supported
Two octets : Not Supported
Structured : Supported
Unstructured : Supported
Maximum frame length : 255

1.6 Application Layer (IEC 60870-5-103 Section 8.3)

Transmission Mode for Application Data

Mode 1 (Least significant octet first) for all application data.

Common Address of ASDU

One common address of ASDU (identical with station address) - Supported

More than one common address of ASDU - Supported

(Different from station address)

Information Object Address

No choice. Always ONE Octet.

Cause of Transmission

The size of Cause of Transmission is always ONE octet. The DCA supports the following Cause of Transmission (COT):

Monitor direction:

- Spontaneous (1).
- Cyclic (2).
- Reset frame count bit (3).
- Reset communication unit (4).
- Start / restart (5).
- Power on (6).
- Test mode (7).

- Time synchronization (8).
- General interrogation (9).
- Termination of general interrogation (10).
- Positive acknowledgement of command (20).
- Negative acknowledgement of command (21).

Control direction:

- Time synchronization (8).
- General interrogation (9).
- General command (20).

1.7 DCA Handling of COT in Monitor Direction

Table 2 DCA Handling of COT in Monitor Direction

COT in Monitor Direction	DCA Processing of COT
Spontaneous	The DCA updates the system database with the received values for the data points.
Cyclic	The DCA updates the system database with the received values for the data points.
Reset FCB	The remote device is ready to accept messages. The DCA queues a General Interrogation then followed by a Time Sync request (if required).
Reset CU	The remote device is ready to accept messages. The DCA queues a General Interrogation then followed by a Time Sync request (if required).
Start/Restart	The DCA toggles the devices' Start/Restart pseudo BI point ON then OFF.
Power ON	The DCA toggles the devices' Start/Restart pseudo BI point ON then OFF. The DCA also posts a message to the system log to indicate the device is powered ON.
Test Mode	The DCA updates the system database for the corresponding point flag to indicate Remote Force ON.
Time Synchronization	The DCA updates the device's Time Sync In-Progress pseudo BI point to OFF.
General Interrogation	The DCA updates the system database with the received values for the data points.
General Interrogation Termination	The DCA updates the device's General Interrogation In-Progress pseudo BI point to OFF.
ACK	The DCA returns an ACK to RtDB to indicate success of the general command.
NACK	The DCA returns a NACK to RtDB with the IO_OFF_LINE_ERR status to indicate failure of the general command.

Tables

Table 1.1: ACSI Basic Conformance Statement.....6

Table 1.2: ACSI Models Conformance Statement.....7

Table 1.3: ACSI Services Conformance Statement.....9

1. Protocol Implementation Conformance Statement (PICS)

1.1 GENERAL

The Multifunction Controller Platform (MCP) is a family of individual branded product names, with G500 being one of them.

The following ACSI conformance statements are used to provide an overview and details about G500 with firmware version 2.10:

- ACSI basic conformance statement
- ACSI models conformance statement
- ACSI service conformance statement

The tables in this document are identical to those given in IEC® 61850-7-2, except for the Value/comments column. This column shows the compliance of the MCP IEC 61850 Client to the ACSI.

1.2 ACSI Basic Conformance Statement

The basic conformance statement is defined as below:

Table 1.1: ACSI Basic Conformance Statement

		Client/ Subscriber	Server/ Publisher	Value/ Comments
DCA-server roles				
B11	Server side (of TWO-PARTY-APPLICATION-ASSOCIATION)	–	N	
B12	Client side of (TWO-PARTY-APPLICATION-ASSOCIATION)	Y	–	
SCSMs supported				
B21	SCSM: IEC 61850-8-1 used	Y		
B22	SCSM: IEC 61850-9-1 used	–		Deprecated in Ed2
B23	SCSM: IEC 61850-9-2 used	N		
B24	SCSM: other	N		
Generic substation event model (GSE)				
B31	Publisher side	–		

		Client/ Subscriber	Server/ Publisher	Value/ Comments
B32	Subscriber side	N	–	
Transmission of sampled value model (SVC)				
B41	Publisher side	–		
B42	Subscriber side	N	–	
– = Not Applicable Y = Supported N or Empty = Not Supported				

1.3 ACSI Models Conformance Statement

The ACSI models conformance statement shall be as defined below:

Table 1.2: ACSI Models Conformance Statement

		Client/ Subscriber	Server/ Publisher	Value/ Comments
If Server side (B11) or DCA side (B12) supported				
M1	Logical device	Y		
M2	Logical node	Y		
M3	Data	Y		
M4	Data set	Y		
M5	Substitution			
M6	Setting group control			
Reporting				
M7	Buffered report control	Y		
M7-1	sequence-number	Y		
M7-2	report-time-stamp	Y		
M7-3	reason-for-inclusion	Y		
M7-4	data-set-name	Y		
M7-5	data-reference	Y		
M7-6	buffer-overflow	Y		
M7-7	entryID	Y		
M7-8	BufTm	Y		
M7-9	IntgPd	Y		
M7-10	GI	Y		
M7-11	conf-revision	N		

		Client/ Subscriber	Server/ Publisher	Value/ Comments
M8	Unbuffered report control	Y		
M8-1	sequence-number	Y		
M8-2	report-time-stamp	Y		
M8-3	reason-for-inclusion	Y		
M8-4	data-set-name	Y		
M8-5	data-reference	Y		
M8-6	BufTm	Y		
M8-7	IntgPd	Y		
M8-8	GI	Y		
M8-9	conf-revision	N		
	Logging			
M9	Log control			
M9-1	IntgPd			
M10	Log			
M11	Control	Y		
M17	File Transfer	Y		
M18	Application association	Y		
M19	GOOSE Control Block			
M20	Sample Value Control Block			
If GSE (B31/B32) is supported				
M12	GOOSE			
M13	GSSE			Deprecated in Ed2
If SVC (B41/B42) is supported				
M14	Multicast SVC			
M15	Unicast SVC			
For all IEDs				
M16	Time	Y		
Y = Service is Supported N or Empty = Service is Not Supported				

1.4 ACSI Service Conformance Statement

The ACSI service conformance statement shall be as defined below:

Table 1.3: ACSI Services Conformance Statement

	Services	AA: TP/MC	Client/ Subscriber	Server/ Publisher	Value / Comments
Server (Clause 7)					
S1	GetServerDirectory (LOGICAL-DEVICE)	TP

2. Model Implementation Conformance Statement (MICS)

2.1 Introduction

This model implementation conformance statement is applicable for the IEC 61850 client interface in G500 Firmware Version 2.10. This MICS document specifies the supported Common Data Classes for IEC 61850 Edition 1 and Edition 2.

Note: MICS template taken from 1p0p1_rev1, which is current latest released document.

Note: When a CDC is supported it is assumed that all mandatory and optional attributes are supported. All exceptions should be mentioned in the comment column.

Note:

In general, the FC=CO/MX/SP/ST are supported. Other FC are not supported by client configuration tool.

In general, the timestamp and quality are not shown in the configuration tool but are shown in the HMI. The values will be updated accordingly if they are reported in the FCD.

2.2 SUPPORTED COMMON DATA CLASSES

2.2.1 Common data class specifications for status information

CDC	Ed	Description	Supported	Comment
SPS	1,2	Single point status	Y	
DPS	1,2	Double point status	Y	
INS	1,2	Integer status	Y	
ENS	1,2	Enumerated status	Y	
ACT	1,2	Protection activation information	Y	
ACD	1,2	Directional protection activation information	Y	
SEC	1,2	Security violation counting	Y	Addr/addInfo is not supported
BCR	1,2	Binary counter reading	Y	
HST	1,2	Histogram	N	
VSS	1,2	Visible string status	N	
Notes:				

2.2.2 Common data class specifications for measurement information

CDC	Ed	Description	Supported	Comment
MV	1,2	Measured value	Y	
CMV	1,2	Complex measured value	Y	
SAV	1,2	Sampled value	N	
WYE	1,2	Phase to ground/neutral related measured values of a three-phase system	Y	
DEL	1,2	Phase to phase related measured values of a three-phase system	Y	
SEQ	1,2	Sequence	Y	
HMV	1,2	Harmonic value	N	
HWYE	1,2	Harmonic value for WYE	N	
HDEL	1,2	Harmonic value for DEL	N	
Notes:				

NOTE: It is assumed that when a CDC is supported, all supported control models as specified in the PIXIT are supported. Please specify exceptions in the comment's column.

2.2.3 Common data class specifications for controls

CDC	Ed	Description	Supported	Comment
SPC	1,2	Controllable single point	Y	
DPC	1,2	Controllable double point	Y	
INC	1,2	Controllable integer status	Y	
ENC	1,2	Controllable enumerated status	Y	
BSC	1,2	Binary controlled step position information	Y	Control value 00 is not supported.
ISC	1,2	Integer controlled step position information	Y	
APC	1,2	Controllable analogue process value	Y	Only DOns is supported.
BAC	1,2	Binary controlled analog process value	N	
Notes:				

2.2.4 Common data class specifications for status settings

CDC	Ed	Description	Supported	Comment
SPG	1,2	Single point setting	N	
ING	1,2	Integer status setting	N	
ENG	1,2	Enumerated status setting	N

2.2.5 Common data class specifications for analogue settings

CDC	Ed	Description	Supported	Comment
ASG	1,2	Analogue setting	N	
CURVE	1,2	Setting curve	N	
CSG	1,2	Curve shape setting	N	
Notes:				

2.2.6 Common data class specifications for description information

CDC	Ed	Description	Supported	Comment
DPL	1,2	Device name plate	N	
LPL	1,2	Logical node name plate	N	
CSD	1,2	Curve shape description	N	
Notes:				

2.2.7 Common data class specifications for tracking

CDC	Ed	Description	Supported	Comment
CST	2	Common service tracking	N	
BTS	2	Buffered report tracking service	N	
CTS	2	Control tracking service	N	
GTS	2	GOOSE Control block tracking service	N	
LTS	2	Log control block tracking service	N	
MTS	2	MSVCB tracking service	N	
NTS	2	USVCB control block tracking service	N	
OTS	2	Log tracking service	N	
STS	2	SGCB tracking service	N	
UTS	2	Unbuffered report tracking service	N	
Notes:				

Supported:

Y = Client can issue an ASCII service on this CDC and process the data from/to the CDC

N = Client can't issue an ASCII service on this CDC and doesn't process the data from/to the CDC

3. Protocol Implementation eXtra Information for Testing (PIXIT)

3.1 Introduction

This document specifies the protocol implementation extra information for testing (PIXIT) of the IEC 61850 interface in the client system: “<G500>” with version “<2.10>”, further referred to as “client”.

Together with the PICS and the MICS the PIXIT forms the basis for a conformance test according to IEC 61850-10.

The following chapters specify the PIXIT for each applicable ACSI service model as structured in IEC 61850-10 and the “Conformance Test Procedures for Client System with IEC 61850-8-1 interface”.

3.2 PIXIT for Configuration

ID	Ed	Description	Value / Clarification
Cf1	1,2	Describe how the client handles nameplate configuration revision mismatches	Not Supported
Cf2	1,2	Describe how the client handles report control block configuration revision mismatches	Not Supported

3.3 PIXIT for Association model

ID	Ed	Description	Value / Clarification
As1	1,2	Guaranteed number of servers that can set-up an association simultaneously (one association per server)	500 (for Model G500-B - 4 core APU, 16 GB RAM) 250 (for Model G500-A - 2 core APU, 8 GB RAM)
As2	1,2	Lost connection detection time range (default range of TCP_KEEPALIVE is 1 – 20 seconds)	7200 seconds
As3	1,2	Describe the behavior when association fails	Retry after configured no of Seconds. Default time is 30 seconds. But user can configure using config tool.
As4	3	Is authentication supported?	N

ID	Ed	Description	Value / Clarification
As5	1,2	What is the maximum and minimum MMS PDU size?	Max MMS PDU size: It is a configuration parameter. Default is 32 KB Range: 64 to 262144
As6	1,2	What is the typical startup time after a power supply interrupt?	Time from power on to initialization complete is 2-3 minutes.
As7	1,2	How does the client disconnect from the server?	Release is supported. Restart of device or device's enable/disable option in HMI
		<Additional information>	After device startup, the device database points will initially be Invalid and Offline; Analog and Accumulator points will have zero value, and Digital Inputs will be OFF. Once association is established with the IED, the points will reflect the quality and value reported by the IED and Digital Outputs and Analog Outputs will be Online. Note that the device doesn't persist the point database so after restart, the points will again revert as indicated above: "After device startup".

3.4 PIXIT for Server model

ID	Ed	Description	Value / Clarification
Sr1	1,2	Maximum object identification length.	ED2: 129 octets (64/64). ED1: 96 octets (32/64).
Sr2	1,2	Does client support auto description?	Not supported
Sr3	1,2	Describe how to view data values.	Data values can be viewed using Device Local HMI or Remote HMI
Sr4	1,2	What analogue value (MX) quality bits are used in the client?	Y Good, Y Invalid, Y Reserved, Y Questionable Y Overflow Y OutofRange Y BadReference Y Oscillatory Y Failure YOldData N Inconsistent N Inaccurate Y Process Y Substituted

ID	Ed	Description	Value / Clarification
			Y Test
			Y OperatorBlocked
Sr5	1,2	Which status value (ST) quality bits are used in the client?	Y Good, Y Invalid, Y Reserved, Y Questionable Y BadReference Y Oscillatory Y Failure Y OldData N Inconsistent N Inaccurate Y Process Y Substituted Y Test Y OperatorBlocked
Sr6	1,2	Describe how to view/display quality values	Quality Values can be viewed using the HMI except test flag. Use shmsingle command line tool for viewing test flag.
Sr7	1,2	Describe how to force a SetDataValues request	The SetDataValues request is only sent in the client's control sequence and is only applicable to PulseConfig (always) and Persistent (if present). Enable the CF parameter write option in the Loader (Config tool), issue a control to IED from Local HMI and user shall see PulseConfig attributes in a SetDataValues request, and Persistent attribute in another SetDataValues request is Persistent is present.
Sr8	1,2	Describe how to force a GetDataValues request	There are two ways to force the client to send GetDataValues request: 1. During the control sequence In the control sequence, before sending control requests (DOs, SBOs, DOes, SBOes), the client sends GetDataValues request to get the ctlModel/sboClass of this DO.

ID	Ed	Description	Value / Clarification
			2. Via Polling a “virtual dataset” From the configuration tool, user can configure datasets which do not exist in the imported SCL file and configure these datasets into polling mode with time interval configurable. When this configuration file becomes active and the IED does not support dynamic dataset, the client sends GetDataValues request to get the data value in the “virtual datasets” in the configured interval. In HMI, user can use pseudo point “Point Details -> Digital Output -> Retrieve All Data Sets” to force the client sends GetDataValues to all the data in all the “virtual datasets” immediately.
Sr9	1,2	Describe how to force a GetAllDataValues request	Not Supported
Sr10	1,2	Does the client support writing blkEna values?	N
Sr11	1,2	Describe how the client behaves in case of: - GetDataDefinition response- - GetDataDefinition response+ with more or less attributes as expected - GetLogicalDeviceDirectory response- - GetAllDataValues response- - GetAllDataValues response+ with more or less attributes as expected - GetDataValues response- - GetDataValues response+ with more or less attributes as expected - SetDataValues response-	GetLogicalDeviceDirectory/ GetAllDataValues are not supported. GetDataDefinition response-: The data attribute/attributes will be shown as offline in HMI if the data is absent. If GetDataDefinition response- during the control sequence, the control process may be stopped. GetDataValues response-: When the client receives GetDataValues response- for a specific data, it sets the data point offline on the HMI if it is absent. If GetDataValues response- during the control sequence, the control process may be stopped. SetDataValues response- The client ignores the SetDataValues response-. In general, if the client cannot find the data online, the data will be marked as offline in HMI. For extra attributes, the client does not process it. The HMI only shows the pre-configured data attributes.

ID	Ed	Description	Value / Clarification																																																																			
Sr12	1,2	Which time quality attributes from the server are used in the client?	N Leap Second Known, N ClockFailure Y Clock not synchronized N Accuracy																																																																			
Sr13	1,2	Describe how to view time quality attributes	Use shmsingle command line tool. When Clock not synchronized is detected, the TIME INVALID bit in the data quality is set in HMI.																																																																			
		Additional Information: Mapping between G500 Quality Flags and the IEC 61850 Quality Value.	Note that the Quality Flags displayed in HMI are not only used for IEC 61850 protocol but also used for other protocols. The mapping between G500 Quality Flags and IEC 61850 Quality Value is as shown as below: <table border="1"><thead><tr><th colspan="2">IEC 61850 Value Quality and Time Quality</th><th colspan="2">D400 Quality Flags</th></tr><tr><th>Value Quality</th><th>Value</th><th>Quality Flag</th><th>Value</th></tr></thead><tbody><tr><td rowspan="4"></td><td>Questionable</td><td>Valid</td><td>True</td></tr><tr><td rowspan="3">Good</td><td>Questionable</td><td>True</td></tr><tr><td>Valid</td><td>True</td></tr><tr><td>Questionable</td><td>False</td></tr><tr><td>Overflow</td><td>True/False</td><td>Overflow</td><td>True/False</td></tr><tr><td>OutOfRange</td><td>True/False</td><td>Over Range</td><td>True/False</td></tr><tr><td>Bad Reference</td><td>True/False</td><td>Reference Check</td><td>True/False</td></tr><tr><td>Oscillatory</td><td>True/False</td><td>Chatter</td><td>True/False</td></tr><tr><td rowspan="2">Failure</td><td>True</td><td>Online</td><td>False</td></tr><tr><td>False</td><td>Online</td><td>True</td></tr><tr><td>Old Data</td><td>True/False</td><td>Old Data</td><td>True/False</td></tr><tr><td>Inconsistent</td><td>True/False</td><td>Not Used</td><td>N/A</td></tr><tr><td>Inaccurate</td><td>True/False</td><td>Not Used</td><td>N/A</td></tr><tr><td rowspan="2">Source</td><td>Process</td><td>Remote Force</td><td>False</td></tr><tr><td>Substituted</td><td></td><td>True</td></tr><tr><td>Test</td><td>True/False</td><td>Test</td><td>True/False</td></tr><tr><td>Operator Blocked</td><td>True/False</td><td>Remote Force</td><td>True/False</td></tr></tbody></table>	IEC 61850 Value Quality and Time Quality		D400 Quality Flags		Value Quality	Value	Quality Flag	Value		Questionable	Valid	True	Good	Questionable	True	Valid	True	Questionable	False	Overflow	True/False	Overflow	True/False	OutOfRange	True/False	Over Range	True/False	Bad Reference	True/False	Reference Check	True/False	Oscillatory	True/False	Chatter	True/False	Failure	True	Online	False	False	Online	True	Old Data	True/False	Old Data	True/False	Inconsistent	True/False	Not Used	N/A	Inaccurate	True/False	Not Used	N/A	Source	Process	Remote Force	False	Substituted		True	Test	True/False	Test	True/False	Operator Blocked	True/False
IEC 61850 Value Quality and Time Quality		D400 Quality Flags																																																																				
Value Quality	Value	Quality Flag	Value																																																																			
	Questionable	Valid	True																																																																			
	Good	Questionable	True																																																																			
		Valid	True																																																																			
		Questionable	False																																																																			
Overflow	True/False	Overflow	True/False

	Substituted		True																																																																			
Test	True/False	Test	True/False																																																																			
Operator Blocked	True/False	Remote Force	True/False																																																																			
			For the “test” flag, user needs to use shmsingle command line tool to view it as it is not shown in HMI.																																																																			

3.5 PIXIT for Data set model

ID	Ed	Description	Value / Clarification
Ds1	1,2	Describe how to force a GetDataSetValues request	When a dataset in the imported SCL file is configured into Polling mode, the client sends GetDataSetValues request to the IED in configured polling interval. In HMI, user can use pseudo point “Point Details -> Digital Output -> Retrieve All Data Sets” to force the client sends GetDataSetValues to all the datasets in the IEDs.
Ds2	1,2	Describe how to force a SetDataSetValues request	Not Supported

ID	Ed	Description	Value / Clarification
Ds3	1,2	Describe how to force a DeleteDataSet request	If the IED has a mismatched dataset, then the client will try to delete the dataset and then create a dynamic dataset.
Ds4	1,2	Describe how the client handles following dataset mismatches between the SCL and the data sets exposed via MMS: 1. new dataset element 2. missing dataset element 3. Reordered dataset members in a dataset of a different data type 4. Reordered dataset members in a dataset of the same data type	If the dataset is configured into polling mode, the client will work as normal to send GetDatasetDirectory, GetDataDefinition for each dataset entry, and then poll the dataset in polling interval. The client will try to delete the dataset and then create a dynamic dataset. In case the IED does not support dynamic dataset: 1. The client does not process the new dataset element 2. If the data is not reported anywhere else, the client will mark the data point the missing dataset element offline and invalid 3. The client processes it as normal 4. The client processes it as normal
Ds5	1,2	Describe how the client behaves in case of: - GetLogicalNodeDirectory(DA TA-SET) response- - GetDataSetDirectory response- - GetDataSetValues response- - SetDataSetValues response-	GetLogicalNodeDirectory is not supported. GetDataSetDirectory Response-: If the IED supports dynamic dataset, the client will try to create a dynamic dataset, otherwise the device logs a message in its diagnostic log window and marks the data points as offline and invalid if it cannot get them from other reports or datasets. GetDataSetValues response-: If the IED supports dynamic dataset, the client will try to create a dynamic dataset, otherwise if the client's process can reach this stage, the client marks the missing data offline and invalid. SetDataSetValues response- : The client continues as normal.
Ds6	1,2	Maximum name length for dataset Maximum name length for dataset member, including LD and FC	ED2: <64/16\$32> <64/61+3> ED1: <32/11\$32> <32/61+3>

ID	Ed	Description	Value / Clarification
Ds11	1,2	Describe how to force a CreateDataSet request - non-persistent - persistent	CreateDataSet request will be issued automatically by the client if the user configured dynamic dataset is not created in the IED. CreateDataSet request will be issued automatically by the client if it detects any mismatch between configured dataset using SCL file and IED supported Dataset through MMS requests if the server supports dynamic datasets. The new dataset shall always be persistent. non-persistent is not supported by the client.
Ds12	1,2	Describe how to force a DeleteDataSet request - non-persistent - persistent	DeleteDataSet request will be issued automatically by the client if it detects any mismatch between configured dataset using SCL file and IED supported Dataset through MMS requests. The new dataset shall always be persistent. non-persistent is not supported by client.
Ds13	1,2	Describe how the client behaves in case of: - CreateDataSet response- - DeleteDataSet response-	Device logs the message in its diagnostic log and GetDataValues request will be sent provided the DataSet is configured into polling mode.

3.6 PIXIT for Substitution model

ID	Ed	Description	Value / Clarification
Sub1	1,2	Describe how to substitute a value	Not Supported

3.7 PIXIT for Setting group control model

ID	Ed	Description	Value / Clarification
Sg1	1,2	How can the client be forced to send a GetLogicalNodeDirectory(SGCB) request?	Not Supported
Sg2	1,2	Describe how to change the active setting group	Not Supported
Sg3	1,2	Describe how to get the actual setting group values	Not Supported
Sg4	1,2	Describe how to edit setting group values	Not Supported
Sg5	1,2	Describe how the client behaves in case of: - GetSGCBValues response- - SelectEditSG response- - SetEditSGValue response- - SelectActiveSG response- - ConfirmEditSGValues response- The configured SG differs from the actual setting group	Not Supported

ID	Ed	Description	Value / Clarification
Sg6		Does the client read the optional ResvTms value?	Not supported

3.8 PIXIT for Reporting model

ID	Ed	Description	Value / Clarification
Rp1	1,2	Does the client search for RCB in all logical nodes? If not, specify the logical nodes	No Client does not search for RCB. It directly accesses the pre-configured RCB's
Rp2	1,2	Which dynamic RCB attributes are/can be configured by the client?	RptID Y DataSet Y Optional fields Y Trigger conditions Y Buffer time Y Integrity period Y
Rp3	1,2	Does the client support IED's with indexed and non-indexed report control blocks (RCB)?	BRCB indexed Y BRCB not indexed Y URCB indexed Y UCB not indexed Y
Rp4	1,2	The supported trigger conditions are	integrity Y data change Y quality change Y data update Y general interrogation Y
Rp5	1,2	The minimum required optional fields are	sequence-number N report-time-stamp Y reason-for-inclusion Y data-set-name N data-reference N buffer-overflow Y entryID Y confRev N Client writes only the above optional fields to during the enabling of RCB process and this behavior is fixed.
Rp6	1,2	Does the client support segmented reports?	Y

ID	Ed	Description	Value / Clarification
Rp7	1	Does the client support pre-assigned RCB?	N Client directly accesses the pre-configured RCB's
Rp8	1,2	Does the client support reported data set containing structured data objects or data attributes?	reporting of data objects Y reporting of data attributes Y (quality is not supported)
Rp9	1,2	Describe how the client does respond when a previously used URCB is reserved by another client for: - Indexed URCB with max>1 configured in SCL (static reporting) - Indexed URCB with max=1 configured in SCL (static reporting) - URCB not configured in SCL (dynamic Reporting)	Client works on pre-defined configuration. Client will continue to try and enable the previously know URCB.
Rp10	1,2	Describe how the client does respond when a previously used BRCB is reserved by another client for: - Indexed BRCB with max>1 configured in SCL (static reporting) - Indexed BRCB with max=1 configured in SCL (static reporting) - BRCB not configured in SCL (dynamic Reporting)	Client will continue to retry until BRCB is available.
Rp11	1,2	Describe how the client does respond on a SetBRCBValues(EntryID) respond-	No special processing. Client will always issue a write to the GI during RCB initialization.
Rp12	1,2	Describe how the client does respond when a report has an unknown: dataset, RptID, unexpected number of dataset entries, and/or unexpected data type format entries	The client will accept any report that has a matching RptID/dataset name and will process all expected dataset entries. It will ignore unexpected dataset entries.
Rp13	1,2	Describe how the client detects reporting configuration changes (mismatches). Does it check the "configuration revision" attributes and/or does it check the dataset members? Is the dataset update done online or offline?	Check ConfRev N Check dataset members Y Dataset update online or offline: Online If device supports deleting and creating of a dataset, update of dataset elements is Online else Offline.

ID	Ed	Description	Value / Clarification
Rp14	1,2	Describe how to force the client to change the RCB buffer time	Client will automatically write the RCB buffer time on startup based on the configuration.
Rp15	1,2	Does client set server TrgOps.GI prior to first issuance of GI command?	Y TrgOps.GI will always set by client.
Rp16	1,2	Describe how to force the client to send the GI request	In HMI, user can use pseudo point "Point Details -> Digital Output → Retrieve All Data Sets" to force the client to send a GI to all configured RCBs.
Rp17	1,2	Describe how to force the client to enable a RCB	It is done automatically based on the configuration.
Rp18	1,2	Describe how the client does respond when a report control block is renamed or deleted - Does it prevent reading the deleted RCB - If it reads the missing RCB, how does it handle the GetURCBValues or GetBRCBValues response-	Device will read the missing RCB and log an error message in the diagnostic log.
Rp19	1,2	Describe how the client behaves in case of: - SetURCBValues response- - Unsupported optional fields - Unsupported trigger condition(s)	The client will continue to try to read/enable the RCB. The client will write the optional fields and trigger conditions as part of its initialization procedure. Client supports all the trigger conditions.
Rp20	1,2	Describe how the client behaves in case of: - Buffer overflow	The client sets the Reporting Buffer Overflow DI pseudo point, which can be viewed in the HMI. The client send GI request in the Buffered RCB after it finds buffer overflow. The new GI report will not have overflow and the Reporting Buffer Overflow DI pseudo point will be reset shortly.
Rp21	1,2	Describe how to force the client to send SetBRCBValues request for - EntryID - PurgeBuf	After the client has received at least one report, restart the device and it will write the EntryID received from the last report as part of initialization of the remote server. The client will never send a PurgeBuf.

ID	Ed	Description	Value / Clarification
Rp22	1,2	Does the client support writing resvTms?	Y The client always writes the value 1
Rp23	1,2	Does the client support reading owner?	N
Rp24	2	Does the device function only as test equipment?	N

3.9 PIXIT for Logging model

ID	Ed	Description	Value / Clarification
Lg1	1,2	Does the client search for LCB in all logical nodes? when not specify the logical nodes	Not Supported
Lg2	1,2	Describe how to change LCB attributes	Not Supported
Lg3	1,2	Describe how to force the client to enable a LCB	Not Supported
Lg4	1	Does the client support sending QueryLogByTime and/or QueryLogAfter?	Not Supported
Lg5	2	Describe how to force the client to change GLOG settings	Not Supported
Lg6	1,2	Describe how the client behaves in case of: - Renamed LCB - Removed LCB - Renamed Logical Device - Renamed LOG	Not Supported
Lg7	1,2	Describe how the client behaves in case of: - GetLCBValues response- - GetLogStatusValues response- - SetLCBValues response-	Not Supported

3.10 PIXIT for GOOSE control block model

ID	Ed	Description	Value / Clarification
		<additional items>	Not supported

3.11 PIXIT for Control model

ID	Ed	Description	Value / Clarification
Ctl1	1,2	What control modes are supported?	Y status-only Y direct-with-normal-security Y sbo-with-normal-security Y direct-with-enhanced-security Y sbo-with-enhanced-security *For APC, only DOns is supported
Ctl2	1,2	Is Time activated operate (operTm) supported?	N
Ctl3	1,2	Is “operate-many” supported?	Y
Ctl4	1,2	Can the client set the test flag?	Y Pseudo point in HMI “HMI -> Point Details -> Digital Output -> Enable Test Flag in Controls” can be used to set the test flag ON in control.
Ctl5	1,2	What check conditions can be set?	Y synchrocheck Y interlock-check This shall be set during the configuration time in the “Loader -> Map points -> Adjust Parameters -> Digital Output or Analog Output -> Check”. The available values are Interlock, Syn, None or Both.
Ctl6	1,2	Which originator categories are supported and what is the originator identification?	Orcat Station control, Remote control, and Automatic Station Control are supported OrIdent is always G500
Ctl7	1,2	Describe if and how the client sets/increments the ctlNum	It is incremented automatically each time a new sequence control is done
Ctl8	1,2	What does the client when it receives a LastApplicationError and describe how to view the additional cause?	It displays the AddCause on its HMI page of “Point Details -> Analog Input”
Ctl9	1,2	What does the client when its receives a Select, SelectWithValue or Operate respond negative?	It displays “Problem issuing command” window when it receives a negative response. The AddCause information can be viewed on its HMI page of “Point Details -> Analog Input”. If the control is not successful but no LastApplicationError, the AddCause will be shown as -255.

ID	Ed	Description	Value / Clarification
Ctl10	1,2	Can the client change the control model via online services?	No
Ctl11	1	What does the client when the ctlModel is not initialized in the SCL?	It retrieves the ctlModel from the IED and issues control accordingly. If it cannot find the ctlModel, the control sequence will be stopped and "Problem issuing command" will be shown in HMI.
Ctl12	1,2	What does the client when the ctlModel in SCD and in SERVER SIMULATOR is different?	It retrieves the ctlModel from the IED and issues control accordingly.
Ctl13	1,2	Describe how to view a - CommandTermination request+ - CommandTermination request- - TimeActivatedOperateTermination request+ and request-	Command Termination request positive and negative responses will be logged by the device in its log file. The AddCause of the CommandTermination will be displayed in the HMI.

3.12 PIXIT for Time and time synchronization model

ID	Ed	Description	Value / Clarification
Tm1	1,2	Describe how to view the internal time & quality or how to expose the timestamp and timestamp quality via the IEC 61850 interface	View the timestamp and timestamp quality in a SelectWithValue or Operate request from the client.
Tm2	1,2	What time quality bits are supported?	Y LeapSecondsKnown (Ed2) N LeapSecondsKnown (Ed1) N ClockFailure Y ClockNotSynchronized (Ed2) N ClockNotSynchronized (Ed1)
Tm3	1,2	What is the behavior when the time synchronization signal/messages are lost?	No change in behavior. The ClockNotSynchronized quality bit in the SelectWithValue or Operate request from the client will be set.
Tm4	1,2	When is the quality bit "Clock failure" set?	Not Supported
Tm5	1	When is the quality bit "Clock not synchronized" set?	15 minutes
		Extra information	It may take up to 30 minutes for the device to synchronize and update the time.

3.13 PIXIT for File transfer model

ID	Ed	Description	Value / Clarification
Ft1	1,2	Describe when or how to force the client to request GetServerDirectory(FILE) and what it does with the responded filenames	The test configuration includes the ARRM application configured to retrieve files from a simulated IED defined in the test gateway IID file using the RDRE logical node and the RcdMade DI point. The ARRM application will automatically request the IEC 61850 client to retrieve new files whenever the RcdMade DI toggles. Toggle the RcdMade DI on the server simulator. The device will issue the request and then retrieve new files that were not retrieved since the last RcdMade DI change.
Ft2	1,2	Does the client uses a wildcard in the GetServerDirectory(FILE) request?	Y, wildcard = "*"
Ft3	1,2	Does the client support IED's that include the path in the file name in the GetServerDirectory(FILE) respond?	N path included Y path not included
Ft4	1,2	Does the client support IED's that use the file separator?	Y "/" N "\"
Ft5	1,2	What is the maximum file name size including path?	160
Ft6	1,2	Can the client read a file with size 0?	Y
Ft7	1,2	Are directory/file names case sensitive?	Case sensitive
Ft8	1,2	Maximum file size	100M
Ft9	1,2	Describe how the client behaves in case of: - GetFile response- - GetFileAttributes response- - SetFile response-	Device will log a message in the device diagnostic log and abort the file transfer. SetFile is not supported.

3.14 PIXIT for Service tracking model

ID	Ed	Description	Value / Clarification
Tr1	2	Which tracking services are supported by the client: - BrcbTrk - UrcbTrk - LocbTrk - GocbTrk - MsvcbTrk - UsvcbTrk - SgcbTrk - SpcTrk - DpcTrk - IncTrk - EncTrk - ApcFTrk - ApcIntTrk - BscTrk - IscTrk - BacTrk - GenTrk	N N N N N N N N N N N N N N N N
Tr2	2	Describe how to view the tracking objects or their attributes	Not supported

4. TISSUES Implementation Conformance Statement (TICS)

4.1 Introduction

This tissue implementation conformance statement is applicable for the IEC 61850 client interface in G500 Firmware Version 2.10. According to the UCA IUG QAP the Tissue conformance statement is required to perform a conformance test and is referenced on the certificate.

4.2 Mandatory Edition 2 Tissues

Below tables give an overview of the applicable mandatory Tissues.

“Supported by client”:

“Y”: means that the client supports servers that have implemented the respective tissue.

“ni”: No impact on testing

“na”: not applicable if the client does not support the corresponding ACSI service(s)

4.2.1 Part 6 Tissue List

Part 6 Tissue	Description	Supported by client
658	Tracking related features	na
663	FCDA element cannot be a "functionally constrained logical node"	Y
668	Autotransformer modeling	na
719	ConfDataSet - maxAttributes definition is confusing	Y
721	Log element name	na
768	bType VisString65 is missing	Y
779	object references	Y
788	SICS S56 from optional to mandatory	na
789	ConfLdName as services applies to both server and client (supportsLdname)	na
804	valKind and IED versus System configuration (valimport)	Y
806	Max length of log name inconsistent between -6 and -7-2	ni
807	Need a way to indicate if "Owner" present in RCB	Y

Part 6 Tissue	Description	Supported by client
822	Extension of IED capabilities	Y
823	ValKind for structured data attributes	Y
824	Short addresses on structured data attributes	Y
825	Floating point value	Y
845	SGCB ResvTms	na
853	SBO and ProtNs	Y
855	Recursive SubFunction	na
856	VoltageLevel frequency and phases	ni
857	Function/SubFunction for ConductingEquipment	na
886	Missing 8-1 P-types	na
901	tServices as AP or as IED element	Y
936	SupSubscription parameter usage is difficult	na
1175	IPv6 address lowercase only	na

4.2.2 Part 7-1 Tissue List

Part 7-1 Tissue	Description	Supported by client
828	Data model namespace revision IEC 61850-7-4:2007[A]	Y
1151	simulated GOOSE disappears after 1st appearance when LPHD.Sim = TRUE	na
1196	Extensions to standardized LN classes made by third parties Note: this tissue is not final yet	na

4.2.3 Part 7-2 Tissue List

Part 7-2 Tissue	Description	Supported by client
778	AddCause values – add value not-supported	Y
780	What are unsupported trigger option at a control block?	Y
783	TimOper Resp- ; add Authorization check	na
786	AddCause values 26 and 27 are switched	Y
820	Mandatory ACSI services (use for PICS template)	Y
858	typo in enumeration ServiceType	ni
861	dchg of ConfRev attribute	na
876	GenLogicNodeClass and SGCB, GoCB, MsvCB, UsvCB	ni

Part 7-2 Tissue	Description	Supported by client
1038	Loss of Info Detection After Resynch	Y
1062	Entrytime not used in CDC	ni
1071	Length of DO name	ni
1091	The sentence "The initial value of EditSG shall be 0", has to be stated in part 7.2 not in 8.1	na
1127	Missing owner attribute in BTS and UTS	na
1163	Old report in URCB	ni
1202	GI not optional	ni

4.2.4 Part 7-3 Tissue List

Part 7-3 Tissue	Description	Supported by client
697	persistent command / PulseConfig	Y
698	Wrong case is BAC.dB attribute	na
722	Units for 'h' and 'min' not in UnitKind enumeration.	ni
919	Presence Condition for SVC	ni
925	Presence of i or f attribute - Problem with writing	Y
926	Presence Conditions within RangeConfig	na

4.2.5 Part 7-4 Tissue List

Part 7-4 Tissue	Description	Supported by client
671	mistake in definition of Mod & Beh	Y
674	CDC of ZRRC.LocSta is wrong	na
675	SIML LN	ni
676	Same data object name used with different CDC	na
677	MotStr is used with different CDC in PMMS and SOPM LN classes	na
679	Remove CycTrMod Enum	na
680	SI unit for MHYD.Cndct	ni
681	Enum PIDAlg	ni
682	ANCR.ParColMod	ni
683	Enum QVVR.IntrDetMth	ni
685	Enum ParTraMod	ni
686	New annex H - enums types in XML	Y
694	Data object CmdBlk	ni
696	LSVS.St (Status of subscription)	ni

Part 7-4 Tissue	Description	Supported by client
712	interpretation of quality operatorBlocked	Y
713	DO Naming of time constants in FFIL	na
724	ANCR.Auto	na
725	Loc in LN A-group	Y
734	LLN0.OpTmh vs. LPHD.OpTmh	na
735	ISAF.Alm and ISAF.AlmReset	na
736	PFSign	na
742	GAPC.Str, GAPC.Op and GAPC.StrVal	Y
743	CCGR.PmpCtl and CCGR.FanCtl	na
744	LN STMP, EEHealth and EEName	na
772	LPHD.PwrUp/PwrDn shall be transient	Y
773	Loc, LocKey and LocSta YPSH and YLTC	Y
774	ITCI.LocKey	na
775	KVLV.ClsLim and OpnLim	ni
776	LPHD.OutOv/InOv and LCCH.OutOv/InOv	ni
800	Misspelling in CSYN	na
802	CCGR and Harmonized control authority	na
808	Presence condition of ZMOT.DExt and new DOs	na
831	Setting of ConfRevNum in LGOS	na
838	Testing in Beh=Blocked	Y
844	MFLK.PhPiMax, MFLK.PhPiLoFil, MFLK.PhPiRoot DEL->WYE	na
849	Presence conditions re-assessing in case of derived statistical calculation	na
877	QVUB -settings should be optional	na
909	Remove ANCR.ColOpR and ColOpL	na
920	Resetable Counter is NOT resetable	Y
932	Rename AVCO.SptVol to AVCO.VolSpt	na
939	Change CDC for ANCR.FixCol	na
991	LGOS: GoCBRef (as well as LSVS.SvCBRef) should be mandatory	ni
1007	PTRC as fault indicator - Update of description required	ni
1044	TapChg in AVCO	na
1077	Rename DOnames within LTIM	na

Note: Tissues 675, 735, 772, 775, 776, 878 are not relevant for conformance testing.

4.2.6 Part 8-1 Tissue List

Part 8-1 Tissue	Description	Supported by client
784	Tracking of control (CTS)	na
817	Fixed-length GOOSE float encoding	ni
834	File dir name length 64	Y
951	Encoding of Owner attribute	Y
1040	More associate error codes	Y
1178	Select Response+ is non-null value	Y

MODIFICATION RECORD

VERSION	REVISION	DATE	CHANGE DESCRIPTION
1.00	0	02 nd May, 2019	Created.
2.00	0	11 th May, 2020	Updated PICS for Ed2, appended MICS/PIXIT/TICS.
	1	13 th May, 2020	Updated PIXIT for Association Model, PIXIT for File transfer model.
	2	03 rd June, 2020	Updated PIXIT for Dataset Model, PIXIT for Server Model, PIXIT for Reporting Model, ACSI Service Conformance Statement. Added clarification about MCP family and G500.
2.10	0	13 th September 2020	Updated as per the feedbacks from the IEC61850 Client Level B Certification Test. Added Chapter 5: G500 Client ICD File
	1	03 rd September, 2025	GE Vernova Logo is added on the first page. Updated Company name, Copyright Notice and Trademark Notice. Updated to GE Vernova style.

IEC 60870-5-101/104 Client (DCA) for the MCP

Conformance Statement

NTEK-A031M-0CS

Version 1.00 Revision 3

Associated Software Release: Version 1.00

MODIFICATION RECORD	28

Figures

No table of figures entries found.

Tables

No table of figures entries found.

1. IEC 60870-5-101 Client Interoperability Profile

This interoperability profile presents the sets of parameters and alternatives, and identifies by selection, those items required for implementation in the GE Vernova Grid Solutions MCP. The following legend reflects the options used in this selection of requirements:

- ☒ Function or ASDU is used as standardized (default)
- ☐ A black check box indicate that the option cannot be selected (and is thus not required)
- ☒ Function or ASDU is used in reverse mode
- ☒ Function or ASDU is used in standard and reverse mode
- ☐ Function or ASDU is not used

In cases where several options are available, for example, multiple lengths of address fields, the GE Vernova Grid Solutions MCP shall be configurable to use the required value.

In this document, the bracketed number trailing each subheading title refers to the corresponding section number within the IEC 60870-5-101 standard.

1.1 System or Device (8.1)

- ☐ System definition
- ☒ Controlling station definition (Master)
- ☐ Controlled station definition (Slave)

1.2 Network Configuration (8.2)

(network-specific parameter)

- | | |
|---|---|
| ☒ Point-to-point | ☒ Multipoint-party line |
| ☒ Multiple point-to-point | ☒ Multipoint-star |

1.3 Physical Layer (8.3)

(network-specific parameter)

1.3.1 Transmission Speed (Control Direction)

Unbalanced interchange circuit V.24/V.28 Standard	Unbalanced interchange circuit V.24/V.28 Recommended if > 1,200 bit/s	Balanced Interchange Circuit X.24/X.27	
☐ 100 bit/s	☒ 2,400 bit/s	☐ 2,400 bit/s	☐ 56,000 bit/s
☐ 200 bit/s	☒ 4,800 bit/s	☐ 4,800 bit/s	☐ 64,000 bit/s
☐ 300 bit/s	☒ 9,600 bit/s	☐ 9,600 bit/s	
☒ 600 bit/s	☒ 19,200 bit/s	☐ 19,200 bit/s	
☒ 1,200 bit/s		☐ 38,400 bit/s	

1.3.2 Transmission Speed (Monitor Direction)

Unbalanced Interchange Circuit V.24/V.28 Standard	Unbalanced Interchange Circuit V.24/V.28 Recommended if > 1,200 bit/s	Balanced Interchange Circuit X.24/X.27	
☐ 100 bit/s	☒ 2,400 bit/s	☐ 2,400 bit/s	☐ 56,000 bit/s
☐ 200 bit/s	☒ 4,800 bit/s	☐ 4,800 bit/s	☐ 64,000 bit/s
☐ 300 bit/s	☒ 9,600 bit/s	☐ 9,600 bit/s	
☒ 600 bit/s	☒ 19,200 bit/s	☐ 19,200 bit/s	
☒ 1,200 bit/s		☐ 38,400 bit/s	

Note: The master station shall only support the Unbalanced Interchange (Circuit V2.4/V2.8). The combination of V.24 and V.28 is ITU-T's equivalent to the EIA's RS-232.

1.4 Link Layer (8.4)

(network-specific parameter)

Frame format FT 1.2 (IEC 60870-5-1 Section 6.2.4.2) fixed and variable length is used (length is configurable).

Single character 1 (IEC 60870-5-1 Section 6.2.4.3) is used as an acknowledge.

Fixed time out interval is used (value is configurable).

Link Transmission Procedure

- ☒ Balanced transmission
- ☒ Unbalanced transmission

Address Field of the Link

- ☐ Not present (balanced transmission only)
- ☒ One byte
- ☒ Two bytes
- ☒ Structured
- ☒ Unstructured

Frame Length

Maximum length L (number of bytes)

~~Time during which repetitions are permitted (Trp) or~~ number of repetitions.

Note: For unbalanced mode, Maximum Frame Length (L) = Maximum Length of ADSU Frame.
For balanced mode, Max Frame Length (L) = Maximum Length of ADSU Frame + 1 + Link Address Length.

When using an unbalanced link layer, the following ASDU types are returned in Class 2 messages (low priority) with the indicated clauses of transmission:

- ☐ The standard assignment of ASDUs to Class 2 messages is used as follows

Type identification	Cause of transmission
9,11,13,21	<1>

- ☐ A special assignment of ASDUs to Class 2 messages is used as follows

Type identification	Cause of transmission

Note: In response to a Class 2 poll, a controlled station can respond with Class 1 data when there is no Class 2 data available.

1.5 Application Layer (8.5)

1.5.1 Transmission Mode for Application Data

Mode 1 (Least significant byte first), as defined in clause 4.10 of IEC 60870-5-4, is used exclusively for all application data.

1.5.2 Common Address of ASDU

(system-specific parameter)

- ☒ One byte ☒ Two bytes

1.5.3 Information Object Address

(system-specific parameter)

- ☒ One byte ☒ Structured
☒ Two bytes ☒ Unstructured
☒ Three bytes

1.5.4 Cause of Transmission

(system- specific parameter)

- | | |
|--|--|
| ☒ One byte | ☒ Two bytes (with originator address).
Set to zero in case of no originator address |
|--|--|

1.5.5 Selection of Standard ASDUs

1.5.5.1 Process Information in Monitor Direction

(station-specific parameter)

☒	<1>	:= Single-point information	M_SP_NA_1
☒	<2>	:= Single-point information with time tag	M_SP_TA_1
☒	<3>	:= Double-point information	M_DP_NA_1
☒	<4>	:= Double-point information with time tag	M_DP_TA_1
☒	<5>	:= Step position information	M_ST_NA_1
☒	<6>	:= Step position information with time tag	M_ST_TA_1
☒	<7>	:= Bitstring of 32 bits	M_BO_NA_1
☒	<8>	:= Bitstring of 32 bits with time tag	M_BO_TA_1
☒	<9>	:= Measured value, normalized value	M_ME_NA_1
☒	<10>	:= Measured value, normalized value with time tag	M_ME_TA_1
☒	<11>	:= Measured value, scaled value	M_ME_NB_1
☒	<12>	:= Measured value, scaled value with time tag	M_ME_TB_1
☒	<13>	:= Measured value, short floating-point value	M_ME_NC_1
☒	<14>	:= Measured value, short floating-point value with time tag	M_ME_TC_1
☒	<15>	:= Integrated totals	M_IT_NA_1
☒	<16>	:= Integrated totals with time tag	M_IT_TA_1
☐	<17>	:= Event of protection equipment with time tag	M_EP_TA_1
☐	<18>	:= Packed start events of protection equipment with time tag	M_EP_TB_1
☐	<19>	:= Packed output circuit information of protection equipment with time tag	M_EP_TC_1
☐	<20>	:= Packed single-point information with status change detection	M_PS_NA_1
☒	<21>	:= Measured value, normalized value without quality descriptor	M_ME_ND_1
☒	<30>	:= Single-point information with time tag CP56Time2a	M_SP_TB_1
☒	<31>	:= Double-point information with time tag CP56Time2a	M_DP_TB_1
☒	<32>	:= Step position information with time tag CP56Time2a	M_ST_TB_1
☒	<33>	:= Bit string of 32 bits with time tag CP56Time2a	M_BO_TB_1
☒	<34>	:= Measured value, normalized value with time tag CP56Time2a	M_ME_TD_1
☒	<35>	:= Measured value, scaled value with time tag CP56Time2a	M_ME_TE_1
☒	<36>	:= Measured value, short floating point with time tag CP56Time2a	M_ME_TF_1
☒	<37>	:= Integrated totals with time tag CP56Time2a	M_IT_TB_1
☐	<38>	:= Event of protection equipment with time tag CP56Time2a	M_EP_TD_1
☐	<39>	:= Packed start events of protection equipment with time tag CP56Time2a	M_EP_TE_1
☐	<40>	:= Packed output circuit information of protection equipment with time tag CP56Time2a	M_EP_TF_1

1.5.5.2 Process Information in Control Direction

(station-specific parameter)

☒	<45>	:= Single command	C_SC_NA_1
☒	<46>	:= Double command	C_DC_NA_1
☒	<47>	:= Regulating step command	C_RC_NA_1
☒	<48>	:= Set point command, normalized values	C_SE_NA_1
☒	<49>	:= Set point command, scaled value	C_SE_NB_1
☒	<50>	:= Set point command, short floating-point value	C_SE_NC_1
☐	<51>	:= Bitstring of 32 bits	C_BO_NA_1

1.5.5.3 System Information in Monitor Direction

(station-specific parameter)

☒	<70>	:= End of initialization	M_EI_NA_1
-------------------------------------	------	--------------------------	-----------

1.5.5.4 System Information in Control Direction

(station specific parameter)

☒	<100>	:= Interrogation command	C_IC_NA_1
☒	<101>	:= Counter interrogation command	C_CI_NA_1
☐	<102>	:= Read command	C_RD_NA_1
☒	<103>	:= Clock synchronization command	C_CS_NA_1
☐	<104>	:= Test command	C_TS_NA_1
☐	<105>	:= Reset process command	C_RP_NA_1
☒	<106>	:= Delay acquisition command	C_CD_NA_1

1.5.5.5 Parameter in Control Direction

(station-specific parameter)

☐	<110>	:= Parameter of measured value, normalized value	P_ME_NA_1
☐	<111>	:= Parameter of measured value scaled value	P_ME_NB_1
☐	<112>	:= Parameter of measured value, short floating-point value	P_ME_NC_1
☐	<113>	:= Parameter activation	P_AC_NA_1

1.5.5.6 File Transfer

(station-specific parameter)

File Download and Upload

☐	<120>	:= File ready	F_FR_NA_1
☐	<121>	:= Section ready	F_SR_NA_1
☐	<122>	:= Call directory, select file, call file, call section	F_SC_NA_1
☐	<123>	:= Last section, last segment	F_LS_NA_1
☐	<124>	:= Ack file, ack section	F_AF_NA_1
☐	<125>	:= Segment	F_SG_NA_1
☐	<126>	:= Directory {blank or x , only available in monitor (standard) direction}	F_DR_TA_1

1.5.5.7 Type identifier and Cause of Transmission Assignments

(station-specific parameter)

Shaded box[es] are not required.

Blank = Function or ASDU is not used

Type identification		Cause of transmission																			
		1	2	3	4	5	6	7	8	9	10	11	12	13	20 to 36	37 to 41	44	45	46	47	
<1>	M_SP_NA_1		x	x		x						x	x		x						
<2>	M_SP_TA_1			x		x						x	x								
<3>	M_DP_NA_1		x	x		x						x	x		x						
<4>	M_DP_TA_1			x		x						x	x								
<5>	M_ST_NA_1		x	x		x						x	x		x

1.6 Basic Application Functions (8.6)

1.6.1 Station Initialization

(station-specific parameter)

☐ Remote initialization

1.6.2 Cyclic Data Transmission

(station-specific parameter)

☒ Cyclic data transmission

1.6.3 Read Procedure

(station-specific parameter)

☐ Read Procedure

1.6.4 Spontaneous Transmission

(station-specific parameter)

☒ Spontaneous transmission

1.6.5 Double Transmission of Information Objects with Cause of Transmission Spontaneous

(Station-specific parameter)

The following type identification can be transmitted in succession caused by a single status change of an information object. The information object addresses for which double transmission is enabled are defined in a project-specific list.

- ☐ Single-point information M_SP_NA_1, M_SP_TA_1, M_SP_TB_1 and M_PS_NA_1
- ☐ Double-point information M_DP_NA_1, M_DP_TA_1 and M_DP_TB_1
- ☐ Step position information M_ST_NA_1, M_ST_TA_1 and M_ST_TB_1
- ☐ Bitstring of 32 bits M_BO_NA_1, M_BO_TA_1 and M_BO_TB_1
- ☐ Measured value, normalized value M_ME_NA_1, M_ME_TA_1, M_ME_ND_1 and M_ME_TD_1
- ☐ Measured value, scaled value M_ME_NB_1, M_ME_TB_1 and M_ME_TE_1
- ☐ Measured value, short floating-point number M_ME_NC_1, M_ME_TC_1 and M_ME_TF_1

1.6.6 Station Interrogation

(station-specific parameter)

- | | | |
|---|--|--|
| ☒ global | | |
| ☒ group 1 | ☒ group 7 | ☒ group 13 |
| ☒ group 2 | ☒ group 8 | ☒ group 14 |

| ☒ group 4 | ☒ group 10 | ☒ group 16 |
| ☒ group 5 | ☒ group 11 | |
| ☒ group 6 | ☒ group 12 | |
- Information Object Address assigned to each group shall be shown in a separate table

1.6.7 Clock Synchronization

(station-specific parameter)

- ☒ Clock synchronization
- ☒ Day of week used
- ☐ RES1, GEN (time tag substituted/not substituted used)
- ☐ SU-bit (summertime) used

1.6.8 Command Transmission

(object-specific parameter)

- ☒ Direct command transmission
- ☒ Direct set point command transmission
- ☒ Selected and Execute Command
- ☐ Select and execute set point command
- ☒ C-SE ACTTERM Used

- ☒ No additional definition
- ☒ Short pulse duration (duration determined by a system parameter in the controlled station)
- ☒ Long pulse duration (duration determined by a system parameter in the controlled station)
- ☒ Persistent output

1.6.9 Transmission of Integrated Totals

(station or object-specific parameter)

- ☒ Mode A: Local freeze with spontaneous transmission
 - ☒ Mode B: Local freeze with counter interrogation
 - ☐ Mode C: Freeze and transmit by counter-interrogation command
 - ☐ Mode D: Freeze by counter-interrogation command, frozen values reported spontaneously
-
- ☒ Counter read
 - ☐ Counter freeze without reset
 - ☐ Counter freeze with reset
 - ☐ Counter reset
-
- ☒ General request counter
 - ☒ Request counter group 1
 - ☒ Request counter group 2
 - ☒ Request counter group 3
 - ☒ Request counter group 4

Addresses per group must be defined

1.6.10 Parameter Loading

(object-specific parameter)

- ☐ Threshold value
- ☐ Smoothing factor
- ☐ Low limit for transmission of measured value
- ☐ High limit for transmission of measured value

1.6.11 Parameter Activation

(object-specific parameter)

- ☐ Activ/deactiv. of persistent cyclic or periodic transmission of the addressed object

1.6.12 Test Procedure

(station-specific parameter)

- ☐ Test procedure

1.6.13 File Transfer

(station-specific parameter)

1.6.13.1 File Transfer in Monitor Direction

- ☐ Transparent file
- ☐ Transmission of disturbance data of protection equipment
- ☐ Transmission of sequences of events
- ☐ Transmission of sequences of recorded analogue values

1.6.13.2 File Transfer in Control Direction

- ☐ Transparent file

1.6.14 Background Scan

(station-specific parameter)

- ☒ Background scan

1.6.15 Acquisition of Transmission Delay

(station-specific parameter)

- ☒ Acquisition of transmission delay

2. IEC 60870-5-104 Client Interoperability Profile

This interoperability profile presents the sets of parameters and alternatives, and identifies by selection, those items required for implementation in the GE Vernova Grid Solutions MCP. The following legend reflects the options used in this selection of requirements:

- ☒ Function or ASDU is used as standardized (default)
- ☐ A black check box indicate that the option cannot be selected (and is thus not required)
- ☒ R Function or ASDU is used in reverse mode
- ☒ B Function or ASDU is used in standard and reverse mode
- ☐ Function or ASDU is not used

The text descriptions of parameters, which are not applicable to this standard, are strike-through (corresponding check box is marked black).

In this document, the bracketed number trailing each subheading title refers to the corresponding section number within the IEC 60870-5-104 standard.

Note: In addition, the full specification of a system shall possibly require individual selection of certain parameters for certain parts of the system, such as the individual selection of scaling factors for individually addressable measured values.

2.1 System or Device (9.1)

- ☐ System definition
- ☒ Controlling station definition (Master)
- ☐ Controlled station definition (Slave)

2.2 Network Configuration (9.2)

(network-specific parameter)

- | | |
|--|--|
| ☐ Point-to-point | ☐ Multipoint-party line |
| ☐ Multiple-point-to-point | ☐ Multipoint-star |

2.3 Physical layer (9.3)

(network-specific parameter)

2.3.1 Transmission Speed (Control Direction)

Unbalanced interchange circuit V.24/V.28 Standard	Unbalanced interchange circuit V.24/V.28 Recommended if > 1200 bit/s	Balanced Interchange Circuit X.24/X.27	
☒ 100 bit/s	☒ 2,400 bit/s	☒ 2,400 bit/s	☒ 56,000 bit/s
☒ 200 bit/s	☒ 4,800 bit/s	☒ 4,800 bit/s	☒ 64,000 bit/s
☒ 300 bit/s	☒ 9,600 bit/s	☒ 9,600 bit/s	
☒ 600 bit/s	☒ 19,200 bit/s	☒ 19,200 bit/s	
☒ 1,200 bit/s		☒ 38,400 bit/s	

2.3.2 Transmission Speed (Monitor Direction)

Unbalanced Interchange Circuit V.24/V.28 Standard	Unbalanced Interchange Circuit V.24/V.28 Recommended if > 1200 bit/s	Balanced Interchange Circuit X.24/X.27	
☒ 100 bit/s	☒ 2,400 bit/s	☒ 2,400 bit/s	☒ 56,000 bit/s
☒ 200 bit/s	☒ 4,800 bit/s	☒ 4,800 bit/s	☒ 64,000 bit/s
☒ 300 bit/s	☒ 9,600 bit/s	☒ 9,600 bit/s	
☒ 600 bit/s	☒ 19,200 bit/s	☒ 19,200 bit/s	
☒ 1,200 bit/s		☒ 38,400 bit/s	

2.4 Link Layer (9.4)

(network-specific parameter)

Frame format FT1.2, single character 1 and the fixed time out interval is used exclusively in this companion standard.

Link Transmission Procedure

- ☒ Balanced transmission
- ☒ Unbalanced transmission

Frame Length

- ☒ Maximum length L (number of bytes)

Address Field of the Link

- ☒ Not present (balanced transmission only)
- ☒ One byte
- ☒ Two bytes
- ☒ Structured
- ☒ Unstructured

2.5 Application Layer (9.5)

2.5.1 Transmission Mode for Application Data

Mode 1 (Least significant byte first), as defined in clause 4.10 of IEC 870-5-4, is used exclusively in this companion standard.

2.5.2 Common address of ASDU

(system-specific parameter)

- ☐ One byte ☒ Two bytes

2.5.3 Information Object Address

(system-specific parameter)

- ☐ One byte ☒ Structured
☐ Two bytes ☒ Unstructured
☒ Three bytes

2.5.4 Cause of Transmission

(system-specific parameter)

- ☐ One byte ☒ Two bytes (with originator address).
 Originator address is set to zero if not used

2.5.5 Length of APDU

(system specific parameter)

The maximum length of APDU is 253 (default). The maximum length can be reduced by the system.

253 Maximum length of APDU

2.5.6 Selection of Standard ASDUs

2.5.6.1 Process Information in Monitor Direction

(station-specific parameter)

☒	<1>	:= Single-point information	M_SP_NA_1
☐	<2>	:= Single-point information with time tag	M_SP_TA_1
☒	<3>	:= Double-point information	M_DP_NA_1

2.6.11 Parameter Activation

(object-specific parameter)

- ☐ Act/deact of persistent cyclic or periodic transmission of the addressed object

2.6.12 Test Procedure

(station-specific parameter)

- ☐ Test procedure

2.6.13 File Transfer

(station-specific parameter)

2.6.13.1 File Transfer in Monitor Direction

- ☐ Transparent file
- ☐ Transmission of disturbance data of protection equipment
- ☐ Transmission of sequences of events
- ☐ Transmission of sequences of recorded analogue values

2.6.13.2 File Transfer in Control Direction

- ☐ Transparent file

2.6.14 Background Scan

(station-specific parameter)

- ☒ Background scan

2.6.15 Acquisition of Transmission Delay

(station-specific parameter)

- ☒ Acquisition of transmission delay

2.6.16 Definition of Time Outs

Parameter	Default value	Remarks	Selected value
t_0	30 s	Time-out of connection establishment	30 s
t_1	15 s	Time-out of send or test APDUs	15 s
t_2	10 s	Time-out for acknowledges in case of no data messages $t_2 < t_1$	10 s
t_3	20 s	Time-out of sending test frames in case of a long idle state	20 s

Maximum range of values for all time-outs: 1 to 255 s, accuracy 1 s.

2.6.17 Maximum Number of Outstanding I Format APDUs k and Latest Acknowledge APDUs (w)

Parameter	Default value	Remarks	Selected value
K	12 APDUs	Maximum difference receives sequence number to send state variable	12 APDUs
W	8 APDUs	Latest acknowledge after receiving w I format APDUs	8 APDUs

Maximum range of values k : 1 to 32767 ($2^{15}-1$) APDUs, accuracy 1 APDU

Maximum range of values w : 1 to 32767 APDUs, accuracy 1 APDU (Recommendation: w should not exceed two-thirds of k).

2.6.18 Port Number

Parameter	Value	Remarks
Port number	2404	In All Cases

2.6.19 Redundant Connections

☒ 1 Number N of redundancy group connections used

2.6.20 RFC 2200 suite

RFC 2200 suite is an official Internet Standard that describes the state of standardization of protocols used in the Internet as determined by Internet Architecture Board (IAB). It offers a broad spectrum of actual standards used in the Internet. The suitable selection of documents from RFC 2200 defined in this standard for given projects must be chosen by the user of this standard.

- ☒ Ethernet 802.3
- ☐ Serial X.21 interface
- ☐ Other selection from RFC 2200:

List of valid documents from RFC 2200

6.

MODIFICATION RECORD

VERSION	REVISION	DATE	CHANGE DESCRIPTION
1.00	0	02 nd May, 2019	Created.
	1	29 th July, 2020	Updated “Type identifier and Cause of Transmission Assignments” sections and added “Redundant Connections” section.
	2	22 nd Oct, 2020	Updated “Application Layer (8.5 and 9.5)”, “Basic Application Functions (8.6 and 9.6)” sections.
	3	13 th September, 2025	GE Vernova Logo is added on the first page. Updated Company name, Copyright Notice and Trademark Notice. Updated to GE Vernova style.

GE Vernova
Grid Solutions

MCP NERC-CIP5 Response

Product Bulletin

Date: April 11, 2025 **Classification:** GE Vernova Information **Publication Number:** PRBT-0429

NOTICE This document applies to the MCP family (G100/G500) unless otherwise indicated.

Overview

The purpose of this document is to answer commonly asked questions pertaining to the features supported by the version 1.1 and further of MCP Series of Substation Gateway products. This is not a NERC-CIP document. Users of GE Vernova Grid Solutions MCP equipment may require this information for the purposes of assessment and implementation of NERC-CIP v5 processes.

Standard	Req #	Requirement	Applicable Security Measures
CIP-002-5.1a Cyber Security – BES Cyber System Categorization	All	It is left up to the Responsible Entity to determine the level of granularity at which to identify a BES Cyber System within the qualifications in the definition of BES Cyber System (...)	Not Applicable (Responsible Entity Organizational function)
CIP-003-8 Security Management Controls	R1	Each Responsible Entity shall review and obtain CIP Senior Manager approval at least once every 15 calendar months for one or more documented cyber security policies (...)	Not Applicable (Responsible Entity Organizational function)
CIP-003-8 Security Management Controls	R2	Each Responsible Entity with at least one asset identified in CIP-002 containing low impact BES Cyber Systems shall implement one or more documented cyber security plan(s) for its low impact BES Cyber Systems that include the sections in Attachment 1. [Violation Risk Factor: Lower] [Time Horizon: Operations Planning]	Not Applicable (Responsible Entity Organizational function)
CIP-003-8 Security Management Controls	R3	Each Responsible Entity shall identify a CIP Senior Manager by name and document any change within 30 calendar days of the change. [Violation Risk Factor: Medium] [Time Horizon: Operations Planning]	Not Applicable (Responsible Entity Organizational function)

Product Bulletin

Standard	Req #	Requirement	Applicable Security Measures
CIP-003-8 Security Management Controls	R4	The Responsible Entity shall implement a documented process to delegate authority, unless no delegations are used. Where allowed by the CIP Standards, the CIP Senior Manager may delegate authority for specific actions to a delegate or delegates. These delegations shall be documented, including the name or title of the delegate, the specific actions delegated, and the date of the delegation; approved by the CIP Senior Manager; and updated within 30 days of any change to the delegation. Delegation changes do not need to be reinstated with a change to the delegator. [Violation Risk Factor: Lower] [Time Horizon: Operations Planning]	Not Applicable (Responsible Entity Organizational function)
CIP-004-7 Personnel & Training	R1 – R3	Awareness, Training and Personnel Risk Assessment	Not Applicable (Responsible Entity Organizational function)
	R4	Access Management Program	Not Applicable (Responsible Entity Organizational function)
	R5	Access Revocation	Responsible Entity Organizational function The MCP can help enforce this process thanks to its support for TACACS+ and LDAP, which provides a centralized administration point where users can be revoked. The MCP also supports manually deployed Certificate Revocation Lists to remove a user's access to network IEDs using SSL/TLS.
	R6	Authorize, verify, and revoke provisioned access	Responsible Entity Organizational function The MCP can help enforce this process thanks to its support for TACACS+ and LDAP, which provides a centralized administration point where users can be revoked. The MCP also supports manually deployed Certificate Revocation Lists to remove a user's access to network IEDs using SSL/TLS.
CIP-005-7 Electronic Security Perimeter	R1.1	All applicable Cyber Assets connected to a network via a routable protocol shall reside within a defined ESP.	Responsible Entity Organizational and Project Engineering function. MCP facilitates implementing this requirement by using different NICs.

Product Bulletin

Standard	Req #	Requirement	Applicable Security Measures
CIP-005-7 Electronic Security Perimeter	R1.2	All External Routable Connectivity must be through an identified Electronic Access Point (EAP).	Responsible Entity Organizational and Project Engineering function. MCP facilitates implementing this requirement by using different NICs. The MCP can constitute an EAP. User authentication is possible via login/password or certificates. For central authentication, multifactor authentication is possible with TACACS+RSA SecureID. The MCP can also be connected to an EAP – as desired.
CIP-005-7 Electronic Security Perimeter	R1.3	Require inbound and outbound access permissions, including the reason for granting access, and deny all other access by default	MCP facilitates implementing this requirement by using different NICs and an internal rule based and configurable firewall. The MCP will only enable the ports and services configured. The firewall will automatically block all other ports.
CIP-005-7 Electronic Security Perimeter	R1.4	Where technically feasible, perform authentication when establishing Dial-up Connectivity with applicable Cyber Assets.	When used as an EAP, for the purpose of providing access to Cyber Assets, MCP can be configured to require name and certificate-based authentication. Authentication can be based on locally defined user or centrally managed users via LDAP or TACACS+.
CIP-005-7 Electronic Security Perimeter	R1.5	Have one or more methods for detecting known or suspected malicious communications for both inbound and outbound communications.	The MCP logs authentication attempts, connections status, and firewall actions.
CIP-005-7 Electronic Security Perimeter	R2.1	For all Interactive Remote Access, utilize an Intermediate System such that the Cyber Asset initiating Interactive Remote Access does not directly access an applicable Cyber Asset. For all Interactive Remote Access, utilize an Intermediate System such that the Cyber Asset initiating Interactive Remote Access does not directly access an applicable Cyber Asset.	Responsible Entity Project Engineering function. MCP facilitates implementing this requirement by using different NICs and an internal rule based and configurable firewall and RBAC.
CIP-005-7 Electronic Security Perimeter	R2.2	For all Interactive Remote Access sessions, utilize encryption that terminates at an Intermediate System.	MCP can be configured to allow remote access sessions using HTTPS (TLS), SSH, and VPN.

Product Bulletin

Standard	Req #	Requirement	Applicable Security Measures
CIP-005-7 Electronic Security Perimeter	R2.3	Require multi-factor authentication for all Interactive Remote Access sessions	Responsible Entity Project Engineering function. For remote HMI access, MCP assists compliance by using LDAP or TACACS+ authentication which in turn can be configured to require RSA token access in the organization. For Remote Access sessions for the purpose of pass-through EAP connections ("virtual connection") – the MCP requires user names and keys/certificates.
CIP-005-7 Electronic Security Perimeter	R2.4	Have one or more methods for determining active vendor remote access sessions (including Interactive Remote Access and system-to-system remote access).	Responsible Entity Organization function. MCP assists in implementing these requirements by providing user activity logs.
CIP-005-7 Electronic Security Perimeter	R2.5	Have one or more method(s) to disable active vendor remote access (including Interactive Remote Access and system-to-system remote access).	Responsible Entity Organizational and Project Engineering function.
CIP-005-7 Electronic Security Perimeter	R3.1	Have one or more method(s) to determine authenticated vendor-initiated remote connections.	Responsible Entity Organizational and Project Engineering function. MCP assists in implementing these requirements by providing support for login/logout events of vendors viewable in the MCP HMI, User Activity Log, and in an SIEM that receives events from the MCP Syslog Client. In addition, Host SSH login/logout events are viewable from the PETC log viewer.
CIP-005-7 Electronic Security Perimeter	R3.2	Have one or more method(s) to terminate authenticated vendor-initiated remote connections and control the ability to reconnect.	Responsible Entity Organizational and Project Engineering function. MCP assists in implementing these requirements by providing a method to logout SSH sessions to Host as well as to change the Host shell Idle timeout. MCP assists in implementing these requirements by providing an inactivity timeout.
CIP-006-6 Physical Security of BES Cyber Systems	All	All	Responsible Entity Organization function.

Product Bulletin

Standard	Req #	Requirement	Applicable Security Measures
CIP-007-6 Systems Security Management	R1.1	Where technically feasible, enable only logical network accessible ports that have been determined to be needed by the Responsible Entity, including port ranges or services where needed to handle dynamic ports. If a device has no provision for disabling or restricting logical ports on the device, then those ports that are open are deemed needed.	MCP facilitates implementing this requirement by using an internal firewall, rules based and configurable. The MCP will only enable the ports and services associated with the configured functionality. The firewall will automatically block all other ports. Users can further edit and customize the firewall rules as needed and close/open ports according to their needs.
CIP-007-6 Systems Security Management	R1.2	Protect against the use of unnecessary physical input/output ports used for network connectivity, console commands, or removable media.	USB ports can be disabled. Network ports are disabled by default. Front maintenance port which can be disabled by configuration.
CIP-007-6 Systems Security Management	R2.1	A patch management process for tracking, evaluating, and installing cyber security patches for applicable Cyber Assets. The tracking portion shall include the identification of a source or sources that the Responsible Entity tracks for the release of cyber security patches for applicable Cyber Assets that are updateable and for which a patching source exists.	The GE Vernova SDLC includes testing with vulnerability scanners and fuzzers tailored for the MCP. Our scanning tools are continuously updated for the latest vulnerabilities and issues and run against our devices. GE PSIRT maintains a registered users list for Cyber Security notifications. The process is setup to send notifications to registered users if a critical vulnerability is identified. Based on severity and exposure of vulnerability details, the assessment of new discovered vulnerabilities is within 30 days. MCP logs all installations of patches and this log is available to administrators.
CIP-007-6 Systems Security Management	R2.2	At least once every 35 calendar days, evaluate security patches for applicability that have been released since the last evaluation from the source or sources identified in Part 2.1.	Responsible Entity Organizational function. Aided by the GE Vernova process notification of registered users.

Product Bulletin

Standard	Req #	Requirement	Applicable Security Measures
CIP-007-6 Systems Security Management	R2.3	For applicable patches identified in Part 2.2, within 35 calendar days of the evaluation completion, take one of the following actions: • Apply the applicable patches; or • Create a dated mitigation plan; or • Revise an existing mitigation plan. Mitigation plans shall include the Responsible Entity's planned actions to mitigate the vulnerabilities addressed by each security patch and a timeframe to complete these mitigations.	Responsible Entity Organizational function. Aided by the GE Vernova process notification of registered users.
CIP-007-6 Systems Security Management	R2.4	For each mitigation plan created or revised in Part 2.3, implement the plan within the timeframe specified in the plan, unless a revision to the plan or an extension to the timeframe specified in Part 2.3 is approved by the CIP Senior Manager or delegate.	Responsible Entity Organizational function.
CIP-007-6 Systems Security Management	R3.1	Deploy method(s) to deter, detect, or prevent malicious code.	Responsible Entity Organizational and Process Engineering function, for e.g. offline scanning of USB FLASH drives used for patching, control electronic access to resources. This is aided by the MCP being based on an embedded computer platform. MCP is built with in-depth security concept (access control, hardening, no backdoors, etc.). Even if an attacker finds a way to inject malicious code in the device, several other mechanisms are there to ensure security: • The device Operating system is a Linux base hardened following security best practices (ex. kernel hardening, privilege separation, etc.) • The Operating System security relies on secured containers which allow isolation between applications. • The MCP does not automatically mount USB drives when they are inserted. A user must login and manually mount the drive. Concerning the Windows hosted configuration tools such as DSAS (DS Agile Studio). We recommend the customer installs antimalware solution based on application whitelisting technology on all PCs.

Product Bulletin

Standard	Req #	Requirement	Applicable Security Measures
CIP-007-6 Systems Security Management	R3.2	Mitigate the threat of detected malicious code.	Responsible Entity Organizational and Process Engineering function. The MCP aides by providing logs of all running application processes, with their unique ID and dependencies. The Operating System security relies on secured containers which allow isolation between applications.
CIP-007-6 Systems Security Management	R3.3	For those methods identified in Part 3.1 that use signatures or patterns, have a process for the update of the signatures or patterns. The process must address testing and installing the signatures or patterns.	Responsible Entity Organizational and Process Engineering function. The MCP does not support the major delivery mechanisms of malware targeted for generic operating systems. See R3.1 answer
CIP-007-6 Systems Security Management	R4.1	Log events at the BES Cyber System level (per BES Cyber System capability) or at the Cyber Asset level (per Cyber Asset capability) for identification of, and after-the-fact investigations of, Cyber Security Incidents that includes, as a minimum, each of the following types of events: 4.1.1. Detected successful login attempts; 4.1.2. Detected failed access attempts and failed login attempts;	The MCP logs successful and failed login attempts, as well as running processes with their application ID.
CIP-007-6 Systems Security Management	R4.1.3	Detected malicious code.	The MCP is an embedded computer platform, using Linux OS. The following major sources of entry of mainstream malware are simply not supported by the MCP: - Installable third-party programs using generic tools like apt-get, yum or windows installer - Auto mount and auto-run of programs on a USB stick or CD drive - Opening documents with embedded macros - Receiving emails with attachments - External web browsing - Open file shares The Responsible Entity Organizational and Process Engineering should develop procedures to control offline scanning of USB FLASH drives used for MCP patching. Also see R3.1 answer

Product Bulletin

Standard	Req #	Requirement	Applicable Security Measures
CIP-007-6 Systems Security Management	R4.2	Generate alerts for security events that the Responsible Entity determines necessitates an alert, that includes, as a minimum, each of the following types of events (per Cyber Asset or BES Cyber System capability): 4.2.1. Detected malicious code from Part 4.1; and 4.2.2. Detected failure of Part 4.1 event logging	See R3.1 Failure of the event logging subsystem itself cannot be logged by the same failed subsystem; appropriate system architectures can be deployed, where absence of renewed logs present (uploaded) at an Enterprise Level can be detected and alarmed.
CIP-007-6 Systems Security Management	R4.3	Where technically feasible, retain applicable event logs identified in Part 4.1 for at least the last 90 consecutive calendar days except under CIP Exceptional Circumstances.	Responsible Entity Organizational and Process Engineering function. Logs in MCP are maintained by size, not by time. MCP log rotate mechanism maintains last 10 user activity log files, each 256 KB of size (2.56 MB maximum); the System Architecture should provision for the MCP to send these logs to an Enterprise Repository for long term availability.
CIP-007-6 Systems Security Management	R4.4	Review a summarization or sampling of logged events as determined by the Responsible Entity at intervals no greater than 15 calendar days to identify undetected Cyber Security Incidents.	Responsible Entity Organizational and Process Engineering function. Logs in MCP are maintained by size, not by time, it is up to the Responsible Entity to review them as needed.
CIP-007-6 Systems Security Management	R5.1	Have a method(s) to enforce authentication of interactive user access, where technically feasible.	All interactive user access to the MCP is subject to authentication, either local or remote (TACACS+, LDAP).
CIP-007-6 Systems Security Management	R5.2	Identify and inventory all known enabled default or other generic account types, either by system, by groups of systems, by location, or by system type(s).	Responsible Entity Organizational and Process Engineering function. MCP does not have generic accounts that cannot be changed. The following roles exist in MCP; a given user can be assigned to a role: - Administrator (full rights) - Supervisor (full access to the HMI) - Operator (can execute commands but cannot change configuration) - Observer (can only see data) - RD Tunnel (can establish a remote desktop tunnel) - SSH pass-through (can establish an SSH based pass-through connection)

Product Bulletin

Standard	Req #	Requirement	Applicable Security Measures
CIP-007-6 Systems Security Management	R5.3	Identify individuals who have authorized access to shared accounts.	Responsible Entity Organizational and Process Engineering function. For Local based authentication, the list of accounts is presented in the MCP configuration tools.
CIP-007-6 Systems Security Management	R5.4	Change known default passwords, per Cyber Asset capability.	Responsible Entity Organizational and Process Engineering function. MCP does not have passwords that cannot be changed.
CIP-007-6 Systems Security Management	R5.5	For password-only authentication for interactive user access, either technically or procedurally enforce the following password parameters: 5.5.1. Password length that is, at least, the lesser of eight characters or the maximum length supported by the Cyber Asset; and 5.5.2. Minimum password complexity that is the lesser of three or more different types of characters (e.g., uppercase alphabetic, lowercase alphabetic, numeric, non-alphanumeric) or the maximum complexity supported by the Cyber Asset.	MCP complies and exceeds all R5.5 requirements for password complexity when Local based authentication is used. For Remote based authentication (TACAS+, LDAP) – the password complexity requirements must be implemented in the central servers.
CIP-007-6 Systems Security Management	R5.6	Where technically feasible, for password-only authentication for interactive user access, either technically or procedurally enforce password changes or an obligation to change the password at least once every 15 calendar months.	While the MCP alone doesn't enforce timely passwords changes, the Responsible Entity can meet this requirement by using centralized user management and procedures enforcing the timely changes.
CIP-007-6 Systems Security Management	R5.7	Where technically feasible, either: - Limit the number of unsuccessful authentication attempts; or - Generate alerts after a threshold of unsuccessful authentication attempts.	MCP complies to R5.7 requirements.
CIP-008-6 Cyber Security Incident Reporting and Response Planning	R1.1	One or more processes to identify, classify, and respond to Cyber Security Incidents.	Responsible Entity Organizational function. The MCP provides the necessary logs enabling the Responsible Entity to implement this requirement.

Product Bulletin

Standard	Req #	Requirement	Applicable Security Measures
CIP-008-6 Cyber Security Incident Reporting and Response Planning	R1.2	One or more processes to determine if an identified Cyber Security Incident is a Reportable Cyber Security Incident and notify the Electricity Sector Information Sharing and Analysis Center (ES-ISAC), unless prohibited by law. Initial notification to the ES-ISAC, which may be only a preliminary notice, shall not exceed one hour from the determination of a Reportable Cyber Security Incident.	Responsible Entity Organizational function. The MCP provides the necessary logs enabling the Responsible Entity to implement this requirement.
CIP-008-6 Cyber Security Incident Reporting and Response Planning	R1.3	The roles and responsibilities of Cyber Security Incident response groups or individuals.	Responsible Entity Organizational function.
CIP-008-6 Cyber Security Incident Reporting and Response Planning	R1.4	Incident handling procedures for Cyber Security Incidents.	Responsible Entity Organizational function.
CIP-008-6 Cyber Security Incident Reporting and Response Planning	R2.1	Test each Cyber Security Incident response plan(s) at least once every 15 calendar months (...)	Responsible Entity Organizational function.
CIP-008-6 Cyber Security Incident Reporting and Response Planning	R2.2	Use the Cyber Security Incident response plan(s) under Requirement R1 when responding to a Reportable Cyber Security Incident or performing an exercise of a Reportable Cyber Security Incident. Document deviations from the plan(s) taken during the response to the incident or exercise.	Responsible Entity Organizational function.
CIP-008-6 Cyber Security Incident Reporting and Response Planning	R2.3	Retain records related to Reportable Cyber Security Incidents.	Responsible Entity Organizational function. Logs in MCP are maintained by size, not by time, it is up to the Responsible Entity to retain logs as required.
CIP-008-6 Cyber Security Incident Reporting and Response Planning	R3.1	No later than 90 calendar days after completion of a Cyber Security Incident response plan(s) test or actual Reportable Cyber Security Incident response (...)	Responsible Entity Organizational function.

Product Bulletin

Standard	Req #	Requirement	Applicable Security Measures
CIP-008-6 Cyber Security Incident Reporting and Response Planning	R3.2	No later than 60 calendar days after a change to the roles or responsibilities, Cyber Security Incident response groups or individuals, or technology that the Responsible Entity determines would impact the ability to execute the plan (...)	Responsible Entity Organizational function.
CIP-008-6 Cyber Security Incident Reporting and Response Planning	R4.1	Initial notifications and updates shall include the following attributes, at a minimum, to the extent known: 4.1.1 The functional impact; 4.1.2 The attack vector used; and 4.1.3 The level of intrusion that was achieved or attempted.	Responsible Entity Organizational function.
CIP-008-6 Cyber Security Incident Reporting and Response Planning	R4.2	After the Responsible Entity's determination made pursuant to documented process(es) in Requirement R1, Part 1.2, provide initial notification within the following timelines: - One hour after the determination of a Reportable Cyber Security Incident. - By the end of the next calendar day after determination that a Cyber Security Incident was an attempt to compromise a system identified in the "Applicable Systems" column for this Part.	Responsible Entity Organizational function.
CIP-008-6 Cyber Security Incident Reporting and Response Planning	R4.3	Provide updates, if any, within 7 calendar days of determination of new or changed attribute information required in Part 4.1.	Responsible Entity Organizational function.
CIP-009-6 Recovery Plans for BES Cyber Systems	R1.1	Conditions for activation of the recovery plan(s).	Responsible Entity Organizational function.
CIP-009-6 Recovery Plans for BES Cyber Systems	R1.2	Roles and responsibilities of responders.	Responsible Entity Organizational function.

Product Bulletin

Standard	Req #	Requirement	Applicable Security Measures
CIP-009-6 Recovery Plans for BES Cyber Systems	R1.3	One or more processes for the backup and storage of information required to recover BES Cyber System functionality.	Responsible Entity Organizational function. MCP assists compliance via snap-shot images which can be remotely retrieved and restored using DSAS (SFTP & SSH protocol).
CIP-009-6 Recovery Plans for BES Cyber Systems	R1.4	One or more processes to verify the successful completion of the backup processes in Part 1.3 and to address any backup failures.	Responsible Entity Organizational function. MCP assists compliance when using compressed configuration archives with integrity checks in place.
CIP-009-6 Recovery Plans for BES Cyber Systems	R1.5	One or more processes to preserve data, per Cyber Asset capability, for determining the cause of a Cyber Security Incident that triggers activation of the recovery plan(s). Data preservation should not impede or restrict recovery.	Responsible Entity Organizational function. See R1.3
CIP-009-6 Recovery Plans for BES Cyber Systems	R2.1	Test each of the recovery plans referenced in Requirement R1 at least once every 15 calendar months: - By recovering from an actual incident; - With a paper drill or tabletop exercise; or - With an operational exercise.	Responsible Entity Organizational function.
CIP-009-6 Recovery Plans for BES Cyber Systems	R2.2	Test a representative sample of information used to recover BES Cyber System functionality at least once every 15 calendar months to ensure that the information is useable and is compatible with current configurations. An actual recovery that incorporates the information used to recover BES Cyber System functionality substitutes for this test.	Responsible Entity Organizational function.
CIP-009-6 Recovery Plans for BES Cyber Systems	R2.3	Test each of the recovery plans referenced in Requirement R1 at least once every 36 calendar months through an operational exercise of the recovery plans in an environment representative of the production environment. An actual recovery response may substitute for an operational exercise.	Responsible Entity Organizational function.

Product Bulletin

Standard	Req #	Requirement	Applicable Security Measures
CIP-009-6 Recovery Plans for BES Cyber Systems	R3.1	No later than 90 calendar days after completion of a recovery plan test or actual recovery (...)	Responsible Entity Organizational function.
CIP-009-6 Recovery Plans for BES Cyber Systems	R3.2	No later than 60 calendar days after a change to the roles or responsibilities, responders, or technology that the Responsible Entity determines would impact the ability to execute the recovery plan: 3.2.1. Update the recovery plan; and 3.2.2. Notify each person or group with a defined role in the recovery plan of the updates.	Responsible Entity Organizational function
CIP-010-4 Configuration Change Management and Vulnerability Assessments	R1.1	Develop a baseline configuration, individually or by group, which shall include the following items: 1.1.1. Operating system(s) (including version) or firmware where no independent operating system exists; 1.1.2. Any commercially available or open-source application software (including version) intentionally installed; 1.1.3. Any custom software installed; 1.1.4. Any logical network accessible ports; and 1.1.5. Any security patches applied.	Responsible Entity Organizational Function. MCP assists compliance by allowing users to create snapshots of the configurations used via DSAS.
CIP-010-4 Configuration Change Management and Vulnerability Assessments	R1.2	Authorize and document changes that deviate from the existing baseline configuration.	Responsible Entity Organizational Function. DSAS Detailed Config Compare utility can help with the process based on the configurations.
CIP-010-4 Configuration Change Management and Vulnerability Assessments	R1.3	For a change that deviates from the existing baseline configuration, update the baseline configuration as necessary within 30 calendar days of completing the change.	Responsible Entity Organizational Function and Process.

Product Bulletin

Standard	Req #	Requirement	Applicable Security Measures
CIP-010-4 Configuration Change Management and Vulnerability Assessments	R1.4	For a change that deviates from the existing baseline configuration: 1.4.1. Prior to the change, determine required cyber security controls in CIP-005 and CIP-007 that could be impacted by the change; 1.4.2. Following the change, verify that required cyber security controls determined in 1.4.1 are not adversely affected; and 1.4.3. Document the results of the verification.	Responsible Entity Organizational and Engineering Function and Process. Users should engage in necessary testing and qualification processes before installing or changing the MCP within a live BES Cyber System. MCP assists compliance by providing all configurations in XML format, which can be easily compared (via DSAS Detailed Config Compare utility).
CIP-010-4 Configuration Change Management and Vulnerability Assessments	R1.5.1	Where technically feasible, for each change that deviates from the existing baseline configuration: 1.5.1. Prior to implementing any change in the production environment, test the changes in a test environment or test the changes in a production environment where the test is performed in a manner that minimizes adverse effects, that models the baseline configuration to ensure that required cyber security controls in CIP-005 and CIP-007 are not adversely affected;	Responsible Entity Organizational and Engineering Function and Process. Users should engage in necessary testing and qualification processes before installing or changing the MCP within a live BES Cyber System.
CIP-010-4 Configuration Change Management and Vulnerability Assessments	R1.5.2	Where technically feasible, for each change that deviates from the existing baseline configuration: 1.5.2. Document the results of the testing and, if a test environment was used, the differences between the test environment and the production environment, including a description of the measures used to account for any differences in operation between the test and production environments.	Responsible Entity Organizational and Engineering Function and Process. Users should engage in necessary testing and qualification processes before installing or changing the MCP within a live BES Cyber System.
CIP-010-4 Configuration Change Management and Vulnerability Assessments	R1.6	Prior to a change that deviates from the existing baseline configuration associated with baseline items in Parts 1.1.1, 1.1.2, and 1.1.5, and when the method to do so is available to the Responsible Entity from the software source: 1.6.1. Verify the identity of the software source; and 1.6.2. Verify the integrity of the software obtained from the software source.	Responsible Entity Organizational Function. The MCP configuration tool (DSAS) assists compliance by allowing users to create snap-shots of the configurations used to be protect it by password.

Product Bulletin

Standard	Req #	Requirement	Applicable Security Measures
CIP-010-4 Configuration Change Management and Vulnerability Assessments	R2.1	Monitor at least once every 35 calendar days for changes to the baseline configuration (as described in Requirement R1, Part 1.1). Document and investigate detected unauthorized changes.	Responsible Entity Organizational and Engineering Function and Process. MCP assists compliance by providing all configurations in XML format, which can be easily compared (via DSAS Detailed Config Compare utility).
CIP-010-4 Configuration Change Management and Vulnerability Assessments	R3.1	At least once every 15 calendar months, conduct a paper or active vulnerability assessment.	Responsible Entity Organizational and Engineering Function and Process.
CIP-010-4 Configuration Change Management and Vulnerability Assessments	R3.2	Where technically feasible, at least once every 36 calendar months: 3.2.1. Perform an active vulnerability assessment in a test environment, or perform an active vulnerability assessment in a production environment where the test is performed in a manner that minimizes adverse effects, that models the baseline configuration of the BES Cyber System in a production environment; and 3.2.2. Document the results of the testing and, if a test environment was used, the differences between the test environment and the production environment, including a description of the measures used to account for any differences in operation between the test and production environments.	Responsible Entity Organizational and Engineering Function and Process.
CIP-010-4 Configuration Change Management and Vulnerability Assessments	R3.3	Prior to adding a new applicable Cyber Asset to a production environment, perform an active vulnerability assessment of the new Cyber Asset, except for CIP Exceptional Circumstances and like replacements of the same type of Cyber Asset with a baseline configuration that models an existing baseline configuration of the previous or other existing Cyber Asset.	Responsible Entity Organizational and Engineering Function and Process.
CIP-010-4 Configuration Change Management and Vulnerability Assessments	R3.4	Document the results of the assessments conducted according to Parts 3.1, 3.2, and 3.3 and the action plan to remediate or mitigate vulnerabilities identified in the assessments including the planned date of completing the action plan and the execution status of any remediation or mitigation action items.	Responsible Entity Organizational and Engineering Function and Process.

Product Bulletin

Standard	Req #	Requirement	Applicable Security Measures
CIP-010-4 Configuration Change Management and Vulnerability Assessments	R4	Each Responsible Entity, for its high impact and medium impact BES Cyber Systems and associated Protected Cyber Assets, shall implement, except under CIP Exceptional Circumstances, one or more documented plan(s) for Transient Cyber Assets and Removable Media that include the sections in Attachment 1. [Violation Risk Factor: Medium] [Time Horizon: Long-term Planning and Operations Planning]	Responsible Entity Organizational and Engineering Function and Process. In the MCP, any Removable Media has to be manually mounted. GE Vernova provides SWM0105 Secure Deployment User Guide.
CIP-011-3 Cyber Security - Information Protection	R1.1	Method(s) to identify BCSI.	Responsible Entity Organizational and Engineering Function and Process. Based on its end user application, the MCP can be a Medium or High Impact asset.
CIP-011-3 Cyber Security - Information Protection	R1.2	Method(s) to protect and securely handle BCSI to mitigate risks of compromising confidentiality.	Responsible Entity Organizational and Engineering Function and Process. To further assist, the MCP offline configuration tool (DSAS) provides integrity validation for configuration archives and snapshots (when a strong password is used). The MCP SED is shipped with a default SED password (set in UEFI). The G100 SED has no password. In addition, if passwords are saved, a strong password is required.
CIP-011-3 Cyber Security - Information Protection	R2	R2.1: Prior to the release for reuse of applicable Cyber Assets that contain BCSI (except for reuse within other systems identified in the "Applicable Systems" column), the Responsible Entity shall take action to prevent the unauthorized retrieval of BCSI from the Cyber Asset data storage media. R2.2: Prior to the disposal of applicable Cyber Assets that contain BCSI, the Responsible Entity shall take action to prevent the unauthorized retrieval of BCSI from the Cyber Asset or destroy the data storage media.	Since the configuration and sensitive data exist in the MCP's removable SSD drives, it is recommended that these drives be removed before disposing the MCP or sending it for repairs. It is the Responsible Entity's responsibility to protect these drives and/or destroy the contained information accordingly.

Product Bulletin

Standard	Req #	Requirement	Applicable Security Measures
CIP-012-1 Cyber Security – Communications between Control Centres	R1	The Responsible Entity shall implement, except under CIP Exceptional Circumstances, one or more documented plan(s) to mitigate the risks posed by unauthorized disclosure and unauthorized modification of Real-time Assessment and Real-time monitoring data while being transmitted between any applicable Control Centers. The Responsible Entity is not required to include oral communications in its plan. The plan shall include: [Violation Risk Factor: Medium] [Time Horizon: Operations Planning] Page 1 of 5 CIP-012-1 – Cyber Security – Communications between Control Centers 1.1. Identification of security protection used to mitigate the risks posed by unauthorized disclosure and unauthorized modification of Real-time Assessment and Real-time monitoring data while being transmitted between Control Centers; 1.2. Identification of where the Responsible Entity applied security protection for transmitting Real-time Assessment and Real-time monitoring data between Control Centers; and 1.3. If the Control Centers are owned or operated by different Responsible Entities, identification of the responsibilities of each Responsible Entity for applying security protection to the transmission of Real-time Assessment and Real-time monitoring data between those Control Centers.	Responsible Entity Organizational and Engineering Function and Process.

Product Bulletin

Standard	Req #	Requirement	Applicable Security Measures
CIP-013-2 Cyber Security – Supply Chain Risk Management	R1	Each Responsible Entity shall develop one or more documented supply chain cyber security risk management plan(s) for high and medium impact BES Cyber Systems and their associated Electronic Access Control or Monitoring Systems (EACMS) and Physical Access Control Systems (PACS). The plan(s) shall include: [Violation Risk Factor: Medium] [Time Horizon: Operations Planning] 1.1. One or more process(es) used in planning for the procurement of BES Cyber Systems and their associated EACMS and PACS to identify and assess cyber security risk(s) to the Bulk Electric System from vendor products or services resulting from: (i) procuring and installing vendor equipment and software; and (ii) transitions from one vendor(s) to another vendor(s). 1.2. One or more process(es) used in procuring BES Cyber Systems, and their associated EACMS and PACS, that address the following, as applicable: 1.2.1. Notification by the vendor of vendor-identified incidents related to the products or services provided to the Responsible Entity that pose cyber security risk to the Responsible Entity; 1.2.2. Coordination of responses to vendor-identified incidents related to the products or services provided to the Responsible Entity that pose cyber security risk to the Responsible Entity; 1.2.3. Notification by vendors when remote or onsite access should no longer be granted to vendor representatives; 1.2.4. Disclosure by vendors of known vulnerabilities related to the products or services provided to the Responsible Entity; 1.2.5. Verification of software integrity and authenticity of all software and patches provided by the vendor for use in the BES Cyber System and their associated EACMS and PACS; and 1.2.6. Coordination of controls for vendor-initiated remote access.	Responsible Entity Organizational and Engineering Function and Process. GE Vernova can help by having the PSIRT maintaining a registered users list for Cyber Security notifications. The process is setup to send notifications to registered users if a critical vulnerability is identified. Based on severity and exposure of vulnerability details, the assessment of new discovered vulnerabilities is within 30 days. MCP logs all installations of patches and this log is available to administrators.

Product Bulletin

Standard	Req #	Requirement	Applicable Security Measures
CIP-014-2 Physical Security	R1-R6	All	Responsible Entity Organization function. MCP assists in implementing these requirements by providing a configurable real time interface to the systems which monitor Physical Access, using industry standard communication protocols (for e.g.: SNMP, MODBUS, ASCII). Events gathered can be alarmed locally or remotely via email, RSYNC over SSH, SFTP, FTP (push). Event can also be forwarded to a syslog server or a SIEM via syslog protocol.

Frequently Asked Questions (MCP)

The following NERC CIP-007-5: Frequent Asked Questions, are applicable to the MCP.

CIP-007-5 R1 – Ports and Services

- Q :** **R1a - Provide a list of factory default open ports – tcp and udp**
A : Please refer to the table in the **Software Configuration Guide SWM0101, Appendix H – List of Factory Default open ports (TCP and UDP)** for complete list of ports. Factory default open ports are indicated by “Yes” from the “Enabled by default?” column.
- Q :** **R1b - Can these ports be closed via firmware or software?**
A : Yes, by configuring with custom firewall rules.
- Q :** **R1c - Can new ports be opened via firmware or software?**
A : Yes, by configuring any LAN applications, Rsyslog Service, Secure Connection Relay, Terminal Server, SNMP, OpenVPN, or NTP, the associated ports will be opened.

CIP-007-5 R2 – Security Patch Management

- Q :** **R2a - Are automated security update notifications available from the vendor via email?**
A : GE Multilin™ maintains a registered users list for Cyber Security notifications. The process is setup to send notifications to registered users if a critical vulnerability is identified.
- Q :** **Can GE Vernova provide periodic updates for the MCP that would bring software such as the operating system, web server, and database up to their current versions?**
A : MCP updates are provided on an as-needed basis. Patch updates are signed and update the existing firmware. Full firmware releases are also signed but update the whole firmware as a single image with the configuration being backed up, upgraded, and restored by the desktop software.

CIP-007-5 R3 – Malicious software prevention

Q : R3a - Does the device support anti-malware tools?

A : No, as this is not currently technically feasible as well as the device does not run a generic OS but a tailored RTOS that is not designed to load or execute 3rd party software components or programs.

CIP-007-5 R4 – Security Status Monitoring

Q : R4a - Does the device provide support for automated security status monitoring tools, specifically for monitoring system events related to cyber security (example, syslog)?

A : Yes, the MCP logs events in SOEs can retrieve any syslog files from connected IEDs.

Q : R4b - Can the device log events, especially security related events?

A : Yes, the MCP logs successful and unsuccessful login attempts, any use of sudo, password change, SSH sessions information, and more.

Q : R4c - Can the device detect a security incident?

A : No, the MCP relies on a Security Event Manager software package to perform alerts of a security incident.

Q : R4d - Can the device send an alert upon detecting a security incident?

A : No, the MCP relies on a Security Event Manager software package to perform alerts of a security incident.

CIP-007-3 R5 – Account Management

Q : R5a - Can the device be accessed remotely via the network?

A : Yes, if configured.

Q : R5b - If yes, does the access method use login accounts?

A : Yes, the access method uses both local accounts and remote accounts via LDAP or TACACS server.

Q : R5c - Provide a list of factory default accounts and their access privileges (e.g. administrator, individual, shared, read-only, read-write)

A : Factory default User account/Username: defadmin; Access privilege: administrator. This is an administrator account that is used only for initial IP address and admin user setup. As soon as an admin account is created and logged into, this 'defadmin' account is automatically removed.

Serial default User account/Username: root; Access privilege: administrator. This is present on all Linux computers, and the expectation is that the Customer will change this to a password of their choosing.

Predix Edge Console default User/Username: admin; Access privilege: administrator. This is present for future expansion. A default Admin user and password exist, and the expectation is that the Customer will change the password to something of their choosing.

Q : R5d - Can new user accounts be created in addition to the factory default ones?

A : Yes.

Q : R5e - Can the privileges of the user accounts be changed for both – factory default and newly created ones?

A : No, the factory default user account privileges cannot be changed. The newly created account privileges can be changed for HMI use.

Q : R5f - Does the access require passwords?

A : Yes, access to the MCP always requires password.

Q : R5g - If yes, does the MCP enforce the password to have the minimum number of characters (combination of alpha, numeric, and special)?

A : Yes, the password must be minimum 8 characters and have at least one number and at least one special character.

Q : R5h - Can the device support a user access log?

A : Yes, the MCP support local SOE log can be accessed remotely, as well as the ability to retrieve any Syslog logs from any connected device.

Q : R5i - If yes, can the user access log be stored in the device for at least 90 days for auditing purposes?

A : Yes, the local user access log can be configured to hold enough records for normal account activity over a period of 90 days (e.g. 10,000 records).

In addition – SNMP related questions

Q : Does the device support SNMP?

A : Yes, as an SNMP client only.

Disclaimer

The MCP family of products are digital devices designed to be installed and operated in utility substations & industrial plant environments and connected to secure private networks. MCP family devices should not be connected to the public internet.

GE strongly recommends that users protect their digital devices using network defense-in-depth practices. This includes, but is not limited to, placing digital devices inside the control system network security perimeter, deploying, and maintaining access controls, monitoring (such as Intrusion Detection System), security awareness training, security policies, network segmentation and firewalls installation, strong and active password management, data encryption, antivirus and other mitigating applicable technologies.

Many electric utilities have deployed cyber security solutions in accordance with the NERC-CIP implementation requirements.

For additional details and recommendations on how to protect The MCP family of products, please see the Secure Deployment User Guide. GE Vernova Grid Automation may also provide additional instructions and recommendations to users from time to time relating to MCP Family devices and cyber security threats or vulnerabilities.

It is the users' sole responsibility to make sure that MCP Family Devices are installed and operated considering its cyber security capabilities, security context, and the instructions and recommendations provided to the user. Users assume all risks and liability associated with damages or losses incurred in connection with any and all cyber security incidences.

Document Revision History

Version	Revision	Date	Change Description
1.00	0	Sept 30 th , 2019	Initial Release.
1.10	0	March 3 rd , 2020	Added FAQ section.
	1	Aug 09 th , 2020	Updated FAQ section.
2.00	0	Sept 30 th , 2020	Updated for MCP v2.0: added information about MCP SED default password in section CIP-011-1, R1.2.
3.00	0	April 21 st , 2021	Updated for MCP family.
4.00	0	Feb 14 th , 2022	Updated for CIP-005-6, IP-007-6, CIP-008-6, and CIP-010-3.
4.10	0	April 26 th , 2023	Updated to add RD tunnel and SSH passthrough users. CIP-007-6, R5.2. Added Disclaimer. Updated FAQ: R1a.
	1	Jan 08 th , 2025	Updated GE Vernova Logo, Company name, Copyright Notice and Trademark Notice. Updated to GE Vernova style.
4.11	0	April 11, 2025	Updated with the latest NERC-CIP versions. Added sections: CIP-005-7 R3.1 and R3.2, CIP-012-1, CIP-013-2 and CIP-014-2. Updated GE Vernova email addresses and phone numbers in Contact Technical Support section.
