GE
Grid Solutions

UISOL
Utility Integration Solutions.

Cyber Security Services

Protecting information, control systems, and networks is mission critical to grid reliability and utility operational integrity and regulatory compliance. UISOL understands the utility business and the vital and ever increasing functional and technical challenges that utilities face to secure their information assets. Our experts can help proactively assess possible vulnerabilities and implement leading-edge prescriptive solutions to improve cyber security.

Broad Cyber Security Experience

UISOL's team of industry veterans with deep technical and energy/utility industry experience can support successful implementation of proactive security solutions for utility, energy market and transmission / distribution network security across both IT & OT domains. UISOL experts assist in assessing vulnerabilities, implementing solutions and ensuring ongoing regulatory compliance and operational integrity. UISOL can improve your cyber security stance with proactive health checks, new solution integrations, upgrades, and business process improvements.

Supporting Project Success

We design, deploy, integrate and extend GE products to increase the utility's business value and satisfaction with GE products. We also have the skills and experience to support end-to-end solution delivery with full IT/OT system integration with 3rd party applications and technologies. UISOL provides thought leadership and support services that result in customers' successful adoption of transformational technologies.

Cyber Security Services

- A threat risk assessment of the current security posture within the application environment to identify areas that are currently meeting industry standards as well as identify any security gaps related to cyber security controls

- On site vulnerability assessments performed on key power, market, and network application systems, possibly including interviews to gather information on goals and concerns

- Report on utility application vulnerabilities with recommendations on best practices to improve security posture

- Best practice standards, policies, and guidelines to serve as a baseline for application and network governance

- Cyber security plan creation or review

- Audit and assessment templates to align with industry best practices and ISO standards
